CAMILLA, in Roman fable, a virgin wonderfully swift of foot who aided Turnus against Æneas. She was said to be a daughter of king Metalus.

CAMILLUS, **MARCUS FURIUS**, a celebrated Roman patrician who first makes his appearance as consular tribune, 403 B.C. His military career was a series of unbroken successes, according to the accounts which have come down to us; but these accounts have been shown by Niebuhr to possess a considerable admixture of mythological or poetic fiction. In 396, C. was made dictator, during the Veientine war, in which he mined and captured the city of Veii; but the proud splendor of his subsequent triumph offended the Roman populace, who were still further displeased when C. demanded a tithe of the spoils of Veii, in order to fulfill a vow made to Apollo, on condition of victory. In 394, C. was again elected consular tribune, and besieged the Falerii, who after bravely defending themselves, were led by a magnanimous act of C. to yield unconditionally. Afterwards, C., being accused of peculation, and foreseeing certain condemnation, banished himself from Rome, 391, and lived in retirement at Ardea, until Brennus, at the head of his wild Gauls, had swept through Etruria, and captured and destroyed the whole of Rome except the capitol. C. was now recalled, and appointed dictator a second time. He achieved a decisive victory over the invaders, rebuilt Rome, and obtained new victories over the Volsci, and others. In 386 B.C., he was elected dictator for the third time, but refused the office. In 381 n.c., C. was victorious in the war of Rome against Preneste and other Latin towns; and in 368 B.C. he was elected to his fourth dictatorship, but abdicated during the same year. In 367 B.C., when war broke out with the Gauls, C., though 80 years old, accepted the dictatorship for the fifth time, defeated the barbarians near Alba, and made peace between patricians and plebeians. After this, he erected near the capitol a temple to Concord, and, having retired from public life, died 365 B.C., of the plague, lamented by the whole Roman people.

CAMILLUS AND **CAMILLA**, applied in ancient Rome to the boys and girls who shared in sacrificial ceremonies. If they were designed for the priesthood, it was necessary that their parents should be still living and free-born.

CAMINATZIN, or **CACUMAZIN**, d. 1521; king of Mexico; nephew of Montezuma. He was one of the victims of the treachery of Cortes, against whom he had declared war. At the instigation of Cortes, Montezuma invited his nephew to the city of Mexico to make a reconciliation with the invaders. He replied that he would enter that city only to destroy the enemies of the country. Still influenced by Cortes, Montezuma had the young prince seized, but his captors permitted Cortes to get possession of him, and he was kept a prisoner until the expulsion of the Spaniards. He probably died soon after the siege of Mexico.

CAMISARDS, the name given to the peasantry of the Cevennes, a mountainous region in s. France, who for several years from 1702 kept up an organized military resistance to the *dragonnades*, or conversion by torture, death, and confiscation of property, by which, after the revocation of the edict of Nantes, the Roman Catholic leaders endeavored to enforce their authority in all the Huguenot districts. The name is of doubtful origin; some say it was from *camise*, a white shirt or frock, outwardly worn by the peasants; others that it was from *camisade*, a night attack; and still others, from *camis*, a road runner. The C. were also called barbets (or water dogs, a term also applied to the Vaudois), vagabonds, assemblers (a name given to a meeting or convention of Huguenots), fanatics, and children of God. They belonged to the romance-speaking people of Gothic descent, who took part in the earliest movements towards religious reform. It was in Languedoc that the peace of God and the mercy of God were formed in the 11th c. against the miseries of private war. (See GOD'S TRUCE, *ante*.) There were preserved the forms of municipal freedom, which nearly all Europe had lost; and there commerce flourished without spoiling the thrift, the patience, or the simplicity of the national character. Calvin was warmly welcomed when he preached at Nîmes, and Montpellier became the chief center for the instruction of Huguenot youth; but it was in the triangular mountainous plateau called Cevennes (see CEVENNES, *ante*), among the small farmers, the cloth and silk weavers, and the vine-dressers, that Protestantism was most universal and intense. The people were, and still are, very poor; but they are intelligent and pious, and add to the deep fervor of the Provençal character a gravity that is probably the result of the trials and sufferings of their ancestors.

To understand the position of the C. in the war which began at the commencement of the 18th c. it is necessary to glance at the preceding history of France. The system of toleration which was established by the edict of Nantes (see *ante*), April 13, 1598, and the edict of Grace, July, 1629, was essentially a political compromise, and not a recognition of religious equality. The right of having a private chapel was given to certain seigneurs. New public churches were to be authorized at a certain rate in certain places. On the other hand, Calvinists were admitted to all public posts and to all professions; and they could publish books in towns where they had churches. The chamber of edict was formed in the parliament of Paris for the impartial judgment of cases brought by Huguenots; and the half-Catholic, half-Protestant constitution was adopted in the town consulates and the local parliaments of the south. After the short struggle between Louis XIII. and the duc de Rohau, the Huguenots settled down into contented industry; the army and navy of France were led by two Huguenots—Turenne and Duquesne—and Cardinal Bentivoglio wrote to the pope that he no longer found in France the insane fervor for right of conscience so radical among the Huguenots. But the court in which Mme. de Maintenon had succeeded to Mme. de Montespan, where Louvois, and the Jesuit, père la Chaise, were as supreme as Bossuet and Flechier in the church, could not long be satisfied with tolerated heresy, which they chose to consider as veiled rebellion. On the death of Mazarin a commissioner had gone over the kingdom to inquire into the titles, or rather to suppress as many as possible, of the Huguenot churches, schools, and cemeteries. The extirpation of heresy had indeed been provided for by a clause in the marriage contract between Louis and Maria Theresa as long before as 1660, and in spite of the protection of Colbert, a policy was begun of gradually destroying the privileges of dissenters. They were shut out from public offices and trade corporations; they were forbidden to marry with Roman Catholics, and the conversion of their children seven years old and upward was encouraged and almost enforced. The famous edict came in Oct., 1685. It directed all dissenting churches to be destroyed, forbade their religious meetings under pain of imprisonment and confiscation of property, ordered all pastors who would not change their faith to be banished within fifteen days and to stop preaching at once, promised exemption from taxes and increased salaries to converted ministers, suppressed Huguenot schools and directed all children to be baptized and brought up in the Roman Catholic faith, prohibited all Huguenots except ministers from going abroad, and declared the property of those who had already gone to be forfeited unless they returned within four months. These were the main points of the edict revoking the liberal edict of Nantes. In carrying it out Huguenot Bibles and books of instruction were burned, and Huguenots were forbidden to hire themselves as artisans or as domestic servants. Torture, hangings, insults worse than death to women, the galleys, and imprisonment for life were the ordinary occurrences of the next sixty years. In the twenty years preceding the revocation, it is believed that 400,000 Protestants fled from France, and that 600,000 escaped in the twenty years that followed. But in the Cevennes the people were too poor to escape, and all over Languedoc began the secret meetings of the church of the desert. At last Louvois, the sanguinary war minister of Louis XIV., proposed that this district should be made an actual desert. An army of 40,000 was raised, and forts were erected at Nîmes, St. Hippolyte, Alais, and Anduze. The abbe du Chaila, a Roman Catholic missionary from Siam, had been appointed inspector of missions in the Cevennes. He introduced the "squeezers" (an instrument of torture which resembled the Scotch "boot"), and his cruelty at last broke the patience of the victims. His assassination, July 23, 1702, was the first blow in the war. There was to have been a general massacre of

Roman Catholic priests, but the plan failed, and the originator, Esprit Seguier, soon fell. He was succeeded by La Porte, an old soldier, who, as his forces increased, assumed the title of "colonel of the children of God," and named his country the "camp of the eternal." His captains were selected from those on whom the prophetic influence had fallen, such as the forest-ranger, Castanet; the wool-carders, Conderc and Mazel; and the soldiers, Catinat, Joany, and Ravenel; but the most famous were Roland and Jean Cavalier, the baker's boy (see CAVALIER, JEAN). For three years the C. held out. Then there was sent against them an army of 60,000, among them an English brigade which had just returned from the persecution of the Vaudois. A policy of extermination was commenced, and in the upper Cevennes alone 466 villages were burned, and nearly the entire population put to the sword. In this bloody work the pope, Clement XI., assisted by issuing a bull against the "execrable race of the ancient Albigenses," promising remission of sins to the holy militia which was now formed among the Roman Catholic population under the name of cadets of the cross. The formidable force brought against them induced Cavalier to listen to proposals, and he finally assented to a surrender on being guaranteed liberty of conscience, the right of assembly outside of walled towns, the liberation of all his people then in durance, and the restitution to emigrants of their civil rights and property. Still, the greater part of the army, under Roland, Ravenel, and Joany, refused, and insisted upon the complete restoration of the edict of Nantes. They continued the war until the beginning of 1705, by which time their leaders were killed or dispersed and they became disorganized. In 1711 all outward signs of the reformed religion had disappeared, and Mar. 8, 1715, a few months before his death, Louis XIV., by a special medal and by proclamation announced the entire extinction of heresy. Fourteen years afterward, in spite of the strictest surveillance aided by military occupation, there had been organized in Languedoc 120 churches, which were attended by 200,000 Protestants. Persecution could not secure suppression, but it was not until 1775 that the last galley slave from Languedoc was liberated, and not till 1789 that the national assembly repealed all the penal laws against Protestantism.

There was a singular psychologic or spiritual phase in the history of the C. that must be noticed. It was a sort of inspiration or ecstasy. The subject, who had endured long fasting, became pale, and fell insensible to the ground. Then came violent agitations of the limbs and the head; and finally the patient, who might be a little child, a woman, or a half-witted person, began to speak in good French of the Huguenot Bible, warning the people to repentance, prophesying the immediate coming of the Lord in judgment, and claiming that these exhortations came directly from the Holy Ghost. After a long discourse the patient returned to his native patois with no recollection of what he had been doing or saying. All kinds of miracles, so they believed, attended upon the Camisards. Strange lights guided them to places of safety, unknown voices spoke encouragement, and wounds were often harmless. Those who were in the ecstasy of trance fell from trees without sustaining hurt; they shed tears of blood, and they subsisted without food for nine days. The supernatural was a part of their life. Many judgments have been passed upon these phenomena. Flechier and Brueys, Roman Catholics, consider them the product of fasting and vanity, nourished by apocalyptic literature. Bertrand and Calmeil, physicians speak of magnetism, hysteria, and epilepsy, and a prophetic mania based on belief in divine possession. Most Protestants are content with the epithet "ecstasy," while semi-radical Roman Catholics consider the whole business the work of the devil.

CAMISARDS. See CEVENNES.

CAMLET (from Arab. *chamal*, fine) is properly a fabric made from the hair of the Angora goat (q.v.). The camlets made in Britain are either wholly of wool, or of wool mixed with cotton or linen, and spun hard.

CAMMERHOFF, JOHN FREDERICK, 1721-51; b. in Germany, and one of the first Moravian bishops in America, where he arrived in 1756, as assistant to the bishop then presiding. He won the confidence of the Indians, with whom he was a great favorite. In 1750, he attended an important Iroquois council at Onondaga, N. Y., making a canoe journey of 13 days up the Susquehanna, and going thence on foot through the wilderness, an exertion which ruined his health.

CAMOENS, LUIS DE, the epic poet of Portugal, was b. about 1524, at Lisbon, and studied the ancient classics at Coimbra. On his return to Lisbon, he fell in love with a lady of honor, Catharina d'Atayada. This affair was the beginning of all the poet's misfortunes. Having been banished by royal authority to Santarem, C. joined the expedition of John III. against Morocco, and lost his right eye in a naval engagement with the Moors in the strait of Gibraltar. On his return to Lisbon, his bravery as a soldier was no more honored than his genius as a poet. Disappointed in all his hopes, he determined to leave forever his native land, and sailed for India, 1553. Offended by certain abuses of the Portuguese authorities in India, C. ventured to expose them in a satire, entitled *Disparates na India*, "Follies in India," in which he treated even the viceroy with ridicule. For this offense the poet was banished, 1556, to Macao, where he lived several years, and was engaged in writing *Os Lusíadas*. Here C. held the unpoetical but probably lucrative post of administrator of the effects of deceased persons; and having

saved, as he thought, a competency for his future life, was recalled from his banishment, 1561. Unhappily, in returning to Goa, he suffered shipwreck, and lost all his property, excepting his epic poem. After other wanderings and misfortunes, C. took ship for Lisbon, where he arrived in 1569, with no other wealth but his epic. He dedicated *The Lusiad* to the young king, Sebastian, who was very gracious; but, nevertheless, all the real patronage bestowed on C. consisted of a very small pension (about £4), and permission to remain at the court of Lisbon. Even this small pittance was taken away after the death of Sebastian, and C. was left in such poverty, that a faithful Indian servant begged in the streets of Lisbon for the support of the great epic poet of Portugal. C.'s lyric poems, written during this time of destitution, contain many pathetic lamentations. He died obscurely in the hospital at Lisbon, 1579; and 16 years afterwards, when it was proposed to erect a splendid monument to his memory, there was some difficulty in finding his burial-place.

The Lusiad (*Os Lusíadas*, "the Lusitanians") celebrates the chief events in the history of Portugal, and is remarkable as the only modern epic poem which is pervaded by anything like the true national and popular spirit of ancient epic poems. It is a gallery of epic pictures, in which all the great achievements of Portuguese heroism are represented. Among the most famous passages are the tragical story of Inez de Castro, and the apparition of the giant Adamastor, who appears as the Spirit of the Storm to Vasco da Gama, when crossing the cape. The versification of *The Lusiad* is extremely charming. Patriotic sentiments pervade the whole work. Besides his epic poem, C. wrote sonnets, odes, elegies, eclogues, epigrams, satires, epistles, and three comedies—*Os Amphitryoes* (after Plautus), *King Seleucus*, and *Filodemo*. The latest and best complete edition of his poems appeared in three volumes (Hamburg, 1834). The best edition of *The Lusiad* was published in Paris (1817), reprinted in 1819, and again, with emendations by Berdier, in 1823. *The Lusiad* has been translated into Spanish, French, Italian, English, Polish, and German.

CAMOGLIA, a t. of n. Italy, on the gulf of Genoa, about 13 m. e.s.e. of the city of that name. Its inhabitants, amounting, in 1872, to 6,345, are chiefly engaged in fishing.

CAMOMILE. See CHAMOMILE.

CAMOR'RA, the name of a secret society, existing throughout all parts of the former kingdom of Naples, the members of which are called *camorristi*, and have exercised lawless force to a great extent over the humbler classes of society. Under the Bourbons, they openly presented themselves at markets, hackney-coach stations, public spectacles, and all occasions of popular amusement; assumed the right of deciding disputes; extorted a portion of whatever money passed from hand to hand for purchases, rents, wages, and the like, or in games; undertook also the transport of smuggled goods, and contracted for the commission of serious crimes. Their readiness for violence and murder, and their close association among themselves, made them so much dreaded, that even camorristi who had been thrown into prison, succeeded in exacting money from their fellow-prisoners, and from the jailer himself. The society has a central rendezvous in every large provincial town, and twelve such in the city of Naples. Those who belong to each of these sections of the society are under the absolute government of a chief elected by themselves, with whom is associated a treasurer. The latter has the charge of the common fund into which all the camorristi of that section pay their whole gains, for equal distribution among all their associates. Candidates for membership must show that they have neither been guilty of espionage nor theft; also, that neither their wives nor their sisters are prostitutes; and must swear upon an iron crucifix a fearful oath of fidelity and secrecy. The candidate remains for a year, with the designation of *picciotto d'onore*, as a pupil under an old camorrista; and having completed this probation, and given proof of his courage and obedience in circumstances involving danger of life, he is advanced to the rank of a *picciotto di sgarro*. Finally, after a longer period, and when he has given proof of his fitness on a number of occasions, he is admitted to full membership of the society as a *camorrista*. Each camorrista carries about with him two knives of peculiar form, by which the members of the society recognize each other. They are held under the strictest discipline. Disobedience is punished by flogging, suspension from employment, or expulsion; treachery, even on the part of a member who has been expelled, is punished with death. If two camorristi quarrel, their chief decides the question between them; but in difficult cases, a duel with daggers is the mode of decision. Under king Ferdinand II. the C. was tolerated for political reasons. The government of Francis II. endeavored to put down the society, and the police received instructions to seize and transport all known members of it. Those who remained entered into alliance with the Garibaldi committee, and rendered essential service in the expulsion of the Bourbons. An attempt was now made to employ them in the police service, but completely failed. The C. having fallen out with the new government, the members of the society now chiefly live by robbery in s. Italy.—See Monnier, *La Camorra*, *Notizie Storiche* (Flor. 1863).

CAMOUFLET, in military pyrotechny, is a stinking composition inclosed in paper-cases. It is used in siege-works, to blow into the faces of the sappers and miners, when hostile parties come within reach of each other, and thus to confuse them.

CAMP (Fr., from Lat. *campus*, a plain, or level field). The signification of this word in English is rather that which belonged to the Latin *castrum*, an encampment, or *castra*, a collection of tents, huts, and other structures, for the accommodation and protection of troops, than that which its etymology would more directly indicate. The regular system of encampment ultimately adopted by the Romans, was forced upon them by degrees. The most complete account of it is furnished to us by Polybius. A plan will be found in Dr. Smith's *Dictionary of Greek and Roman Antiquities*, constructed for the purpose of illustrating his description. When a Roman army was about to encamp, a tribune and several centurions were sent on before, to select a suitable site for the purpose. As soon as the locality was determined on, they chose the spot for the praetorium or general's tent, and marked it with a white flag. Around the praetorium, as a sort of center or heart to the whole system, the rest of the C. was laid out. It was generally placed on an elevated position, in order that the general might have the rest of the encampment under his eye, and be able to transmit his orders with greater facility. Polybius himself tells us, that the best conception which can be formed of a Roman C. of the more permanent kind is by regarding it as a military town, resembling in many respects no doubt that which has recently grown up at Aldershot (q. v.). The streets were broader than those usually to be found in towns, the wider ones measuring 100, and the narrower 50 ft.; and the *forum*, as its name indicates, was a sort of public market-place. A space of 200 ft. was left vacant all round between the tents and the ramparts, partly to afford space for the arrangements of the army, and for stowing away any booty that might be captured, but chiefly to protect the soldiers' huts from incendiary attempts from without. In form, the Roman C. was square, except in the case in which it was intended to embrace within its ramparts four legions, or two consular armies, when it became an oblong rectangle. The C. was surrounded by a fosse or trench (*fossa*), which was generally 9 ft. deep and 12 broad. On the top of the rampart, which was of earth, there were stakes. The labor of constructing the rampart and the fosse was divided between the allies and the Roman legions, the former making the sides along which they were stationed, and the legions the rest. The task of superintending the construction of the C. amongst the Romans was intrusted to the tribunes; amongst the allies, to the prefects. Before the arrival of the troops, the different parts of the C. were so distinctly marked out and measured off, that they at once proceeded to their respective stations, as if they had entered a well-known city, and were marching to their quarters. The discipline of the C. was of the strictest kind. The tribunes administered an oath against theft both to freemen and slaves, and two maniples were chosen to keep the *via principalis*, which was a place of general resort, clean and in good repair. The other occupations connected with the C., too numerous to be mentioned here, were portioned out in like manner; and the superintendence of the whole was intrusted to two tribunes chosen by lot from each legion, and appointed to serve for two months. The prefects of the allies possessed a similar authority, which, however, seems to have been limited to their own troops. Every morning at daybreak, the centurions and horsemen presented themselves to the tribunes, and these, in their turn, received their orders from the consul. The watchword for the night, marked on a four-cornered piece of wood, was given out with much formality. The night was divided into four watches, each of three hours' length; and there was a curious arrangement for ascertaining that guard was kept with vigilance. The soldiers of the watch companies received from the tribune a number of small tablets, with certain marks upon them, and these tablets were collected during the night by the horsemen whose duty it was to visit the posts, from such of the guards as they found on duty. Where these inspectors found the guards asleep or absent, they called upon the bystanders to witness the fact, and then passed on to the next. In the morning, the inspectors appeared before the tribunes, and gave up the tablets they had received, when the guards whose tablets were not produced were required to account for them. A regular scale of rewards and punishments was established in the camp. In comparing the encampments of the Romans with those of his own countrymen, Polybius tells us that the Greeks trusted mainly to a judicious selection of their ground, and regarded the natural advantages which they thus secured as supplying in a great measure the place of artificial means of defense. The Greeks, consequently, had no regular form of C., and no fixed places were assigned to the different divisions of the army. When the practice of drawing up the army according to cohorts, introduced by Marius and Cæsar, was adopted, the internal arrangements of the C. experienced a corresponding change. Latterly, even the square form was abandoned, and the C. was made to suit the nature of the ground. It was always held to be of importance, however, that the C. occupied a defensible position; that it could not be overlooked; and that it had a command of water.

When stationary camps (*castra stativa*) came into more general use, we hear of several parts which are not mentioned by Polybius, for example, the infirmary (*valetudinarium*), the farriery (*veterinarium*), the forge (*fabrica*), etc.; and as a great variety of troops then came to be employed, they must, of course, have had new stations appointed to them in the camp. Many of the stationary camps ultimately became towns, and to this is ascribed the origin of most of the towns in England the names of which end in *chester* or *chester*. Amongst the most perfect of those which retained the form of the simple

encampment, is that at Ardoch in Strathearn, Perthshire, in the grass-covered mounds and ridges of which most of the divisions of the C. have been distinctly traced by antiquaries. For further information on this subject, the reader is referred to gen. Roy's *Military Antiquities in Great Britain*, and the *Caledonia Romana* of the late Mr. Robert Stuart. In these works will be found ample accounts of some of the more remarkable Roman camps in Britain; those described by Roy being rendered intelligible by large engravings.

It is believed that, during the middle ages, the plan adopted by the Romans in their camps was more or less adhered to, seeing that the weapons employed, which mainly determined the character of the troops, were nearly the same. In Britain, before the arrival of the Romans, and also during the Saxon and Danish periods, the camps, usually circular in form, appear to have been somewhat rude in character, with the cavalry grouped round the standard in the center, and the infantry placed near the front.

The principles of castrametation, or camp-formation, underwent much change after the invention of gunpowder, owing to the necessity for defending the C. from artillery. Modern camps, of different kinds, will be found described under ENCAMPMENT.

CAMPAGNA, a t. of Italy, in the province of Salerno, is situated between high mountains, about 20 m. e. of Salerno. It has a fine cathedral, several convents, and a large annual fair. Pop. '72, 9813.

CAMPAGNA DI ROMA, an undulating, uncultivated, and unhealthy plain of Italy surrounding Rome, including the greatest part of ancient *Latium*, and forming the late papal delegation of Frosinone and a great part of the *Comarca di Roma*. Its length is variously stated, arising from the fact that different authorities measure it from different points. But supposing the name to apply to the district extending from cape Linaro, s. of Civita Vecchia, to Terracina, beyond the Pontine marshes, its length is about 90 m.; and its breadth inland, to the Alban and Sabine hills, is stated at from 27 to 40 miles. A broad strip of sandy plain skirts the Mediterranean. The ground, which never rises above 200 ft. above the sea, is almost entirely volcanic, and the lakes are formed by craters of extinct volcanoes. The vapors rising from this district, and especially from the Solfatara (q. v.), produce the pestilential atmosphere styled *aria cattiva*. The number of inhabitants is very small, and in summer they are driven from the C. by its pestilent air, and seek shelter in Rome and other neighboring places. In autumn, herdsmen descend from the Apennines to the C. with their herds, the pasturage in some parts being rich and abundant. This district was not always uncultivated and depopulated as we now find it, for Domitian and Hadrian built here their splendid villas. Wars and devastations, the "black-death" (q. v.) in the 14th c., which greatly thinned the population, and inundations from the Tiber, have been the main causes of the present state of the C.; but, according to Livy, it was always an unhealthy district, even when well cultivated. Some of the popes, especially Pius VI., have endeavored to drain the Pontine marshes, and, during the dominion of the French in Italy, gen. Miollis made great improvements in drainage, timber-planting, and cultivation in the Campagna.

CAMPAIGN generally means a connected series of military operations, forming a distinct stage or step in a war. Under the old system of warfare, when armies kept the field only during the summer months, a C. was understood to include all that was done by an army from the time it took the field till it went again into winter-quarters. Now that winter is no longer allowed to arrest military operations, it is more difficult to say where one C. ends and another begins. Some writers make a C. include all the steps taken to accomplish some one immediate object.

CAMPAN, a t. in France, in the department of Hautes-Pyrenees, 18 m. s. e. of Tarbes; pop. 3700. It is in a valley of the same name, on the Adour, and is noted for picturesque scenery, for a stalactite grotto, and marble quarries, along the road to Bagnères de Bigorre. Some of the finest of colored marbles, with green, flesh-colored, red, and white veins, are found here. The women are employed in knitting scarfs and wonderfully thin gauze from fine wool brought from Spain.

CAMPAN, JEANNE LOUISE HENRIETTE, reader to the daughters of Louis XV., was b. in Paris, Oct. 6, 1752. She was favored by Marie Antoinette, and gave her royal patroness numerous proofs of her fidelity. When the unfortunate queen was conveyed to the Temple, she wished to share her captivity, but was refused entrance by Petion. During the reign of terror, she remained concealed at Combertain. After the fall of Robespierre, she opened a boarding-school at St. Germain-en-Laye, which was patronized by Josephine Beauharnais, who sent her daughter Hortense to it. In 1806, Napoleon appointed her lady-superintendent of the institution at Ecoeu for the education of the daughters of the officers of the legion of honor. After the restoration, this institution was suppressed, and Mme C. retired to Mantes, where she died, May 16, 1822. She is chiefly remembered on account of her interesting works—*Mémoires sur la Vie Privée de la Reine Marie Antoinette* (4 vols., 5th ed., Par. 1824); *Journal Anecdotique* (Par. 1824); and *Correspondance Inédite avec la Reine Hortense* (3 vols., Par. 1835)—giving recollections of the court of Louis XV., of Marie Antoinette, the revolution, and some traits from the private character of Napoleon.

CAMPANA, LA, a t. of Andalusia, Spain, situated on the Madre-Vieja, a tributary of the Guadalquivir, about 37 m. e.n.e. of Seville. The inhabitants, numbering 5,380, are engaged chiefly in agricultural pursuits, and in weaving and brick-making.

CAMPANA RIO, a t. of Estremadura, Spain, about 62 m. e.s.e. of Badajos. It is an ill-built place, with narrow, uncarved-for streets. It has manufactures of linens and ropes, and a trade in the agricultural produce of the neighborhood. Pop. 5,400.

CAMPANELLA, TOMMA'SO, a Dominican monk celebrated for his philosophical ability, was b. in 1568 at Stilo in Calabria, and studied in Naples and Cosenza. The writings of Telesius first awakened his doubts respecting that pile of artificial dogmas styled the "scholastic philosophy." The results of his studies were given in his *Philosophia Sensibus Demonstrata*, etc. (Naples, 1591), which contained a defense of Telesius. His superiority in disquisitions exposed him to the hatred and false accusations of the orthodox monks and schoolmen. He was in consequence compelled to flee from Naples to Rome, and thence to Florence, Venice, and Bologna. Afterwards, he returned to Calabria, but having involved himself in a political conspiracy, he was seized and confined in a Neapolitan dungeon for 27 years; tried five times, and tortured seven; accused of heresy; and declared the author of a book which had been published thirty years before he was born. In 1626, pope Urban VIII. had him brought to the prison of the inquisition at Rome, but immediately liberated him, and treated him in a very generous manner. After being again persecuted by the Spanish government, C., who had formed the friendship of the French ambassador at Rome, the duc de Noailles, obtained a letter of introduction to cardinal Richelieu, and secretly left for France, where he was graciously received. He died in the Dominican monastery of St. Honoré, near Paris, 1639. Most of his works—*De Gentilismo non Retinendo* (Paris, 1636); *Astrologicorum Libri VII.* (Lyons, 1629); *Prodromus Philosophiæ Instaurandæ* (Frankfort, 1617); *Exordium Metaphysicæ Novæ, De Sensu Rerum et Magia* (Frankfort, 1620)—were written during his imprisonment. His philosophical views give expression to that confused fermentation of new ideas which was characteristic of the close of the 16th and opening of the 17th c.—bold and clear opinions, strangely mingled with commonplaces and with astrological dreams and fancies. It may seem strange that C. should have been patronized by the pope; but this favor was gained, not by his speculative works, but by several writings in defense of the Roman Catholic church. His *De Monarchiâ Hispanicâ Discursus* is a work of great power and value, comprising a sketch of the political world of C.'s time, with special reference to Spain. It was translated into English during Cromwell's protectorate.

CAMPANA'HA, a t. of Brazil, about 150 m. n.w. of Rio de Janeiro, surrounded by bare hills, much cut up by gold-mines. The houses are built chiefly of earth, and surrounded by gardens. C. has several churches, a Latin school, a hospital, theater, etc. Pop. 6,000.

CAMPANIA, anciently a province of central Italy, having Capua as its capital (now subdivided into the provinces of Benevento, Naples, Salerno, Avellino, and Caserta), was bounded on the s. by Lucania, e. by Samnium, n. by Latium, and w. by the Tyrrhenian sea. It was one of the most productive plains in the world, producing in extraordinary abundance corn, wine, and oil; and both by Greek and Roman writers is celebrated for its soft and genial climate, its landscapes, and its harbors. It was the *regio felix* of the Romans, who built here many of their most splendid villas, etc. Through it passed the Appian Way, the greatest high-road of Italy. The promontory Misenum, Mt. Vesuvius, the river Volturnus, the towns Baiæ, Cumæ, Linternum, Putcoli, Naples, Herculaneum, Pompeii, Nola, Salernum, Capua, etc., belonged to Campania. It was the oldest Greek settlement in Italy, having been colonized, according to the later chronologers, about 1050 B.C.; but this is in all probability too early a date. It was next conquered by the Etruscans, and several of the towns above mentioned, such as Capua and Nola, were founded by that people. The Etruscans then succumbed to the more warlike and hardy Samnites, who, in their turn, yielded to the irresistible valor of Rome (340 B.C.). Through all these vicissitudes of conquest, the substratum of the people remained as at the beginning. The mass of the Campanians were essentially of Oscan race, and Oscan they remained. Indeed, it is mainly from them that our knowledge of the Oscan language is derived, and one of their towns—Atella, between Capua and Naples—had the honor of introducing upon the early Roman stage a species of popular drama or comedy, which was greatly relished for its quaint and vigorous humor. See **ATELLANÆ**.

CAMPA'NI-ALIMENIS, MATTEO, an Italian philosopher and mechanic of the 17th century. He was a curate in Rome, but devoted his time mainly to scientific pursuits, constructing the object-glasses with which two of Saturn's satellites were discovered; making illuminated and noiseless clocks; and attempting to correct the variations of the pendulum due to temperature. He published a work on horology. Giuseppe, a younger brother, was also an optician and astronomer of some eminence.

CAMPANILE (Ital., from Mid. Lat. *campana*, a bell), a name adopted from the Italian to signify a bell-tower of the larger kind, and usually applied only to such as are

detached from the church. Scarcely any of the existing bell-towers of England answer to the Italian conception of the C., but it is said that there was a very fine one at Salisbury, 200 ft. in height, which was destroyed by Wyatt. In Italy, they are found everywhere—at Bologna, Padua, Ravenna, Cremona, Venice. Perhaps the most remarkable are the so-called "leaning tower" of Pisa, and the C. of Florence. The former, which is circular in form, is decorated with columns and arcades to the summit of its eight stories, and presents a very imposing appearance, reminding the traveler of the Coliseum at Rome, from which, and the now destroyed Septizonium, the idea of it is said to have been taken by the architects Bonano of Pisa, and Wilhelm of Innsbruck. But though less curious, the famous C. of Giotto is perhaps even more worthy of the traveler's attention. It was erected in 1334, with the express object of surpassing, both in height and in richness of workmanship, any of the remains of antiquity. In form, it is a parallelepiped, and is of the same dimensions from bottom to top. Though it is very lofty—267 ft.—it consists of only four stories, of which the tallest are the uppermost and undermost; and the windows in the upper story are rather larger than those in the two beneath, the object being to counteract the diminution to the eye occasioned by the greater distance. The effect of this arrangement has been much praised by architects; but there seems ground for skepticism as to its advantages. The style is the real Italian Gothic, which unites simplicity with great richness of ornamentation. The original design of Giotto was that a spire of 100 braccia in height should have surmounted the present structure, and on the summit may be seen the four great piers from which it was intended that it should have risen. The splendid C. of Florence, in its present condition, must thus be regarded only as a fragment. There is a fine C. at Seville, 350 ft. in height, which was built by Guever the Moor in 1568. It is called La Giralda, from a brazen figure, which, though it weighs a ton and a half, turns with the wind.

CAMPANI'NI, ITALO, b. Parma, 1846; an Italian tenor. He enlisted in the army of Garibaldi when fourteen years of age, and took part in the fight before Milazzo. Having discovered during the campaign that he had a wonderful voice, he studied singing for two years at the conservatory of Parma, and made his first appearance as the notary in *La Sonnambula* at one of the theaters of his native town. He sang with very little success with different opera companies till 1869. In that year he went to Milan and placed himself under the tuition of the celebrated teacher, Francesco Lamperti. After a thorough training he made his debut in *Faust* at La Scala of Milan, and was pronounced by a critical audience to be one of the finest tenors of the age. In 1872, he made his London debut as "Genaro," in *Lucrezia Borgia*, and in 1873 sang with Christine Nilsson in New York. He returned to America during the season of 1879-80. Besides being the greatest tenor living, he is remarkable for the immense scope of his repertory, which includes nearly 80 operas, the tenor rôles of which he can sing at a few hours' notice.

CAMPANULA (Lat., a little bell), a genus of plants of the natural order *campanulaceæ* (q.v.), distinguished by a bell-shaped corolla with five broad short segments, filaments dilated at the base, a 2 to 5 cleft stigma, and a top-shaped capsule with 2 to 5 cells, opening by lateral clefts below the calyx segments. The species are very numerous, chiefly but not exclusively abounding in the northern parts of the world, and the more elevated districts of the temperate zones. They are mostly herbaceous, some of them annual. The name BELL-FLOWER is common to many of them, and is often extended to all. The flowers are in general beautiful, and many of the species are therefore frequent ornaments of flower-borders. Of the native British species, the most common, and one of the most beautiful, is the harebell (q.v.), or BLUEBELL (*C. rotundifolia*). The CANTERBURY BELL (*C. medium*) is a very beautiful annual, which has long been so generally sown in flower-borders in Britain, that it is almost as familiar to every one as the most common field-flowers. It is a native of the central parts of Europe.—Medicinal virtues were formerly ascribed to some species, particularly in affections of the throat, wherefore *C. trachelium*, frequent in woods in England, has received the name of throatwort; but they are now regarded as inert.—The roots of some are reckoned among esculents, as those of the rampion (q.v.) (*C. rapunculus*), occasionally cultivated in Britain, and much more generally in some parts of continental Europe.

CAMPANULA'CEÆ, a natural order of exogenous plants, herbaceous or half shrubby, with a bitter milky juice; leaves without stipules, and generally alternate; the calyx usually 5-lobed, its tube adhering to the ovary; the corolla monopetalous, inserted into the top of the calyx, usually 5-lobed and regular; the stamens inserted into the calyx, and alternate with the lobes of the corolla; the fruit with two or more many-seeded cells, crowned with the withered calyx and corolla, and opening by division of the cells (*loculicidally*); the seeds fixed to the axis, and having fleshy albumen. About 500 species are known, natives chiefly of the temperate and colder climates of the northern hemisphere, where their blue or white flowers are among the finest ornaments of fields and woods. The roots and young leaves of some species are eatable, as is the half-fleshy fruit of *canarina campanula*, a native of the Canary islands.

CAMPBELL, a co. in n.w. Georgia, on the Chattahoochie river and the Atlantic and Westpoint railroad; 360 sq.m.; pop. '70, 9,176—2,587 colored. Among its minerals are gold and iron. Productions, corn, wheat, and cotton. Co. seat, Campbellton.

CAMPBELL, a co. in n. Kentucky, on the Ohio and Licking rivers; 120 sq. m.; pop. '70, 27,406—282 colored. The surface is level in the bottom lands, and undulating away from the rivers; soil generally fertile, producing grain, tobacco, etc. Co. seat, Alexandria.

CAMPBELL, a co. in n.e. Tennessee, on the Kentucky border; watered by Clinch river; 450 sq. m.; pop. '70, 7,445—428 colored. It has a rough surface, and is traversed by a spur of the Cumberland mountains, and is to a large extent covered with forests. It produces corn, wheat, and sugar. Co. seat, Jacksonborough.

CAMPBELL, a co. in s. Virginia, between James and Staunton rivers, intersected by the Atlantic, Mississippi and Ohio railroad; 576 sq. m.; pop. '70, 28,384—14,543 colored. It has an uneven surface, and fertile soil; producing tobacco, corn, wheat, etc. Co. seat, Campbell Court-house.

CAMPBELL, the family name of the lords of Argyle. The origin of the family has not been satisfactorily ascertained. One theory makes it of Anglo-Norman origin; another traces its descent through a long line of Celtic chiefs to king Arthur. It first appears in record towards the end of the 13th c., when it held lands in Ayrshire and Argyle. The chiefs of the family having taken a prominent part in public affairs, the most distinguished are noticed under the head ARGYLE.

CAMPBELL, ALEXANDER, D.D., 1788—1866; b. in Ireland; educated at Glasgow university, and came to the United States in 1809, settling in Bethany, Penn., as pastor of a Presbyterian church, from which he soon departed and organized a society whose doctrine was that the Bible should be the sole creed of the church. His followers increased, and are now known as "Disciples of Christ," or "Campbellites," and number about half a million. Dr. C. was the author of many works on religious subjects, and held important controversies with such disputants as Robert Owen, archbishop Purcell, Rev. N. L. Rice, and Rev. Wm. McCalla.

CAMPBELL, ARCHIBALD. See ARGYLE, DUKE OF, *ante*.

CAMPBELL, Sir COLIN, Lord CLYDE, one of the bravest soldiers and most distinguished generals of modern times, was born in Glasgow, in 1792. His father was a cabinet-maker, named John Macliver, but Colin assumed the name of Campbell, to gratify an uncle on the mother's side. He entered the army as an ensign in 1808; fought through the war in the Spanish peninsula with distinction, and took part in the expedition to the United States in 1814. In 1842, he attained the rank of col., and in the same year he was present at the attack on Chusan, in China, and for his services there received honorable mention in the *Gazette*. He next served in the Punjab, commanding the left at the battle of Chillianwallah. For his conduct in this battle, lord Gough awarded him the highest praise in his dispatch to the governor-general of India. He next commanded in the Peshawur district, with uniform success against the hill-tribes. On the breaking out of the Crimean war in 1854, he was appointed to the command of the Highland brigade, and took a prominent part at the battle of the Alma; and afterwards at Balaklava, where, with the 93d Highlanders, which he did not even form into square, he beat back the Russian cavalry, who were swooping down on the port, with its accumulation of shipping and stores. His services in this war were rewarded with promotion to the rank of maj.gen., and he was also created a knight grand cross of the order of the bath, and received the cross of the French legion of honor. He was appointed inspector-gen. of infantry, and in 1857, commander of the forces in India, then engaged in quelling the Indian mutiny, which by his energy and judgment was soon utterly subdued. One of the most notable characteristics of C.'s generalship, was the care he took of the lives of his men, all his victories being won with the minimum expenditure of the blood of his soldiers. For his exploits in India, C., in 1858, was created a peer of the realm, with the title of baron Clyde, and appointed a gen., the East India company granting him an annuity of £2000. C. arrived in Britain from India in 1860, and died Aug., 1863.

CAMPBELL, GEORGE, D.D., an eminent theological writer, was born at Aberdeen in 1719. He was educated for the law, but abandoned that profession for the study of divinity. In 1746, he was ordained minister of Banchory Ternan, a parish lying some miles s.w. of Aberdeen; and in 1759, he was appointed principal of Marischal college. His first work was his famous *Treatise on Miracles*, in answer to Hume. The dispute concerning miracles has assumed a new form in the present century, and C.'s arguments would not meet all the objections which the modern school of rationalists urge; but the work in its own day was greatly admired, and characterized as "one of the most acute and convincing treatises that has ever appeared on the subject." It was speedily translated into French, Dutch, and German. In 1771, C. was elected professor of divinity in Marischal college. In 1776, he published his *Philosophy of Rhetoric*, which is still a standard work on the subject. His last work was a *Translation of the Gospels, with Preliminary Dissertations and Notes*. He died April 6, 1796. After his death appeared his *Lectures on Ecclesiastical History*.

CAMPBELL, JOHN (CAMPBELL), Lord, high chancellor of England, son of a minister of Cupar, in the co. of Fife, Scotland, was born in 1779. He was at first destined to follow his father's profession, and was sent, while still a mere boy, to the neighboring univer-

sity of St. Andrews. C. himself had no inclination for a clerical life, and when he had completed his studies in the faculty of arts, he left for London, being then about 19 years of age. He obtained employment on the staff of the *Morning Chronicle*, where, in due time, he was intrusted with the care of the theatrical criticism and the reports in the house of commons. He was called to the bar in 1806. His sound sense, and unpretending activity and devotion to business, were awarded with an extensive common-law practice, and, after a time, with professional promotion. The silk-gown of a king's counsel was conferred upon him in 1827. Three years afterwards, he entered parliament, actuated, he tells us in the preface to one of his works, by a desire to obtain for England the benefits of a national registry of titles to land. The effort, at the time, was unavailing, as the landlords, whom it was destined more immediately to benefit, completely misunderstood the purport of the project. C. was promoted by the Whig party, to which he had attached himself, to the solicitor-generalship in 1832, and to the attorney-generalship in 1834. In the same year, he was chosen the representative in parliament for Edinburgh. He continued to represent Edinburgh down to 1841, and remained in the office of attorney-general during that period, with the exception of the short time in 1835, when the conservatives were in power. In 1841, he was made chancellor of Ireland and a peer of the United Kingdom; but held the office of chancellor for only a few months, when the Melbourne cabinet left office, necessitating C. also to resign. For the first time since boyhood, he found himself without regular daily labor, and at the mature age of 60, set to work to win the literary fame which he professes always to have secretly coveted. His first publication was a collection of his speeches at the bar and in the house of commons. For three or four years after the publication of his speeches, C. was engaged in the preparation of the *Lives of the Chancellors*, the first series of which appeared in 1845. In 1846, he joined the Russell cabinet in the capacity of chancellor of the duchy of Lancaster. His ministerial duties were not sufficiently arduous to interrupt his literary labors, and he proceeded to complete the *Lives of the Chancellors*, and to publish a supplemental series of *Lives of the Chief-justices of England*. Both works have enjoyed great popularity, but leave no doubt that the author was more fitted for a practical lawyer than for a man of letters. C. returned to more congenial labors in 1850; he was then appointed to succeed Denman as chief-justice. He held the office for nine years, at the end of which he received the highest honor that can be obtained by a member of the legal profession—the chancellorship of England. He died June, 1861.

CAMPBELL, THOMAS, a distinguished English poet, was b. in the city of Glasgow, 27th July, 1777. His father was a merchant, and the poet was the youngest of ten children. He was sent to the university of his native city, and remained there six years. During his collegiate course, he received several prizes, and was particularly distinguished for his knowledge of Greek literature. On leaving the university, C. went to reside as a tutor for a year in the island of Mull. The scenery of the w. Highlands made a deep impression on his mind, and to his abode in these grand and desolate regions we are indebted for many of the touches of sublimity which occur in his verses. Returning from Argyleshire, C. meditated the study of law, and repaired to Edinburgh; but he could not shake off his recollections. In his eyes, the mists were folded on the hills of Morven, the roar of Corrievekin was in his ears, and instead of prosecuting the study of jurisprudence, he wrote *The Pleasures of Hope*. The poem was published in 1799, and went through four editions in a twelvemonth. After its publication, C. went to the continent; and on Dec. 3, 1800, witnessed from a Bavarian monastery the battle of Hohenlinden, fought between the French and Austrians. In 1801, he returned to England with *The Eric of Erin* and *Ye Mariners of England* in his portmanteau; and shortly after, took up his abode in Edinburgh, where *Locheil's Warning* was composed. In 1803, C. proceeded to London, and adopted literature as a profession. He contributed articles to *The Edinburgh Encyclopaedia*, and compiled *The Annals of Great Britain from the Accession of George II. to the Peace of Amiens*, in 3 vols. In 1806, through the influence of Mr. Fox, C. received a pension of £200 per annum from government. In 1809, he published *Gertrude of Wyoming*, which bears the same relation to *The Pleasures of Hope* that *The Castle of Indolence* bears to *The Seasons*—a less brilliant and striking, but more mature and finished performance. In 1818, C. was again in Germany, and on his return, he published his *Specimens of the British Poets*, in 7 vols. In 1820, he delivered a course of lectures on poetry at the Surrey institution. From this date to 1830, C. edited *The New Monthly Magazine*, and contributed thereto several poems, one of which, *The Last Man*, is in some respects the loftiest of all his performances. In 1824, he published *Theodoric and other Poems*. In 1827, he was elected lord rector of the university of Glasgow, and received the unusual honor of re-election the two following years. He published *The Pilgrim of Glencoe and other Poems* in 1842. His later publications did not add to his fame. He died at Boulogne, in 1844, and was buried in Westminster abbey, Macaulay, dean Milman, and other celebrated persons bearing the pall.

C. is an established English classic. With the young, *The Pleasures of Hope* will ever be a chief favorite; while readers of maturer years will linger with delight over the sylvan scenery and tender domestic scenes of *Gertrude*. It is in his lyrics, however, that C. has ascended highest into the heavens of song—*Hohenlinden*; *Ye Mariners of England*; and *The Battle of the Baltic*, cannot be paralleled in the language. Than these lyrics.

nothing can be more simple and spirited. Once read, they cannot be forgotten. They will fan the patriotism of many generations.

CAMPBELL, WILLIAM, 1745-81; b. in Va.; an officer in the revolutionary war. He was among the earliest of the patriot troops from that colony, and was distinguished in the conflicts of King's mountain and Guilford, for which he was promoted to be brig.gen. He died in Lafayette's camp, just before the Yorktown surrender.

CAMPBELL, WILLIAM, Lord, d. 1778; the last English governor of South Carolina. He was a capt. in the navy; a member of parliament in 1764; in 1766, governor of Nova Scotia, and 1775, of South Carolina. He was active in stirring up the Indians against the colonists, and was in the expedition led by sir Peter Parker against South Carolina, in the course of which he received the wound that caused his death.

CAMPBELL ISLAND, a lonely spot on the s. Pacific, in lat. 52° 33' s., and long. 169° 9' e. Though it is mountainous, and measures only 36 m. round, it is yet valuable on account of its harbors. It is also scientifically interesting, being volcanic, and displaying a rich and rare flora.

CAMPBELLITES. See DISCIPLES OF CHRIST.

CAMPBELTON, a royal burgh and seaport, on the e. coast, near the s. end of the peninsula of Cantire, Argyshire, and the most important town in that co., is 65 m. w.s.w. of Glasgow, on a fine harbor or sea-loch, 2 m. long, and one mile broad. It is noted for the number—between 20 and 30—of its whisky distilleries. It unites with Ayr, Inverary, Irvine, and Oban to return one member to parliament. A sculptured granite cross stands in the principal street, and is supposed to have been brought from Iona. Pop. '71, 6680. The chief exports are whisky, herrings, and Highland cattle and sheep. In 1874, 806 British vessels of 6838 tons, and 18 foreign of 2353 tons, entered the port. C. is a favorite summer resort.

CAMPE, JOACHIM HEINRICH, 1746-1818; a German teacher educated at Halle in theology, and chaplain at Potsdam. In 1787, he was counselor of education in Brunswick, where he published books for schools, and established a prosperous business. His works on education have been widely circulated, not only in German, but in other languages.

CAMPEACHY, one of the states of Mexico occupying the s. part of the peninsula of Yucatan, and bordering on Guatemala and the Belize; 26,000 sq.m.; pop. about 90,000, of whom a large proportion are Indians. The soil is for the most part sandy and unproductive, but there are good pasture lands. The main productions are rice, sugar, and salt.

CAMPEACHY, a seaport on the w. side of the peninsula of Yucatan, which divides the Caribbean sea from the gulf of Mexico. It is in lat. 19° 50' n., and long. 90° 33' west. Though it has a shallow haven, yet it is the center of the trade in logwood; it exports likewise cotton and wax. It is a handsome city of 15,000 inhabitants, containing churches, convents, a cemetery, a theater, a college, and ship-building docks. *Campeche* is the Spanish spelling.

CAMPEGGIO, or CAMPEGGI, LORENZO, 1479-1539; in early life a lawyer, but on losing his wife he joined the Roman Catholic church and rapidly rose to the position of cardinal. In 1519, he was sent to England to preach a crusade against the Turks, but was unsuccessful. Henry VIII. made him bishop of Salisbury in 1524, and he came again to England in 1528 to assist Wolsey in the case of Henry's divorce from Catherine. He accomplished nothing, however, and the see of Salisbury was taken from him.

CAMP EQUIPAGE is a general name for all the tents, furniture, fittings, and utensils carried with an army, applicable to the domestic rather than the warlike wants of the soldier. In the days when armor was worn, the C. E. was enormously heavy and complicated. In the present day, a certain amount of C. E. is provided for a given number of troops. See ENCAMPMENT, TENT, etc.

CAMPER, PETER, one of the most learned and acute physicians and anatomists of the 18th c., was born at Leyden, 11th May, 1722, and studied medicine there. In 1750, he became professor of medicine at Franeker; in 1755, at Amsterdam; and in 1765, at Groningen. In 1773, he resigned his post, resided some time at Franeker, and then traveled. On being elected a member of the state council in 1787, he removed to the Hague, where he died, 7th April, 1789. C. was distinguished not only for the services he rendered to anatomy, surgery, obstetrics, and medical jurisprudence, but also as a promoter of the fine arts. He was remarkably skillful in pen-and-ink drawing, painted in oil, embossed, and even acquired considerable experience as a sculptor. For his observations on the facial angle, see article ANGLE. His work on the connection of anatomy with the art of drawing was an important contribution to the theory of art. Another work, *Description Anatomique d'un Eléphant Mâle*, edited by his son, G. A. Camper, and published at Paris in 1802, is also worthy of notice. C.'s collected writings, with plates, appeared under the title, *Œuvres qui ont pour Objet l'Histoire Naturelle, la Physiologie et l'Anatomie comparée*, 3 vols. (Par. 1803).

CAMPERDOWN, a broad tract of low downs which separates the small hamlet of Camp, in North Holland, from the German ocean, about 30 m. n. from Haarlem. It is

known on account of the victory obtained, off that part of the coast, by admiral Duncan over the Dutch fleet, Oct. 11, 1797. The Dutch fleet under admiral Van Winter had stolen out of the Texel, with the view of joining the French fleet at Brest, when it was intercepted by admiral Duncan, and after an obstinate battle, attended with great loss on both sides, the Dutch admiral was compelled to yield, leaving 8 sail of the line and several smaller vessels in the hands of the English, himself becoming a prisoner.

CAMP FOLLOWERS are the sutlers and dealers in small-wares who follow an army. In India, owing to the peculiar habits and customs of the Hindus, and the large number of servants retained by English officers, the C. F. are in immense number: comprising servants, sutlers, cantiniers, hostlers, water-carriers, snake-charmers, dancers, conjurers, and women. In Feb., 1839, when a Bengal army of 15,000 men left Shikarpoor for Afghanistan, it was accompanied by no fewer than 85,000 C. F.; the commander took with him six weeks' food for the whole 100,000. All English commanders in India find this regulation a very burdensome one. Even in European armies, however, C. F. are regarded as necessary; they are under the control of the commanding officer, and are subject to the articles of war—not, however, in cantonments, only in the field. French armies are accompanied by women much more largely than English.

CAMPHAUSEN, WILHELM, b. 1818; a German painter whose specialty is battle pieces, to qualify for which he served as a volunteer in the army. Among his works are "Tilly at Breitenfeld," "Prince Eugene at Belgrade," "Godfrey de Bouillon at Ascalon," "Puritans watching the Enemy," "A Convoy of Prisoners of Cromwell's Camp," "Cavaliers and Roundheads," "Storming of an English Castle by Cromwell's Soldiers," "Charles II. in the Retreat from Worcester," "Charles I. at Naseby," etc. In 1859, he was made professor of historical painting in the Dusseldorf academy.

CAMPHERE, or **CAMPHELENE**, is an artificial variety of camphor obtained from turpentine, by acting thereon with the dry vapor of hydrochloric acid, and keeping the whole at a low temperature by immersing the vessel in a freezing mixture. A solid substance is produced, which separates in white crystalline prisms, and has the taste and agreeable aromatic smell of common natural camphor. As prepared, it is strictly a hydrochlorate of C.; but the latter can be obtained free from hydrochloric acid, by passing the vapor of the compound substance over dry heated quicklime, when the acid is held by the lime, and pure C. passes over. It is not so similar to ordinary camphor when thus freed from the hydrochloric acid.

CAMPHINE is the name applied to a variety of spirit of turpentine obtained from the *pinus australis* of the southern states of America, and rather extensively sold and used in Britain for burning in out-of-door lamps. It is very volatile, and burns very freely, giving off a pure white brilliant light; and when the vapor diffuses itself through air, and is set fire to, it forms a dangerous and violently explosive mixture.

CAMPHOR is a solid essential oil which is found in many plants, and may be separated from many essential oils. It particularly abounds in certain species of the natural order *lauraceæ* (q. v.). Almost all the C. of commerce is the produce of the C. laurel or C. tree (*camphora officinarum*, formerly known as *laurus camphora*), a native of China, Japan, Formosa, and Cochinchina, and which has been introduced into Java and the West Indies. The genus *camphora* differs from *cinnamomum* (see CINNAMON) chiefly in having a thin instead of a leathery calyx. The C. laurel is a tree of considerable height, much branched, with lanceolate, evergreen leaves on short stalks, and small yellowish-white flowers in axillary and terminal panicles. The fruit is in size and appearance not unlike an imperfectly ripened black currant. Every part of the tree, but especially the flower, smells strongly of camphor. The wood is light and durable, not liable to be injured by insects, and much valued for carpenter's work. In the extraction of C. from the *C. laurel*, the wood of the stem and branches is chopped up into fragments, and introduced into a still with water, and heat applied, when the steam generated carries off the C. in vapor. These vapors rise, and in passing through rice-straw, with which the head of the still is filled, the C. solidifies, and is deposited round the straw in minute grains or particles, somewhat about the size of raw sugar or coarse sand. These grains of impure C. are detached, and being introduced into a large globular glass vessel in quantities of about 10 lbs., are reheated, when first the water rises in steam, and is allowed to escape at a small aperture; and thereafter, this aperture being closed, the C. sublimes and resolidifies in the interior upper part of the flask, as a semi-transparent cake, leaving all the impurities behind. The flasks are then cooled and broken by throwing cold water on them, and the C. taken out, and sent into market. The glass globes employed are called by an Italian name, *bomboloes*, the sublimation of C. having been first practiced in Venice.—C. was unknown to the Greeks and Romans, and was first brought to Europe by the Arabs. It is a white tough solid, slightly lighter than water, and floats thereon. It is very sparingly soluble in water, but freely soluble in alcohol, ether, acetic acid, and the essential oils. It fuses at 347°, and boils at 399°, and when set fire to, is very inflammable, and burns with a white smoky flame. Thrown upon water, it floats, and may be set fire to, when the currents generated alike from the solution in water and the irregular burning of the pieces, cause a curious rotatory motion. It has a peculiar hot aromatic taste, and an agreeable characteristic odor.

C. is used in medicine, both internally and externally, as a temporary stimulant. It is frequently employed in gout and rheumatism. In small doses, it acts as an anodyne and antispasmodic; in very large doses, it is an irritant poison. It is generally reckoned an anaphrodisiac. Its alcoholic solution and liniments in which it is the principal ingredient, are much used for external application in sprains and bruises, chilblains, chronic rheumatism, and paralysis.—The effluvia of C. are very noxious to insects, and it is therefore much used for preserving specimens in natural history.

The Borneo C. or Sumatra C. of commerce, sometimes called hard C., is the produce of *dryobalanops aromatica*, a large tree of the natural order *dipteraceæ* (q.v.). The C. is obtained by cutting down the tree, and splitting it into small pieces; being found in crystalline masses in natural cavities of the wood. To this substance, the Chinese ascribe extraordinary medicinal virtues, so that it is sold among them at more than 50 times the price of common camphor. It is seldom brought to Europe as an article of commerce.—The *dryobalanops aromatica* yields also a pale-yellowish limpid fluid, which gushes out when deep incisions are made in the tree with an axe, and which is generally called liquid C. or C. oil. It is sometimes imported into Europe. It has a smell somewhat resembling that of C., but more aromatic, like oil of cajeput. It is supposed to be from this fluid that the crystalline hard C. is deposited. See BORNEENE.

CAMPHUYSEN, DIRK RAFAELSZ, 1586–1627; a Dutch painter, theologian, and poet. He made a translation of the Psalms, and wrote many short poems of merit; also several theological works, among which was a compendium of the doctrines of Socinius. His fame rests upon his work as a painter, which was more than ordinarily good.

CAMPI, a family of artists, who founded at Cremona, in the middle and near the close of the 16th c., an eclectic school of painting, parallel with that founded by the family Caracci (q.v.). Giulio C. (1500–72) was the head of the school. He studied painting, sculpture, and architecture under Giulio Romano. He also imitated the works of Titian (at least in coloring) and Pordenone with such success that his pictures have sometimes been ascribed to both of these artists. His female heads, like those of his brothers, are remarkably beautiful.—Antonio C. studied, under his brother, both painting and architecture. His knowledge of the latter was very serviceable in several of his paintings; for example, that of the sacrifice of St. Peter. He was also a plastic artist, an engraver, and the historian of his native place.—Vincenzo C. (b. before 1532, d. 1591) seems to have followed the guidance of Antonio rather than that of Giulio, and excelled more in small figures than in large pictures. His paintings of fruits are highly valued.—Bernardino C. (b. 1522, d. about 1590), a kinsman of the three brothers C., was the most famous of the whole. Lanzi terms him “the Annibale Caracci” of the school. He studied first under Giulio C., but soon excelled his master. Afterwards, he chose Giulio Romano, Titian, and Correggio as models, but chiefly followed Raphael, yet without servile imitation. Many of his works are found in Milan and Cremona. In the latter place, the cupola of the choir in the church San-Gismondo is Bernardino's master-piece. He was distinguished as a portrait-painter and engraver. The lady-painter, Sophonisba Anguissola, was a distinguished pupil of Bernardino.

CAMPIAN, or CAMPION, EDMUND, 1540–81; one of the few English Jesuits of celebrity; educated at Oxford; ordained deacon in 1567, but as he could not consent to the Protestant formulary as required by the English church, he went to Ireland and wrote a history of that country; and then to Douay, where he joined the society of Jesus. In 1580, he returned to England as a propagandist missionary. The next year he was charged with exciting the people to rebellion and holding treasonable correspondence with foreign powers, found guilty, and hanged at Tyburn, with several others of his order.

CAMPIDOGLIO, PALAZZO DEL, a pile of buildings erected by Michael Angelo on the Capitoline hill, in Rome, on the site of the ancient capital.

CAMPINAS, or SAN CARLOS, a t. of Brazil, in the province, and 70 m. n. of the city of Sao Paulo, is situated in a fertile and picturesque district, on a small river, the Piraticaba, a feeder of the Parana. There are large coffee and sugar plantations in the surrounding district, and large quantities of sugar are exported. Many of the houses are built of mud or clay, and the immense church, whose walls are 5 ft. thick, is composed of beaten earth. Pop. 6,000.

CAMPION. See LYCHNIS and SILENE.

CAMPOBASO, a province in s. Italy, 1178 sq. m.; pop. '70, 364,208. The surface is almost wholly mountainous, the highest point being monte Miletto, 6,740 feet. Chief products, grain, wine, and vegetables. There are manufactories of steel and iron ware. The most important stream is the Biferno.

CAMPOBASO, a fortified t. of s. Italy, in the province of the same name, about 53 m. n.e. of the city of Naples. The town stands on a slope of the monte Verde, in a cool, airy, and healthy region. It has a fine cathedral, a ruined castle, some convents, and palaces belonging to resident nobles. It has manufactories of cutlery, which enjoys a considerable reputation for excellence. Its situation, though far from

inviting as regards scenery, is favorable for trade, which is facilitated by good roads. Pop. 13,500.

CAMPOBAS'SO, **NICOLÒ**, Count of, a soldier of fortune in the 15th c.; the son of a noble family whose estates were confiscated because he sided with Anjou in a war against Naples. He sold his services to Charles the bold, but subsequently betrayed him, and was suspected of being concerned in Charles's death. Walter Scott depicted C. in *Anne of Geierstein*.

CAMPOBELLO, an island in Passamaquoddy bay, 2 m. from Eastport, Maine, belonging to New Brunswick; 8 m. long; pop. 1073. There are copper and lead ores; but fishing is almost the only occupation.

CAMPOBELLO, an island of New Brunswick, situated at the mouth of the Passamaquoddy bay, in lat. 44° 57' n., and long. 66° 55' west. It is small, being 9 m. long, and from 1 to 3 m. broad; but it is decidedly valuable, possessing some good harbors, and, at its n. end, a light-house of 60 ft. in height.

CAMPO DE CRIPTANA, a t. of Spain, in the province of, and about 50 m. n.e. of the city of Ciudad-Real. It has manufactures of coarse cloths, and some trade in corn and fruits. Pop. 5250.

CAMPO-FORMIO, a village in the province of Udine, northern Italy, about 7 m. s.w. of the city of Udine, is celebrated for the treaty of peace here concluded, Oct. 17, 1797, between Austria and the French republic. After subjugating Italy (1796), the French army had crossed the Noric Alps, and threatened Vienna. Austria, therefore, hastened to arrange preliminaries of peace. In the treaty which was concluded by Bonaparte with the count of Coblenz, 17th Oct., 1797, Austria ceded the Netherlands, Milan, and Mantua, and received as compensation the districts Istria, Dalmatia, and the left bank of the Adige in the Venetian states, and the capital, Venice; while France took the remaining territory of Venice, its possessions in Albania, and the Ionian islands. In the secret articles of the treaty, Austria, in ceding the left bank of the Rhine, was to receive as compensation Salzburg and the Bavarian district on the Inn; and promises were held out to the duke of Modena, and other Italian houses, that their concessions should be compensated at the cost of Germany.

CAMPOMANES, **PEDRO RODRIGUEZ**, Count of, Spanish minister and director of the royal academy of history at Madrid, founded by Philip V. in 1738, was b. in Asturias in 1723. His talents and learning were devoted to the advancement of his native country. By his enlightened views of state policy, as well as by his writings, which ranked him among the most eminent Spanish authors, he obtained a great reputation through out Europe. He gave effectual assistance to count Aranda in his difficult enterprise of driving the Jesuits out of Spain. He died Feb. 3, 1802. C.'s chief works are *Antigüedad Marítima de la Republica de Cartago con el Pèriplo de su general Hannon, traducido del Griego y ilustrado* (Madrid, 1756); *Discurso sobre el fomento de la Industria popular* (1771); *Discurso sobre la Educacion popular de los Artisanos y su fomento* (1775); *Apèndice a la Educacion popular* (1775-77). These writings contained his opinions on politics, taxation, agriculture, manufactures, and commerce. The best known of his financial productions is *Tratado de la Regulia de Amortizacion* (Madrid, 1765).

CAMPO SANTO (holy field) is now the Italian designation for a cemetery or burying-ground, but more especially for an inclosed place of interment, surrounded internally by an arcade, and destined to receive the remains of persons of distinction. The most famous C. S., and that from which the others derived the name, is that of Pisa—in the neighborhood of the Dome, and consecrated to the memory of men who had deserved well of the republic. It was founded by archbishop Ubaldo, towards the end of the 12th century. The archbishop, having been driven out of Palestine by Saladin, brought his fifty-three vessels, which had been destined for the conquest, laden with the earth of the Holy Land. This he deposited on the spot which was thence called the holy field, and which, as we have said, gave its name as a generic term to the burying-grounds of Italy. The architect of the existing building was Giovanni Pisano, under whose superintendence it was completed in 1283. It contains an area of 400 ft. in length, and 118 in breadth; and is surrounded by a lofty wall, on the inner side of which a wide arcade runs round the whole inclosure, giving to it the character of one magnificent cloister. At the smaller eastern side, there is a large chapel, and two smaller chapels of smaller size on the northern side. The lofty circular arches of the arcade are filled with the richest Gothic tracery, which belongs, however, to a later date—the latter half of the 15th c.—and consequently formed no part of the original design. The walls are adorned with frescoes which are of great interest and value, both absolutely and with reference to the history of art. The oldest of those which have been preserved adorn one side of the eastern wall; they represent the passion of Christ, his resurrection, and other sacred subjects. These remarkable paintings are supposed to date before the middle of the 14th c., and are ascribed to Buffalmacco. But the most marvelous productions are those of Giotto (q. v.), of Simone Memmi, the friend of Petrarch, and of Andrea and Bernardo Orcagna. As a museum of classical antiquities, the C. S. is perhaps even more remarkable than in any other point of view. Altars, sarcophagi, bass-reliefs, statues,

inscriptions, everything that is interesting or curious which has come into the possession of the Pisans for centuries, they have accumulated within its walls.

CAMPUS, in ancient Rome, a vacant space in or near a city, for public shows, combats, etc. There were eight around Rome, of which the C. Martius (camp of Mars) was the most important. It was outside the walls, occupying the level space between the Quirinal, Pincian, and Capitoline hills. In this met the *comitia centuriata* and the *comitia tributa*; and in it was the public hall for the use of the magistrates and foreign ambassadors, who were not permitted to enter the city. In later times it became a pleasure ground, with shaded walks, gardens, baths, theaters, and a race-course. Julius Cæsar built within it the marble halls for the comitia; Agrippa the baths and the pantheon; Augustus his own mausoleum; and Statilius Taurus the first stone amphitheater. Later emperors crowded this particular C. with public buildings and private residences. Under Aurelian it was taken in as a part of the city. The district in which the old C. was situated is now called Campo Marzo. Another ancient C. was the Sceleratus, the polluted field, where vestals who had been untrue to their vows of chastity were buried alive. The open grounds around modern colleges often bear the name of campus.

CAMPVERE, now called VERE, VEERE, or TER-VERE, a small fortified t. on the n.e. of the island of Walcheren, in the Netherlands province of Zealand, 4 m. n.e. of Middelburg. It has a port on the Veersche Gat, which runs from the Sloe to the Roompot, separating Walcheren from North Beveland. The town has fallen into decay; but its former prosperity is indicated by the town-house of white freestone, with elegant tower, and the front ornamented by statues of several lords and ladies of the house of Borssele; and by the large and beautiful cathedral church which is no longer used. Pop. Jan. 1, 1875, 1192. C. owed its name to the ferry (Dutch, *veer*) existing from thence to the village of Campen, in North Beveland, the site of the present hamlet of Kamperland.

From a historical point of view, C. is a town of great interest. In 1304, it was the scene of a battle between William, governor of Holland and Zealand, and Guy, count of Flanders, who was victorious. In 1572, the Spaniards were driven away; and a century later, C. was the first town which proclaimed William III., the prince of Orange, general stadtholder. It is chiefly interesting as the seat of a Scottish factory for three and a half centuries. Wolfaard van Borssele, lord of C., having, in 1444, married a princess of the Stuart line, an impulse was given to the Scottish trade. A factory of merchants was formed, and by contract between the royal burghs of Scotland and the united provinces, C. became the only staple port. The goods could not be transferred to any other place until sold, merchants resorting thither to do business. The factors obtained many privileges, such as freedom from several duties and the right of being governed by the law of Scotland, having a lord conservator who was supreme judge in all matters. No factor might settle at C. without the written authority of the commissioners of royal burghs of Scotland, who took security for his honorable behavior. In 1795, the Batavian republic withdrew the privileges, and the factory was broken up, but the conservatorship was held as a sinecure long after the necessity for the office had ceased, the name of sir Alexander Ferrier appearing in the *Edinburgh Almanac* as "conservator at Campvere" so lately as 1847. The magistrates of C. were bound to provide a church for the factory, "to the end that the people of the Scottish nation be not frustrate of the Word of God and exercise of the reformed religion in their own proper language." The ministers were appointed by the commissioners of royal burghs, from 1613 to 1790, when the last appointment was made.

CAMTOOS, or **GAMTOOS**, a river of the e. division of the Cape Colony, of 200 m. in length. It rises in the Nieuwveld mountains, near lat. 32° s., and, flowing through the inland district of Beaufort, and the maritime one of Uitenhage, falls into that inlet of the sea which is immediately to the w. of Algoa bay. It is valuable as an aid to irrigation. For instance, Hankey, a station of the London missionary society on its banks, is thoroughly watered by means of a splendid tunnel carried through solid rock at the expense of the association just mentioned.

CAMUCSINI, VINCENZO, one of the most distinguished modern historical painters in Italy, was b. in Rome, 1775. The school of which he became the head was founded on the theatrical antique style of the French painter David. The first important works by C. were the "Assassination of Cæsar" and the "Death of Virginia;" both painted for lord Bristol at the commencement of the present century. His picture of "Unbelieving Thomas" was copied in mosaic for St. Peter's church. For the church of San Giovanni in Piacenza he executed a "Presentation in the Temple," which was greatly admired. These works were followed by many scenes from Roman history; among them, the pictures of "Horatius Cocles," and "Romulus and Remus" as children. C., who, as a man and an artist, was highly honored during his career, died at Rome, Sept. 2, 1844.

CAMUS, ARMAND GASTON, a prominent character in the French revolution, was b. in Paris, April 2, 1740. On account of his superior knowledge of ecclesiastical law, he was elected advocate-general of the French clergy. He was a zealous and ascetic Jansenist, and possessed of extraordinary firmness of character. He hailed the movements of 1789 with joy, and was elected member of the states-general by the people of Paris.

In this position, he appeared as the resolute foe of the ancient régime. He gained possession of, and published, the so-called *Red Book*, giving accounts of court expenditure, which was highly disadvantageous to the court and its ministers. After the fight of Louis XVI., C., with Montmorin, Lafayette, and Bailly, accused the king of treason and conspiracy, and insisted on the suppression of all orders and corporations based on hereditary rights. As conservator of the national archives, he rendered an important service by preserving from destruction the old documents of the abolished corporations and institutions. He was absent in Belgium during the king's trial, but sent his vote for death. In Mar., 1793, when he was commissioned to make prisoners of Dumouriez and other generals suspected of treason, C. himself and his four colleagues were taken prisoners and delivered over to the Austrians (April 3); but, after an imprisonment of two and a half years, he was exchanged for the daughter of Louis XVI. On his return to Paris, he was made member of the council of five hundred, of which he became president, Jan. 23, 1796, but resigned 20th May, 1797, and devoted his time to literature. Remaining, however, true to his principles, he voted, July 10, 1802, against Napoleon's proposed consulship during life. C. died of apoplexy, Nov. 2, 1804.

CAMUS, CHARLES ETIENNE LOUIS, 1699-1768; a French mathematician, associate of the Paris academy of sciences, and member of the royal society of London. In 1736, he accompanied Maupertuis and Clairaut in an expedition to Lapland to measure a degree of the meridian. He was the author of a *Course of Mathematics*, and several essays on mechanical and mathematical subjects.

CAMWOOD, or BARWOOD, a dyewood which yields a brilliant but not permanent red color, and is used along with sulphate of iron to produce the red color in English bandana handkerchiefs. It is the wood of *baphia nitida*, a tree of the natural order *leguminosæ*, sub-order *cæsalpinieæ*, a native of Angola. It is preferred to Brazil wood (q.v.), as producing a finer and richer red.

CA'NAAN, the fourth son of Ham, and grandson of Noah. The posterity of Canaan were numerous, there being ten sons who were the fathers of as many tribes dwelling in Palestine and Syria. His eldest son, Zidon, is supposed to have been the founder of the city of Sidon. The whole of Palestine was called after the patriarch the "Land of Canaan." As to the curse pronounced by Noah upon Canaan and his descendants, there is no just reason to suppose that it was the immediate consequence of the unfilial conduct of Ham.

CA'NAAN. See PALESTINE.

CA'NAANITES, a collective name for the several nations conquered by the Israelites on the w. side of Jordan. Five, six, seven, and ten nations are mentioned in various places in the Old Testament; but of only two of them have we any collateral information—the Hittites, and the Amorites. And the former of these appears to have been included not with strict propriety among the Canaanites, evidence now tending to show that they not only dwelt beyond the border of Canaan, but did not even speak a Semitic language; nor were they homogeneous with other Canaanitish people. In general, the Canaanites are described as living in a state of political disintegration; the combined result of Semitic love of independence, and of varied conformation of the soil. Thirty-one of their petty kings are mentioned in the book of Joshua. That the Israelites were not immediately successful in conquering the C. is now universally recognized. The work of many years was concentrated by tradition on a single great name. The immediate result of the Israelite invasion was, not the extinction of the old, but the addition of a new element of stronger material, but less advanced culture. The chief object of Canaanitish worship was the dual-natured god of life and fruitfulness, Baal, or the Baal, "the lord," and his consort Ashérah, "the happy." The masculine form of the latter was the name of one of the twelve sons of Jacob. Ashérah must not be confounded with Ashtoreth or Astarte, who belonged to another type of Semitic religion. The symbol of Ashérah was the stem of a tree, though possibly sometimes carved into an image; that of the Baal probably had the form of a cone and represented the rays of the sun, or the generative power. It is these symbols which are referred to in the phrase "the Baals and Ashérah's" (Judges iii. 7), where "the groves" of the king James's version is clearly a mistranslation. The licensed harlotry which formed a part of the worship of Ashérah was peculiarly obnoxious to the later Hebrew prophets, though, indeed, even the folk-lore of the Israelites shows traces of aversion to its attendant immorality. Another characteristic of the Canaanitish religion was soothsaying, and this was vigorously denounced by the conquerors (Deut. xviii. 10-14). There were relics of Canaanitish times in old traditions which the Israelites did not suppress, and it is alleged by uncompromising historical critics that some of the narratives in Genesis are revised and purified versions of Canaanitish legends. The most obvious of these are said to be the stories which are attached to localities in Canaan, such as Luz and Beersheba. The question whether a remnant of the old population of Palestine may not be still in existence is answered in the affirmative by several recent investigators, who find descendants of the C. in the fellahs or peasants of the Holy Land. From an ethnological point of view there seems to have been a close affinity of the three peoples, the Israelites, the C., and the Phœnicians, who appear to have

migrated successively from a Babylonian center, and the last to move westward were probably the Hebrews.

CANADIAN RIVER, rising in n.w. Mexico, 25 m. n.e. of Santa Fé, running s. 150 m., and then e. near the bounds of the Indian territory and Texas, thence through the Indian territory, and emptying into the Arkansas river near the w. boundary of the state of Arkansas; whole length about 600 miles.

CANADA, as a geographical designation, has had in history a variety of meanings. Originally, it comprised an extensive range of country reaching, under the French, as far as even the Mississippi, away beyond the boundary lakes. It was subsequently limited to a region chiefly in the basin of the St. Lawrence—including in that term both the lakes and the river. C., in the sense in which that word is most generally known, was, in 1791, divided into two provinces, Ontario and Quebec, or Upper and Lower Canada.* These two sections were reunited in 1840; but became separate members of the confederation—the Dominion of Canada—in 1867. The country composed of these two provinces extends eastwards from a line drawn between lake Superior and James bay, a branch of Hudson's bay, to the gulf of St. Lawrence. Northward, it reaches from the Canadian lakes and the St. Lawrence to the high ridge of land which separates the rivers of C. from those of the region long known as the Hudson bay territory, but since 1870 forming a part of the Dominion of Canada. C. is bounded n. by the (former) Hudson bay territory; e., by the gulf of St. Lawrence; s., by the states of Maine, New Hampshire, Vermont, New York, and the lakes Erie and Ontario; w., by lakes St. Clair, Huron, and Superior; and n.w., by the Indian territories. The area of C. is about 331,280 sq. m., of which 121,260 are in the province of Ontario, and 210,020 in the province of Quebec. The principal river of C. is the St. Lawrence, and its most important tributaries are all from the left. The St. Lawrence drains an area of 565,000 miles. The Ottawa, 450 m. long, forms the boundary between Ontario and Quebec. The St. Maurice, nearly 400 m. in length, and the Saguenay, noted for its fine scenery, rank as rivers of the first magnitude, according to European analogies. The only affluents from the right worth naming are the Richelieu, the St. Francis, and the Chaudiere; and even of these subordinate streams, the last two are totally Canadian, while the first, as the outlet of lakes Champlain and George, belongs to the United States only in part.

In 1535, Jacques Cartier, a French navigator, b. at St. Malo in 1494, entering the St. Lawrence on the festival of the saint of that title, took nominal possession of North America in the name of his king, Francis I. It was not, however, till nearly a century later (1608) that Quebec was taken formal possession of. From that stronghold, France ruled for 150 years a vast region, extending eastward to Acadia—Nova Scotia—westward to lake Superior, and down the Mississippi to Florida and Louisiana. In 1759, a small British army—5000 in number—under the command of gen. Wolfe (q. v.), virtually wrenched *La Nouvelle France*, on the "plains of Abraham," from her first European rulers by the taking of Quebec. Isle aux Noix, and forts Oswegatchie and Lévis, successively passed into the hands of the British, and then Montreal was beleaguered and taken by gen. Amherst with an army of 17,000 men. The capitulation of that city, which was signed Sept., 1760, brought to a final close the era of French dominion in Canada. The people of the conquered country were secured, by the terms agreed to, in the free exercise of their religion; and peace was concluded between Britain and France in 1763.

In that year, a small portion of the recently acquired territory was organized by royal proclamation under English laws. In 1774, the new province was extended by parliamentary enactment, and that under French laws, down the Ohio to its confluence with the Mississippi, and up the latter stream to its source. Finally, C. receded to its present limits in 1783, giving up to the American republic the sites of six sovereign states—Minnesota, Wisconsin, Michigan, Ohio, Indiana, and Illinois. In 1791, it was divided, under separate legislatures, into two sections—the eastern retaining French institutions, and the western receiving those of England; and these sections, again, after political discontent had in each ripened into armed insurrection, were re-united for legislative purposes in 1840.

In 1763, the French population amounted to about 65,000, occupying the immediate banks of the lower St. Lawrence and its tributaries. Excepting within the cities of Montreal and Quebec, the immigrants of a different origin, whether from the old colonies or from the mother country, scarcely attempted to establish themselves among the ancient settlers; thus producing a kind of reciprocal isolation, which, even down to the present day, has not been materially disturbed. Generally speaking, therefore, the two grand elements of the provincial population are locally distinguished from each other—a relative position which has happily excluded, as between them, nearly every difficulty as to education and religion. The settlers of French origin, almost entirely confined to lower C., occupy the banks of St. Lawrence and of the lower courses of its tributary streams; all the rest of lower C. and the whole of upper C., so far as they are reclaimed at all, belong to colonists of English race.

The origin of the name is most probably to be found in the assertion that Jacques

* In the first half of the article the name Canada is used in this sense; the second half gives a notice of the *Dominion* as now constituted.

Cartier, the discoverer of Canada, having heard the natives apply the Indian word *Kannatha* (village) to their settlements, mistook it for the name of the whole country.

Upper and lower C. have presented a striking contrast in their rates of progress. To take, for instance, the growth of towns: In lower C. there are only two towns with a pop. (1871) above 5,000—Lévis, on the St. Lawrence, 6,691, and Sorel, at the confluence of the St. Lawrence and the Richelieu, 5,636—in addition to Quebec, Three Rivers, and Montreal, the three French foundations. The growth of Montreal and Quebec, remarkable enough in itself, has been owing rather to their commercial facilities with regard to the country at large than to the agricultural resources of their immediate vicinities; while Toronto, London, Kingston, and Hamilton—each nurtured chiefly by its own locality—have an aggregate population of above 110,000. Great part of upper and lower C., more especially the shores of lake Superior, is valuable only for mineral resources, such as iron, zinc, lead, copper, silver, gold, cobalt, manganese, gypsum, marl, granite, sandstone, limestone, slate, and marbles of nearly every imaginable color. Considerable portions also, though heavily timbered, chiefly with pine, are yet but little adapted to settlement and cultivation. Towards the gulf of St. Lawrence, again, a considerable section derives importance mainly from the fisheries, being, with partial exceptions in Gaspé, comparatively worthless for every other object. Thus the area for the profitable production of ordinary cereals cannot materially exceed 40,000 sq. m., containing, however, within this space a singularly small proportion of ir reclaimable surface. This cultivable block increases in width and fertility from its commencement on the lower St. Lawrence to the shores of lake Huron. Below Quebec—to say nothing of the precarious nature of the crops—there may always be seen, on one or on both sides, the primeval forest. Between that city, again, and the basin of the Ottawa, a gradual improvement shows itself, even on the n. side; and towards the s., there stretches away to the frontier of the United States a broad belt of generally undulating character, probably the best field in the country for the blending of pasturage and agriculture. From the basin of the Ottawa inclusive, the parallel of the s. end of lake Nipissing may be said to cut off, towards the s.w., the entire residue of the practicable soil, in the shape of a roughly defined triangle, which, as a whole, is at least equal, in the growth of grain in general and of wheat in particular, to any region of the same extent in North America.

As C. slants southwards eight or nine degrees from the mouth of the St. Lawrence to that of the Detroit, which communicates between lakes St. Clair and Erie, the climate of the w. must be warmer than that of the east. In addition to this cause of difference, it holds as a general law over the continent that the climate improves in advancing westward, even on the same parallel. Besides, the lakes of upper C. appear, in a good measure, to neutralize and mitigate the extremes of a Canadian climate. While Quebec in winter ordinarily enjoys five or six months of sleighing, the corresponding season in Toronto ranges from five or six days to five or six weeks. As to summer, the difference in favor of Toronto is rather in point of duration than of intensity. As indications of the climate of C., it may be stated that the isle of Orleans, immediately below Quebec, is famous for its plums, and the island of Montreal for its apples; and from the neighborhood of Toronto to the head of lake Erie, grapes and peaches ripen without any aid whatever. Melons, again, of large size, come to maturity, through the settled parts of the province, in the open air; and pumpkins and squashes attain enormous size, some of them near Toronto having weighed 300 lbs. The climate of C., though, as a whole, vastly steadier than that of the British isles, is yet occasionally liable to such changes as among us are all but impossible. Montreal, for instance, may be said, on an average, to have an extreme cold of 24° below zero, and an extreme heat of 96° above it. Now, on short notice, a thaw may surprise the former temperature, and a frost the latter; so that there is room, in winter and summer respectively, for a comparatively sudden rise or fall of about 60°. In fact, it may be said that C. has the summer of Italy and the winter of Southern Russia or North Germany. The average summer temperature of Toronto is 67.8°, of Paris, 64.5°, and of Rome, 74.2°; while the average winter temperature of Toronto is 24.5°, of Berlin, 31.4°, and of St. Petersburg, 18.1°. And, lying in the latitudes of the summer rains, and of the most valuable cereals and grasses, the latitude most favorable for animals which enhance domestic wealth—the ox, the sheep, and the horse—C. occupies one of the best positions in the world for rearing men and women. It lies in the latitude where man attains the greatest energy of body and mind, and from which have hitherto issued the conquering races. C. may thus be looked on as destined to influence the future of the world.

The Dominion of Canada.—The name Canada has lately acquired an enormous extension of territorial signification. In 1867, an act for the union of C. (Upper and Lower), Nova Scotia, and New Brunswick was passed, and by it these provinces were federally united into one Dominion of C. under the crown of the United Kingdom, with a constitution similar to that of the mother country and with Ottawa for its capital. All the vast territory which the Hudson bay company held under a charter issued by Charles II., was transferred to the imperial government in Dec., 1869—the company receiving an indemnity from the Canadian government of £300,000—and was, by order of H. M. the queen in council, received into the Dominion the following year. The portion of that territory known as Red River Settlement (q.v.) was in 1870 erected into the province of Manitoba. (The district to the n. and e. of Manitoba is now known as

Keewatin. The vast region towards the n.w. was organized as a territory in 1875 under the name of the North-west territory.) British Columbia became a member of the Dominion in 1871. Prince Edward island joined the confederation in 1873, and the accession of Newfoundland cannot be long deferred.

This vast extent of territory, extending from the latitude of Rome to the Arctic ocean, stands in superficial area (3,500,000 sq.m.), even if we exclude Labrador and the islands of the Arctic ocean, little behind the United States (3,603,000) and Europe (3,720,000). East and w. it extends from the 53d to the 141st meridians. The total habitable area is, however, diminished considerably when the frozen regions n. of the 60th parallel of latitude are deducted.

The physical characteristics and statistics of the various provinces will be found discussed under their several heads.

The census of 1871 gives the following figures for the several provinces:

Provinces.	Area in sq. miles.	Pop. 1871.
Ontario.....	107,780	1,620,851
Quebec.....	193,355	1,191,516
New Brunswick.....	27,322	285,594
Nova Scotia.....	21,731	287,800
Manitoba.....	13,969	12,228
British Columbia.....	356,000	31,586
Prince Edward island.....	2,133	94,021
North-west territory.....	2,650,000	60,500
Total for Dominion.....	3,372,290	3,66,093
Newfoundland (1869).....	40,200	146,136
Total for Dominion of the future.....	3,412,490	3,882,632

The Indian population of the Dominion was in 1877 reported by the superintendent of Indian affairs to amount to 99,650. In 1871, the number of immigrants into the Dominion was 37,949; in 1873, they numbered no less than 99,059; and in 1874, 80,022. Of these a fair proportion became actual settlers; thus of a total of 31,650 immigrants in 1876, 25,633 settled in the country. Of late there has been some immigration from the United States. In 1879, there were upwards of 6000 Chinese residents in British Columbia.

Church and Education.—There is no state church in C. In 1871, there were 1,492,000 Roman Catholics in the Dominion, the mass of the inhabitants of Quebec province being French Catholics. The Presbyterians numbered 544,000; the Methodists, 514,000; and the Episcopal church, 494,000. Lutherans, Congregationalists, and many other sects are also represented. The Episcopal church is governed by nine bishops, and the Roman Catholic church by four archbishops and fourteen bishops.

Education is carefully fostered in the Dominion. Especially in the oldest settlement both primary and secondary schools are numerous. The province of Ontario had in 1871 nearly 5000 educational establishments, including 16 called colleges. Quebec has 3 universities, 1 being Catholic, and above 20 classical and industrial colleges. New Brunswick has nearly 1000 primary schools. Nova Scotia has a university at Halifax; and the new province of Manitoba has already a university at Winnipeg. In 1871, there were 420 newspapers and other periodicals published in C., of which 255 appeared in Ontario.

Revenue.—The total revenue of the Dominion of C. for the financial year ending June, 1877, amounted to £8,877,956, and the gross expenditure was £8,840,324, leaving a surplus of £37,632. In the financial estimates for the year ending June, 1879, the total expenditure was fixed at £7,866,876. The debt of the Dominion, incurred chiefly on account of public works, the interest of which forms the largest part of the expenditure, amounted in 1878 to £29,879,421; and of this capital, £24,497,524 represented debt payable in London.

Commerce.—The trade of the Dominion is chiefly with the United States and Great Britain; and while the greater part of the Canadian exports finds its way to Great Britain, the imports are now chiefly from the United States. Thus, of a total exportation of 76,000,000 in 1877, 41 millions went to Great Britain, 26 millions to the United States; while of a total importation of 99,000,000, 40 millions came from Great Britain, but 51 millions from the United States. In 1878, the total exports were valued at \$79,323,667 (£15,864,000); the imports at \$93,081,787 (£18,616,000). The staple articles of export are wood and breadstuffs; also fish, furs, etc., and minerals. The chief imports from the United Kingdom are iron, wrought and unwrought, woolen manufactures, and cotton goods.

Shipping.—The merchant shipping of C. is important, and, considering its population, remarkably extensive. At the end of 1877, there were 7362 vessels on the regular books of the Dominion, measuring 1,310,468 tons of register tonnage. C. is, accordingly, the fifth in rank of the ship-owning states of the world, following, for extent of shipping, Britain, the United States, Norway, and Italy, but taking precedence of Germany, France, and all other maritime powers.

Fisheries.—The total produce of the Canadian fisheries in 1877 was valued at £2,405,991. In that year fish to the value of £1,400,140 were exported. This includes the fisheries of British Columbia, but of course excludes those of Newfoundland. In 1879, there were seven establishments in C. for artificial fish culture, from which in the preceding year 13,500,000 young fish (salmon, speckled trout, and white fish) were sent forth into the waters of the Dominion.

Mines.—In the year 1876-77, Canadian mines gave produce (including, coal, gold, gypsum, manganese, mineral oil, copper, iron, lead, silver, salt, slate, and stone) to the value of £739,790.

Canals and Railways.—In the matter of communication C. is unrivaled. The St. Lawrence, with its lakes, puts great part of it in connection at once with the most commercial section of the United States and with the open ocean. The navigation of this great water system has been greatly assisted by art; numerous and extensive canals, of which the Rideau and the Welland are the most important supplement to the main artery. The revenue of the canals in 1877 amounted to £74,790. C. is also not deficient in roads of every description, at least in the settled regions; and it already possesses an immense and steadily increasing network of railways. In 1877, there were in operation over 5,570 m. of railway, while nearly 2,000 m. were in course of construction. The Grand Trunk railway, 1388 m. in length, and giving unbroken communication between Portland and Detroit, is the longest line in the world owned by one company and under the same management. The Victoria bridge, by which the railway crosses the St. Lawrence at Montreal, is one of the wonders of the world. In 1872, the imperial parliament notified the guarantee of a Canadian loan, to be applied to the construction of a railway through British territory to the Pacific shores; but the original arrangements have been departed from, and the undertaking progresses but slowly. There has been much debate as to the best point for the terminus. The total revenue of the railways in the year 1876-77, was £3,748,413. There is weekly communication between Liverpool and Glasgow and Montreal and Quebec.

Army and Naval Force.—The number of imperial troops in C. was in 1871 reduced to 2,000 men, who form the garrison of the fortress of Halifax—still accounted an "imperial station," as it also is the headquarters of the British fleet in these waters. C. has besides a large volunteer force, and a recently organized militia, consisting of all male British subjects in C. between the ages of 18 and 60. The active militia consisted in 1879 of 43,729 officers and men, and the reserve comprised 665,000 men. C. is divided into 11 military districts; there is a royal military college at Kingston, and several centers of military instruction. The naval armament of C. consisted in 1877 of 8 armed screw-steamers, of a total tonnage of 2,014 tons, besides two other fast steamers available as gun-boats. These are provided partly by the imperial government, partly by the Dominion, and are kept on the great lakes and on the St. Lawrence.

Money, Weights, and Measures.—The decimal system of currency was introduced in 1871, the unit of account being the dollar (at the average rate of exchange equal to 4s.). The English imperial yard, pound, avoirdupois, and gallon are standards for C.; but in 1859 the hundredweight of 112 lbs. and the ton of 2,240 lbs. were abolished, a hundredweight of 100 lbs. and a ton of 2,000 lbs. being substituted.

See the articles on the various provinces and the towns of the Dominion; and CANADA.

CANADA has recently acquired a more enlarged signification. An act of the imperial parliament (called shortly the *British North America* act) was passed 29th Mar., 1867, and came into force 1st June of the same year, uniting federally the former separate provinces of Canada, Nova Scotia, and New Brunswick into one *Dominion*, under the name of *Canada*. The upper and lower divisions of the former Canada (q.v.), which had been politically united since 1840, are again dissociated, so that the federation consisted, in 1867, of four members or provinces, as under:

	English square miles.
Quebec (formerly <i>Lower Canada</i> , or <i>Canada East</i>).....	210,020
Ontario (formerly <i>Upper Canada</i> , or <i>Canada West</i>).....	121,260
New Brunswick.....	27,105
Nova Scotia.....	18,660
Total.....	377,045
Estimated population (1867).....	3,800,000

The constitution of the Dominion is after the model of the mother-country. The parliament consists of the queen, an upper house styled the senate, and a house of commons. The queen is represented by a governor-general (with a salary of £10,000), who exercises his authority with the aid and advice of a council, styled the queen's privy council for Canada, chosen from time to time by the governor. The senate, in 1867, consisted of not more than 72 members, 24 for each of the provinces of Ontario and Quebec, and 12 each for the maritime provinces. The senators are chosen by the governor.

general, and hold the appointment for life. Among other qualifications, a senator must have real property to the value of \$4,000, and must be resident in the province for which he is appointed. The speaker of the senate is nominated by the governor-general. The house of commons consisted at the same date of 181 members—82 for Ontario, 65 for Quebec, 19 for Nova Scotia, and 15 for New Brunswick. The duration of a house of commons is five years. Until the parliament of Canada otherwise provides, the franchise and other regulations are to be the same as those hitherto in force in returning members to the house of assembly in the several provinces. The house of commons elects its own speaker. Any bill passed by the houses of parliament, even though assented to by the governor-general in the queen's name, may afterwards be disallowed by the queen in council. Each province has an executive and legislature of its own, presided over by a lieutenant-governor, and constituted in the mean time pretty much as before the union. The lieutenant-governors are appointed by the governor-general. The provincial parliaments may, under the provisions of the act, amend from time to time their own constitutions.

In the distribution of legislative power between the general and the provincial parliaments, certain classes of subjects of a local nature are assigned exclusively to the legislatures of the provinces, while subjects of more general concern are assumed by the parliament of Canada. Among the subjects enumerated in the act as coming under the latter description are: the public debt and property; taxation (for federal purposes), postal service, military and naval defense, the salaries of the civil officers of the general government; the census; navigation; money, weights, and measures; copy-rights; marriage and divorce; criminal law. The provincial legislatures, again, have the power of taxing themselves for provincial purposes, and of borrowing money on the sole credit of the province; of regulating and paying provincial officers; of establishing asylums, etc. Education is also left to the provincial legislatures, with certain provisions against encroachment on the rights of religious minorities.

The debts of the several provinces, at the union, are assumed (with certain limitations) by the federal government; and on the other hand, certain duties and revenues, and certain public works and properties belonging to the several provinces before the union, are taken possession of, to form a consolidated revenue fund for defraying the interest of these debts, and for the other expenditure of the federal government.

Provision is made for the introduction of uniformity of laws, which, however, must be with consent of the legislatures of the several provinces.

The union of the various British American provinces had been long and eagerly discussed, public opinion in Canada being generally in its favor, but in the other provinces strongly opposed to it, from the natural apprehension that the immense preponderance of C. in population, wealth, and general importance would utterly swamp the others. However, after much and careful consideration, the great advantages which it was shown the scheme would confer, overcame the provincial jealousies, the pro-federalists in Nova Scotia and New Brunswick came to preponderate, and these two provinces were, in 1867, united with Quebec and Ontario to form the Dominion of Canada. In British Columbia and the Hudson's bay territories the feeling in favor of annexation was strong, and in 1869 the latter, and in 1871 the former, was transferred to the imperial government. The Hudson's bay company received an indemnity of £300,000. In 1871, the Red river settlement was formed into a province under the name Manitoba. In 1873, Prince Edward island was annexed. The only part of British North America which stands aloof is Newfoundland, but provision has been made for its admittance in the act of union, and its accession cannot be long deferred. The area of the vast dominion is about 3,500,000 sq. m., exceeding that of the United States, and little inferior to Europe. The number of members of parliament given above has, of course, been increased by the representatives of the new provinces—viz., 2 senators and 4 members of the house of commons for Manitoba, 3 senators and 6 members for British Columbia, and 4 senators and 6 members for Prince Edward island. The total (with a few additional members in the old provinces) was in 1879, 75 senators, and 205 members of the house of commons.

CANADA BALSAM is a kind of turpentine (q. v.) obtained from the balm of Gilead fir (*abies* or *picea balsamea*), a native of Canada and the northern parts of the United States. See FIR. It exists in the tree in vesicles between the bark and the wood, and is obtained by making incisions, and attaching bottles for it to flow into. It is a transparent liquid, almost colorless, and with an agreeable odor and acrid taste. It pours readily out of a vessel or bottle, and shortly dries up, and becomes solid. When fresh, it is of the consistence of thin honey, but becomes viscid, and at last solid by age. It consists mainly of a resin dissolved in an essential oil, and its composition is as follows:

Essential oil.....	18.6
Resin, soluble in alcohol.....	40.0
Resin, sparingly soluble.....	33.4
Elastic resin.....	4.0
Bitter extractive and salts.....	4.0

100.0

It is the finest kind of turpentine obtained from any of the *coniferae*, and is much employed for medicinal purposes, particularly as a stimulant for the cure of mucous discharges, and as a detergent application to ulcers. It is also used for a variety of purposes in the arts—as an ingredient in varnishes, in mounting objects for the microscope, in photography (q.v.), and by opticians as a cement, particularly for connecting the parts of achromatic lenses to the exclusion of moisture and dust. Its value for optical purposes is very great, and depends not only on its perfect transparency, but on its possessing a refractive power nearly equal to that of glass.

CANADA GOOSE. See GOOSE.

CANAJOHARIE, a t. and village of Montgomery co., N. Y., 50 m. n.w. of Albany; pop. of township '75, 4,241. There are fine stone quarries in the vicinity.

CANAL, an artificial channel for water, formed for purposes of drainage, irrigation, or navigation, but now usually employed to designate only such cuts as are intended for the passage of vessels.*

Canals date from a period long anterior to the Christian era, and were employed as a means of irrigation and communication by Assyrians, Egyptians, and Hindus; also by the Chinese, whose works of this kind are said to be unrivaled in extent; one of them, the Imperial C., having a length of about 1000 miles. For the most part, however, these early canals were of one uniform level, and hence exhibit no great skill or ingenuity; and the moderns were content to follow the rudimentary efforts of the ancients in this way until the 15th c., when the invention of the lock (q.v.)—showing how canals might be generally and advantageously used for inland navigation in countries whose surface was irregular—gave a great impulse to this branch of engineering. The Italians and Dutch, for both of which nations the invention of the lock has been claimed, were the first to develop this kind of engineering in Europe. In France, the first C., that of De Briare, to form a communication between the Loire and the Seine, was opened in 1642. In 1681 was completed the greatest undertaking of the kind on the continent, the C. of Languedoc, or the C. du Midi, to connect the Atlantic with the Mediterranean. The length of this C. is 148 m., it has more than 100 locks, and about 50 aqueducts, and in its highest part it is no less than 600 ft. above the sea. It is navigable for vessels of upwards of 100 tons. It was not until nearly a century later that C. navigation assumed importance in England, through the sagacity, energy, and liberality of the duke of Bridgewater (q.v.), and his celebrated engineer, James Brindley (q.v.). The success of these works stimulated other public persons to engage in similar undertakings. Speculation in C. shares became a mania similar to that which overtook the people in connection with railways at a more recent period, and a crash ensued on the prospect of war in 1792. It would be an endless task to pursue the history of canal development in Britain, which speedily became intersected with these watery highways to an extent unequalled in any European country save Holland. In the space at our disposal, we shall briefly consider the several kinds of canal. See SUEZ and SUEZ CANAL.

Canals may be divided into three general heads—viz., 1. Canals proper, i.e., entirely artificial channels, having no water running through them beyond what is necessary for their own purpose; 2. Tidal, i.e., affected by the rise and fall of the tides; and 3. Rivers rendered navigable by weirs built across them to increase their depth, and having a lock at one end for the ascent or descent of vessels; and occasionally, when there is much fall, or any formidable obstruction in the river, by lateral cuts, with locks for part of their course.

Another division may be made (1) of ship-canals for the transit of sea-going vessels generally, from sea to sea; these are necessarily of large dimensions, and must be crossed by swing or draw bridges; and (2) of canals for the passage of mere boats or barges, generally without masts, so that they may be crossed by stone or other solid bridges. The largest ship C. in Europe is the Great North Holland C., completed in 1825, which has a breadth of 125 ft. at the water-surface, and of 31 ft. at the bottom, with a depth of 20 feet. It extends from Amsterdam to the Helder, a distance of 51 m.; it thus enables ships of as much as 1400 tons burden to avoid the shoals of the Zuyder Zee. The surface of the water in this C. is below the high-water level of the German ocean, from which it is protected by embankments faced with wicker-work. The locks on this C. are 297 ft. long, 51 ft. broad, and 20 ft. deep. There is a similar C. from near Rotterdam to Helvoetsluis, to avoid the shallows of the Brill at the mouth of the Maas. Another great ship C. is the Caledonian C (q.v.). The Forth and Clyde C. is also one on a smaller scale for the passage of sea-going vessels. Its length is 35 m.; its medium width is 56 ft. at the surface, and 27 ft. at the bottom, and its depth 9 feet. It has 39 locks, each 75 ft. long, and 20 ft. wide, and a rise of 155 feet. In constructing ship-canals, it

* In the fen-districts of the e. coast of England, however, the large channels required for drainage are made subservient to purposes of inland navigation by sluices at the mouth—one to keep out the tide at high water, and another acting in the opposite direction, to retain water of depth sufficient in the channel to float such boats as make use of it. These combinations of drain and canal are commonly called *navigations*; hence the workmen employed in their construction were called *navigators*, which, contracted into *narey*, is now applied indiscriminately to persons engaged in any kind of earth-works.

is important to secure a sheltered entrance, one not likely to become silted up, and of sufficient depth to admit vessels at all times of the tide; and towing-paths on both sides are desirable.

Among the principal canals in England for the passage of barges, some of which run to very great elevation, are the—

	Length. Miles.	Rise. Feet.
Grand Junction.....	128	...
Leeds and Liverpool.....	128	433
Trent and Mersey.....	93	326
Kennet and Avon.....	57	402

The C. of the Loire is one of those aiding the navigation of a river. It has a width on the water line of 33 ft., and a depth of 5½ ft., the locks being 17 ft. broad, and 100 ft. long. The river Lea and the Mersey and Irwell Navigations in England, and the Welland C. in Canada, formed to connect lake Erie with lake Ontario, and avoid the falls of Niagara, are also among the most noteworthy works of this class; the river Thames, above the first lock at Twickenham, partakes also of the nature of a canal.

Many canals pass through long tunnels, some very low and without towing-paths, in which case the mode of propulsion is by the boatmen lying on their backs and pushing with their feet against the roof of the tunnel.

The great expenditure of water and time in "locking" have led to the trial of various other plans for overcoming differences in level. On the Great Western C., boats are raised and lowered by means of machinery, called a perpendicular lift. On the Morris C. (United States), boats are conveyed on a carriage up a railway inclined plane, from one reach to another; on the Chard C., Somersetshire, and on the Monkland C., near Glasgow, they are taken afloat in a caisson, or water-tight vessel, up or down an inclined plane—in the latter case, empty boats of 60 tons burden are raised or lowered 96 feet.

Other matters engineers have to consider are an ample supply of water, by means of feeders and reservoirs to the summit-level; stop-gates at convenient distances, to shut off the water in case of damage to any part of the C.; means of drainage when repairs are necessary; and provision against leakage through the banks, by puddling or otherwise. The floor-line or bottom of a C. is usually made twice the width of the largest boat likely to enter the C., with an addition of 6 or 8 in. for play at each side, and the depth 12 or 18 in. more than the draught of the boat.

The introduction of railways has materially interfered with C. traffic, and some canals have been altogether abandoned. Many, however, still continue to prosper, as, for instance, the Grand Junction, the Lea Navigation, and the Trent and Mersey. It is estimated that the inland boat navigation constructed in Great Britain exceeds 4,700 miles. In the United States there are upwards of 4,000 m. of C., of which 1300 m. are in New York state. The C. system has also been very extensively carried out in France, which has a large mileage of artificial inland water navigation. A new canal, which shortens the distance from Amsterdam to the North sea to 15 m., has recently been completed. The harbor is near Wyk-aan-Zee, and the minimum width is to be 80 yards. This canal was constructed mainly by British capital and engineers.

Laws regarding Canals.—The traffic, and generally the rights, duties, and liabilities of canal companies are regulated by two acts of parliament, the 8 and 9 Vict. c. 42, and the 17 and 18 Vict. c. 31, called "the railway and canal traffic act, 1854." The word *canal* is declared to include any navigation whereon tolls are levied by authority of parliament, and also the wharves and landing-places used by such canal or navigation; and *traffic* is defined as including not only passengers and their luggage, but also goods, animals, trucks, boats, and vehicles of every description. All tolls and charges in respect of the traffic are to be charged equally to all persons. It is declared to be the duty of canal companies to make arrangements for the receiving and forwarding of traffic without unreasonable delay and without partiality, and facilities are given for a remedy to parties complaining of want of attention in these respects.

According to section 7 of the 17 and 18 Vict. c. 31, companies are liable for neglect or default in the carriage of animals or goods, although they may have given notice to the contrary. Where the effect of such neglect or default occasions the loss of or injury to animals, the act provides that no greater damages shall be recovered than as follows: for any horse, £50; for any neat cattle, per head, £15; for any sheep or pigs, per head, £2, unless at the time of delivery for transit, the animals were declared to have been of higher value. No special contract between the company and parties employing the canal shall be binding on the latter unless signed by them. The act saves the rights, privileges, and liabilities of companies under the carriers' act, the 11 Geo. IV. and 1 Will. IV. c. 68.

Injury to canals, with intent to obstruct the navigation, is punishable with penal servitude for not more than seven, or less than three years; or imprisonment for two years, with the addition of hard labor, solitary confinement, and whipping, at the discretion of the court. See CARRIERS.

CANAL (*ante*). Since the great extension of railroads in the United States, the building of canals has been suspended, except for mining or manufacturing purposes.

For purposes of transportation none have been commenced and very few enlarged or improved within the past half-century. The whole length of canals in the union is about 4,200 m., of which New York has over 1300 m., Pennsylvania 920, Ohio 800, Indiana 374, Virginia 225, etc. The most important is the Erie in New York, 363 m. long, connecting lake Erie with the Hudson river, finished in 1825 and enlargement finished in 1862, at a cost of more than \$50,000,000. The other large canals are the Delaware and Hudson, the great coal route to New York from the Pennsylvania mines, 108 m. long, completed in 1829, cost \$6,300,000; the Chesapeake and Ohio, 185 m., cost \$11,375,000; the Schuylkill Coal and Navigation company's canal, 108 m., cost \$13,207,000; and the Wabash and Erie, in Indiana, 374 m., cost \$6,000,000. There are 13 canals in New York, 14 in Pennsylvania, 5 in Ohio, 4 in Virginia, 2 in New Jersey, and 1 each in Delaware, Maryland, Indiana, Illinois, and Michigan. The Chesapeake and Ohio canal originated in a project formed by Washington as early as 1774, to make the Potomac navigable from tide-water to Cumberland, and to connect it by common roads and portages with the affluents of the Ohio w. of the Alleghanies. The war of the revolution postponed the scheme, but in 1784 it was again broached by Washington, and Maryland and Virginia appointed a joint commission, with him at the head, to investigate the subject. The result was the incorporation of a company to make the Potomac navigable from tide-water to the highest possible point by the construction of such locks as might be necessary for that purpose. Of this company Washington was the president until his election as president of the United States compelled his resignation. The project encountered many obstacles, until at last in 1820 it was abandoned as impracticable; when the board of public works of the state of Virginia took steps which led to the organization of a new company, which constructed the Chesapeake and Ohio canal from Georgetown to Cumberland, completing it in 1850. It passes through the Potomac valley to Paw Paw Bend, from which point it passes through the mountain by a tunnel 3,118 ft. long. The whole length of the canal is 184 m., its depth 6 ft., its width to Harper's Ferry 60 ft. at the surface and 42 ft. at the bottom. By means of 74 locks, 100 ft. long and 15 ft. wide, an elevation of 609 ft. is gained. All the water is supplied by the Potomac. The cost of the work was over \$11,000,000.

CANALETTO, or CANA'LE, the name of two Venetian painters, who have acquired a reputation for their landscapes and views of towns. The elder, ANTONIO C., b. 1697, was the son and pupil of a theatrical decorator in Venice. He studied at Rome. He painted a numerous series of excellent views in Venice, among which that of the great canal are especially admirable for their fresh coloring, faithfulness, and the invention displayed in accessory objects. He came to England by the advice of Amiconai. He died in 1768, after having acquired both wealth and fame by his representations of English scenes, several of which are in Buckingham house, and are highly admired.

BERNARDO BELLOTTO, surnamed CANALETTO, nephew and pupil of Antonio, was b. at Venice, 1724, and attained high excellence as a painter, and also as an engraver on copper. He practiced his art in his native place, and afterwards in Rome, Verona, Brescia, Milan, and Dresden. Correct perspective, powerful effects of light and shade, and beautiful sky-tints, are the most prominent characteristics of his works. C. visited England, where, among several other excellent works, he painted a masterly interior view of King's College chapel, Cambridge. He died in Warsaw, 1780.

CANAMINA, a t. of Dahomey, Africa, about 12 m. s. of the capital, Abomey. It is situated in the midst of a cultivated plain, and has a house for the accommodation of white men, set apart by the king. Pop. 10,000.

CANANDAIGUA, a beautiful village in New York. U. S., at the n. of the lake of the same name, on the Rochester and Syracuse railway. Pop. '70, 4,862.

CANANDAIGUA (*ante*), a beautiful village in Ontario co., N. Y.; the co. seat, situated at the n. extremity of Canandaigua lake, 24 m. s.e. of Rochester, on the New York Central railroad, where it is joined by the Rochester and Elmira, and the Canandaigua, Black Rock and Tonawanda railroads. The village is celebrated for picturesque scenery and the elegance of its private residences. Pop. '75, 7,771. Among the public buildings are a fine court-house, two orphan asylums, several churches, an academy, and a seminary for women. The Indian name "Canandaigua" means "the chosen spot."

CANANDAIGUA LAKE, in Ontario co., N. Y., 15 m. long by about 1 m. wide; 668 ft. above the tide and 437 ft. above lake Ontario, into which it is emptied by the Clyde and Seneca rivers. It is surrounded with high banks and charming scenery, and its steamboats are largely patronized by pleasure-seekers.

CANANORE, a seaport and military station of the district of Malabar, in the presidency of Madras. It is in lat. 11° 52' n., and long. 75° 26' e., being about 50 m. to the n. of Calicut. The town stands at the head of a bay, which, opening from the s., forms its harbor, while the fort and cantonments occupy the bluff headland, which shelters the inlet on the side of the Arabian sea. Besides pepper, grain, and timber, the neighborhood produces immense quantities of cocoa-nuts, which are largely exported to the northward, where they are said to be scarce. C. has been a British possession since 1791, having in that year been taken from Tippoo Sultan. Pop. '71, 31,070.

CANA OF GALILEE, called by the natives "Kefr Cana." This place, celebrated in Scripture as the scene of our Lord's first miracle, when he turned water into wine, is now a small village of a few hundred inhabitants, who are principally Greek Christians or Nazarenes, situated about 13 m. w. of the sea of Galilee, and 6 m. n. of Nazareth. At the entrance to the village there is a fountain of the clearest and most delicious water—the best, say the Christians of Palestine, in the world: from it, it is supposed, the vessels for the marriage-feast were filled; and near the fountain are also lying the fragments of a Roman column. A house is still shown as that in which the miracle was performed; and some earthen jars sunk into the floor are said to be the very jars in use on that day. A church was built over the spot, but it is now in ruins.

CANARA, a region on the w. coast of the Indian peninsula, comprising two British collecterates. **NORTH C.**, also called *Honawar*, the most southerly portion of the Bombay province, is, like the other districts in the coast southwards, exceedingly fertile. The area of the district is 4,235 sq. m., and the pop. was 398,406 in 1872. **SOUTH C.**, a narrow strip of hilly and very fertile country, lies in the Malabar like the preceding, but is comprised for administrative purposes in the province of Madras. It is sometimes called *Mangalore*, from its chief town. Area, 3,902 sq. m.; pop. in 1871, 918,362.

CANARAC, a t. on the Orissa coast, at the n.w. angle of the bay of Bengal, in lat. 19° 54' n., and long. 86° 10' e., being 235 m. to the s.w. of Calcutta. It is remarkable chiefly for the remains in its vicinity of a colossal pagoda. The entire area, a square of about 13 acres, is said to have been surrounded by walls 150 cubits high and 19 broad; and the principal materials appear to have been red granite and black basalt, some of the blocks measuring 15 or 16 ft. in length, by 6 or 8 in width, and 2 or 3 in thickness. Most of the sculptured embellishments have been removed to the temple of Juggernaut, which is in the same district of Pooree as C. itself.

CANARIES, or CANARY ISLANDS, a group of islands belonging to Spain in the Atlantic ocean, off the n.w. coast of Africa, in lat. 27° 40' to 29° 25' n., and long. 13° 25' to 18° 16' w., forming a Spanish province. The group consists of seven large and several small islets, with a joint area of about 3,800 sq. m., and a pop. of (1870) 283,859. The principal islands, proceeding from e. to w., are Lanzarote, Fuerteventura, Gran Canaria, Teneriffe, Gomera, Palma, and Hierro or Ferro. The coasts are steep and rocky, and the surface is diversified with lofty mountains (the greatest elevation being attained in the *Pico de Teyle*, in the island of Teneriffe, which has a height of 12,182 ft.), narrow gorges, and fertile valleys. All the islands are of volcanic origin. On the summits of the highest elevations, depressions, like those left by fallen cones of volcanoes, are almost everywhere found; and the steep declivities are marked by deep fissures, of which, usually, only one penetrates the depressed summit, and exposes to view the several strata of the volcanic rock. There are numerous torrents, but no rivers, and fresh water is very scarce in the southern parts of the islands, and especially in Hierro.

The researches of Humboldt and Von Buch led to the division of the botanical geography of Teneriffe into five distinct regions. The first, or region of African forms of vegetation, extends to about 1300 ft. above the sea, and is marked by the growth of the date palm, sugar-cane, dragon's-blood tree, etc. The second region extends to the height of 2,800 ft., and produces vines, corn, maize, olives, chestnuts, etc., in luxuriance. This zone represents the vegetation of southern Europe. In the third region, rising 1200 ft. or so higher, we have laurels and evergreens. In the fourth, extending to above 6000 ft., we find vegetation nipped by cold and excessive dryness, snow falling several months of the year, and only the *pinus Canariensis* and other coniferae flourishing. The fifth region attains an elevation of nearly 11,000 feet. Here are found a kind of *spartium* (broom) peculiar to this zone, with cedrine junipers, and one Alpine plant, *Arabis Alpina*. The barren mountain-peaks are just below the limit of perpetual snow, although in a cavern at the height of 11,000 feet above the sea, snow is said to be preserved throughout the year. All the rest of the islands are similar in character, with the exception of Fuerteventura and Lanzarote, which are less elevated, more abundantly wooded, and more luxuriant in vegetation generally.

Minerals are few, and of little importance. Near the sea, the general temperature ranges from 60°–66° F. in Jan., to 78°–87° F. in October. The rainy season lasts from Nov. to Feb.; from April to Oct., the weather is uniformly fine. The islands, however, suffer much from the e. and s.e. winds, which, blowing over the hot deserts of Africa, burn up vegetation, and generate disease. Very little wine is now produced, the grape disease having destroyed almost all the vines. Cactus plants, on which the cochineal insect feeds, now mainly occupy the desolated vineyards, and the value of cochineal exported in 1874 was £435,000, out of a total value for exports of £596,244. Other products are cereals, tobacco, potatoes, barilla, oil, and fruits. The chief foreign trade is with the United States, England, and Hamburg. There is little manufacturing.

TENERIFFE, the largest island of the group, has an area of 877 m., with a population of 95,000.* In the n.w. of this island, which is the principal seat of the cochineal cul

* The population of the separate islands is not from the census of 1870, of which only the total return is available.

tivation, is situated the famous Pico de Teyde, or peak of Teneriffe (q.v.). The chief town and port is Santa-Cruz de Santiago (q.v.), on the n.e. coast.

GRAN CANARIA, which is next in importance, has an area of 758 sq.m., with a pop. of 69,000. Its culminating peak is El Cumbre, with a height of 6,648 feet. The capital, Las Palmas (q.v.), on the e. coast, is the largest town of the archipelago.

PALMA has an area of 718 sq.m., and a pop. of 33,000. Its highest peak, Pico de los Muchachos, has an elevation of more than 7,600 feet. Capital, Santa-Cruz des las Palmas (q.v.), on the e. coast.

The area and population of the other islands are as follows: LANZAROTE is 323 sq.m., pop. 17,400; FUERTEVENTURA, 326 sq.m., pop. 13,800; GOMERA, 169 sq.m., pop. 11,700; HIERRO, 82 sq.m., pop. 4,400. The chief towns of these islands are small.

The C. are supposed to have been the Fortunate islands of the ancients. The Carthaginians are said to have visited them, and Juba II., king of the two Mauritias, wrote an account of them that has been transmitted to us by Pliny. In modern times, the first account of them was furnished in the first half of the 14th c., by the crew of a vessel that had been driven among them by stress of weather. A Spanish gentleman obtained a grant of them from the pope; but when an attempt at settlement was made, the Spaniards were driven off by the natives. In the beginning of the 15th c., the Spaniards succeeded in obtaining a footing in the islands; but a difference having arisen with Portugal concerning them, it was not until 1493 that the authority of Spain was finally established. Since that time, they have remained attached to the Spanish crown. The Guanches, who were the aborigines of the islands, have long ceased to exist as a separate people, the population being now quite Spanish. They were a brave and intelligent race.

CANARIUM, a genus of trees of the natural order *amyridaceæ*, natives of the south-eastern parts of Asia, the Malayan archipelago, etc. The fruit is a drupe. The kernel of the fruit of *C. commune* is eaten both raw and roasted; and in Amboyna, bread is made of it, which is generally in the form of rolls about a yard long and an inch thick. An oil is expressed from it, which is used both for the table and for lamps. The tree is about 50 ft. high. *C. sylvestre* also produces eatable kernels. *C. commune* is supposed to be one of the trees which yield elemi (q.v.), and *C. microcarpum* yields an oil very like copaiva, known in ship-building yards as damar (q.v.).

CANARY, or CANARY BIRD, a beautiful little bird, very common as a cage-bird, and much esteemed for its musical powers. It is one of the numerous family of finches (*fringillide*), and is *fringilla canaria* of Linnæus. Some modern ornithologists place it in the genus *carduelis*, others in *linota*; it is indeed intermediate between these genera, the goldfinches and the linnets. Some make it the type of a genus or sub-genus, *canaria*. It is found in Madeira, the Canary isles, and the Cape Verd isles; frequents the neighborhood of human habitations; builds its nest of moss, feathers, hair, etc., in thick, bushy, high shrubs or trees; and produces four, five, or even six broods in a season. In its wild state, its plumage is greenish, or greenish-yellow, sometimes tinged with brown, and exhibits less variety and beauty than in domestication. It was brought to Europe in the beginning of the 16th century. It breeds readily in confinement, and seems thoroughly reconciled to its cage-life; but although canaries of long domesticated races sometimes excel in imitative powers and acquired strains, yet they are surpassed in loudness and clearness of note by some of the wild birds, which, when caught and imported, are occasionally sold for extraordinary prices. Even in confinement, the C. often breeds four or five times a year, laying from four to six eggs each time. The eggs are pale blue. The male assists the female in building the nest and in feeding the young. Besides seeds of various kinds, which are their principal food, canaries are very fond of bland green leaves, such as those of chickweed, a supply of which is very necessary for their health; and one of their favorite luxuries is sugar. The C. not unfrequently lives 15 or 16 years. It can be taught various notes and airs, and some even learn to articulate words. The rearing and training of canaries afford occupation to no small number of persons, particularly in the Tyrol. The C. hybridizes readily with some other species of finch, producing "mules," some kinds of which are valued as song-birds.—There are several species very closely allied to the C., one of which, a beautiful little bird, entirely yellow, with an orange crown, a native of Brazil, is sometimes sold in Britain as a song-bird, but its musical powers are very inferior to those of the common species.

CANARY GRASS, *Phalaris canariensis*, a grass of which the seed is much used, under the name of *Canary seed*, as food for cage-birds, and which is, on that account, cultivated to some extent in the s. of Europe, and in certain districts of Germany and England. It is a native of the Canary islands, naturalized in the s. of Europe, and in many places in Britain. The chief seats of its cultivation in England are the counties of Kent and Essex. The seed is sown early, generally in Feb., yet the crop is not reaped till after the ordinary grain harvest, for which reason the cultivation of C. G. is seldom attempted in the northern parts of Britain.—This grass attains a height of 2 or 3 ft., and has a crowded, egg-shaped, spike-like panicle, from an inch to almost 2 in. long; the spikelets are one-flowered, very much laterally compressed, a rudimentary scale-like floret on each side of the perfect floret; the *glumes* winged on the keel, and with two strips of

darker green on each side; the *palææ* awnless, shining, and at last firmly inclosing the seed. A fine flour is prepared from Canary seed, which is employed as dressing in fine cotton-weaving, and for the finishing of silken stuffs. The groats and flour of this small kind of grain are also used in the Canary islands, in Barbary, and in Italy, as food, the flour being made into bread, which is very nutritious and pleasant.—Other closely allied species of *phalaris* produce a similar grain, but are inferior in productiveness and quality.—A grass, now generally referred to this genus, and sometimes called REED C. G. (*phalaris arundinacea*), is very common on the banks of lakes and rivers, and in other wet places in Britain, and throughout southern and central Europe. It differs very much in appearance from C. G., having a large spreading panicle, generally of a reddish color; and the glumes are not winged at the keel. It is a somewhat reed-like grass, 4 to 6 ft. high, with creeping roots, which help to secure river banks; and yields a great bulk of hay, but has been very generally despised as a coarse grass, fit only for littering cattle. The justice of this opinion has, however, been called in question, and the grass proclaimed to be very nutritious, and sufficiently acceptable both to horses and oxen when cut early. It may be mown twice a year. A variety with curiously striped leaves is well known in gardens, as *ribbon grass*, *gardeners' garters*, or *ladies' traces*.

CANARY PLANT. See TROPEOLUM.

CANARY WINE, also known as TENERIFFE, is the produce of the Canary islands, and resembles Madeira; but the name is properly applied only to the Bidogne wine, which must be distinguished from the Malvoisie of the Canaries. The former is made from grapes gathered before they have ripened, and, when new, is crude and unpleasant; but in the course of two or three years, increasing in mildness as in age, becomes so much like Madeira, that it is often sold for it. Like Madeira, it is greatly improved by a voyage to the tropics. It is produced chiefly on the island of Teneriffe, and the trade in the wine is mostly carried on at the chief port of this island. The Canary of the island of Palma is inferior to Teneriffe, but may be consumed sooner, and has a pleasant flavor.

CANASTER, the name given to a rush basket in which tobacco is placed in Spanish America; hence is said to be derived the name canaster, now applied to tobacco of a certain kind.

CANBY, EDWARD RICHARD SPRIGG, LL.D.; 1819-73; b. Ky.; a graduate of West Point; served in the Florida and the Mexican war, and in the war of the rebellion; in 1862, made brig.gen. of volunteers, and maj.gen. in 1864. He was severely wounded on two occasions, and was often chosen for special and difficult duty. In 1866, he was commissioned as brig. in the regular army. In the winter of 1872-73, he was sent to make a settlement of the difficulties between the Modoc Indians and the whites of n. California and Oregon, and was holding a talk under a flag of truce near his camp when he was treacherously shot by capt. Jack, one of the Modoc leaders.

CANCALE, a seaport of France, 10 m. e. of St. Malo, on the bay of St. Michael; famous for its oyster trade; pop. '72, 3814. In 1758, the duke of Marlborough here landed an English army of 14,000, intending to attack St. Malo, but returned without making the attempt.

CANCAN, a wild dance, or rather a series of violent gymnastic exercises, originated by the demi-monde of Paris. Though perhaps quite as decorously clad as the opera-ballet, the C. is considered out of the pale of respectable diversions. There is some resemblance between it and the wild orgies of the Bacchic or Dionysian festivals of ancient Greece.

CANCAO', CANCAR, or KANG-KAO, also known as PONTIAMUS or POTAMAT, the capital of a small state in w. Cambodia, on the e. side of the gulf of Siam, at the mouth of the river Cancao, 10° 14' n. and 105° 55' east. It was once the center of Cambodian trade, but in 1717 the Siamese drove out the merchants who had settled there, since which time the trade of the town has greatly decreased. The harbor is shallow, but there is a good depth of water in the river.

CANCELING OF DEEDS AND WILLS. The word cancel comes from the Lat. *cancelli* (lattice-work), and a deed was formerly said to be canceled when lines were drawn over it in the form of lattice-work. The word cancel is now used to signify any sort of obliteration.

The court of chancery in England gives relief against the effect of improper cancellation; on the other hand, it may order a deed which has been improperly obtained to be delivered up in order to be canceled. The effect of the cancellation is to make the deed void. If a deed is given up to be canceled, and the cancellation does not take place, it remains in force at law. But if an obligee deliver up an obligation to be canceled, and the obligor do not afterwards cancel it, and the obligee happen to get it again into his hands, and sue the obligor on it, the latter cannot plead its voidance, for the deed still remains in force at law—although here, too, equity would relieve, and decree according to the original cancellation. Where a deed is canceled by consent of the parties to it, it is thereby destroyed as to their interest under it, but third parties may still produce it in evidence. As to a will, its cancellation may have the effect of revoking it, if done with such intention.

In Scotland, the system of registration of deeds and other writings prevents the

occurrence of many of the questions that arise in England on this head, but the intention and effect of the cancellation or destruction of documents would in most cases be a question of evidence; and where it is necessary to know the contents of the destroyed paper, its effect may be judicially declared by a form of suit called an action for *proving the tenor*, as indeed may be done in an English court of equity by a bill to recover the contents of a lost document. In the Scotch law, again, a deed or other writing may be judicially canceled or set aside by an action of reduction, and the courts in England substantially exercise a similar jurisdiction.

It would appear that where a testator has prescribed certain forms for the authentication of his will, and such forms have either not been observed by him, or if observed, have, in some essential particular, been negatived by obliteration, an intention to revoke will be presumed: thus, where a Scotchman, who had long resided in India, executed a will, concluding, "In testimony of this being my last will and testament, I hereto set my hand and seal;" and the document was found in his repositories with the part to which the seal had evidently been affixed cut (not torn) off, the house of lords held the deed to be canceled, because the testator had himself, besides the usual solemnities, prescribed a seal as necessary to the authentication of his will. A will, however mutilated or canceled by a testator during his insanity, would be good; and of course there is no effectual cancellation when done by a third party without sufficient authority. But all such considerations are questions of evidence. See DEED, WILL.

CANCELING OF LETTERS-PATENT. The lord chancellor may cancel the queen's letters-patent, when granted contrary to the law, "which," says Blackstone, quoting sir Edward Coke, "is the highest point of his jurisdiction." See LETTERS-PATENT, CHANCELLOR.

CANCELLARIA, a genus of mollusks—class *gasteropoda* (q.v.), order *pectinibranchiata*—with univalve shells, sometimes regarded as belonging to the family *volutidae*, or volute shells (q.v.), but now generally placed among *buccinidae*, or whelks (q.v.). The spire is prominent, the last whorl ventricose, the surface reticulated, the mouth large, the columella plaited. All the recent species are natives of tropical or subtropical seas, and are found chiefly on sandy bottoms, at the depth of a few fathoms. The fossil species, amounting to 19, occur in the newer strata from the chalk upwards.

CANCER, a disease characterized by slow alterations of structure, or tumors in various parts of the body, occurring either simultaneously or in a certain order of succession. In many cases, an isolated tumor in an external part is the earliest symptom; it is then viewed at the starting-point of the disease, and is termed a *malignant tumor* (*tumor mali moris*), from its presumed tendency to infect the system, and to cause the reproduction of growths similar to itself. It is right, however, to remark, that upon the pathology of C. authorities are by no means agreed, some holding that a constitutional taint or *diathesis* must always precede any local development of C., and that the first growth in point of time (or primary C.) is therefore only the first of a series determined by a pre-existing cause in the blood or general system; while others hold that C. is originally a truly local disease, or even that a growth at first simple (*non-malignant* or *benign*), may, in consequence of local causes, *degenerate*—i. e., become cancerous, and infect the whole system with the morbid tendency thus secondarily acquired. The discussion of this disputed question involves statements of a too complicated kind to be in place here; but it is a question of considerable importance, as bearing on the probability or improbability of curing the disease by extirpating the primary tumor at an early stage of its development. All authorities are agreed that, when any trace of secondary C. exists, the removal of the parts affected gives scarcely any hope of a favorable result, and, accordingly, operations under these circumstances, unless merely for the relief of local suffering, are discountenanced by all respectable surgeons. The disease, however, is one of which the ignorant as well as the learned have a well-founded dread, and hence it presents a large field for the practice of imposture, and for that less deliberate, but often not less hurtful kind of quackery which is the result of pure ignorance, grafted on a meddling desire to do good. We propose to give such a sketch of the characters and progress of cancerous disease as may serve, in some degree, as a protection against ignorance on the one hand, and deception on the other.

The leading character of C. being a tumor or morbid growth in a part, it is important, in the first place, to observe that not all, nor even the majority, of morbid growths are cancerous. A very large proportion of growths, involving swelling or change of structure in a part, are either determined by a previous process of inflammation—leading to chronic abscess and induration—or belong to what is called the non-malignant order of tumors—e. g., cysts, fatty and fibrous tumors, simple hypertrophy of glandular structures, cartilaginous, bony, calcareous, and vascular growths. See TUMORS. Further, among the tumors admitted by general consent into the order of cancerous, there are widely different degrees of *malignancy* or *cancerousness*, so to speak; some having the tendency to spread rapidly, and infect the system at an early period, while others remain local for a considerable time, and may be removed while yet local, with good hope of a permanent recovery.

Now, the practical distinction, or *diagnosis*, to use the technical phrase, of these different tumors, is founded upon a very careful and delicate appreciation of the characters

of the malignant and non-malignant tumors, considered as morbid products, and also upon a thorough knowledge of the anatomy and relations of the textures in which they arise. One of the leading characters of malignant tumors is the tendency to involve, by a kind of specific destruction or degeneration, the ultimate elements of the textures in which they arise and in which they spread. The attempt, therefore, to distinguish these from other growths, must always call for the highest qualities of the surgeon—large experience, guided at every step by consummate science, and, in particular, by minute and thorough knowledge of natural structure. And the difficulties of the inquiry are such, that even in the dead body, or in a tumor excised from the living body, all the resources of the anatomist, aided by the microscope, will occasionally fail in distinctly and surely discovering the true character of the morbid structure.

The most common seats of C. are, among external parts, the female breast, the eye, the tongue, the lip, the male genital organs, and the bones; among internal organs, the liver, stomach, uterus, rectum, gullet, peritoneum, and lymphatic glands. Some of these parts are more liable to primary, others to secondary cancer. Thus, the female breast, the neck of the uterus, the lower lip, the scrotum, the extremity of the penis, are very often the seats of a single cancerous tumor, which in its early stage at least seems to be unconnected with any constitutional taint; while the liver, the bones, and the lymphatic glands are more frequently the seats of secondary or multiple cancerous tumors. There are also differences in the character of C. itself, apart from its anatomical seat, which are to be taken into account in estimating the probability of its being solitary. Some of these differences are regarded by pathologists as amounting almost to specific distinctions; thus, *scirrhous*, or hard C., observed most frequently in the breast, uterus, and stomach, is more frequently solitary than *encephaloid* (brain-like), otherwise called *medullary*, or soft C.; again, *melanosis*, or *melanic C.*, a variety charged with a brown or black pigment, is almost always multiple in its occurrence; while *epithelial C.*, or *epithelioma*, as it has been recently termed, of which examples are frequently found in the lip, scrotum, penis, or tongue, is so generally solitary as to have led some pathologists to place it in a class altogether apart from the truly cancerous growths, with which, however, it presents too many points of affinity in its fatal tendency to recur after operation, and to infect the lymphatic glands and other structures adjoining the part primarily affected. Again, there are certain varieties of fibrous and of cartilaginous tumor, as well as certain tumors of bone, and bone-like tumors developed in soft parts (osteoid), which must be regarded, in the meantime, as occupying a doubtful position between the malignant and non-malignant growths. (Paget, *Lectures on Surgical Pathology*, vol. ii.)

Generally speaking, a tumor may be said to fall under the suspicion of being C. when it more or less completely infiltrates the texture in which it arises, and passes from it into the surrounding textures; when it invades the lymphatic glands adjoining the part first affected; when it is attended by stinging or darting pains, or by obstinate and slowly extending ulceration, not due to pressure; when it occurs in a person having impaired health, or past the middle period of life, and is not traceable to any known cause of inflammatory disease or local irritation, nor to any other known constitutional disease, such as syphilis or scrofula. The probabilities are of course increased if the tumor be in one of the habitual seats of C., or if it be attended by evidence of disease in some internal organ known to be frequently thus affected. But it is hardly necessary to point out that the very complex elements of *diagnosis* here referred to ought to be always submitted to the scrutiny and judgment of a well-educated medical adviser, whose skill and personal character place him above suspicion, before the disease has assumed such a form as to be beyond the reach of remedial procedure. The patient who broods in secret over a suspicion of C., or who declines to apply for advice from a fear of encountering the truth, is in all probability only cherishing the seeds of future suffering; while if, as often happens, the suspicion is unfounded, a few minutes' careful examination would suffice to remove a source of misery which otherwise would poison the mind for years.

These remarks apply still more emphatically to the misguided persons who trust to the non-professional *cancer-curer*, or to the quasi-professional specialist. The charlatan, who pretends to hold in his hands a secret remedy for this most terrible disease, will invariably be found to pronounce almost every tumor C., and every C. curable. By this indiscriminating procedure, and by the fallacious promise of a cure without an operation, many persons who have never been affected with C. at all, have been persuaded to submit to the slow torture of successive cauterizations by powerful caustics, at the expense of needless mutilation and no small risk to life. In other cases, truly cancerous tumors have been removed slowly and imperfectly, at the cost of frightful and protracted sufferings, only to return at the end of a few weeks; and Mr. Spencer Wells has lately shown that in some notorious instances persons were reported as cured, when they had actually died of the disease at no long period after the supposed cure was stated to have taken place. (*Cancer and Cancer-curers*, Lond. 1860.)

What is really known as to the cure of C., may be stated in few words. Modern pathological researches render it probable that a complete suspension of the progress of C. sometimes, though rarely, takes place; and individual tumors are found not unfrequently to undergo partial healing, or even to become entirely metamorphosed into inert

cicatrices, while others, associated with them, continue to advance. The degree of rapidity of the advance of C. is also, as we have already stated, exceedingly variable. But these observations modify only to a very slight degree the general doctrine, that C. is a disease tending to a fatal issue, and hardly, if at all, under the control of remedies, as to its ultimate result. The removal of a cancerous tumor, indeed, is still resorted to by surgeons; and there appears to be no reasonable doubt that, when performed early, and in well-selected cases, it has been followed by long-continued exemption. But the occasional spontaneous arrest of such growths on the one hand, and the doubtful results of operation in a large proportion of cases on the other, have combined to render surgeons of late years more chary of the use of the knife. In aged persons, in particular, the question often resolves itself into a calculation of the chances of life, founded on a great number of conflicting data, and only to be solved by a careful attention to the state of the general health, as well as to the rate of progress of the local disease. Operations are now very rarely performed after the lymphatic glands are involved, or when there is evidence of a deteriorated constitution, or of internal disease; but sometimes great pain, or profuse and exhausting discharge from an external tumor, may justify its removal, as a palliative measure, even under these unfavorable circumstances. For the mode of removal of cancerous and other tumors, see TUMORS.

Among the lower animals, this disease is more rare; nevertheless, cases are not unfrequently presented, presenting the same malignant characters as those observed in the human subject. Usually manifesting itself in the form of a specific tumor of some organ or tissue, there is a tendency to the invasion of other parts of the system, and the development of a constitutional state called the cancerous cachexia. M. U. Leblanc of Paris, the best veterinary authority on this subject, has shown that the dog and cat are most frequently affected with C.; and next in frequency come the pig, ox, horse, and mule. It has not been observed in birds, reptiles, or fishes. Females are more liable to C. than males. It is hereditary, but not transmissible from animals to man, or from one animal to another. It does not disappear under the influence of remedies, but, if possible, the tumors should be excised when first seen, and, if the knife fail to extirpate the malady, cauterization should be had recourse to. A relapse is almost certain; but Leblanc says there is greater chance for the patient, when a carnivorous animal, if it is kept on a strictly vegetable diet.

CANCER, the *Crab*, the fourth of the twelve constellations of the zodiac, usually represented on the globe as a crab, and denoted in works on astronomy by the sign ♋, which resembles the number 69 laid sideways. It contains, according to Flamsteed, 83 stars, of which the principal is *Acubens*, a star of the third magnitude. In the divisions of the ecliptic, the *sign* called C. occupies a place between 90° and 120° from the vernal equinox; but, owing to precession, the sign and the constellation have not coincided for nearly 2,000 years. See ECLIPTIC, PRECESSION, ZODIAC. Besides *Acubens*, it has two stars of the fourth magnitude, called by the Romans *Aselli* or the Little Asses; and a nebulous cluster of minute stars about 2° from the Asses, visible to the naked eye, and which goes by the name of *Præsepe*, or the Manger.

CANCER. See CRAB.

CANCER, TROPIC OF. See TROPICS.

CANCER ROOT, or BEECH-DROPS, *Epiphegus Virginiana*, a parasitic plant of the natural order *orobancheæ* (q. v.), a native of North America, growing almost exclusively on the exposed roots of beech-trees. Like all the other plants of its order, it has a curious appearance, having scales instead of leaves. Its stem is branching, and produces distant alternate white flowers, streaked with purple. The whole plant is powerfully astringent; and the root is brownish, spongy, and very bitter and nauseous in taste. It has acquired, in its native country, the reputation of being a cure for cancer. All parts of the plant are used, and externally more than internally. This plant, in conjunction with white oxide of arsenic, is believed to have formed a medicine once famous in North America under the name of *Martin's cancer-powder*.—Another American plant of the same order, *Phelipæa biflora*, is sometimes also called C. R., and is used in the same way; and an infusion of the common broomrape (*orobanche major*)—a native of Britain and of the s. of Europe, parasitic on the roots of broom, furze, and other leguminous plants—has been employed as a detergent application to foul sores.

CANCERIN, GEORG, Count, 1774-1845; a Russian statesman, educated in Germany, and employed in various capacities in Russian service. In 1813, he was commissary-gen. of all the forces, and in 1814, he accompanied the emperor Alexander to Paris. He was minister of finance from 1823 until his death. He was one of the few Russian writers on political economy.

CANCERUM O'RIS, known also as *noma*, *water-cancer*, and *water-canker*, is a peculiar form of mortification, arising apparently from defective nutrition. The disease seldom occurs except between the 2d and 11th years, and is usually preceded by measles, remittent or intermittent fever, or some other serious disease. The following is the ordinary train of symptoms: more or less general disturbance of the system, accompanied by loss of appetite, followed by swelling of the salivary glands, and a profuse flow of saliva, which escapes from the mouth involuntarily during sleep; ulceration of

the gums, which swell and become livid; looseness of the teeth; and the appearance of ash-colored spots on the gums and adjacent mucous membrane, which turn into dark-colored sloughy sores. These sores spread rapidly by a gangrenous process, expose the bone, and finally make a large aperture in the cheek. In some cases, the entire cheek has been destroyed in a very few days. Fortunately, this terrible disease is more rare in this country than in some parts of the continent, and most of the cases recorded are described by foreign writers. Van Swieten describes a case in which he saw the first set of teeth fall out, the second set destroyed, the lower jaw exfoliated, and the lips, cheeks, tongue, and chin eaten away before the child died. The obvious indications of treatment are to remove the patient to pure air, to administer tonics, nourishing food, and (in moderation) stimulants; to touch the diseased parts with nitrate of silver, or glyceride of carbolic acid, and to wash out the mouth frequently with a weak solution of Condy's fluid.

CAN'DACE, queen of the portion of upper Nubia called by the Greeks Meroë, probably corresponding with the present province of Athbara, between 13° and 18° north. From its fortunate situation, Meroë became one of the richest countries in the world. Candace appears to have been the name of several female rulers in Ethiopia. The one here meant invaded Egypt 22 B.C., but was defeated by the Roman governor, Petronius, who destroyed Napata, the queen's capital city. The queen was leniently treated by Augustus. The high chamberlain or treasurer of Candace was converted to Christianity by Philip the evangelist, and there is a tradition that through the efforts of this officer the queen herself was converted.

CANDAHAR, or **KANDAHAR**, a mountainous province of Afghanistan, s.w. of Cabool. It is for the most part sterile, though there are fruitful belts along the rivers where tobacco, grain, and fruits are produced. A large transit trade passes through C. between India and Persia. Candahar once formed a part of the latter kingdom; was afterwards subjected to the sovereigns of Delhi; was once more annexed to Persia, but after the death of Nadir Shah it became a province of Afghanistan. The people are Mohammedans, chiefly of the Sunni sect.

CANDAHAR, or **KANDAHAR**, the capital of central or southern Afghanistan, situated about 200 m. to the s.w. of Cabool. It is in lat. 32° 37' n., and long. 66° 20' e., and has an elevation of 3,484 ft. above the level of the sea. It is in the form of an oblong square, while all its streets run straight, and cut one another at right angles. At the point of intersection there is a large dome (*charsu*), 50 yards in diameter. Pop. variously estimated from 25,000 to 100,000. C. is well watered by two canals drawn from a neighboring river, which send to almost every street its own adequate supply; and the same means of irrigation have covered the immediate vicinity with gardens and orchards. C. is a place of great commerce, trading with Bombay, Herat, Bokhara, Samarcand, etc. Among its permanent residents, C. has a larger proportion of Afghans, chiefly of the Dooranee tribe, than any other city of Afghanistan. There are numerous Hindu and Persian merchants. About 2 m. to the northward rises a precipitous rock, crowned by a fortress impregnable to everything but heavy artillery. Here, amid all the disasters of the Afghan war, the British maintained their ground. C. has been a pivot for the history of central Asia during more than 2000 years. It is supposed to have been founded by Alexander of Macedon, owing, most probably, its name to the oriental corruption of Iskender or Scander, as in Scanderoon or Iskenderun of Syria. A comparative blank of upwards of 13 centuries in the history reaches to the famous Mahmood of Ghiznee, who wrested the stronghold from the Afghans. From that epoch down to 1747, when the native rule was permanently established, C., with brief and precarious intervals of independence, was held by Tartary, India, and Persia in turn. In the war of 1878-79, the British entered C. unopposed.

CANDAULES. See **GYGES**, *ante*.

CANDEISH, or **KHANDESH**, a collectorate in the presidency of Bombay, and containing 10,166 sq.m., with a comparatively scanty pop. of (1872) 1,028,642. It lies chiefly in the valley or basin of the middle part of the Tapti, which enters the gulf of Cambay below Surat; and it is bounded mostly by territories of nearly all the powerful native princes—the Nizam, Scindia, Holkar, and the Guicowar. Through its situation, it necessarily suffered much from the long contest between the Mohammedans and the Mahrattas, and also from the struggles among the rival chiefs of the latter. Accordingly, when, in 1818, it fell to the East India company on the overthrow of the Peishwa, it presented little better than a scene of desolation, with ruined mansions, dismantled towns, and dilapidated temples. The difficulties of the new government were considerably aggravated by the Bheels, a more than half-savage race, that formed about an eighth of the population; and even beasts of prey, particularly tigers, had, under the constant influences of human strife, multiplied to an unusual extent. But the improvement was regular and steady. Peace and security reigned; so that roads, formerly hazardous for armed parties, were traversed in safety by unarmed individuals. The staple productions are cotton, wheat, and other grains, and also a little indigo. The cultivators are generally in a progressive condition, more especially in the cotton districts, and the well-watered talooka of Baglan.

CANDELA, a t. of southern Italy, province of Foggia, 22 m. s. of the town of Foggia Pop. 5,600. It is pleasantly situated on the summit of an eminence. The surrounding district is very fertile.

CANDELA BRUM, a Latin word signifying properly a candlestick (from *candela*, a candle), but more frequently employed to mean a support for a lamp. There were, perhaps, no articles of furniture in which the ancients combined the beautiful with the useful to so large an extent as in their candlesticks and lamps. Candelabra usually stood on the ground, and were of considerable height—from 4 to 8, or even 10 feet. The most common were of wood; but metals of all kinds, including the precious metals, were used for their construction, and sometimes they were even adorned with gems. The candelabra found at Herculaneum and Pompeii are mostly of bronze. In the temples and palaces of the emperors, they were frequently of marble, and of great size and richness. They have usually a capacious cup at the top, either for the purpose of containing oil enough to feed a large flame, or that they might be used for burning incense. Though varying greatly in details, a general design runs through the forms of the candelabra of antiquity. They have all a foot or feet, a shaft, and a plinth on which a lamp is placed, or which is furnished with a socket for a candle. The base often consists of three feet of a lion, goat, griffin, or other animal real or imaginary. Sometimes a figure was introduced either into the body of the shaft, or placed on the top of it, in either case supporting the superincumbent portion of the C. on its head. Sometimes a figure was substituted for the shaft altogether, the receptacle for the oil being placed in one hand. In others, the shaft is a sliding one, like that of a music-stand, the object being, of course, to raise or depress the light at pleasure.

In addition to the various kinds of candelabra which, from their height, seem to have stood on the floor, the ancients had others intended to be placed on a table. These consisted either of a pillar or of a tree, and from the capital of the former, or the branches of the latter, lamps were suspended, as in the accompanying illustration, which we copy from Smith's *Dictionary of Greek and Roman Antiquities*. The C., in this instance, including the stand, is only 3 ft. high. From the size of the stand in proportion to the rest of the C., it would seem to have been used for some other purpose.

CANDIA, in Turkish, "KIRID," called in the most ancient times *Idæa*, afterwards *Crete*, one of the largest islands of the Mediterranean, is situated at the entrance of the archipelago, in long. 23° 40' to 26° 40' e., lat. 34° 50' to 35° 55' north. It is very irregular in form, its length being about 160 m., and its breadth varying from 6 to 35 miles. The history of C. commences with Greek mythology, and historians and poets say that it was governed by its own kings, among whom were Saturn, Jupiter, and Minos, 1300 years before Christ. C. was conquered by the Romans under Metellus, who, on that account, had the title of "Creticus;" on the division of the empire, it fell to the share of the eastern monarchs. In 823 A.D., it was conquered by the Saracens, who built the city of C. on the ruins of Heraclæa. In 1204, it was sold by pope Boniface—to whom Baldwin I. gave it—to the Venetians. In 1645, the Turks besieged Canea, and in 1669 conquered the island, after a war, which lasted 24 years. The Cretans sigh for a union with Greece, and have repeatedly risen in insurrection against Turkish rule, notably in 1866. At the Berlin congress in 1878, the porte engaged scrupulously to carry out in C. the reformed system of government drawn up in 1868.

The island of C. is for the most part mountainous, the mountains being chiefly composed of freestone or marble, which is either gray or white. Towards the s. side of the western part of the island, there is a chain of high mountains, extending in length about 37½ m., which, from their appearing white, especially at their w. end, were anciently called Leuci. Mt. Ida, now called by the natives Upsilorites, is one in a chain of mountains extending to the n.w. of the island almost to Retimo; the mountain is of gray marble, and the surface loose stones: there is no verdure on it except a few small shrubs. Jupiter is said to have passed great part of his youth amongst these mountains in the exercise of hunting and drawing the bow.

The island abounds in springs and fountains, which are found even by the sea-side; most of the rivers are dry in summer, but in winter many of them are very dangerous torrents. The island does not produce any minerals of importance. The soil of C. is fertile, and produces wheat in abundance. The exports, which consist chiefly of oil, wool, linseed, and fruit, amount in annual value to above £400,000, and the imports to about £440,000.

C. had once, according to Homer in his *Odyssey*, 90 cities; there are now only 3 principal towns: Megála Kástron, or Candia, pop. 15,000, of which 5,000 are Christians; Retimo or Rhithymnos, pop. 6,000, of which 2,000 are Christians; Canea or Khania, pop. 12,000 of which 8,000 are Christians. The total pop. of the island now numbers little more than 290,000—less than half its amount at the outbreaking of the Greek revolution in 1821.

The population is for the most part of Greek descent; there are only about 70,000 Turks, with a few Arabs and Armenians, in the island. There are, however, many Greek Moslems in C., the worldly advantages which used to result from embracing Islamism having induced whole districts to abandon the faith of their forefathers; but their change of religious faith was unaccompanied by any change of language.

CAN'DIA, or **MEGALO-CASTRON**, formerly the capital and still the most populous city of Crete, on the n. shore of the island, 13° 20' n., and 25° 9' east. It is surrounded by fortifications built by the Venetians, but which are now out of repair; and much of the town has also been much injured by earthquakes. The main buildings are the pasha's palace, 14 mosques, three churches, a monastery, the bazaars, and the baths. It is the seat of an archbishop of the Greek church. The chief trade is in oil and soap, besides which there is considerable coasting commerce. There are manufactures of leather and of wine. The pop. is from 15,000 to 18,000, of whom about two thirds are Turks. Candia occupies the site of the ancient Heracleion, the seaport of Gnossus. The present city was founded by the Saracens in the 9th c.; was fortified in the 12th c. by the Genoese, and greatly strengthened by the Venetians in the following three centuries. It was taken by the Turks in 1669 after a stubborn defense by the Venetians, who lost 30,000 men.

CANDIAC, **JEAN LOUIS PIERRE ELIZABETH DE MONTCALM DE**, 1719-26; a child of wonderful precocity, b. in Nismes, France. At four years of age he read Latin, either printed or written; at six he understood Greek and Hebrew, had a remarkable acquaintance with arithmetic, history, geography, and heraldry, and had read many of the best authors. He died in Paris at the age of seven.

CANDIDATE (Lat. *candidatus*). Among the Romans, a suitor for the office of consul, quæstor, prætor, etc., was named C. because, in appearing before the people, he wore a white (*candida*) toga without a tunic. His dress was chosen partly as an ostentation of humility, and partly as it served to display wounds received in battle. The candidature commonly lasted two years: in the first year, the C. was proved by the senate, whose decision, if favorable, was ratified by the popular assemblies; and, in the second, his name was entered in the list of candidates. During this period occurred the *ambitio*, or canvassing of voters, which often gave occasion to enormous bribery, in spite of the severe enactments passed to prevent the corruption of the electors. The elected C. was styled *designatus*.

In the early Christian church, newly baptized converts were styled **CANDIDATES**, on account of the white garments worn during eight days after baptism. In modern times, a German probationer or theological student who has been approved before the highest ecclesiastical authorities, is called a C.; but a still broader signification is also attached to the word, an applicant for any office whatever, religious or secular, being termed a candidate.

CANDLE, a cylinder of wax or fatty matter, with a wick, intended for giving light. Candles are made principally of tallow; also of the solid portion of palm and cocoa-nut oils, bleached wax, spermaceti, and paraffin, and other oily substances found in coal, shale, and gas-tar. They are either dipped, molded, or rolled. "Dips" are made by stretching a number of wicks upon a suitable frame, so that they may hang down at a distance from each other equal to about double the intended thickness of the C.; these are then dipped in a trough of melted tallow, and hung upon a rack until cooled, then dipped again and again, until the required thickness is obtained. The dipper has a number of frames prepared before commencing, and by the time he has dipped the last, the first is cool enough to dip again. The tallow in the trough has to be kept only a little above its melting point, for if it were much hotter, it would melt away a portion of the tallow already on the wick, instead of adding to it. Tallow-candles are much improved by being kept a year or a winter before using.

Molds, or mold-candles, are cast by pouring the tallow down a pewter tube, along the axis of which the wick has been previously fixed. These tubes are well polished in the inside, and several are fitted in a frame, the upper part of which forms a trough, into which the molds all open: thus, by pouring into the trough, all the molds are filled at once.

Wax-candles are not molded, on account of the great amount of contraction which wax undergoes in cooling, and the difficulty of drawing it from the molds. The wicks are warmed, and suspended over a basin of melted wax, which is poured over them until they acquire the proper thickness; they are then rolled, while hot, between two flat pieces of smooth hard wood, kept wetted to prevent adhesion.

Great improvements have recently been made in the manufacture of candles, and these are especially interesting from being the direct results of the progress of scientific chemistry—of theory applied in practice. All oils or fats are composed of one or more fatty acids combined with a base, called glycerine. The fatty acids constitute the combustible and more solid portion of the compound. Both acid and base are very weak, and it is a general law in chemistry, that a strong base, under favorable conditions, will separate a weaker one from its acid, by combining with the acid, and taking the place of the weak base; and a strong acid will in like manner displace a weaker one. Lime is a strong base, and being cheap, is used to separate the glycerine from the fatty acid of tallow, palm-oil, etc. This it does when the melted fat is stirred for some hours with a mixture of lime and water. The lime forms a hard insoluble soap, by combining with the fatty acid, and the glycerine remains in solution with the water. This lime-soap is then broken to powder; and the weak fatty acid separated by means of sulphuric acid,

which combines with the lime, forming sulphate of lime. The whole being heated, the fatty acid floats on the top, is skimmed off, and the candles made from it. These are called composite candles; they give a purer light than ordinary tallow, from being freed from the glycerine, which not only softens the fat, but diminishes its combustibility. Pure stearic acid, or stearine, the chief fatty acid of tallow, is a hard crystalline substance, perfectly dry, and free from any greasiness, with a somewhat pearly luster. Its crystalline structure presents a difficulty in the manufacture of candles, for when cast in molds, it contracts on cooling, and leaves small spaces between the crystals. This has been obviated by mixing a little arsenic with it; but this method is now abandoned, on account of the poisonous gas evolved by the combustion of such candles, and the desired effect is obtained by mixing the stearine with a little wax, and pouring it into hot molds.

To obviate the necessity of snuffing candles, several contrivances have been adopted; in all of them, the object is effected by causing the wick to bend over and its end to fall outside of the flame, and thus, by coming in contact with the oxygen of the air, to be completely burned—for such combustion cannot take place within the flame. See FLAME. This bending over is variously brought about. One method is by twisting the wick with one strand shorter than the rest, which is strained straight while the candles are being cast; and when released by the melting of a portion, it contracts, and bends the wick. Another method is by adding on one side of the wick a paste, consisting of a mixture of borax, bismuth, flour, and charcoal. Another, by coating one of the threads of the wick with a metallic envelope, by dipping it in fused bismuth; the metal fuses at the end of the burning wick, and forms a small globule, which bends the wick over, and is itself readily combustible at a red heat. These are called *metallic* wicks. Various other contrivances have been adopted for the same object. Price's manufactory of "patent" candles, as these improved candles usually are called, is perhaps the largest in England. It is situated at Vauxhall, in the neighborhood of London, and its economic arrangements have attracted not a little public attention. *Paraffin* (q. v.), a white crystalline body, obtained by distillation from cannel coal, etc., affords a beautifully white and clear material for candles, and having thus in a great degree the properties of wax at a much smaller expense, it has lately been much used for this purpose. *Ozokerit* is another oily mineral substance used for candles.

Candles were early introduced—with symbolical signification—into Christian worship, and are still so employed in the Roman Catholic church. In the church of England, candles are sometimes placed on the altar; but the practice is a subject of controversy. The numerous superstitious notions and observances connected with candles and other lights in all countries had a more remote origin, and may be considered as relics of the once universally prevalent worship of the sun and of fire. Numerous omens are taken from them, and they are also used as charms. In Britain, a portion of the tallow rising up against the wick of the candle, is called a winding-sheet, and regarded as a sure omen of death in the family. A bright spark at the candle denotes that the party directly opposite is to receive a letter. Windy weather is prophesied from the waving of the flame without visible cause, and wet weather if the wick does not light readily. Lights appearing to spring up from the ground, or issue out of a house, and traverse the road or air by invisible agency, the superstitious in Wales and elsewhere call *corpse-candles*. They are ominous of death, and their route indicates the road the corpse is to be carried for burial. The size and color of the light tell whether the fated person is young or old. It is or was customary in some places to light a candle, previously blessed, during the time of a woman's travail. C were supposed to be efficacious after death as well as before birth, for they were placed on the corpse. The object was doubtless to ward off evil spirits, who were supposed to be always on the alert to injure souls on entering and on quitting the world. See also CANDLEMAS.

CANDLEBERRY, CANDLEBERRY MYRTLE, WAX TREE, WAX MYRTLE, TALLOW TREE, or BAYBERRY, *Myrica cerifera*, a small tree or shrub of 4 to 18 ft. high, but generally a low-spreading shrub, a native of the United States of America, but most abundant and luxuriant in the south. It belongs to the natural order *amentaceæ*, suborder *myricææ*, according to some, a distinct natural order, distinguished by naked flowers, with 1-celled ovary, a drupaceous fruit (stone-fruit)—the scales becoming fleshy—and a single erect seed. The genus *myrica* has male and female flowers on separate plants; and the scales of the catkin, in both male and female flowers, are concave. The C. has evergreen oblongo-lanceolate leaves with two small serratures on each side at the point, sprinkled with resinous dots. The bark and leaves when bruised emit a delightful fragrance. The drupes—properly called berries—are about the size of peppercorns, and when ripe are covered with a greenish-white wax, which is collected by boiling them and skimming it off, and is afterwards melted and refined. A bushel of berries will yield 4 or 5 pounds. It is used chiefly for candles, which burn slowly, with little smoke, and emit an agreeable balsamic odor, but do not give a strong light. An excellent scented soap is made from it.—*M. gale* is the SWEET GALE of the moors and bogs of Scotland, well known for its delightful fragrance, a native of the whole northern parts of the world. Several species are found at the cape of Good Hope, one of which, *M. cordifolia*, bears the name of WAX SHRUB, and candles are made from its berries.

CANDLE-FISH, or EULACHON, *Thaleichthys Pacificus*, a remarkable fish of the family *salmoides*, nearly allied to the capelin (q.v.), and, like it, strictly a sea-fish approaching the coasts to spawn, but not entering rivers. The candle-fish inhabits the Pacific ocean, near the western shores of America, from Vancouver's island northwards. It is not larger than a smelt, has a somewhat pointed and conical head, a large mouth, teeth on the pharyngeals, and the tongue rough, but the lower jaw, palatines, and vomer destitute of teeth. The color is greenish olive on the back, passing into silvery white on the sides and belly, sparsely spotted with dirty yellow. It is probably the fattest or most oleaginous of all fishes, or indeed of animals, and is used by the Indians not only as an article of food, but for making oil. To broil or fry it, is nearly impossible, because it almost completely melts into oil. Indeed, the Indians often use it, in a dried state, as a lamp for lighting their lodges, merely drawing through it a piece of rush pith, or a strip from the inner bark of the "cypress tree" of these regions, *Thuja gigantea*—a species of arbor vite—as a wick, a long needle of hard wood being used for this purpose, and the fish being then lighted at one end, burns steadily until it is all consumed. In order to use the dried fish for food, the Indians often melt it into oil, by the application of heat, and drink the oil. It is also eaten uncooked. Drying is accomplished without any gutting or cleaning, the fish being fastened on skewers passed through the eyes, and hung in the thick smoke at the top of sheds in which wood fires are kept burning. They soon acquire a flavor of wood-smoke, and the smoking helps to preserve them. They are then stowed away in large frails, made from cedar-bark or rushes, in order to be used for food in winter. Immense shoals of candle-fish approach the shores in summer, and are caught in moonlight nights, when they come to sport at the surface of the water, which may often be seen glittering with their multitudes. The Indians paddle their canoes noiselessly amongst them, and catch them by means of a monster comb or rake—a piece of pine-wood from 6 to 8 ft. long, made round for about 2 ft. of its length at the place of the hand-gripe, the rest flat, thick at the back, but having a sharp edge in front, where teeth are driven into it about 4 in. long, and an inch apart. These teeth are usually made of bone, but the Indian fishers have learned to prefer sharp iron nails when they can get them. One Indian, sitting in the stern, paddles the canoe; another, standing with his face to the bow, holds the rake firmly in both hands, the teeth pointing sternwards, sweeps it with all his force through the glittering mass, and brings it to the surface teeth upwards, usually with a fish, and sometimes with three or four, impaled on each tooth. This process is carried on with wonderful rapidity. When a sufficient quantity of candle-fish has been dried for winter, the rest that are caught are made into oil, being for this purpose, piled in heaps until partially decomposed, and then placed in large square pine-tree boxes; a layer about 3 deep in the bottom of each box, covered with cold water, and a layer of hot stones put in, then a layer of small pieces of wood, another layer of fish, stones, and so on. The oil is skimmed from the surface of the water in the boxes. A vast quantity of oil is thus obtained. The candle-fish is an excellent article of winter food in a climate of which the winter is severe; and notwithstanding its excessive fatness, is of agreeable flavor. It has not yet become an article of economical value to the civilized inhabitants of North-western America, but seems very likely to do so, and to acquire very considerable commercial importance.

CANDLEMAS, in its ecclesiastical meaning, is the feast of the purification of the Virgin Mary, and is observed on the 2d of February. This festival is very strictly kept by the Roman Catholic church, there being a procession with many lighted candles, and those required for the service of the ensuing year being also on that occasion consecrated; hence the name Candlemas day. In Scotland, this day is one of the four term-days appointed for periodical annual payments of money, interest, taxes, etc., and of entry to premises—the three other term-days there being Whitsunday, Lammass, and Martinmas. See TERM.

An old document of the time of Henry VIII., preserved in the archives of the society of antiquaries, London, concerning the rites and ceremonies in the English church, speaks thus of the custom of carrying candles: "On Candlemas daye it shall be declared that the bearyinge of candles is done in the memorie of Christe, the spirituall lyghte whom Simeon dyd prophecye ['a light to lighten the Gentiles'], as it is redde in the churche that daye." But an older and heathen origin is ascribed to the practice. The Romans were in the habit of burning caudles on this day to the goddess Februa, the mother of Mars; and pope Sergius, seeing it would be useless to prohibit a practice of so long standing, turned it to Christian account by enjoining a similar offering of candles to the Virgin. The candles were supposed to have the effect of frightening the devil and all evil spirits away from the persons who carried them, or from the houses in which they were placed. An order of council in 1584 prohibited the ceremony in England. There is a tradition in most parts of Europe to the effect that a fine C. portends a severe winter. In Scotland, the prognostication is expressed in the following distich:

"If Candlemas is fair and clear,
There 'll be twa winters in the year."

Christ's presentation, the holiday of St. Simeon, and, in the n. of England, the wife's feast-day, were names given to Candlemas day. See Brand's *Popular Antiquities*, Bohn's edition.

CANDLE-NUT, *Aleurites triloba*, a tree of the natural order *euphorbiaceæ* (q.v.), a native of the South sea islands, Madagascar, Molucca, Java, etc., which produces a heart-shaped nut with a very hard shell, and a kernel good to eat when roasted, although in a raw state it possesses in a slight degree some of the active properties so common in the *euphorbiaceæ*, and is apt to cause purging and colic. It is about as large as a walnut. An excellent bland oil is procured from it, used both for food and as a lamp-oil. The inhabitants of the Society islands after slightly baking these nuts in an oven, and removing the shell, bore holes through the kernels, and string them on rushes, hanging them up in their houses, to be used for torches, which are made by inclosing four or five strings in a leaf of the screw-pine (*pandanus*). These torches are often used in fishing by night, and burn with much brilliancy. The lamp-black used in tattooing was obtained from the shell of the candle-nut. A gummy substance exudes from the candle-nut tree, which the Tahitians chew.

CANDLESTICK. The ordinary C. is so well known that no description is needed. The most important modern improvement in the C. is a contrivance for maintaining the candle at a uniform height, by means of a spring placed below the candle, and confined in the cylindrical body of the C.; this spring presses the candle upwards with sufficient force to drive it completely out, but for a collar at the top, against which the surface around the wick bears, and thus, as the candle melts, it yields to the pressure of the spring, and maintains a uniform height. The collar, when properly adjusted, also prevents the guttering to which composite candles are liable when exposed to currents of air or moved about.

CANDLISH, ROBERT SMITH, D.D., an eminent Scottish divine, was b. in Edinburgh in 1806, entered the university of Glasgow in 1822, and was licensed as a preacher in connection with the established church in 1828. In 1834, he became minister of St. George's, Edinburgh. From this period, his public career may be said to have commenced. With intense zeal, he advocated the justice and necessity of ecclesiastical reforms, and became one of the boldest and most vigorous leaders of the popular or "non-intrusion" party. After the disruption (see FREE CHURCH), he co-operated with Dr. Chalmers and other chiefs of the newly formed denomination in organizing, consolidating, and extending its aggressive efforts. In 1845-46, he took an active part in the establishment of the evangelical alliance. In 1847, he was, when Dr. Chalmers died, appointed to the chair of divinity, in the new college, Edinburgh, but did not assume the functions of this office. In 1862, he was appointed principal of the same college. He died Oct. 19, 1873. His best known teachings through the press are *Contributions towards the Exposition of the Book of Genesis; The Atonement, its Reality and Extent; An Examination of Mr. Maurice's Theological Essays; The Fatherhood of God; and an Exposition of the First Epistle of St. John.*

CANDY. See CEYLON.

CANDYS (Gr.), a loose gown, worn by the Medes and Persians over their other garments. It was made of woolen cloth, which was either purple or of some other brilliant color, and had wide sleeves. In the sculptures at Persepolis, nearly all the personages are represented as so attired. A gown of a very similar kind is still worn by Arabians, Turks, and other orientals.

CANDY-SUGAR is the popular name applied to ordinary sugar when procured in large crystals by the gradual and slow cooling of a concentrated solution of sugar. See SUGAR.

CANDYTUFT, *Iberis*, a genus of plants of the natural order *crucifera*, distinguished by unequal petals, the largest being towards the circumference of the dense corymbs in which the flowers grow, and by an emarginate pouch with the valves keeled and winged, the cells one-seeded, and the cotyledons accumbent. See COTYLEDON. The species are chiefly found in the countries surrounding the Mediterranean sea, and the name C. is supposed to be derived from that of the island of Candia, the name *Iberis* from Iberia (Spain). One species, *I. amara*, remarkable for its bitterness, is a doubtful native of England. Some species are slightly shrubby, some are herbaceous perennials, some annuals. Some are among the most familiar ornaments of our flower-gardens, as the annual white and purple C. (*I. umbellata*), the sweet-scented C. (*I. odorata*), and two slightly shrubby species, *I. sempervirens* and *I. semperflorens*, the latter of which, in favorable situations, continues to blossom throughout the whole winter, and pleases the eye at all seasons, both by the abundance and the perfect whiteness of its flowers.

CANE, a term sometimes indiscriminately applied to any small and smooth rod, of the thickness of a walking-stick or less; but more correctly limited to the stems of the smaller palms and the larger grasses. We thus speak of sugar C., bamboo C., etc., among the latter; whilst among the former, this name is particularly appropriated to the species of the genus *calamus*, also called rattan. To this genus belong the canes largely imported from the tropical regions of the east for making bottoms of chairs, couches, etc. See RATTAN.

CANE, or **KEN**, a river rising in Bundelcund, near lat. 23° 54' n., and long. 80° 13' e., and, after a n.n.e. course of 230 m., entering the Jumna in lat. 25° 47' n., and long. 80° 35' east. It is too rapid and rugged for navigation; and is remarkable for the matchless beauty of its pebbles.

CANE'A, or **CAN'NA**, called *Khania* by the Greeks, is the chief commercial town of Candia or Crete, and is capital of a province. It is situated on the northern coast, and occupies the site of the ancient Cydonia. The present city is of Venetian origin, and dates from 1252 A.D., when a colony was sent from Venice to occupy it. The object of its foundation was to keep down the Greeks, who had been in arms, and at open war with their Italian lords, almost without intermission from the day when the Venetians first set foot on their shores. Venetian coats of arms are still observed over the doorways of some of the principal houses. C. is surrounded by a strong wall and deep ditch, both of which, however, are in a state of great dilapidation; it has a good but very shallow harbor. C. is the principal mart for Candian commerce, and exports to France and Italy, oil (530 tuns in 1874), soap (50,000 cwts. in 1874), wax, etc. Several consuls are stationed here, and it is the residence of the Turkish governor of the province, and of the Greek bishop. Pop. 12,000, of whom two thirds are native Greeks; the rest mainly Turks. The language spoken is modern Greek. The environs of C. are very beautiful.

CANE-BRAKE, *Arundinaria macrosperma*, a large kind of reed or grass, indigenous to the warmer parts of the United States of North America. It grows in marshy situations. It is of a genus allied to the bamboo. The flowers are in panicles.

CANE DELLA SCALA, 1291-1329; known also as **CAN GRANDE**, "great dog," a noted prince of Verona, who took Padua from the Guelphs. In 1318, he was appointed to the chief command of the Ghibelline forces, which brought upon him the pope's excommunication. After several victories, he was seized with illness while making a triumphal entry into Treviso, and died in the cathedral of that city. His court was the most important political and social center of the time, entertaining Dante, among other men of learning. In the *Paradiseo*, Dante eulogizes his patron in glowing terms, and Petrarch also sang his praises.

CANEL'LA, *Canella alba*, a small tree common in the West Indies, where it is often called wild cinnamon. Its place in the botanical system has not yet been exactly ascertained, but it seems to be allied to *pittosporaceae*. The fruit is a small black berry. The whole tree is very aromatic, and its flowers are extremely fragrant. The bark of the young branches is the *C. bark* of apothecaries, also known in commerce as *white-wood bark*, and sometimes called *white cinnamon*. It forms a considerable article of export from the Bahamas. It has an aromatic fragrance, regarded as intermediate between that of cinnamon and that of cloves, and a bitterish, acrid, pungent taste. It is employed as a stomachic and stimulant tonic, and as an aromatic addition to tonics or to purgatives, in debilitated conditions of the digestive organs.

CANE'PH'ORI, girls of Athens annually selected from the highest families to walk in the Panathenaic and other processions in festivals, carrying on their heads baskets containing the implements and apparatus necessary for a sacrifice. Their graceful attitudes (which may be seen on the friezes of the Parthenon in the British museum) suggested subjects for sculpture to some of the great artists of Greece. Similar statues are also used in architecture to support light entablatures, and are sometimes identified with caryatides.

CANE SUGAR. See **SUGAR**.

CAN'ES VENA'TICI (Lat. hunting dogs), a constellation of the northern hemisphere, added by Helvetius, and known generally as the greyhounds of Helvetius. The dogs are distinguished by the names of Asterion and Chara. On the celestial globe, they are represented as being held in leash by Bootes, and apparently pursuing Ursa Major (q. v.) round the pole of the heavens.

CANG, **CANQUE**, or **KEA**, an instrument of degrading punishment in use in China. It consists of a large wooden collar fitting close round the neck, and the weight of which is usually from 50 to 60 pounds. Over the parts where the C. fastens are pasted slips of paper, on which the mandarin places his seal, so that the culprit may not be relieved until the full term of his sentence has expired, which sometimes extends to 15 days. On the C. is also inscribed, in large letters, the offense and the duration of the punishment. The criminal having been paraded through the streets by the police, is then left exposed in some thoroughfare of the city. As he is incapable of using his hands, he has to be fed during the time he is suffering the penalty.

CANGA-ARGÜELLES, **Jose'**, 1770-1843; a Spanish statesman who was an active opponent of Napoleon, and an energetic member of the cortes of 1812. On the return of the Bourbons he was exiled to the province of Valencia. Under the restoration of 1820, he was made minister of finance, in which position he made many reforms. After the overthrow of the constitution in 1823 he went to England, but returned to Spain in 1829, and was appointed keeper of the archives at Simancas. He wrote *Elements of Finance*; a *Dictionary of Finance*; and *Observations on the Peninsular War*.

CANGAS DE O'NIS, a t. of the Asturias, Spain, about 35 m. e.s.e. of Oviedo. It is a poor place, but in its vicinity are one or two interesting monastic structures, and the cave whence the Goths fled and hid themselves, after the battle of Guadalete, in 711, and from which, in 718, they issued, and annihilated the Moorish invaders. Pop. 7000.

CANGE, DU. See DUFRESNE, CHARLES, *ante*.

CANGIA'GI, or CAMBIA'SO, LUIGI, 1527-85; a Genoese painter, taught by his father. He gained celebrity at an early age, and, in 1583, was invited to Spain by Philip II. to assist in the decoration of the Escorial, in which he painted the ceiling of the choir, representing the "Assemblage of the Blessed," which is considered his best work. Among others of his works are the "Rape of the Sabine Women," the "Sleeping Cupid," and "Judith."

CANICAT TI, a t. in Sicily, in the province of Girgenti, and 15 m. e.n.e. of the city of that name. It is situated on the banks of the Naro, is well built, and has sulphur mines. The inhabitants (1872), 20,908 in number, are principally engaged in agricultural pursuits.

CANICULAR, CANICULAR DAYS, or DOG-DAYS, CANICULAR YEAR. Canicular was an old name of Canis Minor (q.v.); it was also used to denote Sirius, or the dog-star, the largest and brightest of all the stars, and which is situated in the month of Canis Major (q.v.). From the heliacal rising (q.v.) of this star (Sirius), the ancients reckoned their dog-days, or *dies caniculares*, which were 40 in number—20 before, and 20 after the rising of the star. The rising of the dog-star was in ignorance supposed to be the occasion of the extreme heat and the diseases incidental to these days. It was by mere accident that the rising of the star coincided with the hottest season of the year, in the times and countries of the old astronomers. The time of its rising depends on the latitude of the place, and is later and later every year in all latitudes, owing to precession. In time, the star will rise in the dead of winter. The canicular year was that known among the Egyptians and Ethiopians. It was computed from one rising of Sirius to the next, and consisted ordinarily of 365 days, and every fourth year of 366. This year was sometimes called the heliacal year. The reason for computing the year from the rising of Sirius, seems to have been that, at the time, the heliacal rising coincided with the greatest swelling of the Nile.

CANIDÆ (Lat. *canis*, a dog), a family of the digitgrade (q.v.) section of carnivorous mammalia, which, as now generally defined, is less extensive than the Linnaean genus *canis*, the hyenas being excluded from it, and referred to the family *viverridæ* (civets, ichneumons, etc.). Those families are, indeed, closely connected, and hyenas may be said to form a connecting-link between them, the dentition, however, making a nearer approach than in either of them to that of the cats or *felidæ*.—The C. have two flat tuberculous molar teeth or grinders on each side, behind the great carnivorous cheek-tooth—the last premolar—of the upper jaw, a dentition resembling that of the bear family, or *ursidæ*, to which they exhibit a further resemblance in their power of adapting themselves to the use of vegetable food. Their whole organization fits them to be less exclusively carnivorous than the feline tribe. They have generally three incisors or cutting teeth, with one large canine tooth, and four premolars on each side in each jaw, two true molars on each side in the upper jaw, and three in the lower. The true molars are adapted for crushing either bones or vegetable food. The last premolars in the upper jaw are remarkably large, and particularly adapted for cutting flesh. See DOG, FENNEC, FOX, JACKAL, LYCAON, WOLF, etc.

CANINA, LUIGI, CAVALIERE, 1798-1856; b. in Piedmont; an architect and archaeologist. He was professor of architecture at Turin, and superintended the excavation of Tusculum in 1829, and of the Appian Way in 1848. He wrote many works on architecture and archaeology, some of which were published in the most sumptuous manner by his patroness, the queen of Sardinia.

CANINES, or CANINE TEETH, the four teeth, two in each jaw, which are pointed and stand between the incisors and the bicuspid; sometimes called "eye teeth" or "stomach teeth." In lions, wolves, dogs, and other carnivora they are large and strong, for holding prey and tearing raw flesh.

CANI'NI, GIOVANNI AGNOLO, 1617-66; b. in Rome; a painter and engraver, pupil of Domenicheno and of Barbalvenga. He painted altar-pieces in Rome, among which are the "Martyrdom of St. Stephen," and that of St. Bartholomew. He was engaged by Colbert to design from medals, antique gems, and other sources, portraits of the most illustrious characters of antiquity; but he died soon after the work was begun, leaving the completion to his brother Marcantonio, who, with the assistance of Picard and Valet, published, in 1699, 150 engravings.

CANISIUS, PETRUS, 1521-97; a Dutch Jesuit, who took a prominent part in the council of Trent in 1545; was preacher to Ferdinand I., and the first ecclesiastical governor of the Jesuits in Germany. He established colleges of the order at Prague, Friebourg, Ausburg, and Dillengen. He was the author of two catechisms, the larger and the smaller, the latter of which has passed through more than a hundred editions.

CANIS MAJOR, the *Greater Dog*, a constellation of the southern hemisphere, below the feet of Orion. It contains Sirius, the brightest of all the stars, and its place may be found by means of this star, which is on the continuation of the line through the belt of Orion. According to Flamsteed, it contains 31 stars.

CANIS MI NOR, the *Lesser Dog*, is a constellation of the southern hemisphere. It is near Canis Major, and just below Gemini. Procyon, of the first magnitude, is its principal star, and lies in a direct line between Sirius and Pollux; so that the position of the constellation may be found by means of this star. According to Flamsteed, it contains in all 14 stars.

CANISTER SHOT. See CASE SHOT.

CANKER, a disease of plants, especially fatal to fruit-trees in many gardens. It is a kind of gangrene, usually beginning in the young shoots and branches, and gradually proceeding towards the trunk, killing the tree in the course of a few years. Wet subsoils seem in many cases to induce it, and it begins most readily in shoots that have been imperfectly ripened and injured by frost, or which have received some accidental wound. Those varieties of fruit-trees which have been long propagated by grafting and budding are most liable to it. It is sometimes cured by *heading down* the tree, and causing it to throw out new branches.

CANKER, a vague term applied to various diseases of the lower animals, characterized by their chronic nature, and consisting chiefly in ulceration, suppuration, and the development of fungoid excrescences in the parts affected.

CANKER, in the foot of the horse. This malady, believed by Gerlach, of Berlin, to be truly cancerous, is observed in two different forms: in the acute stage, when the malady is chiefly local; and in the chronic stage, when the constitution suffers, and all local remedies fail to restore a healthy function of the structures of the foot.

Symptoms.—It usually commences by discharge from the heels, or the cleft of the frog of the horse's foot. The horn becomes soft and disintegrated, the vascular structures beneath become inflamed, and the pain which the animal endures is intolerable. It is therefore very lame on one, two, or all feet, according to the number affected. Though there is no constitutional fever, the horse becomes emaciated, and unfit for work. During wet weather, and on damp soil, the symptoms increase in severity. The sore structures bleed on the least touch, and considerable fungoid granulations, commonly called proud flesh, form rapidly.

Causes.—This disease is occasionally hereditary, and it is most frequently seen in low-bred draught or coach horses. Dirt, cold, and wet favor the production of the disease, and there is always a tendency to relapse when once an animal has been affected.

Treatment.—Pare away detached portions of horn, and, in mild cases, sprinkle powdered acetate of copper over the sore; apply over this pledgets of tow, fixed over the foot by strips of iron or wood passed between shoe and foot. In severe cases, tar and nitric acid, creosote and turpentine, chloride of zinc paste, and other active caustics, have to be used for a time with the regular employment of pressure on the diseased surface. The animal requires to be treated constitutionally by periodical purgatives and alteratives. Good food, fresh air, and exercise often aid much in the treatment of the disease.

CANKER (*ante*), in the human being, is developed chiefly among children in the form of ulceration of the mucous membrane of the mouth, commonly the result of indigestive derangement. In general it is only a local and temporary affliction, and may be removed by proper application of nitrate of silver, either solid or in a solution, or with borate of soda.

CANKER WORM, *Anisopterys*, a genus of destructive insects of the order *lepidoptera* and family *geometridæ*. The female moths, from the eggs of which this worm comes, are wingless. In the spring they creep up the trunks of trees, on which they deposit their eggs. These soon produce the worms, which feed upon young leaves of fruit-trees and of nearly all cultivated trees. After about four weeks of feeding they creep down, or let themselves down by a web, and burrow in the ground, where they change to chrysalis, and remain until the following spring. Like other geometridæ, the worm has six legs forward and four stout prop legs behind. In consequence of their singular mode of locomotion they are often called measuring, or inch or span, or loop worms or geometers. As the female moth cannot fly, trees may be protected from this worm, by surrounding their trunks with a hollow vessel filled with oil or thin tar, which prevents the ascent of the egg-laying moth; but in recent years the sparrows introduced from England have entirely subdued this worm in many districts that had been completely denuded of leaves almost every summer. This remedy, however, is worse than the disease. The English sparrow is not, in general, an insect-eating, but is a grain-eating bird; it is very pugnacious, and as prolific as the rabbit; it has driven away the native birds wherever it has gained a footing, and as there are many other insect leaf-eaters which it will not touch, and which no other birds are left to destroy, the trees are in nearly as great danger as before, while the grain-fields of farmers are beginning to suffer severely from the ravages of the sparrows.

CANNA, a plant of the order *marantaceæ*, a species of reed, the fruit of which is a hard black seed growing in a capsule. The starch of *C.* is sometimes used instead of arrow-root. It grows along the coast in the southern states, and is becoming a common ornamental plant in the north.

CANNA, one of the islands of the Hebrides, off the w. coast of Scotland, 7 m. s.w. of Skye, and 3 m. n.w. of Rum. It belongs to Argyleshire, and is $4\frac{1}{2}$ m. long from e. to w., and 1 m. broad. The surface stands high above the sea, and consists of trap (clay-stone, porphyry, and trap conglomerate, with fragments of old red sandstone and bituminous wood), which has overflowed thin laminae of coal and shale. The island has a hill of basalt, called Compass hill, which reverses the magnetic needle. Pop. '71, 48.

CANNABINA CEE, a natural order of dicotyledonous plants, or, according to many, a suborder of *URTICACEÆ* (q. v.), differing from the proper *urticeæ* chiefly in the suspended exalbuminous seed, and hooked or spiral embryo. But only two plants of the order or suborder are known, both of them valuable, *HEMP* (q. v.) and the *HOP* (q. v.).

CAN'NABIS IN'DICA. See *HEMP*, *ante*.

CAN'NÉ (ancient *Cannæ*), a t. of Southern Italy, in the province of Bari, 8 m. w. s. w. of Barletta, not far from the mouth of the Ofanto, formerly the Aufidus. It is celebrated on account of the great victory here gained by Hannibal over the Romans in the summer of 216 B. C. Hannibal crossed the Aufidus at a ford, and attacked the Romans, who in a short time were almost annihilated by the terrible Numidian cavalry. Among those left on the field were Paulus Æmilius, the consul of the previous year; Minucius, the late master of the horse; and a vast number of Roman knights. The loss of the Romans is stated by Livy at 45,000 infantry and 3,000 cavalry. As Hannibal lost in the battle 8,000 men, he did not think it prudent to follow the advice of Maharbal, and advance rapidly on Rome. Twenty thousand Romans were made prisoners, partly on the field of battle and partly in the camp.

CANNEL COAL. See *COAL*, *ante*.

CANNELTON, a t. in Perry co., Ind., 70 m. above Evansville: pop. '70, 2,481. Near the town are the most extensive coal mines below Pittsburg. Fire-clay, sandstone, and limestone are also abundant. There is a large cotton mill in the village.

CANNES, a seaport t. of France, in the department of Alpes-Maritimes, pleasantly situated on the Mediterranean, on the road to Nice. It is famed for its salubrity, which has induced a number of English families to make it a winter residence. Lord Brougham used to occupy a fine villa here. Latterly, the town has been much improved. It has fisheries of anchovies and sardines, and a trade in the produce of the district. After his escape from Elba, Bonaparte landed about a mile and a half to the e. of C., Mar. 1, 1815. Pop. '76, 13,519.

CANNIBAL (derived from a variety in the spelling of Caribs, the original inhabitants of the West India islands, who were reputed to be man-eaters, and some tribes of whom, having no *r* in their language, pronounced their name *Canib*), means, like the Greek word *anthropophagos*, which is often used instead of it, one who feeds on human flesh. The practice is often attributed by classical and early Christian writers to races whose practices they denounce as abominable; but the denunciation is often better evidence of the abhorrence of cannibalism by those making the accusation than of its practice by the accused. Homer makes Polyphemus eat men, but only as one of his other unnatural attributes as a monster. The early Christian writers frequently attributed cannibalism to the unconverted. St. Jerome gives his personal testimony to the practice, stating that when he was a little boy living in Gaul he beheld the Scots—a people of Britain—eating human flesh; and though there were plenty of cattle and sheep at their disposal, yet would they prefer a ham of the herdsman or a piece of female breast as a luxury. Statements in old authors still more absurd induced some thinkers to believe that cannibalism is unnatural, and to deny that it was ever practiced by human beings expect under the pressure of starvation. The accurate observation of late travelers has, however, put it beyond doubt that cannibalism has been and is systematically practiced. Comte, as part of his system of positive philosophy, accepting of cannibalism as a condition of barbarism, maintains that the greatest step in human civilization was the invention of slavery, since it put an end to the victor eating the vanquished. The facts, however, which we possess, show that the people systematically addicted to human flesh are not the most degraded of the human race. For instance, in the Australian continent, where the larger animals are scarce, the people, who are of an extremely degraded type, feed on worms and herbs, and have only been known in casual and exceptional conditions to feed on human flesh. The New Zealanders, on the other hand, who are the most highly developed aboriginal race with which late European civilization has had to compete, were, down to a late period, systematic feeders on human flesh, despising the inefficient food which satisfied the natives of Australia. In Angus's *New Zealand Illustrated*, there is a picture of the country mansion of the accomplished chief Rangihæta, "one of the finest specimens," says the author, "of elaborately ornamented dwellings yet extant." Its name is Kai Tangata, which means, eat man; and it has been so called in pleasing memorial of the feasts held within its walls. It has been supposed that the reason why, among the Jews and several eastern nations, the eating of swine's flesh was forbidden as an unclean food, was its resemblance to human flesh, and the danger that persons accustomed to the one might not retain their abhorrence of the other. In the crusades, the Saracens charged their Christian enemies with eating unclean food, including flesh

of men and of swine. In the old romance of Richard cœur de lion, he is represented, on recovering from sickness, as longing for a piece of pork; but that not being procurable, a piece of a Saracen's head was substituted for it, and pronounced by him to be infinitely more palatable. There have been many sad instances where people who naturally had a horror of such food, have been driven by starvation to eat human flesh—as in sieges and shipwrecks. Besides these instances, however, and the systematic cannibals, there is no doubt that people not otherwise habituated to the practice, have been excited by ferocity and revenge to eat, and with relish, the flesh of enemies. In many of the cannibal countries, only the flesh of enemies is consumed. As an instance that this is a natural development of ferocity in degraded natures, we may take the fate of the princess Lamballe in the French revolution, whose heart was plucked out by one of the savages of the mob, taken to a restaurant, and there cooked and eaten by him. The great Highland chief, sir Ewen Cameron of Lochiel, in a death-struggle with an English trooper, killed him by biting a piece out of his throat, and used to say it was the sweetest morsel he had ever tasted.

CANNING, CHARLES JOHN, Viscount, second son of the statesman George, was b. Dec., 1812. Educated at Eton and Oxford, he succeeded to the peerage as viscount C. on his mother's death in 1837, his elder brother, who was a captain in the navy, having been drowned at Madeira in 1828. In 1841, he became under-secretary of state for foreign affairs in sir Robert Peel's government, and afterwards commissioner of woods and forests. When lord Aberdeen came into office, he was made postmaster-general; and in the beginning of 1856, he succeeded lord Dalhousie as governor-general of India. His conduct during the awful crisis of the Indian mutiny was decried at the time by many as weak and pusillanimous; but the general opinion now, when all the circumstances of the case are better known, is that he acted with singular courage, moderation, and judiciousness. He died in London, 17th June, 1862.

CANNING, GEORGE, a distinguished British statesman and orator, was b. in London, April 11, 1770. His father, who was descended from an ancient family, incurred the displeasure of his relatives for marrying beneath his station, and died in poverty when his son was only a year old. His mother (who for a subsistence tried the stage, with but little success, married an actor, and subsequently a linen-draper) lived to rejoice in the success and participate in the good-fortune of her boy, whose education was liberally provided by an uncle. C. was first educated at Eton, from which he passed, at the age of 17, to Christ's church college, Oxford, where he greatly distinguished himself, especially in classics. While here, he cultivated the friendship of the Hon. Charles Jenkinson (afterwards lord Liverpool), who was of considerable service to him in after-life. From Oxford he went to Lincoln's inn, but on the suggestion of Burke, as it is said, he soon relinquished the bar for a parliamentary career. He entered the house for Newport, Isle of Wight, in 1793, as the protégé and supporter of the minister, Pitt. In 1796, he was appointed an under-secretary of state. It was not, however, until 1798 that C. made a reputation as an orator and a statesman, by his speeches in favor of the abolition of the slave-trade, and against Mr. Tierney's motion regarding peace with the French directory, the latter of which, especially, was regarded as a masterpiece of eloquence, alike by the house and the country. In the debates on the habeas corpus suspension act, the union with Ireland, and other important questions, C. gave valuable assistance to the ministry, not only by his voice in parliament, but by his pen in a satirical paper, called the *Anti-Jacobin*, in which he especially lashed the "new philosophy," as it was called, promulgated by the French republicans. *The Knife Grind* is one of the best known and happiest of his efforts in this line. In 1801, Pitt resigned office, and C. joined the opposition against the Addington ministry. When Pitt again became premier in 1804, C. was made treasurer of the navy, an office which he held until Pitt's death in 1806. His opposition to the short-lived Grenville ministry which succeeded, savored of the bitterness of party feeling, and his treatment of Fox in his last days, and of his memory after his death, was far from generous. When the Portland ministry was formed in 1807, C. was appointed minister for foreign affairs, a position for which he was specially qualified, and his dispatches, written at this time, are models of manliness and lucidity. In 1812, all his eloquence was enlisted in favor of Catholic emancipation. During the same year he was elected for Liverpool, for which he was again returned three successive times. In 1814, he went as ambassador to Lisbon, returned in 1816, and was made president of the board of control, and supported the Liverpool ministry in all their arbitrary and repressive measures until 1820, when he resigned, in consequence of the action of the government against queen Caroline. Nominated governor-general of India in 1822, he was on the eve of departure when the suicide of the marquis of Londonderry called him to the head of foreign affairs. In this capacity, C. conferred lasting benefits on his country. He infused a more liberal spirit into the cabinet, he asserted the independence of British politics against the diplomacy that would have entangled the nation with the Holy Alliance, and gave a new direction and impetus to commercial affairs by a gradual laying aside of the prohibitive system. He arranged the relations of Brazil and Portugal; drew the French cabinet into agreement with the British respecting Spanish American affairs; was the first to recognize the free states of Spanish America; promoted the treaty combining England, France, and Russia, for a settlement of the affairs of Greece,

and which was signed July 6, 1827; protected Portugal from Spanish invasion; contended earnestly for Catholic emancipation; and prepared the way for a repeal of the corn-laws. In Feb., 1827, a stroke of paralysis forced the earl of Liverpool to resign, and Mr. C. was called upon to form a new administration. His health, however, gave way under the cares of office, and he died 8th Aug. of the same year. His remains were interred in Westminster abbey, near those of Pitt. As a parliamentary orator, C. holds a prominent place in British annals. His acuteness of mind, power of expression, and well-pointed wit, were remarkable; but, on the whole, he was inferior to Pitt, Burke, and Fox. He lacked the imposing characteristics of the first, the overpowering enthusiasm of the second, and the winning address of the last. He was intensely British, and his foreign policy was of the character best calculated to promote British interests.

His speeches have been reprinted in 6 vols. 8vo, by Therry, and several memoirs, including one by his private secretary, Mr. Stapleton, have been published.

CANNING, Sir STRATFORD. See STRATFORD DE REDCLIFFE, Viscount.

CANNON is a general name for large pieces of ordnance or artillery, as distinguished from those pieces which can be held in the hand while being fired. No military weapon in use before the invention of gunpowder can fairly come under this designation; they were more generally of the kinds described under BALISTA. At what exact date C. were first used is not known; but C., called "crakys of war," were employed by Edward III. against the Scots in 1327, by the French at the siege of Puy Guillaume in 1338, and by Edward III. at Crecy, and at Calais in 1346. The first C. or *bombards* were clumsy, wider at the mouth than at the chamber, and made of iron bars hooped together with iron rings. The balls fired from them were first made of stone, afterwards superseded by iron. In the 15th c., various kinds were known by the names of C., *bombards*, *culverins*, *serpentine*s, etc. *Bombards* of great length and power were employed by Louis XI. during his Flemish campaign in 1477, some with stone balls, some with iron. About this time, C. began to be made by casting instead of with hooped bars; and bronze or brass as a material began to be used as well as iron. The C. of the 16th c. were generally smaller, but better finished, than those of the 15th. The largest C. made in the 17th c., so far as is known, was the Bejapoor cast-iron gun, "Malick é Meidan," or "Lord of the Plain," made either by Aurungzebe or by the Mahrattas; it was 14 ft. long, 28 in. bore, and required a ball of 1600 lbs. weight. From the time of the great European wars in that century, C. have undergone vast improvements, as well as the science and art of artillery necessary for their management. Major Straiith, a leading authority on this matter, gives the following tabular view of the chief kinds of ordnance in use in the British service, prior to the introduction of rifled guns:

Kind.	Name.	Caliber. Inch.	Length. Ft. Inch.	Weight. Cwt.
Iron shell guns.....	12 inch.....	12	8 4	90
	10 ".....	10	9 4	84
	8 ".....	8	8 9	60
	32-pounders.....	6.4	9 5	56
Long iron guns.....	24 ".....	5.8	9 0	47
	18 ".....	5.3	9 0	42
	12 ".....	4.6	9 0	33
	9 ".....	4.2	8 6	28
	12 " (medium).....	4.6	6 7	18
Long brass guns.....	9 ".....	4.2	6 0	13
	6 " (heavy).....	3.7	8 6	23
	6 " (light).....	3.7	5 0	6
	3 " (colonial).....	2.9	4 0	3
	1 ".....	2.0	5 0	2
Iron howitzers.....	10 inch.....	10.0	5 0	40
	8 ".....	8.0	4 0	20
	32-pounders.....	6.3	5 3	17
Brass howitzers.....	24 ".....	5.0	4 9	12
	12 ".....	4.6	3 9	6
	68 ".....	8.0	5 2	29
	42 ".....	6.8	4 4	22
Iron carronades.....	32 ".....	6.2	4 0	17
	24 ".....	5.7	3 9	13
	18 ".....	5.2	3 3	10
	12 ".....	4.5	2 8	6
Iron mortars.....	13 inch.....	13.0	3 1	36
	10 ".....	10.0	2 4	16
	8 ".....	8.0	1 11	8
Brass mortars.....	5½ ".....	5.5	1 3	150 lbs
	4½ ".....	4.6	1 0	104 lbs

It must be borne in mind, however, that many of the novelties introduced within the last few years are not here included. Nevertheless the table will be useful for occasional reference. The apparent inconsistencies in length and weight are due to the

great differences in thickness of metal; and if we were to go beyond the limits of the table, we should find that, during half a century, iron 32-pounders have varied from 63 down to so low as 25 cwt., and 24-pounders from 50 to 33 cwt.; in each case the length and weight varying, while the caliber remained constant. In the above table, the caliber is not always precisely the same for the same weight of ball; as instanced by the 32-pounders, which have 6.2, 6.3, and 6.4 in. caliber; this is due to the fact that some guns have more *windage*, or space round the ball, than others.

In England, during the last few years, great expense has been incurred in replacing old C. by others of larger power and caliber; while the French are gradually bringing about a limitation in the number of kinds and sizes, for the sake of simplicity.

This being merely a general or collective notice of all kinds of C. as a class, particulars concerning each kind will be found under such headings as ARMSTRONG GUN, CARBONADE, GUN, HOWITZER, LANCASTER GUN, MORTAR, SHELL GUN, etc.

CANNON, ALLOYS FOR. The material formerly used for the manufacture of ordnance was bronze (q. v.), consisting of about 90 parts of copper to about 10 parts of tin. In the casting of small C., such as 8-pounders, the alloy used contained 92½ parts of copper to 7½ parts of tin; while in the larger C. the tin was increased until the proportion reached 88 to 12. The presence of the tin increased the hardness of the alloy, but this was obtained at the expense of the tenacity. Great care must be taken to insure the purity of the copper and the tin. If lead is present, the alloy is always more or less soft, and, moreover, liable to fuse after repeated explosions; while the presence of a mere trace of sulphur, arsenic, phosphorus, etc., renders the alloy very brittle. It was customary, in the casting of C., to use up old C. or other bronze implements, so as to form a beginning of the fused metal in the furnace, and then to add little by little the extra amount of copper and tin. This mode of procedure was followed, owing to the difficulty found in getting copper and tin to amalgamate readily, so as to yield an alloy of uniform composition. This point is of great importance in the casting of ordnance, as the metals, when not properly alloyed, are liable to separate during cooling, and yield a C. of variable composition throughout. With the exception of small steel mountain guns, all British cannon are made of wrought iron.

CANNON, a co. in central Tennessee; 220 sq. m.; pop. '70, 10,502—927 colored. The surface is uneven, but the soil is generally fertile, producing grain, tobacco, etc. Co. seat, Woodbury.

CANNON-BALL TREE, *Couroupita Guianensis*, a tree of the natural order *lecythidaceæ*, a native of Guiana, of great size, the trunk being often more than 2 ft. in diameter. It has large ovate-oblong leaves; the flowers are produced in racemes, they are white and rose-colored; and the fruit is large, "about the size of a 36-pound shot," nearly round. The hard woody shell of this fruit is used for drinking-vessels.

CANNON FOUNDING. Since sir W. Armstrong succeeded, by a process first brought under the notice of the British government in 1854, in making of malleable iron a field-gun of far greater efficiency than any previously in use, cannon founding has in most European countries gradually ceased. This manufacture, which was formerly an important one, is, however, still carried on in the United States, Sweden, and Russia, all three of which countries produce cast-iron of a very superior quality.

Cannon are cast in molds of loam or sand prepared with the help of a pattern, as described under **FOUNDING**. They are usually cast vertically with an extra mass of metal poured in at the top end of each mold to secure by its pressure greater solidity in its walls, as is often done in the case of a hydraulic cylinder. This superfluous portion is, of course, afterwards removed. Cannon are, or at least were, often cast solid with the same object, and afterwards bored, although it is by no means certain that such are generally sounder or of closer texture than those which are cast hollow. In either case the inner surface of the cannon is accurately finished with a boring tool to the required calibre, and the outer surface turned. Brass, or rather bronze cannon, were usually cast in loam by means of a clay model on which were often stuck ornamental figures in wax, these being melted out of the mold before casting.

In the United States, cast-iron guns are made by Rodman's process; that is, they are cast hollow on a core barrel which is filled with water. This is applied so as to cool the metal of the gun in layers, thus modifying the initial strain upon it, and producing the best result that can be obtained from cast-iron for ordnance purposes. Within the last few years guns as large in the bore as 20 in. have been cast by this method at Pittsburg, and one of the same size has been made by it in Russia. The latter weighs 44 tons, throws a spherical ball of 9 cwt., and took 3½ months to finish. Its cost was not more than one fourth that of a built-up gun of steel for the same weight of projectile.

Many of the earlier pieces of ordnance, it is curious to observe, were made of hooped bars, in which one can trace the germ of the process by which the Armstrong gun is made. Indeed, it is doubtful if any modern plan of constructing large guns was not tried in olden times, as is seen by an examination of the different kinds of old cannon still preserved. These, however, had to be constructed without the aid of the steam-hammer and other appliances, which render such work comparatively easy nowadays, and were accordingly deficient in strength. The earlier wrought-iron cannon were eventually superseded by those made of cast-iron and bronze, but not entirely for some considerable time after the latter had been in use.

The *canon*, which was introduced about the commencement of the 14th c., appears to have been not only the most ancient form of cannon, but the first European fire-arm as well. From the beginning of the 15th c., cannon were cast in bronze, and some of great size are stated to have been used at the siege of Constantinople in 1463. Probably hand cannon of cast-iron date as far back as bronze guns, and at any rate we know that large and excellent cannon were made of cast-iron in the early part of the 16th c., they having been used at Flodden, and England having even then acquired a reputation for this kind of ordnance. See FIRE-ARMS. Cannon founding has therefore been practiced for nearly 500 years, and although the art is now to all appearance doomed to decay, no one can predict, in these days of metallurgical wonders, what further change improvements in the manufacture of iron and steel may bring about as respects the making of large fire-arms. In order that the cast guns made on the old system may still be available for some purposes in modern warfare, col. Hay Campbell, some years ago, proposed a plan for lining bronze, and sir W. Palliser another for lining cast-iron cannon with a tube of wrought-iron. Some have been transformed on the Palliser system, which consists in boring a certain thickness off the old gun, and forcing a coiled wrought-iron barrel into the interior, and are said to have given very remarkable results as regards endurance.

Certain peculiarities in the manufacture of special kinds of ordnance are noticed in the articles relating to them. See WAR-SERVICES.

CANNONSBURG. See CANONSBURG.

CANNSTADT, a t. of Würtemberg, beautifully situated on the Neckar, about 3 m. n.e. of Stuttgart. It owes its origin to the Romans, of whose presence there are still found many traces. It has numerous mineral springs, discharging 800,000 cubic ft. of water in 24 hours, which are much frequented during the season; manufactures of woollens, cottons, tobacco, etc.; and a large trade by means of the Neckar. Pop. (75) 15,065.

CANNSTADT, or **KANNSTADT** (*ante*), a t. in Wurtemberg, $2\frac{1}{2}$ m. n.e. of Stuttgart, in a fertile and populous part of the country, and now one of the most flourishing towns in Germany. Among its public buildings are a cathedral of the 15th c., a town hall, the royal theater, market house, etc. The Wilhelm palace, built in 1842-51, for king William, is a fine specimen of elaborate Saracenic architecture. The more important industries are spinning, cotton-weaving, dyeing, and the manufacture of machinery. The mineral springs, about 40 in number, attract a large temporary population of those who suffer from dyspepsia and nervous weakness. In the hill of Seilberg, near by, are caverns in which many fossils are preserved. Down to the middle of the 15th c., C. was the capital of Wurtemberg. Pop. '71, 11,804.

CANO, ALONSO, an illustrious Spanish painter, the founder of the school of Granada, in which city he was born. Mar., 1601. He received his first instructions in the principles of art from his father, Miguel Cano, who was an architect; studied sculpture under J. Montanes, and painting under Pacheco and Juan de Castillo; and attained celebrity so early, that, in 1638 or 1639, he was appointed court painter and architect to the king. C. was of a hasty temper, and was accused of having murdered his wife in a fit of violent jealousy, but the accusation appears to have been quite groundless. He was, however, subjected to the torture; but no confession having been elicited, he was acquitted and received again into the royal favor, named residentiary of Granada, and spent his last years in acts of devotion and charity. He died at Granada in 1664 or 1667. In the opinion of Fuseli, he excelled all his contemporaries except Velasquez. His eminence in the three departments of the fine arts—sculpture, painting, and architecture—obtained for him the hyperbolic honor of being called the *Michael Angelo* of Spain. His pictures, marked by graceful design and pleasing coloring, are very numerous, and are preserved in Granada, Seville, Madrid, Malaga, and other Spanish cities.

CANO, ALONZO, 1601-65; a Spanish painter, called by his countrymen the "Michael Angelo of Spain." His master-piece is said to be the "Conception of the Virgin" in the church of San Diego, in Granada. He was a contemporary of Velasquez, and was court painter to Philip IV. He was a man of violent temper, and was once tried (but acquitted) on a charge of having killed his wife, when the judges who put him to torture, exempted his right arm from the rack, because of its surpassing skill in art. In statuary his famous works are a Madonna and Child, and colossal figures of San Pedro and San Pablo.

CANO, or CANUS, MELCHIOR, 1523-60; a Spanish theologian and bishop, professor at Salamauca. By reason of his violent opposition to the establishment of the Jesuits in Spain, he was sent to the Canaries, but by the king's influence, was soon afterward permitted to return, and became provincial of the Dominican order.

CANOE* is a boat made of a hollow trunk of a tree, or of the bark shaped and

*The word is sometimes said to have been borrowed by the Spaniards from the native Indian name of such boats. But a similar name exists in the Aryan languages: Ger. *kahn*, a boat; old Fr. *cane*, a ship, and *canot*, a boat. The root of these words is the same as that of *cane* (Lat. *canna*), a reed or hollow stem, and signifies hollowness, capacity; Gr. *chaino*, to gape or yawn. From the same root come *cann*, a drinking cup; *cannon* (Ital. *cannone*, properly a large tube, being an augmentative from *canna*, a hollow stem or tube); *canon* (Gr.) a ruler or straight rod, most readily obtained from a joint of a reed; *canal* (Lat. *canalis*, a pipe or conduit).

strengthened. Canoes have been made large enough to carry twenty or thirty hogsheads of sugar. Some have decks, and carry sail of rush or silk-grass; but they are generally open boats, rowed by paddles, and steered by an oar. They are seldom wide enough for two men to sit abreast, but vary greatly in length. Near sea-coasts, canoes are often made of light wooden-frames, covered with seal-skins, which are also drawn across as a deck, with only a hole left for one man to sit in. In the Hudson Bay territories, canoes are used which are light enough to be carried over the *portages*, or portions of rivers too shallow for navigation. Canoes, hollowed out of the trunks of oaks, seem to have been in use among the early inhabitants of the British islands. They have been dug up in considerable numbers in England, Scotland, and Ireland. They appear to have been chiefly of two sorts—one about 10 ft. long, with square ends, and projecting handles; the other, about 20 ft. long, sometimes sharp at both ends, sometimes round at the prow and square at the stern.

CANON, a word originally Greek, and signifying a measuring-rod (see CANOE—foot-note), applied in various arts and sciences to what serves for a rule or standard, but particularly employed to designate collectively those books which constitute the Holy Scripture, and are accepted by Christians as a rule of faith. See BIBLE. In eccles. astical language, the word *canon* signifies, besides, not only a church-precept, but also the decree of a universal council, which is held valid as law. See CANON LAW. At one period the word was used to designate the prayers which the Roman Catholic priests said before, at, and after the consecration of the Host; the term is also employed to denote the catalogue or register of Catholic saints.

CANON, an ecclesiastical dignitary, so called as living under a rule, or as following the rule or canon of divine service. His office is of no great antiquity. According to Paschier, the name was not known before Charlemagne. This, however, is not precisely true, for the term C. was applied in the 4th c. to cenobites living under a common rule; but the office of C. is supposed to have been first instituted by Chrodegand or Chrodegang, bishop of Metz, in 763. It is at least certain that he was the author of the oldest canonical rule, which was simply an adaptation of the monastic rule (commonly but erroneously attributed to St. Augustine) to the priests and "clerks" specially attached to the service of a cathedral or other church. It enjoined on the canons manual labor, the practice of silence at certain times, confession twice a year, and other duties needless to specify. The canons formed the council of the bishop, and assisted him in the government of his diocese. They lived in a house called a *monastery*, slept in a common room, ate at the same table, and were originally supported out of the episcopal revenues. In 816, Louis le Débonnaire induced the council of Aix-la-Chapelle to draw up a general rule for the whole body of canons. Canons found their way not long afterwards into England, Scotland, and Ireland. Various reforms of C. were made in the 11th and beginning of the 12th century. Gradually, however, many began to emancipate themselves from the restrictions of monastic life, and to live independent of any rule, which is not at all surprising, for the canons were wont to keep apart from the "lower clergy," as they called parish priests and others who really labored to impart religious instruction. They were often of noble families, loved titles—at Lyon, they were called *counts*—and in general were men of the world rather than true churchmen. Some of these reformed or remodeled canons were called black canons, from wearing a black cassock; white canons, from wearing a white habit like the *Præmonstratenses* of Picardy in France. The class of *secular* canons, whose manner of life was not conventual, and who therefore escaped destruction in England when the monasteries were abolished by Henry VIII., probably originated in a tendency to relax the severity of rule enjoined on the regulars, which indeed was hardly less stringent than in the case of ordinary monks. Secular canons still exist in the Anglican church, and their duties—making allowance for the difference between the Roman Catholic and Protestant religions—are much the same in kind as they were before the reformation. See CATHEDRAL.

CANON, in music, a kind of fugue in which not merely a certain period or phrase is to be imitated or answered, but the whole of the first part with which the C. begins is imitated throughout by all the other parts. As in fugues, the melody of the part to be imitated is called the subject, and the others its reply. The C. is the highest degree of mechanical musical contrivance. The ancients spent more time in the construction and resolving of mere puzzling and unentertaining canons, than in the cultivation of good harmony and melody. Good canons, however, are always interesting; and different from any other composition. For a full treatment of the method of writing a C., see Marpurg's *Abhandlung von der Fuge* (Peters, Leipsic).

CANYON (Sp. a "tube"), used in the western states and territories to designate a deep ravine, especially if worn down by running streams. Of late the word is often spelled *canyon*. There are many canyons in the Rocky mountain region and further westward; but the greatest is the Grand Cañon of the Colorado, which is more than 300 m. long, with nearly perpendicular walls from 3,000 to 7,000 ft. high. Through this awful gorge the river flows, now down swift declines, now in peaceful pools, or long stretches of navigable water.

CANON CITY, in Fremont co., Colorado, on the Arkansas river at the foot of the Rocky mountains, and on the Denver and Rio Grande railroad. There is unlimited water-power, and in the neighborhood are iron, silver, copper, coal, petroleum, marble, and limestone. There are also hot and cold medicinal springs.

CANONESS, the name given to female members of certain orders in the Roman Catholic church, who seldom took monastic vows, but lived in common. The communities were favored by noblemen, who intrusted their daughters to them, but with the privilege to marry at any time. After the reformation, there were Protestant houses of similar kind in Mecklenburg and Westphalia.

CANONICAL HOURS, are the times fixed for divine service in the Catholic church, but no longer strictly adhered to. These have not always been the same, and it is not known when nor by whom they were settled—some say by popes Damasus, or Gelasius, or Gregory—but they are now fixed at seven; viz., matins and lauds, prime, tierce, sext, nones, vespers, and compline. These used to be observed as follows: Prime, tierce, sext, and nones, at the first, third, sixth, and ninth hours of the day, counting from six in the morning; vespers at the eleventh hour; compline, or completorium, as completing the services of the day, at midnight; and matins shortly after midnight. These hours were by the Anglo-Saxons called *uhtsang*, *primesang*, *undersang*, *middaysang*, *noonsang*, *evensang*, and *nightsang*. The first, two and the last formed the nocturnal, the remaining four the diurnal offices. The reasons given for the dividing the day into seven parts were—that in seven days the creation was completed, that seven times a day the just man falls, there are seven graces of the Holy Spirit, seven divisions of the Lord's prayer, seven ages of a man's life, etc. The hours had also each its mystical reference to certain sacred occurrences, such as the incidents at our Lord's birth and crucifixion. The word "hour," in C. H., is derived, as some have suggested, from *ora*, a prayer; but more probably from *hora*, an hour, and called canonical because according to the canon or rule of the church. The proper offices for the C. H. are to be found in the Breviary (q.v.).

CANONICALS, a term used to describe the proper ecclesiastical dress of the clergy. See **VESTMENTS**.

CANONICAL VIRGINS, young women of the early church who took vows of perpetual virginity, but were not gathered into communities. They were inrolled at their homes, where they continued to reside.

CANONICUS, a Narragansett Indian chief, 1565-1647; the constant friend of the early white colonists, and especially of Roger Williams, to whom he was strongly attached. It was from him that Williams obtained his title to the lands that now constitute Rhode Island.

CANONICUT, or **CONANICUT**, an island in Narragansett bay, about 8 m. long by 1 wide. It forms the town of Jamestown, R. I.; pop. 70, 378.

CANONIZATION, in the church of Rome, the act of the pope by which a deceased person is solemnly declared to be a saint. It had its origin in the practice of the early church, of inserting in the commemorative prayer of the eucharistic liturgy the roll of the names of those who had died as martyrs, or distinguished themselves as confessors of the faith. This record was entered in the diptychs of the church, and read in the so-called "canon" of the liturgy. Each bishop was at first accustomed to declare deceased persons to be saints. In the west, the exercise of this power came to be reserved to the popes, and the ceremonial itself was invested with much solemnity, and regarded as of very great importance. The first papal C. was accomplished by John XV. The popes have possessed the exclusive right since 1170. The right of *beatification* (q.v.) also belongs to them. When it is proposed to canonize a person of reputed sanctity, the pope declares his views in a consistory, and an inquiry is instituted as to the virtues and merits of the person proposed. The form of inquiry is that of a regular process at law, and an ecclesiastic is specially appointed to contend against the claims advanced, who receives the designation of *advocatus diaboli*; and on failure of satisfactory proof, the process is abandoned. When a favorable decision is pronounced, the ceremony of C. is performed in St. Peter's church with great pomp. The last C. was in 1862.

The Greek church also recognizes *canonization*. The right to perform the ceremony lies with the patriarch of Constantinople, but it has rarely occurred. An analogy to Christian canonization has been found in the apotheosis (q.x.) of the ancient Romans.

CANON LAW is a collection of ecclesiastical constitutions for the government and regulation of the Roman Catholic church, although many of its regulations have been admitted into the ecclesiastical system of the church of England, and still influence other Protestant bodies. It was compiled from the opinions of the ancient Latin fathers, the decrees of general councils, and the decretal epistles and bulls of the holy see. These, from a state of disorder and confusion, were gradually reduced into method, and may be briefly described in the following chronological order: 1. *Gratian's Decree*, which was a collection of ordinances, in three books, commenced by Ivo, bishop of Chartres, 1114 A.D., and subsequently corrected and arranged by Gratian, a Benedictine monk, in the year 1150, after the manner of Justinian's *Pandects of the Roman Law*.

This work comprises ecclesiastical legislation, as it may be called, from the time of Constantine the great, at the beginning of the 4th, to that of pope Alexander III., at the end of the 12th century. 2. The *Decretals*. They are a collection of canonical epistles, in five books, written by popes alone, or assisted by some cardinals, to determine any controversy, and first published about the year 1230, by Raimundus Barcinus. They lay down rules respecting the lives and conversation of the clergy, matrimony and divorces, inquisition of criminal matters, purgation, penance, excommunication, and other matters deemed to be within the cognizance of the ecclesiastical courts. To these five books of Gregory, Boniface VIII. added a sixth, published 1298 A.D., called *Sextus Decretalium*, or the *Sext*, which is itself divided into five books, and forms a supplement to the work of Barcinus, of which it follows the arrangement. The *Sext* consists of decisions promulgated after the pontificate of Gregory IX. Then there came the *Clementines*, which were constitutions of pope Clement V., published 1308 A.D. These decretals form the principal portion of the canon law. John Andreas, a celebrated canonist in the 14th c., wrote a commentary on them, which he entitled *Novelle*, from a very beautiful daughter he had of that name, whom he bred a scholar; the father being a professor of law at Bologna, had instructed his daughter so well in it, that she assisted him in reading lectures to his scholars, and therefore, to perpetuate her memory, he gave that book the title of *Novelle*. 3. The *Extravagants* of John XXII. and other later popes, by which term is meant to be denoted documents which transcend the limits of a particular collection of regulations. These books, viz., *Gratian's Decree*, the *Decretals*, and the *Extravagants*, together form the *Corpus Juris Canonici*, or great body of the C. L., as formerly received and administered by the church of Rome. There are, however, other publications of a later period, of more or less authority, but which do not appear to have received the formal sanction of the holy see.

This C. L., borrowing from the Roman civil law many of its principles and rules of proceeding, has at different times undergone careful revision and the most learned and scientific treatment at the hands of its professors, and was very generally received in those Christian states which acknowledge the supremacy of the pope; and it still gives ecclesiastical law more or less to Roman Catholic Christendom, although its provisions have in many countries been considerably modified by the *concordats* (q.v.) which the popes now and then find it expedient to enter into with Roman Catholic sovereigns and governments, whose municipal system does not admit of the application of the C. L. in its integrity. Indeed, the fact of its main object being to establish the supremacy of the ecclesiastical authority over the temporal power, is sufficient to explain why, in modern times, it is found to conflict with the views of public law and government, even in the case of the most absolute and despotic governments.

This ecclesiastical system, however, never obtained a firm footing in England, and the great lawyers and statesmen have always shown not only an unwillingness to defer to its authority, but even an aversion to its rule. There was, however, a kind of national C. L. in England, composed of *legative* and *provincial* constitutions, adapted to the particular necessities of the English church. The legative constitutions were ecclesiastical laws, enacted in national synods, held under the cardinals Otho and Othobon, legates from pope Gregory IX. and pope Clement IV., in the reign of king Henry III., about the years 1230 and 1268. The *provincial* constitutions are principally the decrees of provincial synods, held under divers archbishops of Canterbury, from Stephen Langton, in the reign of Henry III., to Henry Chicheley, in the reign of Henry V., and adopted also by the province of York in the reign of Henry VI. At the dawn of the reformation, in the reign of Henry VIII., it was enacted in parliament that a review should be had of the C. L.; and till such review should be made, all canons, constitutions, ordinances, and synodals provincial being then already made, and not repugnant to the law of the land or the king's prerogative, should still be used and executed. And as no such review has yet been perfected, upon this enactment now depends the authority of the C. L. in England, the limitations of which appear, upon the whole, to be as follows: that no canon contrary to the common or statute law, or the prerogative royal, is of any validity; that, subject to this condition, the canons made anterior to the parliamentary provision above mentioned, and adopted in our system (for there are some which have had no reception among us), are binding both on clergy and laity; but that canons made since that period, and having no sanction from the parliament, are, as regards the laity at least, of no force. See CANONS OF THE CHURCH OF ENGLAND.

In Scotland, Presbyterian though the ecclesiastical system of that country be, the old Roman C. L. still prevails to a certain extent. "So deep hath this canon law been rooted," observes lord Stair in his *Institutes of the Scotch Law*, "that even where the pope's authority is rejected, yet consideration must be had to these laws, not only as those by which church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws, which, because of their weighty matter, and their being once received, may more fitly be retained than rejected." In two old Scotch acts of parliament, made in 1540 and 1551, the C. L. is used in conjunction with the Roman law to denote the common law of the country, the expression used being "the common law, baith canon, civil, and statutes of the realm." See on the subject of this article generally the following authorities—Blackstone's *Commentaries*, by Kerr, vol. i. pp. 65 and 66; Stephen's *Commentaries*, 4th edition, vol. i. pp. 61 and 69—vol. ii. pp.

251, 256, 257, and 290—vol. iii. pp. 45, 48, and 421—and vol. iv. p. 242; Dr. Irving's *Study of the Civil Law*; and Phillimore on the *Influence of the Ecclesiastical Law, etc.*, 1851. See also a discriminating article on this subject in Knight's *Political Dictionary*, 1845; and see Wharton's *Law Dictionary*, 2d edition, 1859. It will also be found carefully treated in Dr. Hook's *Church Dictionary*, 7th edition, 1854. In regard to Scotland, see Stair's *Institutes of the Law of Scotland*, I. 1, 13, and II. 8, 29; and Erskine's *Institutes of the same law*, I. 1, 28.

CANONRY, the office and dignity of a CANON. See CATHEDRAL.

CANONS, BOOK OF, in Scottish ecclesiastical history, a code of canons or rules for the church of Scotland, prepared by the Scottish bishops, in obedience to the command of Charles I., revised by Laud, and confirmed by letters-patent under the great seal, 23d May, 1635. It tended much to increase the dissatisfaction prevalent throughout Scotland, and which soon broke out so violently. It not only required the most strict adherence to the liturgy, then not yet published, but enjoined many things concerning ceremonies in worship beyond what Laud had been able to introduce in the church of England; it also took away the powers of church-courts, and decreed the penalty of excommunication against all who should deny the government of the church by bishops to be scriptural, whilst its very first canon decreed that penalty against all who should deny the king's supremacy in ecclesiastical affairs.

CANONSBURG, a t. in Washington co., Penn., on the Chartier's Valley railroad, 22 m. s. w. of Pittsburg; the seat of Jefferson college and of the Pennsylvania reform school. Pop. '70, 641.

CANONS OF THE CHURCH OF ENGLAND, called constitutions and canons ecclesiastical, agreed upon, with the king's license, in the synod held at London in 1603-04. They were drawn up by the convocation, in order to give effect to the decisions of the conference held at Hampton; and are, for the most part, a digest of old canons, with some new ones added. They are 141 in number. They are the basis of the ecclesiastical law, as far as the clergy are concerned, but they are not binding upon the laity, except in so far as they are declaratory of the ancient canon law. There had been a previous body of canons drawn up in 1571, but these had not been sanctioned by the sovereign. In 1640, the convocation, which was then assembled with the parliament, prolonged its session beyond it, and passed a body of canons of a very arbitrary character; amongst other things, enjoining that on some Sunday in every quarter, every officiating minister should insist on the divine right of kings and their prerogatives, and enforce conformity to the rites of the church of England. In these canons, it was directed that the communion-table should be railed in, and be placed as in cathedrals, as is now done in all churches. These canons were abrogated by an act passed in the 13th year of Charles II. An account of these canons and those now in force may be found at length in Hook's *Church Directory*.—Every clergyman, when instituted to a benefice or licensed to a cure, promises CANONICAL OBEDIENCE to the bishop—i. e., the obedience due according to the canons of the church.

CANOPIC VASES were vases used by the Egyptian priests to contain the viscera of embalmed bodies. They were arranged in a series of four—the first contained the stomach and larger intestines; the second, the smaller intestines; the third, the lungs and heart; the fourth, the liver and gall-bladder; and each had on its lid the head of the particular deity who was supposed to preside over the contents.

CANOPUS or **CANOBUS**, a city of ancient Egypt, from which the Canopic mouth of the Nile derived its name, was situated on the sea-coast, 15 m. e. of Alexandria. The Canopic mouth of the Nile appears to have been at an early period the only one into which foreign ships could enter. At C. the boundary-line between Asia and Africa was drawn by the ancient geographers. There was a temple of Hercules here, which was a secure sanctuary to all who fled to it; also one of Serapis, as several extant Greek inscriptions show. The inhabitants of C., a mixed Egypto-Hellenic people, were infamous, in the Greek and Roman times, for their profligacy. The city declined after the rise of Alexandria. Traces of its ruins are visible about 3 m. from Aboukir.

CANOPUS is also the name of a very brilliant star of the southern hemisphere, in the constellation of the ship Argo, and, as Plutarch relates, received its name from Canopus, the pilot of Menelaus.

CANOPY (Lat. *canopeum*; Gr. *kônôpeion*, from *kônôps*, gnat or mosquito). The derivation of this word throws a curious light on its original meaning, which probably was a mosquito curtain. The simplest form of C., in this its primitive sense, is that mentioned by Herodotus (ii. 95), who tells us that the fishermen on the Nile were in the habit of suspending the net with which they had fished during the day on an upright pole, from which it was expanded into the form of a tent, and served to protect them from the attacks of insects during the night. As it has been proved that insects will not pass through the meshes of a net, though wide enough to admit them, it is probable that this simple contrivance may have been quite effectual for the purpose for which it was used. Horace (Epod. ix. 9), and others of the ancient writers, mention gnat-curtains (*canopea*). Subsequently, the same term came to be used for the projecting covering and hangings of a bed, without reference to their original use, and latterly for any

projecting covering of a similar form, to whatever use it might be adapted, or whatever materials it might be formed. C. is thus used to signify the covering which is borne over the heads of kings and other persons of distinction, and still more frequently over the holy sacrament and the image of Christ, in processions in Roman Catholic countries. See BALDACHIN.

In Gothic architecture, C. is the term applied to those rich coverings which are frequently met with over niches and tombs, and sometimes over doors and windows. It belongs chiefly to the decorated and perpendicular styles, though it was not unknown much earlier. The C. consists of a roof which may be supported on pillars all round, or may have one, or if in an angle *two*, sides attached to the wall, with dependent ornamental work representing drapery. The early English canopies are usually simple in form; those in French buildings of the same period being greatly more complicated and elaborate, as, for example, those in the cathedrals of Chartres and Bayeux. In the decorated style, the canopies were richly ornamented and very various in form. Some canopies are ornamented by pinnacles supporting smaller canopies, the whole terminating in a structure resembling a small turret, or crocketed spire. In the perpendicular style, though more varied in form, the canopies resemble those in the decorated. Most of the cathedrals and larger churches of England furnish examples of canopies, many of which are enumerated in Parker's *Glossary of Architecture*. For the use of canopies in Italian architecture, see BALDACHIN.

CANOSA, a t. of southern Italy, in the province of Bari, 13 m. s.w. of Barletta. It is situated on the declivity of a steep hill, upon the summit of which there are the remains of an old castle. It has a cathedral; and in an adjoining court is a tomb to Bohemond, prince of Antioch. It is chiefly remarkable, however, in connection with the discovered antiquities of ancient *Canusium* (one of the chief cities of the Apulians, the origin of which is obscured in the mists of mythology), on the site of whose citadel the modern town is said to stand. The antiquities consist of subterranean sepulchers, containing painted vases and funereal furniture of the most magnificent description in perfect order, painted busts, marble statues, etc. Many of the bodies found here were attired in cloth of gold, with head-dresses gleaming with precious stones, and ear-rings and bracelets of rich and exquisite workmanship. The objects were transferred to the museum at Naples. The ruins of an amphitheater, aqueduct, etc., have also been found. C. suffered by earthquake in 1851. Pop. 14,500.

CANOSA, a t. of northern Italy, in the province of Reggio, about 12 m. s.w. of the city of Reggio, celebrated as the place where, in 1077, the emperor Henri IV. of Germany obtained absolution from pope Gregory VII., after three days' humiliation. The place, formerly of some importance, is now deserted.

CANOVA, ANTONIO, the founder of a new school of Italian sculpture, was b. Nov. 1, 1757, at Possagno, a village in the Venetian territory. Having displayed in boyhood great talent in modeling, the artist gained the patronage of Giovanni Faliero, a Venetian senator, by whom he was sent to work under a sculptor at Bassano. His first imaginative performance, "Eurydice," half the size of life, was executed in his 17th year. After this he went to Venice, where his study of art properly began. In 1779, Faliero sent him to Rome, with an introduction to Cav. Zurlano, the Venetian ambassador, and one of the most illustrious patrons of art at this time in Italy. In Rome the first result of his studies appeared in the statue of "Apollo," which must be regarded as his earliest effort in ideal sculpture; but a far greater progress toward the pure style of the antique was evident in his next work, "Theseus with the Centaur." Nevertheless, C. did not rigorously adhere to the severe simplicity of the antique, but rather took pains to mitigate it by a peculiar grace and loveliness of his own, such as characterized his group of "Cupid and Psyche," which was produced soon after he had completed the monument of pope Clement XIV. This is apparent even in the colossal monument of Clement XIII. (erected in St. Peter's, 1792); though this work, on the whole, is a magnificent effort of genius, simple in style, and with nothing overwrought in the figures. Among his other works may be noticed a "Winged Cupid," "Venus and Adonis," a "Psyche holding a Butterfly;" "Penitent Magdalen," in life-size; "Hercules hurling Lichas from the Rock," a colossal work, but not free from affectation; "Kreugas and Damoxenos" (two pugilists), "Palamedes," and "Perseus with the Head of the Medusa," a work which, more than all previous efforts, served to raise his fame. In 1802, C. was appointed by pope Pius VII. chief curator of all Roman works of art in the papal states; but was soon called away to Paris, to prepare the model of a colossal statue of Bonaparte.

After the fall of the French empire, C., in 1815, was employed by the Roman government as ambassador to recover the works of art which had been taken to Paris, and paid a visit to England. On his return to Rome, he was created marquis of Ischia, with a pension of 3000 scudi. This money he expended in the support of art and artists in Rome. C. died in Venice, 13th Oct., 1822. A marble statue was erected to his memory in the church de' Frati, 1827. Another monument to C. was erected in the library of the capitol, by order of Leo XII., in 1833.

It is universally allowed that to C. belongs the honor of having restored to sculpture the position which it had lost among the modern fine arts. After Michael Angelo Buonarrotti and Bernini, he was the third of epoch-making Italian sculptors. His delicate

execution and masterly treatment of marble are unrivaled, and even his faults—viz., his exaggerated nicety and carefulness, and his use of corrosives to produce fine finish—served to attract by the novel effects which they produced. The essential characteristic of all his works is sentiment—often verging, however, on sentimentalism—and this also, like his delicacy in details, was accordant with the taste prevalent in his time, and was the chief cause of his popularity, as of his errors. When judged by the sterner principles of antique sculpture, the works of C. are found deficient in that objective or realistic character which Thorwaldsen could express so well.

During his leisure hours C. amused himself in painting, in which he attained such a degree of excellence in following the coloring of the Venetian masters, that his pictures have even deceived connoisseurs. In his private life, C. was a very amiable and benevolent man. Biographies of C. have been written by Missirini (4 vols., Prato, 1824), Cicognara (Venice, 1823), Rosini (Pisa, 1825), and D'Este (Florence, 1864).

CANROBERT, FRANÇOIS CERTAIN, DE, Marshal of France, b. in 1809, studied in the military school of St. Cyr, and in 1828 entered the army. In 1835, he sailed for Algeria, and during the war in the province of Oran was made a capt. In the storming of Constantine, he was one of the first who entered the breach, when he received a wound in the leg. About the same time he had the decoration of the legion of honor conferred upon him. In 1846, he became lieutenant-col. and soon after col. In 1848, he had the command of an expedition against the tribes of the Bouaoun, whom he defeated at the pass of Djerma, and was victorious against the Kabyles. As gen. of brigade, in 1850 he led an expedition through the rocky country of Narah, and destroyed the Arab stronghold there. In Jan., 1853, he became a gen. of division. He had the command of the first division of the French army under marshal St. Arnaud, sent to the Crimea in 1854; and at the battle of the Alma, was wounded in the breast and hand by the splinter of a shell. On the death of the marshal, C. took the chief command of the French army. In the war in Italy against the Austrians, in 1859, C. had the command of the third division of the French army; and at the battle of Magenta, June 4, his *corps d'armée* turned the left of the Austrians. In the great battle of Solferino, on the 24th of the same month, his division was hotly engaged, and lost 1000 men in killed and wounded. In 1860, he married Miss Macdonald, a Scotch lady. When war was declared by France against Prussia, in 1870, he was one of the generals in command at Woerth, where the French received such a defeat. C. was shut up in Metz with Bazaine, and became a prisoner in Germany. In 1877, he was elected a member of the French senate.

CANSO, CAPE, the eastern extremity of Nova Scotia, and the southern boundary of the entrance of Chebueto or Chedabueto bay. It is in lat. 45° 17' n. and long. 61° west. —2. (Strait), a passage of 17 m. in length and 2½ in average breadth, connecting the inlet just mentioned with the gulf of St. Lawrence, so as to form an island of cape Breton. Of the three channels between that inland sea and the open ocean, it is the one that is least frequently used by European vessels.

CANSO, CAPE, the e. point of Nova Scotia; a port of entry, with a large fishing trade. There is a light on Cranberry island, in 45° 19' n., 60° 55' west.

CANSTEIN, KARL HILDERBRAND, Count of, 1667-1719; studied law at Frankfort, but did not practice because of failing health. At Berlin he became intimate with Spencer and Francke, who persuaded him to devote his time to increasing the circulation of the Bible, and that led him to form the Bible society at Halle which bears his name. He published the New Testament for about 8 cents, and the whole Bible at a proportionate price. He wrote a *Life of Spenser*, a *Harmony of the Gospels*, and other theological works.

CANT, on shipboard, is a name given to such timbers, near the bow and stern, as lie obliquely to the line of keel. It is also a general term for anything sloping, inclined, or turned aside. "Canting" is to turn anything over, or out of its proper position.

CANT, ANDREW, a Scottish divine of the 17th c., was first minister of Pitsligo, in the n. of Scotland, and afterwards in Aberdeen. In July, 1638, he was one of the commissioners sent to that city, to compel the inhabitants to subscribe the national covenant; and in Nov. of the same year, he was a member of the memorable general assembly, held at Glasgow, which abolished Episcopacy in Scotland. He was with the Scots army when it obtained possession of Newcastle, Aug. 30, 1640; and in 1641, on the second visit of Charles I. to Scotland, C. preached before his majesty at Edinburgh. In 1660, in consequence of a complaint presented to the magistrates of Aberdeen, charging him with having published a seditious book, entitled *Lex Rex*, and with fulminating anathemas and imprecations against many of his congregation, C. relinquished his charge and left the town. He died about 1664.

CANTABILE, in music, is found in several significations. In general, it is placed over passages of easy and flowing melody, as well in instrumental as vocal music. In songs, the melodies which lie chiefly in the middle region of the voice are marked C.: extreme tones of the voice have a peculiar *timbre* and character quite foreign to the cantabile. C. marked at the beginning of a piece means rather slow than quick. In the C. style the finest effects can be produced by the singer in swelling, sustained sound, the portamento, etc. C. is also called *cantilene*.

CANTA'BRI, a rude race of mountaineers in ancient Spain, were of Iberian origin, and lived in the district now known as Burgos, and on the coasts of the bay of Biscay, which derived from them its name, *Oceanus Cantabricus*. The most important of their nine towns were Juliobrica (near the source of the Ebro), Vellica, and Concana. The C. are described as like the Scythians and Thracians in hardihood and martial character, sleeping on the bare earth, enduring extreme pain without a murmur, and, like most savages, leaving agricultural toil to their women. Their bravery was evinced in the Cantabrian war, a six years' contest with the Romans, begun under Augustus, and concluded by Agrippa, 25-19 B.C. Tiberius afterwards stationed garrisons in the towns of the conquered C.; but some portion retreated into their fastnesses among the mountains, where they preserved their independence. They are supposed to be the ancestors of the Basques (q.v.).

CANTA'BRIA, a district in Spain on the s. coast of the bay of Biscay. The old geographers give the name to nearly the whole of the Biscayan coast, but it is now restricted to the province of Santander and the e. portion of Asturias; indeed, Cantabria is not now a geographical division.

CANTABRIAN MOUNTAINS, the general name of the several ranges of coast and boundary mountains, extending along the n. coast of Spain, from cape Finisterre, to the southern base of the w. Pyrenees, and so dividing the coast districts from the interior elevated plateau of Castile. The summits of the mountains here and there reach the lower line of the snow region, with a more gentle slope on the s. side, and forming plateau districts from 1600 to 2,000 ft. high on the n., where the slopes are steeper and intersected by coast rivers, leave in several parts only narrow stripes of flat coast-land, and running out into the sea form several bold promontories. The whole group of mountains is named variously by the people of various localities, and includes the Sierra de Aralar, Salvada, Anagña, Sejos, Albas, and Altuna—all more or less wild and romantic, but having those fertile and prosperous trading districts which distinguish the Basque Provinces and Asturias from the sterile central plateau of Spain.

CANTACUZE'NUS, JOHANNES, b. about 1300 at Constantinople; a statesman, general, and historian, and under Andronicus II. had principal charge of the government. When Andronicus died he was left regent, the successor being John Palæologus, then only nine years old. C. was suspected by the empress, fled from Constantinople, and got himself crowned in another place. Six years of civil war followed in which the rivals employed foreign mercenaries of every description, and nearly ruined the empire. C. formed an alliance with the sultan of Broussa, agreeing to send his daughter to his ally's harem and to permit the sultan to make slaves of the Greek subjects. In 1346, he entered Constantinople and became joint emperor with John, but retained full power during John's minority. He badly governed the almost ruined empire until 1354, when John made an easy success, and C. took refuge in a monastery, where he wrote a history of his life and times.

CANTAL, a central department of France, formed out of the s. portion of the old province of Auvergne. It has an area of 2,090 sq.m., and a pop. in '76 of 231,086. See AUVERGNE.

CANTALIVER, or **CANTLIVER**, a large bracket used in architecture for supporting cornices, balconies, and even stairs. Cantalivers are often highly ornamented.

CANTALOUPE, or **MUSK-MELON**, a well-known fruit, taking its name from Cantalupo in Italy. It is extensively cultivated in the United States, and is much esteemed for the table.

CANTARINI, **SIMONE**, also known as **SIMONE DA PESARO** or **IL PESARESE**, an Italian painter, was b. at Pesaro in 1612. He studied under Guido Reni at Bologna; but his intolerable arrogance made him numerous enemies, and in consequence he left the city, and went to Rome, where he won a high reputation, and was thought by many to excel even his master in the graceful finish of his brush. On his return to Bologna, he opened a school, but shortly after accepted an invitation from the duke of Mantua to visit that city. Here also his excessive self-esteem involved him in disagreeable relations with everybody, and at last he quarreled with the duke himself, on which he left for Verona, where he died in 1648, under suspicion either of having poisoned himself, or of having been poisoned by a Mantuan painter whom he had injured. C. was distinguished in modeling and flesh-coloring. A "Madonna upborne by Angels," and a head of Guido when old, in the gallery at Bologna; and others elsewhere, remain as proofs of his skill. His 37 etchings closely resemble the etchings of Guido Reni, and have, in several instances, been fraudulently sold with the mark of the master forged upon them.

CANTA'TA, in music, is a name given to a vocal composition; but it is so very indefinite, that it in no way shows in what respect such composition differs from any other. In Zedler of Halle's great *Lexicon*, the C. is defined as a "long vocal composition, the text of which is Italian," etc.; while in Sulzer's *Theorie der Schönen Künste*, it is said to be "a short piece of vocal music of a pathetic nature," etc. The C. is always more extended and wrought out than the simple song, and consists of different movements.

CANTEEN, is a refreshment-house in a barrack, for the use of the soldiers. The chief articles of food are supplied to the troops direct by the government; but wine, malt liquor, and small grocery-wares, the soldier is left to buy for himself; and the C. is, or is intended to be, a shop where he can make these purchases economically without the necessity of going beyond the precincts of the barrack. No soldier is obliged to buy anything at the C.; he may lay out his small sums elsewhere if he prefer. Formerly, the canteens were under civilians called canteen-tenants, and spirits were sold. Between the years 1836 and 1845, it was found that, among 112 canteens in the United Kingdom, the rent and head-money paid varied from £4 per annum (one at Guernsey) to £1344 per annum (one at Woolwich); they brought in collectively to the government about £70,000 annually. Great intoxication having resulted from the sale of spirits at the canteens, the war office prohibited such sale in 1847; as a consequence, the rents had to be lowered to the extent of £20,000 in the following year, the cantineers finding their profits much reduced. The rent paid was found to be injurious to the soldiers, who were charged higher prices within the barrack than without, and who were thence driven to places where dangerous temptations are at hand. The result of this system being undeniably bad and demoralizing, the war office now makes the C. a regimental establishment, controlled by a committee of officers and with a canteen-sergeant as salesman. Pensioned non-commissioned officers may be appointed canteen-sergeants. The profits are applied for the benefit of the men of the corps.

In French barracks, the C. is a sort of club-room for the whole regiment. The cantineer is a non-commissioned officer, who acts merely as an agent for all, selling the liquors and commodities at prime cost.

CANTEEN, besides its application to a room or building, is a name also given to a vessel used by soldiers to contain whatever beverage may be obtainable on the march or in the field. It is sometimes of tin, sometimes of wood. In the British army, the C. is a wooden vessel, holding about three pints, painted blue, and inscribed with the number or designation of the regiment, battalion, and company to which the soldier belongs.

There is still another use of the word C., as a name for a leathern or wooden chest, divided into compartments, and containing the plate and table-equipage for a military officer when on active service.

CAN'TEMIR, ANTI'OCIUS, or CONSTANTINE DEME'TRIUS, 1704-44; the youngest son of Demetrius Cantemir. He was a member of the St. Petersburg academy; wrote satires, and assisted in fixing versification and developing Russian poetry. At the age of 30 he was sent as minister to Great Britain, and in 1736 to France. He was a successful diplomatist, and was highly esteemed both at home and abroad. Besides translating into Russian the main works of Anacreon and Horace, he wrote odes, satires, and fables, and translated important works from French and Italian.

CAN'TEMIR, DEME'TRIUS, 1673-1723; a son of a Moldavian prince and heir to the throne, which, however, he never claimed, preferring to serve the Turks. In 1710, he was appointed prince to resist the expected invasion of Peter the great. Convinced that ruin would come to the Turks, C. joined the czar and shared in the unfortunate campaign on the Pruth in 1711. When peace was made, Peter refused to surrender him to the Turks, and kept him employed in Russia, where he became a great favorite. His most important work was a history of the rise and fall of the Ottoman empire.

CANTERBURY, a municipal and parliamentary borough, a co. by itself, a cathedral city, and seat of the metropolitan see of all England, in East Kent, on the Stour, 56 m. e.s.e. of London, on the high-road from London to Dover. The distance from London by the South-eastern railway is 81 m.; by the London, Chatham, and Dover line, about 60. It stands on a flat between hills of moderate height. It has the aspect of an old town, many of the houses along the high street having gabled ends and projecting fronts. It has little manufacture or traffic. The chief trade is in corn, wool, and hops. Pop. '71, 20,962. Many are engaged in the hop-grounds. C. returns two members to parliament. It is noted for its brawn. Some remains of the walls (1¼ m. in circuit and 20 ft. high) which formerly surrounded C., and one of the gates, still exist. Near the city wall is a large artificial mound, known as the Dane John (probably *Donjon*), and connected with this mound is a public garden, laid out in the end of the 18th c., from the top of which is a fine view of the country around. But the great glory of C. is its magnificent

Cathedral. When St. Augustine became archbishop of Canterbury, 597 A.D., he consecrated, under the name Christ's church, a church said to have been formerly used by Roman Christians. Cuthbert, the 11th archbishop, 740 A.D., added a church to the e. of this. In the course of ages, it received numerous additions, until it assumed its present magnificent form. Among those who helped to repair, enlarge, and rebuild it, were archbishops Odo (940 A.D.), Lanfranc (1070), and Anselm (1093). In 1174, the choir was destroyed by fire, and in order to the rebuilding of it, a number of French and English artificers were summoned. Among the former was a certain William of Sens, and to him, a man of real genius, the work was intrusted. The church was rich in relics; Plegmund had brought hither the body of the martyr Blasius from Rome; there were the relics of St. Wilfred, St. Dunstan, and St. Elfège; the murder of Thomas Becket (q. v.) had recently added a still more popular name to the list of martyrs. The

offerings at these shrines, especially the last, contributed greatly to defray the expenses of the magnificent work. William of Sens did not, however, live to see its completion. He was succeeded by another William, an Englishman, and to him we owe the completion of the existing unique and beautiful choir, terminated by the corona or circular chapel called Becket's crown. Gervasius, a monk, who witnessed the fire of 1174, and has left an account of it, tells us that the parts of Lanfranc's church which remained in his time were the nave, the central and western towers, the western transepts, and their eastern chapels. In the 14th c., the nave and transepts were transformed into the perpendicular style of that period. The central tower, called the Angel steeple, was carried up (1486-1504) to about double its original height, also in the perpendicular style; it is 234 ft. high, and 35 ft. in diameter. The n.w. tower was taken down in 1834; it was 113 ft. high, and divided into five stories. The Norman plinth still remains on each side of the nave in the side aisles, and portions of Norman ashlar may still be seen about the transepts outside the w. wall, and on the eastern piers of the great tower. The indiscriminate use of the "round" or "Norman," and the "pointed" or "early English" arch, is also a very striking feature in the eastern part of the building. The Lady chapel, now called the Dean's chapel, stands on the n. side of the church, and was built in 1468; the roof is a fan-vault. The n. transept is called the Martyrdom, for here took place the murder of Becket, on Tuesday, Dec. 29, 1170. Fifty years later, his remains were translated from the crypt to a shrine in the newly erected Trinity chapel, eastward of the choir. About the year 1500, the yearly offerings at this shrine amounted to £4,000; but they had then declined much in value. A curious mosaic pavement still remains in front of the place where the shrine stood, and the stone steps which lead up to it are worn by the knees of countless pilgrims; but the shrine itself was demolished in 1538, and the bones of the saint burned by order of Henry VIII. In 1643, the building was further "purified," as it was called, by order of parliament. Still very many most interesting monuments remain—such as the tombs of Stephen Langton; that which is commonly, but wrongly, supposed to be the tomb of archbishop Theobald; with those of the black prince, of Henry IV., of archbishops Maphan, Peckham, Chicheley, Courtenay, Sudbury, Stratford, Kemp, Bourchier, Warham, and of cardinal Pole. The total exterior length of the cathedral is 545 ft., by 156 in breadth at the eastern transept. The crypt is of greater extent and loftier—owing to the choir being raised by numerous steps at the east end—than any other in England.

The archbishop of C. is primate of all England, metropolitan, and first peer of the realm. He ranks next to royalty, and crowns the sovereign. His ecclesiastical province includes all England, except the six northern counties. Among his privileges, he can confer degrees in divinity, law, medicine, and music. His seats are at Lambeth and Addington park. He is patron of 149 livings, and has an income of £15,000 a year. There are 14 old churches in C., mostly of rough flint, and containing fragments of still older structures. St. Martin's church stands on the site of one of the 7th c., and is partly built of ancient Roman brick and tile. Attached to the cathedral is a grammar school, remodeled by Henry VIII. Part of St. Augustine's Benedictine abbey still remains, with its fine gateway, near the cathedral. It occupied, with its precincts, 16 acres. The old buildings have lately received large modern additions, in order to fit them for the purposes of a missionary college in connection with the church of England. Another recent institution for education is the clergy orphan school, which occupies a conspicuous position on St. Thomas's hill, about a mile out of the city. The ruins of a Norman castle, 88 by 80 ft., the third in size in England, stands near the city wall. C. stood, in Roman times, at the union of two Roman roads from Dover and Lympne, the chief seaports of the Romans. C. was the capital of Kent, and the center from which England was Christianized. St. Augustine, the apostle of England, sent by Gregory I., was the first archbishop, and baptized king Ethelbert of Kent. C. was the Saxon *Caer Cant.*, city of Kent, and capital of the kingdom of Kent. The Danes, in the 9th, 10th, and 11th centuries, often ravaged and burned the city. Henry VIII. confiscated the treasures of the cathedral, and Edward VI. levied fresh exactions from it. The cathedral suffered much in the parliamentary struggles, but it has since been repaired.

CANTERBURY, a settlement of about 13,000 sq. m., on the e. coast of South island, New Zealand, with Christchurch as its capital, and Lyttleton as its port. The district was settled in 1850 by the Canterbury association, a society of peers, bishops, and commoners interested in the colonization of New Zealand. It has a coast-line of about 200 m., and is well watered by numerous rivers. Coal (in abundance), iron-ore, fire-clays, and quartz have been discovered in the province, and several coal-mines are in operation. On the eastern side of the great range of hills are the far-famed Canterbury plains, the great sheep district of the colony—"3,000,000 of acres rolling back in gentle rise 40 m., to the foot of the central highlands, watered by 20 rivers, and spreading n. and s. further than the eye can reach." The natural pastures of C. are very fine; and to this circumstance is mainly due the rapid advance in prosperity of the country. Pop. '75, 78,715. In 1876, wheat occupied 57,500 acres, estimated to yield 1,770,363 bushels; oats, 72,522 acres, estimated to yield 2,788,688 bushels; barley, 16,820 acres, estimated to yield 620,699 bushels; and the estimated yield of potatoes was 17,895 tons. The total value of exports in 1875 was £42,750; of imports, £1,302,440. Very excellent timber grows in the province.

CANTERBURY BELLS. See CAMPANULA.

CANTHARELLUS. See FUNGI, EDIBLE.

CANTHARIDINE. See CANTHARIS.

CANTHARIS (Gr. a small beetle, plural *cantharides*), a genus of insects of the order *coleoptera*, section *heteromera*. See COLEOPTERA. It belongs to a family called *trachelides*, or necked beetles, the head being separated from the thorax by a distinct neck or pedicle, and forms the type of a subdivision of that family called *cantharidiv*, many of the species of which possess blistering properties analogous to those of the common BLISTERING FLY, SPANISH FLY, or BLISTER BEETLE (*C. vesicatoria*). This insect, the best known and most important of the genus, is about an inch long; has a large heart-shaped head, rather broader than the thorax; thread-like antennæ three times longer than the head; a nearly quadrangular thorax; and soft elytra (wing-covers) concealing the abdomen, and of equal breadth throughout. It is of a bright glossy green color. The common blistering fly is found in the s. of Europe, and in the s. of Siberia. It is abundant in Italy, Sicily, and Spain, in the s. of France, and in some parts of Germany and Russia. It is rare in England. The larva is not well known. The perfect insect feeds on the leaves of the ash, privet, lilac, elder, and honeysuckle; and rests on them during the night, the day being its time of activity. It is therefore taken by beating the branches of the trees in the morning or evening, when it is comparatively lethargic, a cloth being spread below to receive the insects as they fall. The gathering of *cantharides* takes place, in the s. of France, in the month of May. It requires great caution to prevent injury to those who engage in it, the insects emitting a volatile substance with a strong smell, which causes inflammation of the eyes and eyelids, convulsive sneezing, and irritation of the throat and bronchial tubes, nor can they be handled without danger of blistering. Those who collect them, therefore, generally wear gloves and veils. Unpleasant effects have been experienced from even sitting under trees on the leaves of which cantharides were numerous. Various methods are employed for killing cantharides when they have been taken; the cloths containing them are very generally immersed in hot vinegar and water, and they are afterwards carefully dried; sometimes they are killed by the vapor of vinegar, and sometimes by oil of turpentine. Unless kept with great care, they soon begin to lose their active properties, although, in stoppered bottles, they remain fit for use for years. They are very liable to be injured by mites, and afford a favorite food also to a kind of moth and to some other insects. They are imported into Britain from the s. of Europe, and also from St. Petersburg.

The active principle of the blistering flies is *cantharidine*, which possesses such powerful blistering properties, that $\frac{1}{100}$ th of a grain placed on the lip rapidly causes the rise of small blisters. Administered internally, blistering flies cause heat in the throat, stomach, intestines, respiratory organs, etc.; and if in large doses, they give rise to inflammation of a serious nature, and sufficient to cause death. Externally, they are employed as a *blistering agent*. There are various medicinal preparations of blistering flies, such as *vinegar of cantharides*, obtained by macerating blistering flies in acetic acid; *tincture of cantharides*, procured by digesting blistering flies in proof-spirit, etc.; but that most commonly employed is *plaster of cantharides* or *blistering plaster*, obtained by mixing equal parts of blistering flies, yellow wax, resin, and lard. See BLISTER.

CANTICLES, a word which literally signifies songs, but which is specially applied to a canonical book of the Old Testament, called in Hebrew *The Song of Songs*—i.e., the most beautiful song. The author is commonly supposed to be Solomon, and in the rich luxurious splendor of its coloring, it admirably harmonizes with the "golden time" of that magnificent monarch. The theme which it celebrates is love; but what kind of love, whether earthly or spiritual, is a question that has perplexed Biblical critics. The oldest interpretations are allegorical, and are either political or religious. The former of these, considered C. as the symbolical expression of a deep longing for the reunion of the kingdoms of Judah and Israel; the latter, of the love of God for his chosen people, the Jews. The religious interpretation passed over from Judaism to Christianity, and assumed a new aspect in consequence. Origen found the beloved bridegroom in Christ, and the bride in the church or the believing soul. Only among the theologians of the Syrian school do we find an effort made to adhere to more intelligible principles of interpretation, but the "mystical view" obtained the upper hand, and has continued to be the predominant view of the poem amongst orthodox theologians. For a while an attempt was made to distinguish between a primary and a secondary sense, both more or less directly present to the mind of the author; but modern scholarship in the main contents itself with endeavoring to fix the primary or literal meaning. Nor is this an easy task. Some commentators hold, for example, that C. is an anthology of detached idyls; others argue that it is a dramatic unity composed of connected parts. Ewald has done much to establish the latter view. Ewald's followers hold that the poem was written about the middle of the 10th c. B.C. in the northern kingdom of Israel, and conceived in a spirit of hostility against the luxurious court of Zion. Solomon, the type of a sensual monarch, has carried off to his harem a northern shepherd maiden, who in the poem appears surrounded by the ladies of his court. The king fails even by the proffer of honorable espousals to overcome the maiden's fervent attachment to her shepherd lover

in the north country, and wholly abashed, ceases to press his suit. Finally, true and chaste love triumphs in the union of the peasant lovers.

CANTIRE, or **KINTYRE** (Gaelic, headland), a long narrow peninsula of Argyshire, running n. and s. between Arran isle and the Atlantic, and united at the n. end with the mainland of Scotland, by the isthmus of Tarbet, a mile broad between e. loch Tarbet, a small loch or bay of loch Fyne, and w. loch Tarbet. It is 40 m. long, and, on an average, $6\frac{1}{2}$ broad. The surface is much diversified by low, undulating, moorish hills, with many lochs. The highest point is Bennear, 1515 feet. It contains much cultivated land. The n. four fifths of C., and the s. w. corner round the Mull, or promontory, of Kintyre, consist chiefly of mica slate. Old red sandstone occurs on the s. e. shore. Coal is found between Campbelton and the w. coast. A light-house, 297 ft. above the sea, stands on the Mull of Kintyre. C. includes 10 parishes. Pop. about 18,000. Campbelton (q. v.) is the chief seat of population. C. was in ancient times peopled by Picts and Celts more densely than the rest of Scotland. The Scots from Ireland subdued it in 210 A. D., were expelled from it in 446, but returned in 503 under Fergus, the first Scottish king, who fixed his seat at Campbelton. Kenneth II. (MacAlpine), on defeating the Picts in 843, removed to Forteviot. From the 8th to the 12th c., C. was occupied by Northmen from Scandinavia, and afterwards by the Macdonalds of the isles, and more lately by the Campbells. Many burying-grounds and small ruined chapels or monasteries in C., show its former populousness. Near these chapels, and in the villages, are many high, upright slate crosses, with rude figures and inscriptions on them. C. contains many ancient watch or ward forts often vitrified.

CANTIUM, a Roman district in ancient Britain, covering nearly the same territory as the modern co. of Kent. Cæsar speaks of the inhabitants as the most civilized people of the island.

CANTO FERMO, in church music, means plain song, or choral song in unison, and in notes all of equal length. Its introduction into the Christian church is attributed to pope Gregory the great, before the invention of the modern notation. See also **GRECORIAN TONES**.

CANTON. In heraldry, the C. occupies a corner of the shield, either dexter or sinister, and in size is the third of the chief. It is one of the nine honorable ordinaries, "and of great esteem."

CANTON (from the Fr. *canton*, a corner, a district; Ger. *kante*, a point, corner, border; allied to Eng. *cantle*) signifies in geography a division of territory, constituting a separate government or state, as in Switzerland. In France, C. is a subdivision of an *arrondissement*.

CANTON, a city in Fulton co., Ill., on the Chicago, Burlington and Quincy, and the Toledo, Peoria and Western railroads; 210 m. from Chicago, and 28 m. from Quincy; pop. '70, 3,308. Manufacturing and coal mining are the main industries.

CANTON, a t. in Lewis co., Mo., on the Mississippi river and the Mississippi Valley and Western railroad, 200 m. above St. Louis, and 22 m. below Keokuk; pop. '70, 2,363. It is a prominent shipping place, has a number of manufactories, and is the seat of Canton university, an educational institution under the charge of the Christian denomination.

CANTON, a t. in St. Lawrence co., N. Y., on Grass river and the Rome, Watertown and Ogdensburg railroad; 60 m. n. e. of Watertown; pop. '75, 6,123. It is the co. seat, and has a court-house, almshouse, St. Lawrence university, and several churches. There is abundant water-power, used in the manufacture of lumber, flour, etc.

CANTON, a t. in Clark co., O., on the Pittsburg, Fort Wayne and Chicago railroad, 100 m. n. e. of Columbus. There is abundance of water-power, and considerable manufacturing is carried on. Coal and limestone are found, and the surrounding country is a fine wheat-growing district.

CANTON, a large commercial city and port in the s. of China, and capital of the province of Kwang-tung (of which the name C. is merely a corruption). It is situated in lat. $23^{\circ} 7' 10''$ n., and long. $113^{\circ} 14' 30''$ e., on the n. side of the Chookcang, or Pearl river, in a rich alluvial plain, 32 m. from the sea. The river (the entrance to which is known by the name of the Boca Tigris, a Portuguese translation of the Chinese *Hu-mun* ("Tiger's Mouth"), is very picturesque. The city is surrounded by a brick rampart 6 m. in circumference, and entered by 12 gates, to each of which a guard-house is attached. It forms an irregular square, and is divided by a wall into the n. and s., or old and new city. The former is inhabited by the Tartar population, the latter by Chinese; and between the two, communication is maintained by four gates in the separating wall. The suburbs are very extensive, and in one of these, facing the river, stood the European factories or *hongs*. Most of the streets of C. are crooked and labyrinthine beyond description, but there are a small number of straight thoroughfares which make it easy enough for a stranger to find his way. As a rule, a tolerably straight street leads from the water-side to each gate of the city on the southern front, and is more or less prolonged through the interior. Many of the streets are devoted to distinct trades; thus, there is "Carpenter" street, "Apothecary" street, etc. The Joss-houses, chiefly

Buddhist temples, are said to be 124 in number. The largest of these, on Honam island, covers seven acres, and has 175 priests attached. It is called *Hae Chwang Sze*, or "the temple of the ocean banner." Another famous structure is "the temple of the five hundred gods," situated in the western suburbs. There are also several many-storied towers or pagodas, a Mohammedan mosque, founded about A.D. 850 by the Arabian voyagers, who then were accustomed to visit C., a founding-hospital, an English and an American missionary hospital. Streets of wooden houses were formerly to be seen on the river-side, but these were swept away during the late quarrel with Yeh; and one large site that they occupied was walled in for the purpose of erecting new foreign factories, the old ones having been totally destroyed by fire. A very remarkable example of life upon the water is the boat-town of Canton. The total population of the city has been vaguely estimated at 1,000,000. The *climate* of C. may be pronounced healthy; though the heat from June to Sept. is oppressive, and the thermometer sometimes, though rarely, stands at 100° in the shade. In ordinary years, the winter minimum is 42°, and the summer maximum 96°. The n.e. monsoon commences in Oct., and is the prevailing wind till Mar., when the s.w. monsoon sets in. Its average temperature is 70½° F., and the annual fall of rain 70.625 inches. The Cantonese are notorious for their turbulence and hatred of foreigners, and the European factories have more than once been attacked by infuriated mobs, who were only kept at bay by force of arms. This hostility may, however, be greatly due to the baneful influence of those in power; for here the government of the mandarins of the present Manchu Tartar dynasty appears to have reached its maximum of corruption and barbarity, and was fitly represented by the notorious Yeh, late governor-general of Kwang-tung and Kwang-se. The author of *Twelve Years in China* gives us some startling facts illustrative of mandarinic rule in this part of China. After the defeat of the Triad rebels, who besieged C. in 1844-45, it is estimated that 1,000,000 of people perished in the province.

The admirable situation of C. for conducting traffic explains how, from an early period, it was a favorite port with foreign merchants. The Arabs, as has been said, made regular voyages hither as early as the 9th century. The Portuguese found their way to it in the 16th c., and were followed by the Dutch a hundred years later. These in turn were overtaken and supplanted by the English before the close of the 17th c., and an immense trade was carried on by the agents of the East India company. Their monopoly ceased on the 22d April, 1834. Since that date the proceedings of the C. government officers have originated two wars with the British. The city was captured by the allied French and English forces Dec., 1857, and continued to be garrisoned by them till Oct., 1861. See CHINA. After the treaty of Nankin (signed Aug. 29, 1842), C. was known as one of the five ports; Amoy, Foochow, Ningpo, and Shanghai having also been thrown open to foreign commerce.

The chief exports from C. are tea, silk, sugar; the chief imports, raw cotton, piece-goods, opium, metallic wares, etc. "War and rebellion" (say the authors of the *Treaty Ports of China and Japan*, Lond. and Hong-Kong, 1867), "the opening of Hankow as a shipping port for tea, and, above all, the proximity of Hong-Kong and Macao to the delta of the Canton river, with its unrivaled facilities for smuggling, have robbed C. of the pre-eminence it so long enjoyed in commercial prosperity." Yet the following statistics show that the city is recovering ground:

	Total Value of Imports in Mexican Dollars.	Total Value of Exports in Mexican Dollars.
1860.....	18,415,727	16,257,623
1861.....	12,977,353	15,811,512
1862.....	10,580,928	17,742,590
1863.....	9,505,285	16,083,062
1864.....	8,192,795	13,659,177
1865.....	10,556,602	18,054,577
1866.....	14,171,101	18,832,622
1867.....	14,090,581	18,403,154
1868.....	12,991,266	18,491,156
1869.....	11,487,679	20,010,626
1870.....	12,053,394	19,857,543
1871.....	15,661,889	23,612,439

In 1874, the total value of exports was £4,610,470; of imports, £1,985,701, exclusive of treasure.

The Middle Kingdom, by Dr. S. W. Williams; *The Chinese*, by sir John Davis; *Meadow's Chinese*; *Twelve Years in China* (Edin. 1860); *Report of the Missionary Hospital in the Western Suburbs of Canton*; *Treaty Ports of China and Japan* (Lond. and Hong-Kong, 1867).

CANTON, JOHN, 1718-72; an English natural philosopher, who made valuable discoveries in the then new science of electricity. For constructing artificial magnets he was honored with the membership and a gold medal of the royal society, and, in 1757, he became one of the council of the society. He was the first person in England to verify Franklin's theory of the identity of lightning and electricity, having, in 1752,

obtained fire from the clouds during a thunder-storm. He and Franklin almost simultaneously discovered that some clouds were charged with positive and others with negative electricity, a circumstance that made them warm personal friends. C. opposed the theory then generally accepted that water was incompressible.

CANTONMENTS, in the general operations of European armies, are temporary resting-places. Many circumstances, especially the state of the weather and the supply of food, influence a gen. in determining whether to go into C. or to encamp, in the intervals between active operations; or he may take the former course during an armistice. The quartermaster-gen. previously examines the district, and determines how many men and horses to place in each village; arrangements are also made for a main-guard, cavalry pickets, alarm-posts, road-barricades, lines of sentries, mounted orderlies, etc., to guard against a sudden surprise from the enemy. In C. the men are not generally under canvas, as described in **CAMP**.

In India, C. are *permanent* places, regular military towns, distinct and at some little distances from the principal cities. If on a large scale, such a cantonment contains barracks for European cavalry, infantry, and artillery; rows of bungalows or houses, each inclosed in a garden, for the officers; rows of huts for the native soldiery; magazines and parade-grounds; public offices and buildings of various kinds; and a bazaar for the accommodation of the native troops. During the revolt in 1857-58, most of the outbreaks began in the cantonments. It was in the cantonment outside Cawnpore that Nana Sahib commenced his treachery.

CANTONNÉE, in heraldry. When a cross is placed between four other objects, e.g., scallop shells, it is said to be cantonnée.

CANTON'S PHOSPHORUS, or PYROPHORUS, is obtained by heating in a close vessel 3 parts oyster-shells and 1 part sublimed sulphur, when the sulphuret of calcium (CaS) is formed, which takes fire when exposed to or thrown into the air.

CANTOR. See PRECENTOR.

CANTU, CESARE, one of the best of modern Italian authors, was b. Sept. 5, 1805, at Brescia, in northern Italy, and was educated at Sondrio, where he was appointed professor of *belles-lettres*. Having been imprisoned for the offense of expressing liberal tendencies in a historical work on Lombardy, C. spent his leisure hours in describing the sorrows of a prisoner in the form of a historical romance, *Margherita Pusterla* (Florence, 1845). C. has also written several religious hymns and songs, which have become popular; but his great work is the *Storia Universale* (35 vols., Turin, 1837-42). His *History of Italian Literature* appeared in 1851; *History of the Last Hundred Years*, 1852; *History of the Italians*, 1859; and *Milano, Storia del Popolo e pel Popolo*, 1871.

CANTURIO, or CANTU', a t. in northern Italy, 5 m. s.e. of Como. It is situated in the midst of a rich district, has a church with an elegant tower, which served as a beacon during the middle ages, and manufactures of iron-wares. Pop. 5500.

CANUN, a Turkish musical instrument, strung with gut-strings; is played on by the fingers, on which are thimbles of tortoise-shell, pointed with pieces of cocoa-nut, forming plectra for striking the strings with. The C. is a favorite instrument with the ladies in seraglios, many of whom produce very pleasant music and harmony on it.

CANUTE, or CNUT, succeeded to the rulership of the Danes in England on the death of his father, Swein or Sweyn, and was by them proclaimed king of England. On the death of Ethelred, he shared the sovereignty with Edmund Ironside, who ruled over the s., while C. was monarch over the n. of England. The sudden decease or assassination of Edmund made C. sole ruler in 1017, and he continued to reign until his death, in 1035 or 1036. His rule was marked at first by cruelty, but when all who were likely to interfere with his power had been disposed of, he exhibited great mildness and justice, combined with talent and judgment. The Anglo-Saxons, whose complete subjugation he had effected, did not feel their chains: they had experienced no such good government since the time of Alfred and Athelstane. He was easily accessible to all his subjects; and won the hearts of the people by his love song and ballad, and his liberal patronage of gleemen. One verse of an English song written by C. is still extant. As soon as English affairs were settled, C. superseded his brother Harold as king of Denmark; and in 1028 he extended his dominion over Norway—becoming thus one of the most powerful princes of Europe. In his latter years he was devout.

CANVAS, regarded from an artist's point of view, is the principal material upon which oil-paintings are made. Two kinds are prepared for this purpose, of which the best is called *ticking*. Before it is put into the artist's hands, it is usually *primed*, or grounded (see **GROUND**) of a neutral gray, or other tint, as he may direct. Certain sizes of C. being in greater request than others, are kept ready stretched on frames. Those used for portraits are known by the names of *kit-cat*, which measures 28 or 29 in. by 36; *three-quarters*, 25 by 30 in.; *half-length*, 40 by 50; *Bishop's half-length*, 44 or 45 by 56; *Bishop's whole length*, 58 by 94.

CANVAS, SEIL'S. See SAIL, SAILCLOTH

CANVAS-BACK, *fuligina (athya) vallisneria*, a species of duck frequenting the Atlantic coast of the United States, greatly prized for its flesh. The canvas-back reaches its highest perfection in and around Chesapeake bay, where these birds pass the winter after returning from their breeding grounds in the far north-west. In its annual migrations it is taken in great numbers in the marshes which surround the southern extremity of lake Michigan, where the *zostera vallisneria*, or so-called wild celery, known to be identical with the plant of that name in the Chesapeake bay, abounds.

CANZONÉ is the name of one of the oldest and most prized forms of the Italian lyric. The word is borrowed from the Provençals, whose *cançons* or *chansós*, however, were not restricted to any precise form, but were simply verses intended to be sung. The Italian writers first attempted to regulate the wayward and arbitrary character of the Provençal *canós*; Dante, and subsequently Petrarch, being especially successful. The *canzone* *Petrarchesca* or *Toscana* was any considerable lyrical poem, composed of stanzas exactly corresponding to one another in number of lines, measure, and position of rhymes, and which customarily closed with a short stanza. About the end of the 16th c., the Italian writers began to deviate from the strict form of the Petrarchian *canzone*. Torquato Tasso and Chiabrera are the most notable names in the new movement. The most of the *canzones* of the latter—called by their author *canzonette*—are written in short lines and stanzas, the position of the rhymes being also completely arbitrary.

CAOUTCHOUC, GUM ELASTIC, or INDIA RUBBER, a substance which, on account of its peculiar properties, is extensively used in the arts, and of which the use is continually and rapidly increasing. It is one of the products of the wonderful chemistry of nature, being found in the milky juices of plants, and most abundantly in the natural orders *moraceæ*, *artocarpaceæ*, *euphorbiacæ*, *apocynacæ*, *asclepiadacæ*, and *papayacæ*. It exists in the milky juice of plants growing in temperate climates; but it is only in tropical and subtropical countries that it occurs so abundantly as to be of economical importance. Its uses to the plants in which it is elaborated have not been ascertained; and the conjectures of theorists on this subject are not supported by arguments sufficient to give them much probability. In the milky juice, the C. is diffused in the form of minute globules, and not, strictly speaking, in solution; and when the juice is extracted from the plant, and allowed to stand for a short time, these globules separate from the watery part of it, and form a sort of cream on the top, or, in close vessels, appear throughout it as a flaky coagulum. C., as well as some of its useful and curious properties, must have been known in America at a very early period, because balls made of the *gum of a tree*, lighter and bouncing better than the wind-balls of Castile, are mentioned by Herrera when speaking of the amusements of the natives of Hayti, in his account of Columbus' second voyage. In a book published in Madrid in 1615, Juan de Torquemada mentions the tree which yields it in Mexico, describes the mode of collecting the gum, and states that it is made into shoes; also that the Spaniards use it for waxing their canvas cloaks to make them resist water. More exact information regarding C. was afterwards furnished by M. de la Condamine, who visited South America in 1735, but it is curious to note that some of the purposes for which india-rubber is most extensively used at the present time are the same as those for which it was employed in South America nearly three centuries ago. It was at first known by the name of *elastic gum*, and received that of india-rubber from the discovery of its use for rubbing out black-lead pencil marks, for which purpose it began to be imported into Britain in small quantities about the end of last c., being much valued by artists, and sold at a high price. Even before this time its employment for the manufacture of flexible tubes for the use of surgeons and chemists had been successfully attempted; but the expensive character of the solvents then known for it, prevented its general application to any purpose in the arts. It was not till 1820 that its employment began to extend beyond the rubbing out of pencil marks, although in the meantime the quantity imported had considerably increased. Its application to the manufacture of water-proof cloth first gave it commercial importance. About the same time a method was discovered of fabricating articles of various kinds by casting C. in molds. Its elasticity and flexibility, its insolubility in water, and its great impenetrability to gases and fluids in general, have now been found to adapt it to a great variety of uses; but for by far the greater number of its applications it is now employed in the vulcanized state.

The C. of commerce is obtained most largely from South America, but considerable quantities are also procured from British India, the Indian archipelago, the west coast of Africa, and the Mauritius. During the year 1872, the actual imports of this material into Great Britain were:

	Cwts.
From Brazil.....	68,143
“ New Granada, Ecuador, and Central America.....	16,390
“ British India.....	13,855

“ Other Countries.....	18,862
Total.....	157,114

In 1852, the total imports were only 15,269 cwts.; in 1862, 59,703 cwts.; and in 1876, 157,509 cwts. The average annual yield of Brazil for the five years preceding 1871, according to a table sent from that country to the Vienna exhibition of 1873, was about 5,000,000 kilogrammes. The value of the 159,753 cwts. of C. imported in 1877 was £1,484,794.

Brazilian C. is the product of several species of *siphonia* (natural order *euphorbiaceæ*), but chiefly *siphonia elastica*. Bates says that "this tree is not remarkable in appearance; in bark and foliage it is not unlike the European ash, but the trunk, like that of all forest trees, shoots up to an immense height before throwing off branches." The C. of New Granada, Ecuador, and Central America is obtained from *castilloa elastica* (nat. ord. *artocarpaceæ*), that of East India from the beautiful glossy-leaved *ficus elastica* (nat. ord. *moraceæ*), now so common as an ornamental plant in our conservatories, that of Borneo from *urceola elastica*, and that of western Africa from several species of *landolphia*, and also *ficus*. Species of *rabea*, *willughbeia*, *euphorbia*, and other genera likewise yield useful varieties of C., and the sources of some kinds are unknown.

C. is sometimes collected by cutting the trees down, but much more usually by making simple incisions in the trunks. The method of collecting and preparing the liquid C. is thus described in a work recently published at Rio Janeiro. In a few hours, the juice which flows out fills the basins, made of large leaves and plastic clay, which are adapted to the lower part of the tree. It is then poured into other vessels of various shapes; in a short time it becomes thickened, and solidifies in consequence of the evaporation of the liquid part. In order to dry it completely, the practice is to expose it to a gentle heat; for this purpose it is suspended over a brazier lighted with wood, and the flame maintained with the fruits of auricuri, in such a manner that it may receive the smoke, hence the blackish color which the C. of commerce generally presents. Whilst it is liquid, it is fashioned by means of molds, according to the purposes to which it is destined. An attempt has recently been made to import the juice of the tree, and subject it to the drying process in this country, but little has as yet been imported into Britain. The characters of the juice are, that it possesses the consistence of cream, has a yellow color, is miscible with water, but not with naphtha or other of the solvents of ordinary C., and its specific gravity varies from 1.02 to 1.41—ordinary C. being 930. The juice contains about 30 per cent of caoutchouc. When heated, it coagulates (as the glaire of egg does), owing to the presence of albumen; and exposed to the air, it dries up and leaves a film of caoutchouc. In the preparation of pure C., the natural juice is mixed with five or six times its bulk of water, and then either heated or mixed with common salt or hydrochloric acid, when the pure C. separates as a white opaque substance, which becomes transparent when dry. Pure C. is a carbo-hydrogen, its composition being carbon 87.5 and hydrogen 12.5.

Para C. is the best, and commands the highest price in the market. The other South American kinds are of medium quality. East Indian rubber—naturally a fine quality—is too often injured by adulteration and careless collecting. The poorest kind is the w. African, being clammy, offensive in its odor, and only slightly elastic.

Commercial C. is a tough fibrous substance, possessing elastic properties in the highest degree. Reduced to the temperature of freezing water (32° F.), it hardens, and in greater part, if not entirely, loses its elasticity, but does not become brittle. When heated, as by placing in boiling water, it softens, and becomes very much more elastic than at ordinary temperatures, though it does not in any degree dissolve in the water. If suddenly stretched to seven or eight times its original length, it becomes warm; and if kept in this outstretched form for several weeks, it appears to lose, in great part, its elastic properties, and in this condition is readily cut into those thin threads which are used in the *elastic* put in gloves, bonnets, etc., and the elasticity of which is readily renewed by the application of gentle heat. Of late years, however, elastic thread is usually prepared with vulcanized rubber. Commercial C. is insoluble in water and alcohol, is not acted upon by alkalis or acids, except when the latter are concentrated, and heat is applied; but is soluble in ether, chloroform, bisulphide of carbon, naphtha, petroleum, benzol, and the essential oils of turpentine, lavender, and sassafras. Many other essential and fixed oils, when heated with C., cause it to soften, and produce thick glutinous compounds, especially linseed oil, which, in the proportion of 1½ lb. of the oil to 4 ozs. C. in thin strips or films, yields a solution which, when strained, is of great use in rendering shoes, cloth, etc., water-proof. When heated to 248° F., C. fuses; and at 600° it is volatilized, at the same time undergoing decomposition, and yields a liquid called *caoutchoucine* or *cautchisine*, with the specific gravity 680, and possessing great solvent powers over C. and other substances. Caoutchoucine is necessarily very expensive, and hence its use is limited; but cordage steeped in it and dried acquires great supple and tenacious properties, and cloth saturated with it, and dried by exposure to the air, becomes water-tight.

In the employment of C. as a branch of manufacture, the first operation is the purification of the crude material as it comes from abroad. The crude material is cut into minute shreds, and washed by powerful machinery, immersed in water, which releases the solid impurities, and the pure C. being removed, is placed on iron trays, and dried in a room heated by steam. The material then undergoes a process of kneading under very heavy rollers, which causes the adhesion of the various pieces of C. to each other.

and ultimately yields a mass or block of C. in which the condensation is so perfect that all air-holes, and other cells and interstices, disappear. The block of C. is then cut under water by powerful knives or shears into sheets, from which the pieces sold by stationers may be shaped out, or from which C. bands or thread may be obtained. In the manufacture of square threads, mere cutting is had recourse to; and the delicacy of the operation may be understood when it is stated that 1 lb. of C. will yield 32,000 yds. of thread. The round thread elastic is prepared from C. which has been treated with about double its weight of bisulphide of carbon, containing about 5 per cent of alcohol, which yields a soft material resembling in consistence bread dough or putty; and this being squeezed through a series of small holes, is obtained in minute round threads, which are first received on an endless piece of velvet and ultimately on an endless web of common cloth 500 to 600 yds. long, during the transit of the threads across which, the solvent or bisulphide of carbon evaporates, and leaves the caoutchouc. When it is wished to weave these threads into cloth, they are wound upon bobbins, taking care to stretch the C. as much as possible, so as to deprive it, for the time being, of its elasticity; and after it has been woven into the cloth, a hot iron is passed over the fabric, and immediately the C. resumes its elasticity.

In the manufacture of water-proof clothing, or Mackintoshes (see MACKINTOSH), which was the first application of rubber on a large scale, the C. is made into a solution with spirits of turpentine, or other solvent, and spread upon the cloth; when thus coated, the fabric is pressed between heavy rollers. This variety of water-proof cloth has now, however, been almost entirely superseded by another kind made with vulcanized rubber, which we shall notice presently.

Vulcanized Caoutchouc.—Pure india-rubber is now used only to a limited extent in the arts, but it is applied in the vulcanized state to an almost endless variety of purposes. The remarkable change which C. undergoes when mixed with sulphur and heated, according to circumstances, from 240° to 310° F., was discovered by Charles Goodyear, in America, in 1843, and independently, about the same time, by Mr. Thomas Hancock, in England. In the process of vulcanizing, the rubber, as a preliminary step, is either torn into shreds or crushed into thin pieces by machinery, and afterwards washed. There are two principal kinds of vulcanized rubber, one hard and horny in its texture, the other soft and elastic. In the case of the former, the C. is mixed with about one third of its weight of sulphur, and heated for several hours, the temperature finally rising to fully 300° F. For the soft kind of vulcanized rubber, on the other hand, a much smaller proportion of sulphur is required—namely, from 2½ to 10 per cent, and the heat to which it is subjected in the vulcanizing chamber is considerably less. Usually, too, with this latter kind, the articles are made before the rubber is heated. The sulphur is commonly added in the ground state, but sometimes the rubber is treated with some solution containing this element, such as the bisulphide of carbon.

Although sulphur is the only essential ingredient required for vulcanizing rubber, yet other substances are usually added. Thus, in the case of machinery belting, pipes, and some other articles, the silicate of magnesia (French chalk) is used to prevent adhesiveness. Litharge, or carbonate of lead, again, is frequently mixed with the rubber and sulphur for certain purposes; but there is really a long list of materials more or less used in preparing different qualities of vulcanized C., each manufacturer using mixtures, the exact nature of which he is careful not to divulge. Asphalt, tar, lamp-black, whiting, rosin, sulphide of antimony, and ground cork are some of the ingredients most commonly employed in this way. Belting for machinery, and some kinds of tubing, are formed of alternate layers of canvas and vulcanized rubber.

Natural C., as already stated, is elastic, cohesive, impervious to gases, insoluble in water, and resists many chemical re-agents; but it loses its elasticity by cold, softens by heat, and is destroyed by many fixed oils. After being vulcanized, C. has its elasticity greatly increased, is not hardened by cold, and does not soften or become viscid at any temperature short of its absolute decomposition. Besides, it is barely soluble in turpentine, naphtha, and the other solvents of pure C.; nor does oil readily penetrate or soften it.

It would be a hopeless task to attempt to specify the many useful purposes to which vulcanized C. is applied, even if we had the space to spare. From the year 1843, when it was first made, to the present time, the various patented applications of it must be two or three thousand in number. The mere abridgments of the specifications connected with this material, issued by the English patent office, form a thick volume. Under the head GOLOSINES, will be found a brief description of the process of making india-rubber shoes. Water-proof coats are now made in a similar way, the mixture of rubber and vulcanizing materials being pressed on the surface of any suitably woven fabric by heated iron rollers in a calender. The coats are then cut out and the various pieces put together, without sewing, by some solvent, such as turpentine, which makes the edges adhere. They are afterwards heated in the vulcanizing chamber. Both coats and shoes of this material have, however, the objectionable property of preventing the escape of moisture from the skin. Belting, buffers, wheel tires, washers, valves, pipes, fire-hose, and other engineering appliances, form a large branch of the rubber trade. For medical and surgical purposes, many articles are made of this material. Of such an

apparently trivial matter as vulcanized rubber thread, one English firm turns out about 3,000 lbs. per day, and another single small article—namely, tobacco pouches—is made in another factory at the rate of 3,000 per diem.

Hard vulcanized rubber, termed vulcanite, and sometimes ebonite, is made into a great many small articles, such as combs, chains, bracelets, boxes, penholders, paper-knives, knife-handles, buttons, etc., as a substitute for materials like horn, bone, ivory, and jet. As in the case of these substances, it is formed into various objects by molding, cutting, carving, polishing, and other processes. Vast numbers of these articles are now sold, but some time must yet elapse before the quality of this material is thoroughly tested. The black color of vulcanite ornaments has still a tendency to turn gray, but the brittleness which was a fault of combs made of it a few years ago, seems to be overcome. With respect to objects of considerable size, vulcanite has been made into furniture, ornamental tiles, and even rails for railroads. A kind of vulcanite is now very largely employed as an insulator in electric cables, experience having shown that there are certain objections to gutta-percha being used for this purpose.

There are some useful applications of india-rubber in the liquid or semi-liquid state, which it is worth while to note; thus, when melted at 398° F., and mixed with half its weight of slaked lime, it forms a useful cement or lute, which can be easily loosened, but it will dry and harden if red lead is added. A very tenacious glue is formed by heating C., coal tar, and shell-lac together. It forms an ingredient in some special kinds of varnishes, and it also improves the lubricating qualities of mineral oils, when a small quantity is dissolved in them.

In Great Britain there are six or eight large india-rubber factories, each employing from 400 to 600 hands, besides a great number of smaller works. The manufacture of C. is also an extensive industry in the United States, and in some continental countries, especially France. According to an estimate made by M. Ballard in 1867, the annual French consumption of raw india-rubber was then 180,000 lbs., the value of which in a manufactured state was fully £3,000,000. This would indicate that the industry is more largely developed in France than in England. In most india-rubber factories a large number of the work-people are females; and with respect to the operatives engaged in them generally, there is this peculiarity, that as no great skill is required on their part, employment in such works has proved quite a boon to many persons who have never learned a trade.

CAP, in ship-building, is a strong, thick block of wood fixed near the top of each mast; it has a hole to receive the upper end of the lower mast, and another to receive the lower end of the topmast, with eyebolts to aid in hoisting the topmast. There is also a C. of smaller size at the point of junction between the topmast and the top-gallant-mast. When made of iron, the C. is called a *crance*.

CAP. See PERCUSSION CAPS.

CAPACITY, LEGAL, is such a condition of individuals, in regard to their natural qualities and actual position under the constitution of the country, as fits them for the application of the laws civil and criminal. Generally speaking, all persons have this legal capacity excepting *aliens*, persons *attainted*, *convicts*, *insane* persons, and to some extent also *infants*, *femmes coverts* or married women, and persons under *duress*; see these heads.

SEE ALSO CONVEYANCE, CONTRACT, PLAINTIFF, PURSUER, DEFENDANT, SUIT.

CAPANORI, a city of Italy, 5 m. e. of Lucca; situated in a fertile plain, on the railroad from Pisa to Florence; pop. '71, 48,313.

CAP-À-PIE (Fr. head to foot), in the military language of the middle ages, was applied to a knight or soldier armed at all points, or from head to foot, with armor for defense and weapons for attack.

CAPARISONED, in heraldry. A war-horse completely furnished for the field is said to be caparisoned.

CAPE, in geography, the extremity of a portion of land projecting into the sea beyond the general line of the shore. On a low sandy coast, a C. generally forms an obtuse angle, being merely a change in the trending of the land. On rocky shores, capes usually form acute angles, and are here sometimes called points or promontories.

CAPE AGULHAS. See *AGULHAS, ante*.

CAPE ANN, in n.e. Massachusetts, 31 m. from Boston; 42° 38' n., 70° 35' w.; has two fixed lights 90 ft. above tide, and about half a mile apart. There are two other lights on Thatcher's island, about a mile off shore. There are valuable stone-quarries at the cape. The whole rocky peninsula generally included under this name, projects about 30 m. into the Atlantic ocean.

CAPE BAB-EL-MANDEB. See *BAB-EL-MANDEB, ante*.

CAPE BIANCO, the most northerly point of Africa, on the Mediterranean; 37° 20' n., 9° 48' east.

CAPE BLANCO, or *ORFORD*, in s.w. Oregon, 42° 45' n., 125° 45' w.; 25 m. from the mouth of the Rogue river. A little s. of the cape is Port Orford; on the cape is a light 125 ft. above tide.

CAPE BLANCO, on the w. coast of Africa. See BLANCO, *ante*.

CAPE BOE'O, the w. point of Sicily, a mile from Marsala; 37° 28' n., 12° 23' east. Off this cape, in 241 B.C., the Romans gained a naval victory over the Carthaginians, closing the first Punic war.

CAPE BOJADOR'. See BOJADOR, *ante*.

CAPE BON, or RAS ADDER, in Tunis, Africa, 37° 6' n., 11° 3' e., at the entrance of the gulf of Tunis.

CAPE BRET'ON, a rocky island of irregular form in British North America, stretching in n. lat. between 45° and 47°, and in w. long. between 60° and 61° 30'. It is separated from the peninsula of Nova Scotia by Chebucto or Chedabucto bay and the gut of Canso, contains 3,120 sq.m., with a pop. (1871) of 26,454. Its principal exports are pine, oak, birch, maple, fish, and coal. Though the island produces maize and other grains, yet it depends for its breadstuffs chiefly on the United States. C. B., originally a French possession, was taken by the English in 1745; but being subsequently restored to France, it was again captured in 1758, and ceded in 1763. After having been for a time a distinct colony, it now forms part of the province of Nova Scotia. The towns are Sydney, Arichat, and Port Hood, the once famous Louisbourg, stripped of its fortifications, having become merely a village.

CAPE BRET'ON, a co. in e. Nova Scotia, a part of the island of the same name, nearly surrounded by the ocean; pop. '71, 76,424. Coal is the chief production. Chief town, Sydney.

CAPE CANAVERAL, about the middle of the Atlantic coast of Florida, 28° 27' n., 80° 33' west. It has a revolving light 139 ft. above the water. There are dangerous shoals around the cape.

CAPE CHARLES at the n.e. entrance of Chesapeake bay, Virginia. On Smith's island there is a revolving light 37° 3' n., 76° 2' west. This cape is the extreme s. projection of the "eastern shore" of Maryland.

CAPE CLEAR, a high promontory on the s. side of Clear island, co. Cork, Ireland, usually the first land seen when steamers are approaching England from America. There are two lights, one in 51° 26' n., 9° 29' w.; and one on Fastnett rock, 3½ m. n.w. by s. from the cape, 148 ft. above high water.

CAPE COAST CASTLE, the chief settlement of Great Britain in north or upper Guinea, lat. 5° 5' n., and long. 1° 13' west. The place, as its name implies, is defended by a fort, or rather by three forts. It has a pop. of 10,000. During 1871, the external trade of the entire Gold Coast, C. C. C. being the capital, was as follows: imports, £364,672; exports, £327,012. Under the latter head, the principal articles were palm-oil, gold-dust, tortoise-shell, and maize.

CAPE COD, properly a narrow peninsula of Massachusetts, which, with a length of 65 m., forms the s.e. boundary of the great bay of that state. The northern extremity, marked by a revolving light 155 ft. high above the level of the sea, is in lat. 43° 3' 40" n., and long. 70° 14' 48" west.

CAPE COD (*ante*), the n.w. point of the long sandy strip running around Cape Cod bay and forming Barnstable co., Mass., inclosing Provincetown and Cape Cod harbors. The name is applied also to the whole strip of land. On Race point, at the n. extremity, there is a revolving light 155 ft. above tide, in 42° 4' n., 70° 15' west. There are also several other lights. The cape was discovered by Gosnold 18 years before the arrival of the pilgrims.

CAPE COLONY. See CAPE OF GOOD HOPE, *ante*.

CAPE COMORIN. See COMORIN, *ante*.

CAPE DIAMOND, the high rock at the junction of the St. Lawrence and the St. Charles on which stands the citadel of Quebec.

CAPE DISAPPOINTMENT, or CAPE HANCOCK, the s.w. point of Washington territory, at the entrance of Columbia river; 46° 16' n., 124° 2' w.; has a white light 232 ft. above the water.

CAPE DUCATO. See DUCATO, *ante*.

CAPE ELIZABETH, in the town of that name in Cumberland co., Me., 6 m. s.e. of Portland, 43° 33' n., 70° 11' w. There are two lights, one fixed and one floating. The town is a suburb of Portland, and a popular summer resort; pop. '70, 5,106.

CAPE FAREWELL, the s. point of Greenland, a precipitous headland on an island; 59° 49' n., 43° 54' w. The currents, the ice, and the winds combine to make this probably the most boisterous point on the globe.

CAPE FEAR, the s. point of Smith's island at the mouth of Cape Fear river in North Carolina; 33° 48' n., 77° 57' w. There is a light about a mile from the shore.

CAPE FEAR RIVER, in North Carolina, formed by the Haw and Deep rivers, and affording navigation from the ocean to Wilmington, and further for steamboats. It enters the Atlantic n. of Smelt island.

CAPEFIGUE, BAPTISTE HONORÉ RAYMOND, a French publicist and historian, was b. 1802, at Marseilles. He studied law at Aix, and in 1821 proceeded to Paris, for the purpose of completing his juridical course, but soon betook himself to journalism and authorship. He held a post in the foreign office until 1848. This, however, did not interfere with his amazing activity. Besides contributing extensively to many of the Parisian journals, he has "manufactured" not less than a hundred volumes of history—not, indeed, intrinsically valuable, but indicating wonderful facility in the use of the pen. The best is the *Histoire de la Restauration* (3d edit., 1842). He has published of late years many interesting biographical works.

CAPE FINISTERRE. See **FINISTERRE**, *ante*.

CAPE FLATTERY, the extreme w. point of the United States (except Alaska), in Washington territory, s. of the strait of Juan de Fuca. On an island half a mile from the cape is a light, 48° 20' n., 124° 43' 48" west.

CAPE FLORIDA, the s. extremity of Key Biscayne in Dade co., Fla., e. of the Everglades. There is a fixed white light.

CAPE GATA, or **CAPE DE GATTE**, a promontory of Spain in the province of Granada extending into the Mediterranean; a mass of rock about 24 m. in circumference. The most notable of the pile is the ancient Promitorium Charidemi, the Moorish Kheyran, and is formed chiefly of agates, spars, and crystals. The cape was once a resort of Moorish pirates.

CAPE GIRARDEAU, a co. in s.e. Missouri, on the Mississippi and the St. Louis and Iron Mountain railroads. It is level, fertile, and well cultivated; producing wheat, corn, oats, potatoes, tobacco, etc.; 875 sq.m.; pop. '70, 17,558—1646 colored. Co. seat, Jackson.

CAPE GIRARDEAU, a city in the co. of the same name in Missouri on the Mississippi river, 100 m. below St. Louis; pop. '70, 3,585. It is in a rich and well cultivated section. St. Vincent's college, Roman Catholic, is the principal public institution.

CAPE GUARDAFUI. See **GUARDAFUI**, *ante*.

CAPE HATTERAS, a dangerously low point of North Carolina, U. S., in lat. 35° 14' n., and long. 75° 30' w. It forms the eastern extremity of the insular banks of the same name, projecting virtually into the Florida stream, and marking the spot where the coast-line abruptly turns from the direction of n.e. to that of due north.

CAPE HATTERAS (*ante*), the point of the coast of North Carolina stretching furthest into the Atlantic, and by far the most dangerous part of the American coast for navigators, on account of shoals and frequent gales and storms. Coasting vessels are apt to be crowded up towards this cape by the gulf stream, which is only about 20 m. east. There is a light near the cape 192 ft. above the sea. Cape Hatteras is off about the middle of Pamlico sound, and is one of the most desolate and barren regions on the U. S. coast.

CAPE HAYTIËN (formerly called *Cape Français* and *Cape Henri*), a seaport t. of the island of Hayti, on its n. coast, in lat. 19° 40' n., long. 72° 54' west. It is pleasantly situated on a small bay, partly encircled by hills, has wide and well-paved streets, and some handsome squares. A great portion of it, however, is in ruins, the effects of the revolutionary wars at the end of last century. Safe anchorage is found within the harbor, which, however, is rather difficult of access. C. H. carries on a considerable trade with the United States. Pop. stated at from 12,000 to 16,000.

CAPE HENLOPEN, on the e. coast of Delaware, at the s. entrance of the Delaware bay, 13 m. s.s.w. of cape May, which is in New Jersey, on the other side of the entrance. Cape Henlopen is in 38° 47' n., 75° 5' w., and has a fixed light 182 ft. above the sea.

CAPE HENRY, on the coast of Virginia, at the s. entrance to Chesapeake bay, opposite to cape Charles in Maryland; 36° 56' n., 76° 4' w.; has a fixed light 120 ft. above the sea.

CAPE HORN, or **HOORN**, the most southerly point of America, terminating an island of its own name, in the archipelago of Terra del Fuego. It is in lat. 55° 58' 40" s., and long. 67° 16' w., having a perennially antarctic climate, and being in itself merely a detached link, bare and rugged, of the chain of the Andes. It was discovered by Schouten, a native of Hoorn in Holland, about 90 years later than the strait of Magellan, and since then the course of navigation of sailing vessels has been round the cape instead of through the strait.

CAPEL, ARTHUR, Lord, 1600—49; representative of Hertford, in the Long parliament of 1640. He was a royalist officer, acting with lord Colchester and Edward Hyde as a general, and was in the actions of Bristol, Exeter, and Taunton. At Colchester,

he was compelled by famine to surrender to Fairfax. He was tried for treason and executed Mar. 9, 1649. He was the author of *Daily Observations or Meditations*.

CAPEL, THOMAS JOHN, b. 1835; an English Roman Catholic priest. When but 17 years old, he, with others, founded a normal training college for the education of school-teachers, of which, in 1856, he was chosen president. Being compelled to seek southern Europe on account of ill health, he founded at Pau a mission for English-speaking Roman Catholics, in consequence of which the pope advanced him to "monsignore," a position equivalent to that of bishop. Returning to England, in 1873 he established the Roman Catholic public-school at Kensington, and devoted much of his time to preaching. In 1874, he published a *Reply to Gladstone's Political Expostulation*.

CAPE LA HAGUE, a promontory of France, forming the n.w. extremity of the peninsula of Cotentin, in the department of Manche. It juts out into the English channel, opposite the island of Alderney, and about 16 m. n.n.w. of Cherbourg, and 50 m. s. of St. Alban's Head, in Dorsetshire.

CAPE LA HOGUE, often confounded with cape la Hague, is situated on the e. side of the same peninsula. Here the united English and Dutch fleets defeated the French in 1692.

CAPELIN, *Mallotus Grœnlandicus*, a small fish of the family of *salmonidæ*, extremely abundant on the coasts of Newfoundland, and much used as bait in the cod-fishery. It is also, in a dry state, an article of commerce, and is imported, although not very largely, into Britain, where it sometimes appears on the breakfast or supper table. Its flavor, which is very agreeable, suggests to most persons the idea of its belonging to the herring rather than the salmon family. It is nearly allied to the smelt, but the teeth are smaller and more numerous. It is the only known species of its genus.—Schools of capelins arrive periodically on the coast of Newfoundland, the vast numbers changing the very color of the sea.

CAPELL, EDWARD, 1713-81; b. in Suffolk, England; a Shakespearean annotator and critic. As deputy-inspector of plays, he became so much disturbed by the inaccuracies in the current edition of Shakespeare, that he projected an entirely new print, carefully compared with the original as far as possible. This was published at the expense of the London book-sellers. He continued his Shakespearean researches during his life, and shed much light on the great author's works. He also published a volume of ancient poems under the title of *Provisions*.

CAPELLA, a bright star of the first magnitude, on the left shoulder of Auriga. C. is also called Capra or the *She-goat*, a name also sometimes given to Capricorn.—The poets fable C. to be Amalthea's goat, which suckled Jupiter in his infancy.

CAPELLA. See A CAPELLA.

CAPELLA, MARTIANUS MINEUS FELIX, a learned author belonging to the second half of the 5th c., was born in Africa, but where is not definitely ascertained. Of his life nothing whatever is known. The work which has preserved his name to posterity is the *Satiricon*, a kind of encyclopædia, highly esteemed during the middle ages as a work of reference. It is written in a medley of prose and verse, and is full of curious learning, but possesses no literary value; the style has all the bombastic pomp of the African school of later Latinists. It consists of nine books. The first two consist of an allegory, *The Nuptials of Philology and Mercury*, while the remaining seven are devoted to the "liberal arts," grammar, dialectics, rhetoric, geometry, arithmetic, astronomy, and music. The first edition of the *Satiricon* appeared in 1499, under the care of Franciscus Bodianus; the best in 1836, under the care of U. F. Kopp.

The book on astronomy is remarkable as containing a hint of the true theory of the solar system. Mercury and Venus are there declared to move round the *sun*, and not round the *earth*; and their relation to these bodies is properly explained. Now as Copernicus knew C., and quotes from him, it is not unlikely that he derived the first idea of his doctrine from this writer.

CAPE LOOKOUT, on the e. coast of North Carolina, 85 m. s.w. of cape Hatteras; 34° 7' n., 76° 33' w., having a fixed white light 100 ft. above tide.

CAPE MATAPAN', the s. extremity of the continent of Europe, in Greece, between the gulf of Laconia and Kalamatia, 36° 23' n., 22° 29' east. The ancient Greeks called it Tænarium, and made it sacred to Neptune, whose temple stood near the cape, the remains of which are yet to be seen.

CAPE MAY, the s. point of New Jersey, at the n.e. entrance to Delaware bay. There is a revolving light 152 ft. above tide; 38° 56' n., 74° 57' west.

CAPE MAY, a co. in s. New Jersey, on the ocean and Delaware bay, intersected by the Cape May and Millville railroad; 250 sq. m.; pop. '70, 8349. The surface is level, and somewhat swampy, with alluvial soil, producing grain, hay, and fruit. In one of the swamps is a deposit of cedar trees, the timber of which is still good, though it must have been under-ground more than 2000 years. Co. seat, Cape May Court-house.

CAPE MAY, or **CAPE ISLAND**, a t., village, and celebrated watering place, in Cape May co., N. J.; connected with Philadelphia by railroad; sometimes called Cape city or Cape Island city. There is a fine beach several miles long, and the bathing facilities are of the first order. The hotels are numerous, and of modern construction, and in summer the place is the favorite resort of Philadelphians as well as of people from cities more remote. The climate is usually equable and pleasant.

CAPE MENDOCINO, in Humboldt co., Cal., the extreme w. point of the state; 40° 16' 24" n., 124° 23' 27" west. There is a flashing light 428 ft. above the water.

CAPE NORTH. See **MAGEROE**, *ante*.

CAPE ORTEGAL, the n. extremity of Spain, projecting into the bay of Biscay in the province of Corunna; 43° 47' n., 7° 56' w.; on a rugged and barren coast.

CAPE OF GOOD HOPE, popularly regarded as the most southerly promontory of Africa, though it is half a degree to the n. of cape Agulhas. The latter is merely a projection on a coast-line, which diverges inconsiderably from a parallel; but the former is really the turning-point from s. to e. on the voyage from Europe to India. This celebrated promontory is in lat. 34° 22' s., and long. 18° 29' e., being the termination of Table mountain, which, as it recedes towards the bay of its own name, rises from the height of 1000 ft. above the sea to that of 3,582. The cape (for so it is called by way of eminence) was discovered and doubled by Diaz, a Portuguese navigator, as early as 1486—six years before Columbus, in aiming at the same goal by a different route, led the way to America. But it was only in 1497 that Vasco da Gama realized the value of Diaz's discovery, by rounding it on his adventurous voyage from Lisbon to Calicut. The result was not merely to open a new channel for the traffic of the east, but it was also to transfer trading superiority from the republics of Italy to the states of Western Europe.

CAPE OF GOOD HOPE, a British colony, was so called from the cape on its s.w. extremity. It was established by the Dutch in 1652, some attempts at a settlement having been previously made by the Portuguese. The former only intended it at first as an intermediate station between Holland and their East Indian possessions; and at first occupied only a small tract of ground on the slopes of Table mountain, with some portion of the adjoining flats; but they had in their neighborhood scattered tribes of improvident natives, singularly feeble of purpose, and incapable of organization on a large scale. The tide of immigration set in from Holland, and when the country was finally taken possession of by the British in 1806 (there having been a brief occupation of it from 1796 till 1803), the Dutch had extended their dominion as far to the e. as the mouth of the Great Fish river, and from that point in a waving line across the country to the w., a little s. of Orange river.

In entering upon the government of this large territory, the British found themselves face to face with a race of a totally different sort from that of the purposeless Hottentot—a people styled Kaffirs, mainly of Arab descent, consisting of tall, athletic, finely formed men, of warlike dispositions, with an incurable propensity to steal from any one, provided he was not of their own tribe, and particularly so if he was a foreigner. The inevitable result was a succession of wars—those, namely, of 1812, 1819, 1828, 1835-36, 1846-47, 1851-52.

Cape Colony proper is bounded on the n. by the Orange river and the Kei. But of late the area of this British possession has been greatly extended by the annexation of districts lying to the northward. Of these successive annexations the most important are that of British Kaffraria (see **KAFFRARIA**) in 1866; of Basuto-land, lying in the upper basin of the Orange river, in 1868; of two vast districts across the Kei called Fingo-land and Noman's-land, now called Griqua-land East (q.v.), in 1875; of Griqua-land West, in 1876; and of the Transvaal (q.v.) in 1877. The area of cape Colony proper is 181,592 sq. m., and its pop. in 1875, 496,381. The area of the whole colony, with the newly incorporated districts, is estimated at 329,495 sq. m., and its pop. at 1,142,782.

The highest range of mountains within the colony is 9,000 ft. above the sea. The mountains keep at a distance from the coast-line of from 30 to about 100 m., and receive different names on their course, such as the Stormberg, Sneenwberg, Nieuwveld, Roggeveld, and Kamiesberg. Between this principal range and the sea on the e., there are two other ranges less continuous and regular, the intermediate one generally more distant from the first than they are from each other.

South Africa being not far from the region of the trades, s.e. winds prevail, especially in the summer time; the only other wind that may be said to blow is that from the n.w., which prevails during the colder months. But whichever of these two winds predominates—the one bearing a supply of rain from the Indian ocean, the other, if less frequent, more richly laden from a part of the Atlantic nearer the line than the country which it fertilizes—it fails to deposit its stores on the opposite side of the principal water-shed which crosses its path. Hence the curious fact of the transposition of seasons in the same latitude. As the harvest in such latitudes depends more on the supply of rain than anything else, people are reaping on the one side of the country whilst they are sowing and planting on the other. Certain parts of the country are liable to long continued droughts, because while very heavy rain-falls take place, the rain is confined to a particular part of the year. The country, however, is admirably adapted

for the storage of water. In many places one meets with the successive beds of dried-up lakes, with a narrow outlet at the lower ends, through which a periodic stream flows. By closing up this outlet, artificial lakes or dams may be formed to almost any extent, and of unlimited number; and from the steepness of the slope, the lands lower down admit easily of being laid under water.

As regards minerals, the diamond fields are in Griqualand (q.v.), till recently beyond the limits of the colony, and in the free state. In 1874, the lieutenant of West Griqualand issued an order for the better management of diggings and mines of precious stones and minerals, in which he requires that miners shall have a certificate, dealers a license, and the mines be under official inspection. This ordinance created a great outcry against it by a great body of dealers, but it seems necessary that such protection should shield the weak and the dealer who wishes to trade according to recognized law. Gold is confidently reported to have been found in the Transvaal in payable quantities; but the only mineral within the colony which has greatly added to its wealth is the rich copper ore found in Namaqualand.

There is in the colony almost a total want of navigable rivers, but the system of railways is rapidly extending. Already the copper mines are connected with Port Nolloth; the line which connected Cape Town with Wellington has been carried forward to Worcester. When completed, it will be a trunk line extending from one end of the colony to the other. Another line has been begun at Port Elizabeth, in order that it may pierce the gaps in the mountain regions, and open up the way to the country behind them. A line is projected from East London with a similar view. The shipping at Cape Town is now secure by a breakwater and docks. The same cannot be said of Port Elizabeth, East London, and the Kowie; but measures are being taken which, it is hoped, will result in making these also safe from the fierce s.e. winds.

This splendid country is at present occupied by an assemblage of very varied races. The Portuguese were the first Europeans who landed here. The Dutch are probably still the most numerous, notwithstanding the exodus to the Orange river free state, prompted by the slave question. Next in number are the English, by whom some parts of the country, particularly in the e., are occupied almost exclusively. The French are also largely represented, many refugees having settled in it subsequently to the revocation of the edict of Nantes, but they are now nearly absorbed in the Dutch population. They were at first located principally in the w., where they introduced the culture of the vine, but their names are now found in almost every part of the land. There is also a considerable importation of Germans, who have been settled on the frontiers adjoining the Kaffirs for defensive purposes. As regards the colored inhabitants, large numbers of Kaffirs have been retained in the districts which they formerly occupied, and others have come into the country as shepherds and servants. There is a large number of people of Malay origin in and around Cape Town, and in towns on the e. coast, who gain a livelihood as fishermen, porters, and the more laborious sorts of skilled labor. There are a few Mozambiqueres and Hottentots, besides a number of half-castes, to whom the name of *Africander* properly belongs.

The constitution of the country, after several changes, was fixed in its present form, by an act passed by the colonial legislature in 1872, which provides for responsible government. There are two elective chambers, the upper house, consisting of 21 members, 11 of whom represent the western province as one constituency, and 10 the eastern. They are presided over by the lord chief-justice. To the lower house, or house of assembly, two representatives are appointed by each division of the colony, with the exception of the Cape district, which, as being more populous, returns four. They amount in all to 68, and are presided over by a speaker of their own choice. The 16 electoral divisions into which the western and eastern provinces are each divided, are again subdivided for magisterial and fiscal purposes. The governor carries on the administration along with a ministry of 5 members—the colonial secretary, the attorney-general, the treasurer-general, the commissioner of crown lands and public works, the secretary for native affairs. The supreme court, which has its sittings in Cape Town, has two judges beside the lord chief-justice. Another court holds its sittings in Graham's Town, in which there are two judges only, but there lies an appeal to the supreme court. In other parts of the colony, justice is administered by the judges going on circuit. A colonial university has recently been founded.

Wool is the staple product of the colony; ostrich farming and the culture of the vine are carried on. The following tables show the exports and imports of the colony for recent years:

	Imports.	Exports.
1870.....	£2,352,043	£2,453,768
1874.....	5,725,412	4,468,747
1877.....	5,158,348	3,634,073

The Cape Colony is not exceptional in showing a decline in imports and exports in 1877; but the insecurity caused by the troubles ending in the Zulu war of 1879 has told against the prosperity of the colony. The official tables include in the returns of revenue also the loans raised by the government; the increase since 1873 is accordingly not to be regarded as normal.

	Revenue.	Expenditure.
1870.....	£831,211	£795,695
1873.....	2,078,220	2,159,658
1875.....	2,246,179	2,272,275
1877.....	2,631,602	3,428,392

CAPE PALMAS, the s. extremity of Liberia, Africa, 4° 27' n., 7° 44' west. This was the point at which the Maryland colony of free colored emigrants settled in 1834. The surrounding country is one of the Liberian states, and is called Maryland. There is a light-house on the cape.

CAPE PRINCE OF WALES, in Behring sea, the w. point of the mainland of Alaska, directly opposite to East cape in Siberia, the strait between the two being the narrowest water between America and Asia. The cape is a few miles s. of the Arctic circle, and terminates in a bold bluff, n. of which are dangerous shoals.

CAPE RACE, the s.e. point of Newfoundland, usually the first American land seen by steamers from England, 46° 40' n., 52° 54' west. There is a revolving light 180 ft. above the sea. The cape terminates in a bold rough headland.

CAPERCAIL'ZIE, **CAPERCAILLIE**, **WOOD-GROUSE**, or **COCK OF THE WOODS** (*tetrao urogallus*), the largest of the gallinaceous birds of Europe. It is a species of grouse (q. v.), almost equal in size to the turkey; the male, which is the largest, sometimes weighing fifteen pounds or more. In figure and appearance, it much resembles the black-cock, but the tail of the male C. is rounded, and not forked, as in that species; and the male C. has the feathers of the head elongated. The general color of the adult male is brownish black, minutely freckled with grayish white, and with lighter brown; the quill-feathers dark brown; the tail-feathers nearly black, some of the longer tail-coverts on the sides of the tail tipped with white; the chest is of a shining dark green; there is a small scarlet patch of naked skin above the eye, and the bill is whitish. The general color of the female and of young males is dark brown, freckled with yellowish brown; the front of the neck and the chest are yellowish chestnut; and the feathers of the under parts are generally edged with white. The C. has the feet feathered to the toes, but the toes are naked. It is an inhabitant of pine-woods; feeds on berries, seeds, worms, insects, etc., and on the young shoots of the pine, greatly preferring the Scotch fir to the spruce; occasionally also eating, at least in winter, the buds of the birch and other trees. The female makes her nest on the ground, and lays from six to twelve eggs, of a pale reddish or yellowish brown, spotted with other shades of brown, and more than 2 in. long. Like the black-cock, the C. is polygamous.—The geographical distribution of the C. is very extensive: it is found on the pine-covered mountains of all parts of Europe, from Spain and Italy almost to the North cape, and is abundant in the northern parts of Asia. It was at one time found both in Scotland and Ireland, but was completely extirpated about the end of the 18th or beginning of the 19th century. Through the exertions, however, of the earl of Fife and other proprietors of great Highland estates, but particularly of the marquis of Breadalbane, it has again been restored to the forests of the Highlands of Scotland. The C. is very capable of domestication, and breeds readily, if allowed the range of a space containing a few pine-trees. It is much esteemed for the table. The market of Stockholm is well supplied with it in winter; and since the establishment of steam communication, it has been regularly brought from Scandinavia to London.

CAPE RIVER, properly *Vauks*, taking its popular name from the proximity of its mouth to cape Gracias a Dios, on the e. reach of the Mosquito shore in Central America. After a generally n.e. course of nearly 300 m., it enters the Caribbean sea, about lat. 14° 59' n., and long. 83° 11' w., being navigable for a considerable distance upwards.

CAPERNAÛM, meaning "the field of repentance," or "city of comfort," was in the time of our Savior a favorite and exalted city, and one of the three which he upbraided "because they repented not." It was situated on the north-western coast of the sea of Galilee, or lake of Gennesareth. It is now a heap of ruins, extending more than a mile along the shore and back towards the mountains, so overgrown with grass and bushes, that it is difficult to move among them. C. is called by the natives of Syria Tell-hûn.

CAPERS are the pickled flower-buds of the caper-bush (*capparis spinosa*). They have an agreeable pungency of taste, with a slight bitterness, and have long been in very general use as a condiment and ingredient of sauces, along with boiled mutton and other kinds of food. They possess medicinal properties, being antiscorbutic, stimulant, and laxative. They are of a grayish green color, to improve which, however, copper is sometimes used, as in the case of gherkins and other pickles, rendering them poisonous. This can be detected by thrusting a polished iron rod into the vessel which contains the C.; the surface of the rod soon becoming coated with copper, if it is present.—The caper-bush is a native of the s. of Europe, and other countries near the Mediterranean. It is extensively cultivated in some parts of the s. of France and in Italy, but most of all in Sicily. It succeeds in the open air even at Paris, but in Britain requires the aid of artificial heat. It is a trailing, rambling shrub, loving dry places, and often growing on rocks or walls, adding a fresh charm of beauty to many an ancient

ruin. It begins to flower early in summer, and continues flowering till winter. The buds are gathered every morning, and are immediately put into vinegar and salt: at the end of the season, they are sorted according to their size and color, the greenest and least expanded being the best, and are again put into vinegar, the finest being sent to the market in bottles, the coarser in small barrels. The fruit, which is a small berry, is also pickled in the s. of Italy. The flower-buds of the caper of Mount Sinai (*capparis Sinaica*) are pickled like those of the common species; the seeds are also pickled, and are called by a name signifying mountain pepper. The fruit of *capparis aphylla* is made into a pickle in India. Species of *capparis* are numerous in India, the warm parts of America, etc. See CAPPARIDÆ.—Various substitutes for C. are sometimes used, as the flower-buds of the marsh marigold (*caltha palustris*), those of the Indian cress (*tropæolum majus*), and those of the bean caper (*zygophyllum fabago*).

CAPERS, WILLIAM, D.D., 1790-1855; a Methodist minister of South Carolina, in early life a missionary among the Indians in Georgia. He was for several years presiding elder in Charleston, where he edited the *Wesleyan Journal*, afterwards merged in *Zion's Herald*, and still later changed to the *Christian Advocate and Journal*, of New York. In 1838, he was representative to the Wesleyan conference in England, and in 1855 was chosen professor of the evidences of Christianity in the South Carolina university. In 1846, he was elected bishop, and filled the office until his death.

CAPE SABLE, the s. point of the mainland of Florida, and the s.e. extremity of the mainland of the United States, 26° 55' n., 81° 15' west. The cape is occupied by fort Poinsett.

CAPE SABLE, the s. point of Nova Scotia, 43° 26' n., 66° 38' west. There is a light on Cape Sable island, which island has a pop. of about 600 fishermen.

CAPE SAN LUCAS, the s. point of the peninsula of Lower California, 22° 44' n. 109° 54' west. Directly e. across the gulf is the Mexican port and city of Mazatlan.

CAPE SAN ROQUE, in n.e. Brazil, in the province of Rio Grande, 5° 28' s., 35° 16' west. Behind the cape is a bay, on which is the town of St. Joseph.

CAPE SPARTIVENTO, in s. Italy, in the Mediterranean, 37° 57' n., 16° 5' east. The ancients called it "Hercules' Promontorium," and supposed it to be the most southerly point of Italy.

CAPE ST. VINCENT, a headland forming the s.w. extremity of Portugal, in lat. 37° 2' n., long. 9° w., is celebrated on account of two naval battles in which British ships were engaged, fought off it, one in 1693, the other in 1797. In the former, admiral Rooke, who with some 20 English and Dutch men-of-war was conveying a fleet of some 400 merchantmen, was attacked off this point by the French admiral De Tourville, and after a running fight lost several ships and 80 merchantmen. In Feb. 1797, sir John Jervis, with a fleet of 15 sail, gave battle to a Spanish fleet of 27 sail of the line, and defeated them, capturing four ships and driving the rest into Cadiz bay, where they were blockaded.

CAPE ST. VINCENT, the s.w. extremity of Portugal, 37° 2' n., 9° west. Off the cape, Feb. 14, 1797, the English admiral Jervis defeated a Spanish fleet much larger than his own.

CAPETIAN DYNASTY, the third Frankish dynasty, founded about the close of the 10th c., when Hugo Capet ascended the throne. The surname **CAPET** has been derived from *cappetus*, "a monk's hood," because, though duke of France, Hugo was also abbot of St. Martin de Tours. On the death of the last Carolingian monarch (Louis V., surnamed *Le Fainéant*—i.e., the Slothful), Hugo, the most powerful of French vassals, seized the throne, and by moderation and prudent concessions made to the authorities of the church, as well as to his brother-nobles, who had made themselves independent, contrived to retain the power he had seized. He was crowned at Noyon, July 3, 987. In order to establish his dynasty, Hugo caused his eldest son Robert to be crowned as co-regent, 988. Capet first made Paris the capital of France. He died in 996; when his son Robert, a well-disposed but feeble ruler, ascended the throne, who died 1031, beloved by his domestics, but despised by his neighbors and vassals, forgotten by his people, and permitting all power to vanish from his hands. It was during his long lethargic reign that the towns and cities of France began to form themselves into corporations, to act in their own name, to contract obligations, and lay the foundations of middle-class freedom. In many other ways, also, the happy dissolution of royal power sowed the seeds of national prosperity. Robert's sons were Henry, who succeeded him, and Robert, ancestor of the older house of Burgundy.

Henry left two sons—Philippe I., who ascended the throne, and Hugo, who distinguished himself in the first crusade (1096), and died 1102. Philippe, under the regency of Baldwin, count of Flanders, came to the throne when only eight years old, and first really began to reign after the death of the regent (1066). He took hardly any part in the great movements and events of his times, but supported Robert, son of William the conqueror, in his rebellion against his father. Consequently, William commenced an expedition against Paris, and would probably have dethroned Philippe, but died in

1089. By his dissolute course of life, Philippe fell under a sentence of excommunication issued by pope Gregory VII. in 1094, and, after doing penance, died in 1108.

His successor, Louis VI., surnamed *Le Gros*, had, during Philippe's lifetime, been active in the support of the crown, and now extended the royal power, which had been almost entirely confined within the duchy of Paris. By bold and vigorous measures he brought everywhere his vassals into real subjection to his authority, liberated the towns from baronial oppression, partly abolished feudal bondage, and extended considerably the jurisdiction of the crown. His life was an almost incessant contest with the small and turbulent vassals who had rioted in the license afforded them by the weakness of his predecessors. He died 1137, leaving a numerous family.

As his eldest son and co-regent, Philippe, had died during the reign of Louis, his second son, Louis VII., *le Jeune*, now came to the throne, and by his marriage with Eleanor of Guienne, heiress of the duke of Aquitaine, gained a considerable accession to the power of the crown. He engaged in the second crusade, and led 100,000 men to the east; but was unsuccessful, and returned to France after an absence of two years. In 1152, he divorced his unfaithful wife Eleanor, who subsequently married Henry Plantagenet, afterwards Henry II. of England. This marriage made Henry far more powerful than the king of France, and Louis would probably have lost his crown had not the disturbances in England—the quarrels with Becket and with his own sons—proved sufficient to occupy Henry's attention. Louis le Jeune died 1180.

Philippe Auguste (q.v.), his son by a third marriage, ascended the throne ten months before his father's death, and proved himself the most able ruler of the Capetian dynasty. Against the wishes of his family, he married Isabelle of Hainault, great-granddaughter of the last of the Carolingians, and thus finally united the two houses. His successor, Louis VIII., who died 1226, was said to have been poisoned by the count of Champagne, paramour of the queen, Blanca of Castile. Louis VIII. was followed by his son, Louis IX. (SAINT LOUIS, q.v.), who died at Tunis, 1270. Of the eleven children of St. Louis, the eldest, Louis, died aged 16 years, while the youngest, Robert, became the founder of the Bourbon dynasty (see BOURBON). The second son, Philippe III., *le hardi*, succeeded his father, and, by the decease of two brothers and two uncles, acquired possession of Poitou, Auvergne, and Toulouse. His son (Philippe IV., *le bel*) acquired by marriage Champagne with Navarre. These acquisitions, and his attempt to secure for his uncle, Charles of Anjou, the throne of Naples, involved Philippe III. in contentions with Italy and Spain. He subjugated Navarre, 1276, and died of the plague in 1285. Philippe IV., *le bel*, succeeded to the throne when 17 years old. He soon gave signs of a despotic character, plundered the estates of the church, defied papal authority, persecuted the order of Templars (q.v.), and removed the residence of the pope to Avignon. The atrocious act of burning the grand-master, with sixty knights, of the order of Templars, after they had recalled all the confessions drawn from them by torture, has left an ineffaceable blot on the name of Philippe le bel. He died 1314, and left three sons and a daughter.

The eldest son, Louis X., *le hutin*, who ascended the throne, displayed remarkable weakness of character, and died 1316. He was succeeded by Philippe V., *le long*, second son of Philippe le bel, who died without issue. By his death (1322) the crown came to Charles IV., *le bel*, third son of Philippe le bel, and the last of the direct line of the Capetian kings. He died 1328, leaving by his third marriage a daughter, named Blanche, who married Philippe, duke of Orleans, and died (1392) leaving no issue. Isabelle (daughter of Philippe le bel) married Edward II. of England, and was mother of Edward III., who consequently took the title of king of France, which was retained by the kings of England until the reign of George III.; but Philippe of Valois, cousin of the last Capetian king, and grandson of Philippe III., *le hardi*, claimed the crown of France by virtue of the Salic law, and so founded the dynasty of Valois (q.v.).

CAPE TITMOUSE, *Rarus capeusis*, a small bird of the cape of Good Hope, remarkable for its curious nest, which is built of cotton or other fiber in the form of a bottle, and suspended from the limb of a tree. On the outside, near the opening, is built a pouch or pocket, in which the male bird rests while the female is on the nest, and when she leaves he manages by strokes of his wings to close the mouth of the nest, to prevent intrusion while they are in search of food.

CAPE TOWN, the capital of Cape Colony, faces Table bay to the n.e., is flanked by the mountain Lion's Head, with its continuation to Lion's Rump or Signal hill, and has behind it the precipices of Table mountain. Its lat. is 33° 56' s., its long. 18° 28' 7" east. Its mean temperature 58.3° F. for winter, 76.6° for summer, and 67.3° for the whole year. Pop. 40,000. Two lines of passenger wagons connect it with the diamond fields, which are reached in about a week, railways with Worcester, etc., and electric telegraphs with the principal parts of the colony. It is the principal port for the coasting trade as well as foreign exports and imports; is well supplied with fish, as well as meat, dairy produce, and every sort of fruit and vegetables, at a moderate price. It has a supply of fresh water of excellent quality. C. T. is the seat of the government, the supreme court, and a college and university. All the churches are well represented—the English Episcopal, the Roman Catholic, and representatives of Presbyterians, Lutherans, Wesleyans, Congregationalists, a Free church (chiefly an off-break from the Dutch church), a Jewish

synagogue, and a Mohammedan mosque, the Malay population being of that faith. There are also banks and insurance offices. The town is built upon a double slope, which subsides into a plain on the n.e. side. Its streets, at right angles to each other, are lined with houses, for the most part of an eastern type, with heavy walls, flat roofs, and large public apartments, interspersed with increasing numbers of shops and warehouses, of the sort to be met with in England.

The most remarkable structures are the breakwater, with the docks and patent slip; the castle, with its outworks and bastions; the barracks for the military, the Roman Catholic cathedral, with a few other places of worship; the museum and library, with the Botanic gardens in front; and between it and Government house, a park, with its avenues shaded by stately oaks. Out of town, a little distance to the n.w., is Somerset hospital, and the Royal observatory, about two and a half m. to the n.e.

C. T. returns four members to the colonial assembly. The municipality is administered by a town-council of 18 members—three from each of six separate districts—and is presided over by a mayor elected annually by the council. In Sept., 1872, it possessed 44 vessels, and their united tonnage was 4,416. There are 5 newspapers in C. T., which are issued three times a week; 2 bi-weeklies, 1 weekly, 1 fortnightly, and 3 monthly magazines.

CAPE TRAFALGAR. See **TRAFALGAR**, *ante*.

CAPE VERD, the most westerly headland in Africa, jutting out into the Atlantic ocean, between the rivers Gambia and Senegal, in lat. 14° 43' n., long. 17° 34' west. It was discovered by the Portuguese about 1445, and is said to have derived its name from a group of gigantic baobab trees which adorns its summit.

CAPE VERD ISLANDS (*Ilhas Verdes*), a group of islands belonging to Portugal, lying in lat. 14° 45' to 17° 19' n., and long. 22° 45' to 25° 25' w., and distant about 320 m. w. of the cape from which they take their name. The principal islands are ten—viz., Santiago, the largest and most important, Fogo, Brava, Maio, Boavista, San Nicolão, San Antonio, San Vicente, San Luzia, and Sal. There are besides four islets, barren and uninhabited. The total area is about 1700 sq. m., with a pop. (1872) of 76,000. The islands are all very mountainous, and owe their origin to the action of submarine volcanoes. The highest elevation is reached in a volcanic peak, 9,157 ft. above the sea, on the island of Fogo, and which is still active. The climate is unhealthy during the rainy season. Though water is deficient, vegetation is luxuriant, yielding African and southern European products. Sugar, cotton, coffee, tobacco, and indigo are grown, and the trade in archil, monopolized by government, has in some seasons yielded as much as £24,000. Several of the European domestic animals thrive well. Turtles are abundant in the surrounding seas, and whales also are fished by British and American vessels. Amber is found on the coasts, and great quantities of salt formed by solar evaporation is obtained from the lagoons on the shores, especially on the island of Sal. The inhabitants, who are mostly negroes, indolent but harmless, speak a corrupted form of Portuguese, called *Lingua Creoula*. The revenue for 1874-75 was estimated at about £43,000, and the expenditure for the same year at £42,000. The islands are under a governor-general, exercising both civil and military authority. The chief ports are Porto Praya, on the island of Santiago, and Porto Grande, the best harbor in the whole group, on the island of San Vicente. The islands were discovered about the middle of the 15th c. by the Portuguese, who shortly after colonized them.

CAPE VINCENT, a t. in Jefferson co., N. Y., on the St. Lawrence river; pop. of township, '75, 3,180. The village is a port of entry; is in connection with Watertown by railroad, and with Kingston, Canada, by ferry.

CAPE WRATH, a pyramidal promontory of unrivaled wildness and grandeur, forming the n.w. extremity of Scotland and of Sutherland, and running out into the Atlantic, in lat. 58° 38' n., and long. 4° 58' 5" west. It consists of gneiss, with beds of dark hornblende rock, is intersected by complex granite veins, and presents deep fissures and tall pinnacles. From it a reef of rocks, perforated with arches and caverns, juts out into the sea. Off the cape is Stag Rock, a pillar 200 ft. high. C. W. is 600 ft. high, and there is a light-house near it, 400 ft. above the sea, and seen 25 m. off. From the cape can be seen N. Rona, 50 m. off; Hoy Head, Orkney; the Butt of Lewis; and a grand panorama of mountains in Sutherland.

CAPIAS, in the practice of the English common law, is a writ directed against the person, and so called from the commencement of the process in the old Latin form. It has various applications, the principal of which are the following:

CAPIAS AD RESPONDENDUM is a writ which a plaintiff, after action, may sue out upon affidavit against a defendant who, there is reason to believe, is about to quit England, and against whom there is a cause of action to the amount of £50 or upwards, whether as matter of contract or of damage. The writ directs the sheriff to arrest the defendant, who remains in custody on such arrest until he shall have either given a bail-bond with reasonable sureties. This arrest is only when the defendant's absence will prejudice plaintiff.

CAPIAS AD SATISFACIENDUM, or **CA. SA.** This is one of the writs by which a plaintiff can put a judgment recovered by him in execution. The object of it is to imprison

the debtor till satisfaction, when imprisonment is still permitted. See on the subject of *Capias* generally, APPREHEND, ARREST, ATTACHMENT, EXECUTION, and BAIL.

CAPILLAIRE, a medicinal syrup, used as a pectoral in chronic catarrhs, is prepared by adding sugar and orange-flower water to an infusion of the fern called maidenhair (q.v.), or by pouring boiling syrup on the fern.

CAPILLARIES. The tubes which convey the blood from the left side of the heart to the various parts of the body are termed arteries, while those which return it to the right side of the heart, after it has discharged its various functions in the body, are known as veins. The name of capillary (from *capilla*, a hair) is given to the minute vessels which form the connection between the terminal branches of the arteries and the commencements of the trunks of the veins. These little vessels are of various sizes, some admitting only one blood-corpuscle at once, while others are large enough to allow of the simultaneous passage of two, three, or more corpuscles. In the muscular tissue their average diameter is 0.003 of a line; they are smallest in the brain, and largest in bone. Their arrangement varies in different parts. In some cases, as in muscular tissue, they run for the most part parallel to one another; in other cases (as around fat-cells) they have a spherical arrangement, and in the skin and in parts of the intestines they form loops; and many other forms of distribution might be mentioned. These various arrangements have been discovered by the microscopic examination of tissues that have been successfully injected with colored fluids.

The circulation of the blood through the C. may be readily seen in the web between the toes of the hind-foot of the frog, in the tongue of that animal, in the tail or gills of the tadpole, in the wing of the bat, etc.

The principal uses of the capillary system of vessels will be noticed in the articles on DIGESTION, NUTRITION, RESPIRATION, and SECRETION.

CAPILLARY ACTION. When a clean glass tube with a fine bore, open at both ends, is plunged into a liquid capable of wetting it, such as water, the liquid is found (1) to rise in the tube above the level of its surface in the vessel containing it; (2) to rise the higher in the tube above that level the finer its bore is; (3) to stand above the general level in the tube where it approaches the sides (as in fig. 1, which is drawn on a greatly exaggerated scale), so that its upper surface in the tube is curved and concave. When a similar tube is plunged into a liquid incapable of wetting it, such as mercury, phenomena of a precisely opposite nature are presented. The liquid stands in the tube below the level of its surface in the vessel; and, where it approaches the sides of the tube, it stands below its general level in the tube, so that its upper surface is curved and convex as in fig. 2, the convexity and depression in the tube increasing with the fineness of its bore. While such is the case with the two classes of liquids described, there are others on which fine tubes have no action, so that they stand in such tubes

Fig. 1.

Fig. 2.

at the same level as in the vessel, and with plane upper surfaces. These are the leading phenomena to be explained by what is called C. A., the tubes with fine hair-like bores being called capillary tubes, from Lat. *capillus*, a hair. The phenomena, however, though connected by name with such tubes, are not dependent on them, but may be produced without their intervention by any contrivance which gives room for the so-called capillary action. For instance, if two plates of glass with parallel faces be placed together with two of their edges in contact, and the two opposite be separated a very little by a fine wedge; and then if they be put standing with their common edge

Fig. 3.

vertical in a trough (fig. 3), containing a little colored fluid capable of wetting the glass, the fluid will rise between the plates, the height attained at any point being inversely as the distance between the plates at that point, so that its upper surface will be a curve of the kind known as the hyperbola—being highest near the common edge, and lowest near the edges separated by the wedge. If the same apparatus be placed in a trough containing mercury, the mercury will be depressed between the plates till its upper surface forms a hyperbola convex to the zenith.

To understand the peculiar action producing these phenomena, it must be kept in view that the surface of a fluid at rest under gravity is a horizontal plane (see HYDROSTATICS), and that this plane is maintained by gravity and the mutual attractions of the particles of the fluid mass. Suppose now a fluid at rest in a vessel to have a foreign body, such as a capillary tube, suddenly plunged into it, and separating, as by walls, a portion of the fluid from the rest. By cohesion (q.v.), the fluid particles inside the tube will be held on—drawn downwards—to the mass of the fluid, while by adhesion (q.v.) they will be drawn upwards towards the sides of the tube. By the ordinary action of gravity, as in tubes of a large size, the fluid will at once tend to rise in the tube to its level in the vessel. Whether it will succeed in doing so, or whether it will rise still higher, must depend on the adjustment of the forces of cohesion between the fluid particles and their

adhesion to the solid of the tube. The relation of these forces may be generally explained as follows: Let mm' (fig. 4) be the surface of the column, mn , of a liquid contained in a space, $abb'a'$, above or below the surface, nn' , of the external liquid. There being equilibrium between the liquid in the tube and in the vessel, any line of liquid particles may be taken and supposed to be detached from the rest and inclosed in a tube, without altering the forces exerted. Let the line included between the dotted lines be conceived so detached. The actions which the particles of the liquid in the tube exert on each other, or sustain from the sides of the tube, have no tendency to make the liquid move either up or down. But the column, mb , in the tube has some action exerted on it by the sides of the tube above the surface, mm' . Let A , depending on the force of adhesion, represent this upward action of the tube. The column is also attracted downwards by the detached column bc , i. e., by the liquid in the imaginary tube. Let C , depending on the force of cohesion, represent this downward action of the liquid. Also the part bc of the liquid is attracted upwards by the tube ab by the attraction which we have represented by A . Thus the liquid column is acted on by two upward actions $=2A$, and a downward action, C . The whole force acting on it, excluding gravity, is $2A - C$. Gravity would make the liquid rise to nn' at once, i. e., till it stood as high in the tube as in the vessel. Whether, then, it will rise above nn' , or be depressed below it, must depend on whether $2A$ is greater than C , equal to it, or less than it. If $2A = C$, the liquid will stand in the tube at the level nn' , as if these forces did not act at all. If $2A > C$, then $2A - C$ will be an upward force, and the column will be raised above the level nn' . If $2A < C$, then $2A - C$ will be a downward force, and the column be depressed.

Fig. 4.

Regarding the forms of the upper surfaces of columns of liquid in capillary tubes, it can be demonstrated mathematically that the same relations of the forces of attraction and cohesion which determine the elevation or depression of the liquid column, determine also the form of its upper surface in the two cases of elevation and depression. In fact, the case of the elevated column resembles that of a cylinder of any very elastic substance (so elastic as to suffer change of form very readily under pressure), supported wholly by the rim at one of its ends; or, what is the same thing, by vertical forces acting in the lines composing its outer surface. Gravity draws down the concentric shells, of which the cylinder may be conceived to be composed, the further the more remote they are from the outermost, or that which is directly supported, the central rod being the most depressed. It would appear that the form of the surface has an important bearing on the cause of the production of the whole phenomena.

The third fact of observation—viz., that the liquid rises higher or is more depressed the finer the bore of the tube—is thus explained in the case of elevation: Since the action of adhesion is confined to the superficial layer of the fluid, and between the same substances is, *ceteris paribus*, constant in quantity for an equal extent of surface, the wider the tube the shorter must be the column sustained, as the contents of the column raised by cohesion increase more rapidly when the bore increases than the attracting surface. The column increases with the square of the diameter of the tube, while the attracting surface increases only with the diameter. The height, therefore, is inversely as the breadth of the tube. That the depression must increase as the bore of the tube diminishes, appears from reasoning similar to that employed in the case just discussed.

The degree of elevation varies with the nature of the fluid, the variation depending partly on the difference of cohesion between the particles of the fluid, and partly on the difference of adhesion between the fluid and glass. It is found that temperature affects these forces, so that the height diminishes as the temperature rises.

The depression of mercury in a fine glass tube makes it necessary to use a correction in reading off the height of the mercurial column in the barometer, which, owing to it, stands always a little lower than the height due to the atmospheric pressure. Experience, however, has shown that the capillary depression is nearly one-half less in tubes which have had the mercury boiled within them than in unboiled tubes, as by the boiling a film of air, which in unboiled tubes adheres to the glass, is expelled. By widening the bore of the tube also, the error may be diminished so as to be neglected altogether. In a tube of $\frac{1}{4}$ in. in diameter, in which the mercury has been boiled, the depression is 0.02 in., while with a similar tube of $\frac{1}{2}$ in. diameter it is only 0.003. The depression of mercury, it is found, is slightly increased by an elevation of temperature. It may be mentioned that in reading off the level of mercury in any instrument, such as the barometer, the height should be taken from the convexity of the curve. If the liquid used in the instrument, however, wets the tube, the height should be taken from the concavity.

As already stated, the phenomena are not dependent on the intervention of tubes; any capillary cavity suffices to produce them. When two light bodies, such as two bits of cork, are left to float on water, near each other, they soon come together, moving at last with a rush. This is sometimes given as an example of the gravitation that draws

the planets to the sun; but it is really owing to this capillary action that we are considering. When the liquid wets the floating bodies, it rises slightly all round them, and this sustained liquid hangs as a weight on them on all sides. So long as it rises equally there is no motion; but when the bodies come near each other, the space between them becomes like part of the inside of a capillary tube, the water rises higher there than on the other sides, and the bodies move towards the sides that are most strongly pulled. When the floating bodies are not wetted by the liquid, the surface between the two bodies is depressed, as that of mercury is inside a glass tube, and the bodies descend, as it were, down the opposing slopes, and meet in the bottom of the hollow. If one of two bodies floating on water is smeared with oil so as to prevent the water from adhering, instead of coming together, the two will recede from each other, for reasons analogous to the above.

C. A. plays a most important part in nature in a great variety of ways. An instance of its employment by man is seen in the wicks of lamps and candles, which, being composed of fibrous materials, furnish hair-like channels by which the melted oil is elevated to the flame, and supplied as fast as it is consumed. C. A. influences the circulation of fluids in the porous tissues of animals, and it is the principal mode in which water, with the various substances which it holds in solution, is supplied to the roots of growing plants. It is through it that in summer droughts moisture is raised to the surface for the maintenance of vegetable life. C. A., too, affects many phenomena usually considered under the head DIFFUSION (q.v.) of fluids and gases. The reader, on referring to the article OSMOTIC ACTION, will also see that it enters into the explanation of the phenomena known as exosmose and endosmose.

A familiar illustration of C. A. is furnished when one end of a towel happens to be left in a basin of water, while the other hangs over the side below the level of the water; the basin is soon emptied of its contents. It is important to observe that, although the towel will become wet, not a drop will flow from it, unless the outside end reach below the level of the water in the basin. In this respect C. A. resembles that of the siphon. And this shows the error of supposing that water may rise through the earth by C. A., and flow out as springs at a higher level than the source whence it is drawn.

Some very interesting experiments have been made by M. Poisenille (*Ann. de Chimie et de Phys.* III. xxi. 76) concerning the flow of liquids through capillary tubes, the results of which must here be stated. It appears that when the tube exceeds a certain length—which is greater as the bore increases—the following laws regulate the rate of efflux of the liquid, the efflux taking place under pressure: 1. The flow increases directly as the pressure, so that under double the pressure, double the amount is discharged in equal times. 2. In tubes of equal diameter, the quantities discharged vary inversely as the length of the tube. If a tube 2 in. long discharge 100 grains in 5 minutes, a tube 4 in. long will only discharge 50 grains. 3. In tubes of equal lengths, but different diameters, the flow is as the fourth power of the diameters. If one be $\frac{1}{10}$ of an inch in bore, and the other $\frac{1}{100}$, the efflux from the larger will be 16 times as great as from the smaller. It is further found that the efflux varies with the nature of the liquid, the material of the tube not appearing to affect the result in any great degree. No law of the rate of efflux has yet been discovered, depending on the density, capillarity, or fluidity of the fluids.

It may be mentioned, in conclusion, that the tubes to be used in the experiments on capillarity should be perfectly clean and dry. If wetted, the film of moisture on the tube forms a new tube, and the action will be the same as with a tube of the substance forming the film. The reader should consult Miller's *Elements of Chemistry*, and J. Clerk Maxwell's *Theory of Heat*, where the phenomena are treated from a different point of view; the phrases "superficial energy" and "superficial tension" being substituted for "capillarity," and the hypothesis of molecular attraction being avoided.

CAPISTRA'NO, GIOVANNI DI, 1386–1456; an Italian lawyer who became a Franciscan monk and a powerful and popular preacher. In 1450, the pope sent him to Germany to preach against the Hussites, and also to forward the projected crusade against the Turks, who threatened to overrun Europe. He failed to start the crusade, but in the siege of Belgrade he led the inhabitants with the cross in his hand in three successful sorties. He was canonized, and his tomb became a popular resort for pilgrims.

CAPITA, DISTRIBUTION PER—i.e., distribution by heads, or by numbers, equally—occurs in the case of several claimants to the property of a deceased person, all severally claiming in their own right, in equal degree of kindred, and not under any right of representation. See INHERITANCE, SUCCESSION.

CAPITAL (Lat. *capitulum*, from *caput*, the head), the head of a column, pilaster, etc. Till the period of the renaissance, the head of a column in English was called chapter (chapter), its diminutive being chapitrell. See COLUMN.

CAPITAL, in fortification, is an imaginary line dividing a defense-work into two similar and equal parts. The C. of a bastion is a right line drawn from the point or salient angle to the middle of the gorge or entrance in the rear. The C. of a ravelin is a right line drawn from the re-entering angle of the counterscarp to the salient angle of the ravelin.

CAPITAL, in geography, the principal city or town of a country, that in which the sovereign usually resides, and where the legislature meets, and the chief legal courts are held.

CAPITAL, in trade and political economy, is in its restricted sense applied to the money, or the property convertible into money, with which a trader or producer carries on his business. In this sense, Adam Smith and many other writers call it stock; and there is a convenience in having a separate term for expressing this sense of the word C., since it is totally different from its wider sense as an element in political economy. Many attempts have been made to define C. in its general sense, but with very imperfect success, since no sooner is a restrictive definition laid down, than some one can point at things which are C., and yet are not included in the definition. It has, for instance, been called the produce of past labor stored up and applied to the facilitating of future labor; but, as we shall see, many things become C. which the hand of man has never touched. There is no doubt, however, that the existence of C. arises out of the fact of labor or industry having been exercised; and perhaps a good general understanding of its character may be derived from treating it as the *impulse* or *impetus* which past industry gives to facilitate future industry. Wherever something is reserved from immediate consumption, and made to serve in future production, there is capital. We cannot have a better illustration than in the first bow and arrow made by the savage. He has expended on this machine for securing his food a portion of the time and labor which he might have given to the tedious task of catching his food with his own hands, and at this sacrifice he has obtained the means of more easily and economically obtaining it in future. All C. is not, however, *directly* made by the industry of the owner, or, indeed, by industry at all. The accidental finder of a diamond, or a pearl, worth £100, possesses so much capital. His acquisition, however, would have no value but for those productions of industry which it is permitted to represent, and if pearls and diamonds were often found, they would cease to be valuable; the trade of finding them is as laborious and as ill remunerated in the long-run as most others. The owner of a barren heath, which was intrinsically worth nothing, finds it become suddenly valuable by the progress of a large town; but it is the industry of that town which has given the value, and the owner having the good-fortune to have a hold on a portion of the produce of that industry, becomes a capitalist. It is impossible to enumerate all the elements of which C. in the general sense consists, or all the ways in which it can be made. Whatever thing done enables some other thing to be done which supplies any of the necessities or wishes of the human race becomes capital. Thus, the education and skill of the barrister, the physician, and the artist—the agility, acquired through long and toilsome practice, of the rope-dancer and the juggler—all are capital. It makes C. to shift the place of a thing, bringing it from where it is not, to where it *is*, wanted. So, also, the changing of a person's place may become C. to him, as where he leaves a district in which his trade is not required, or exceeds the demand, for one where he can pursue it to advantage. Successful emigration thus creates C., bringing into human use districts of land which previously lay useless. The total C. at any time in existence consists of an aggregate of the several capitals at the command of individuals or communities. But it is essential to any unit of C. that it should be sufficient for the purpose it is intended for, otherwise it may seem to be, but will not in reality be, a part of the general aggregate—it will, in fact, be lost. If an expenditure of £1000 be necessary to raise a sunk ship, and only £900 are expended, that sum, which might have been available for some other purpose, is lost. C., as distinguished from property or wealth, is a *moving force*; and if it be not sufficiently strong for accomplishing its purpose, it is lost. This is one of the most important truths in all political economy, since most of the great losses suffered by communities and individuals arise from undertakings for which they have not adequate C., or for which that which seems to be C. does not really turn out to be so. Perhaps the most memorable mistake of this kind ever made was when the French revolutionary government issued assignats (q.v.). These were ostensibly issued on a good security—namely, the security of the forfeited land. But, however valuable that land might be in the long-run, it was not available to pay the assignats; there was no purchaser for it; and the assignats consequently fell in value. Gold to a far less amount than the money value of the land—that is to say, than the price which would be paid for it when sold in the natural course of things—would have been a sufficient C. for the issue of these assignats. The same mistake is often exhibited on a small scale when a landed proprietor keeps together a large estate which he cannot afford to improve and cultivate properly. It loses its power of C. in his hands; and he would be much better off if he sold a portion of it for money to be invested in improvements on the remainder. Probably 19 out of every 20 bankruptcies arise from the bankrupts having undertaken enterprises beyond the reach of their C.—from over-trading, or over-speculating, as it is otherwise called. When speculation becomes epidemic, the whole community suffers from undertakings too great for its C., and a crisis occurs. Such was the great railway crisis of 1847. Parliament had, in the previous year, passed bills for the construction of railways, which, if they had all been made, would have cost upwards of £130,000,000—a sum which the country, rich as it was, could not afford to advance. Though it is an axiom that people cannot trade beyond their C., yet what can be accomplished by any

given amount of C. must depend on the skill and sagacity of the person employing it. Competition no doubt tends to equalize profits, but competition is itself a contest in which each tries to drive a more profitable trade than his neighbors, and some are more successful than others. A frequent element of success is the rapid circulation of C., by which it is made to return many profits, though perhaps small ones, in the course of the year. The trader who turns over his C. ten times at a profit of 3 per cent, makes more than he who draws a single profit of 10.

If the nature of C., as the produce of past and the promoter of future industry, were better understood by the working-classes, they would be saved from much unhappiness and mischief. Whatever C. may be to the rich man, it is bread itself to the working family. The withdrawal of the C. embarked in the cotton trade alone would starve millions; and yet many educated men have endeavored to teach working-people that C. is their natural enemy. Its strength may no doubt be sometimes used for evil purposes, but none save evil results can arise from destroying it. The only way in which any man can effectually protect himself from such mischief as he supposes it may do, is to save, and become a participator in it. Itself the result of industry, it is a more powerful instrument in the hands of him who has made it than in any other's. The savings of working-men are the best laid out C. in the world. The first pound laid past is the most profitable of all—it represents freedom from debt, and the capacity of its owner to purchase what he wants with ready money—a privilege probably bringing him a profit of many pounds, or many hundreds per cent upon his capital.

CAPITAL ACCOUNT—such is the name given to what concerns the capital stock of a railway or other public company. In authorizing a railway company—which we take as an example—parliament gives power to raise so much money by shares, and so much by borrowing. The amount that may be borrowed is equal to a third of the share stock, but it cannot be legally borrowed until at least one half of the share stock has been paid up. The form of borrowing is that of giving a mortgage on the whole property of the railway; the deed of mortgage, which is called a debenture, expresses the sum lent, the rate of interest that is to be paid, and the period for which the loan is given. See **DEBENTURE**. Unitedly, the money got for shares and by debentures forms the capital of the company; and, deposited in a bank, constitutes the *capital account*. On this fund the directors of the company make draughts to pay for the land, and all the works connected with the line, as also rails, locomotives, carriages, and, in short, everything involved in perfecting the railway up to the point of working. From the first, the holders of debentures receive interest, which must be paid in all circumstances, and the principal must be returned at the conclusion of the period for which it has been borrowed; at least, such are the ordinary obligations towards debenture holders. For the share part of the capital no return is made till the railway has been in operation, and drawings come in from the traffic.

As soon as traffic commences, there begins a new account called the *revenue account*, and which, kept in the same or a different bank, has no connection with the capital account. This, it may be judged, at once introduces a great complexity into the financial affairs of railways. In ordinary businesses, the profits of a concern are the free proceeds after deducting interest on capital and all expenses; and no attempt is made to keep two accounts, or to detach one part of the revenue from the other. As shareholders in a railway occupy the position of partners in a business, it might be expected that they would receive a divisible part of the proceeds equal to their respective claims after all expenses whatsoever had been paid. This is not the plan usually adopted. In general, the shareholders are only temporary partners; they buy shares in order to sell them at an advance. What they mainly look to is the rise on shares in the market, and therefore any process of management which can promote this important object meets their approval. Hence, the keeping of two accounts, two bank pass-books, and two books of checks. From the revenue account are drawn all payments for wages, rates, and taxes, coke, oil, and other petty furnishings, also repairs on carriages and locomotives, maintenance of way, and general management. What remains is the fund, whence is paid, first, the interest on debentures, and second, the dividend of the shareholders. From the C. A. are drawn all other outlays: first, the repayment of principal to debenture holders, and, second, the expenditure for new carriages and locomotives, new rails, and other substantial repairs upon and additions to the plant. As all railway traffic exceeds the expectations formed respecting it, the demands on the C. A. for fresh additions of one kind or other become exceedingly onerous. Were the shareholders to look to ultimate advantages, they would sanction the payment for permanent improvements out of the current revenue; but, as has been stated, shareholders for the most part care nothing for the remote and contingent prosperity of the undertaking, and will not or cannot make a corresponding sacrifice. Greatly diminished by primary outlay, and now operated upon for all sorts of additions and improvements, the C. A. is at length exhausted, and new powers have to be got from parliament to create new shares and new debentures, and which shares are only taken up by being guaranteed a preferable claim on the funds of the company. Where a large extension of traffic must be provided for, the creation of fresh capital is indispensable and legitimate; but it is equally open to remark that the C. A., as usually conducted, affords the means of enormously

increasing the company's obligations, and is, in fact, an expedient to give good dividends to present holders of stock at the cost of their successors. Perceiving what must be the consequences, those among the proprietary of the small and more prudently managed railways who look to permanent investment, lose no opportunity to urge "that the C. A. shall be closed, and the whole expenditure of the company, including the payment of dividends and interests, be taken from revenue." Objections are raised to these remonstrances, sometimes on plausible, sometimes on sufficiently valid, grounds; and it may be said that in remarkably few cases have railway companies been able, or been disposed, to close their capital account. See RAILWAYS (Legislation and Management).
W. C.

CAPITAL FELONIES. See FELON.

CAPITAL PUNISHMENT in criminal jurisprudence is the punishment of death. It is called *capital* punishment because the head (Lat. *caput*), from being the most vital, is usually that part of the body which is acted on. This applies especially to beheading and hanging; but almost all modes of depriving a criminal of life appear to have in view the peculiar vulnerability, and, at the same time, vitality of the head. This extreme penalty, notwithstanding the practice of the world from the remotest times down to the present day, has frequently been reprobated by philosophers and philanthropists, who have even gone so far as to deny the right so to punish to any earthly power. The weight of authority, however, appears in favor of capital punishment. Mr. Bentham, one of the most reasonable and discriminating authorities on the subject, in his well-known and valuable treatise, says that the idea of C. P. would naturally suggest itself in the infancy of a state. When any one had committed an offense, and disturbed the peace of society, the question would then first arise: "How shall we prevent these things?" and the answer most likely to occur to a set of barbarians would be: "Extirpate the offender, and give yourself no further trouble about him." And in conformity with this view of the matter, he alludes in a note to the case of the Hottentots, who have no fixed laws to direct them in the distribution of justice, and consequently, when an offense has been committed, there is no form of trial, or proportion of punishments to offenses; but the kraal (village) is called together, the delinquent is placed in the midst, and, without further ceremony, demolished with their clubs, the chief striking the first blow. The marquis Beccaria, in his remarkable *Essay on Crimes and Punishments*, strongly argues against the capital sentence being carried out in any case, denying the right, in fact, of government so to punish, and maintaining, besides, that it is a less efficacious method of deterring others, than the continued example of a living culprit condemned, by laboring as a slave, to repair the injury he has done to society. Bentham, on the contrary, holds that death is regarded by most men as the greatest of all evils; and that especially among those who are attached to life by the ties of reputation, affection, enjoyment, hope, or fear, it appears to be a more efficacious punishment than any other. On the question of right, Beccaria is still more pointedly refuted by sir Samuel Romilly, who observed: "Beccaria and his disciples confess that it is not the greatest of evils, and recommend other punishments as being more severe and effectual, forgetting, undoubtedly, that if human tribunals have a right to inflict a severer punishment than death, they must have a right to inflict death itself" (*Memoirs*, vol. iii. p. 278). It is not a little interesting to know that such was the opinion of one who did so much as a statesman to mitigate the severity of the criminal law.

Against C. P. arguments are often urged from Scripture, based on the general principle of Christian charity. To these it is replied that they proceed on a misapprehension and misapplication of the principle; and reference is confidently made to the Old Testament as sufficiently exhibiting the mind of the great Lawgiver in regard to this matter.

Death was, in former times in England, the ordinary punishment for all felonies, and the certain doom of those who could not avail themselves of *benefit of clergy* (q.v.). i.e., the common law inflicted death on every felon *who could not read*, and the law implied that punishment, where a statute made any new offense felony. On the other hand, the numerous acts of parliament creating felonies without benefit of clergy, show that the statute law was still more sanguinary, so that of the 160 offenses referred to by Blackstone as punishable with death, four fifths had been made so during the reign of the first three Georges. That some idea may be formed of such Draconian justice as was then established, we may mention the following as among the offenses which involved sentence of death: stealing in a dwelling house to the amount of 40s.; stealing privately in a shop goods of the value of 5s.; counterfeiting the stamps that were used for the sale of *perfumery*; and doing the same with the stamps used for the certificates for *hair powder*. Thanks, however, to the exertions of sir Samuel Romilly, the inhumanity and impolicy of such a state of the criminal code gave way, towards the end of the reign of George III., to a course of legislation which has reduced the application of death as a punishment within its present humane limits. Practically, indeed, it is only in the case of treason and murder that the capital sentence is ever pronounced; and even then, it is not always carried out, for the crown reserves to itself and exercises a right of review which frequently leads to such a change in the convict's fate as at least spares his life. This discretionary control on the part of the executive is essential in

the present state of the law, which affords no means for a judicial appeal on the merits; for the very nature of the punishment, when finally executed, precludes the idea of all benefit to the sufferer, should the verdict of the jury afterwards turn out erroneous, and the innocence, instead of the guilt, of the accused be established. The law as it stands, indeed, allows a capital sentence to be reversed if technical error can be shown on the face of the judgment or other matter of record—but what avails that, after the sentence has been executed.

In Scotland, the administration of the criminal law has perhaps been, on the whole, as severe as in England. Mr. Erskine says that "those crimes that are in their consequences *most hurtful to society*, are punished capitally or by death," a category that is certainly sufficiently indefinite; and anciently, it might be shown that the executions in Scotland for offenses corresponding to those which were capitally punished in England, were, in proportion to the population, quite as numerous as those in the latter country. But in the more modern practice of Scotland, capital sentence was only pronounced in the four pleas of the crown—viz., murder, rape, robbery, and wilful fire-raising, to which may be added housebreaking. At present the penal system in Scotland may be said to be identical with that in England, death, as a punishment, being only inflicted in the case of convictions for murder.

With respect to the mode of executing C. P., we need not detain the reader by any account of the obsolete cruelties and tortures of former times. It may suffice to state that *hanging* and *beheading* are the two methods which now, for the most part, are practiced in the different European states—indeed, with the exception of Spain, by all. In the last country, the death of the culprit is instantaneously caused by the *garrotte* (q. v.). In England, Scotland, and Ireland, and in all the dependencies of the crown, the convict is hanged; while in France he is decapitated by the *guillotine* (q. v.), an instrument which an old Scotch machine called the *maiden* (q. v.), and used for the same purpose, very much resembled. In most of the German states, beheading is the mode of execution adopted; but in Austria, criminals convicted of capital offenses are hanged, as in England. See EXECUTION.

The following works may be consulted on the subject of this article: Basil Montagu *On the Punishment of Death*, 3 vols. (1809, 1812, 1813), in which he collects the opinions of different eminent authorities; *Memoirs of Sir Samuel Romilly*, 3 vols. (1840), and his miscellaneous law pamphlets; Jeremy Bentham's *Rationale of Punishment* (1830); Beccaria's *Essay on Crimes and Punishments* (1775); Edward Gibbon Wakefield's *Facts Relating to the Punishment of Death in the Metropolis* (1831); and Frederic Hill's *Crime, its Amount, Causes, and Remedies* (1853).

CAPITAL PUNISHMENTS IN THE ARMY AND NAVY.—1. *In the army.*—The law on this subject is contained in the 19th of the articles of war now in force, which prescribes death as the punishment of the following offenses, or such other punishment as by a court-martial shall be awarded. (1) Any officer or soldier who shall excite or join in any mutiny or sedition in any forces belonging to her majesty's army, or royal marines, or who shall not use his utmost endeavors to suppress it, and knowing of it, shall not give immediate information of it to his commanding officer; or (2) who shall hold correspondence with, or give advice or intelligence to any rebel or enemy of her majesty; or (3) who shall treat with any rebel or enemy without her majesty's license, or license of the chief commander; or (4) shall misbehave himself before the enemy; or (5) shall shamefully abandon or deliver up any garrison, fortress, post, or guard committed to his charge; or (6) shall compel the governor or commanding officer to deliver up or abandon such place; or (7) shall induce others to misbehave before the enemy, or abandon or deliver up their posts; or (8) shall desert her majesty's service; or (9) shall leave his post before being regularly relieved, or shall sleep on his post; or (10) shall strike or offer any violence to his superior officer, being in the execution of his office, or shall disobey any lawful command of his superior officer; or (11) who, being confined in a military prison, shall offer any violence against a visitor or other his superior military officer, being in the execution of his office.

By article 20, it is declared that no judgment of death by a court-martial shall pass, unless two thirds at least of the officers present shall concur therein; and by article 21, it is provided that judgment of death may be commuted for penal servitude for any term not less than four years, or for imprisonment for such term as shall seem meet.

It would appear that the employment of a soldier in the service subsequent to his arrest on a capital charge, may operate as a remission of the sentence of death. This is illustrated by the following case, mentioned by Mr. Prendergast in his *Law Relating to Officers in the Army* (2d ed., 1855, p. 245): In 1811, private John Weblin of the 3rd buffs was sentenced to be shot. The commander-in-chief, the duke of Wellington, in his "remarks" upon the proceedings, took notice that, through some extraordinary inattention, the prisoner had actually been permitted to serve in an engagement with the enemy, after he had been put into arrest for his crime. On this ground, the duke pronounced that he was under the *necessity of pardoning* the prisoner.

In the army, C. P. is inflicted by the offender being either shot or hanged—the latter being the more disgraceful mode of execution.

2. *In the navy.*—These are regulated by the 23 Geo. II. c. 33, amended by the 10 and 11 Vict. c. 59. By the first of these acts, certain offenses in the navy, whether on board

ship or on shore, were punished with death absolutely, without any discretion in the court to alter or mitigate the sentence. But, by the 10 and 11 Vict., this severity is removed (excepting in the cases of murder and other unnatural offenses mentioned in the act), and courts-martial are authorized to abstain from pronouncing judgment of death, if they shall think fit, and to impose such other punishment instead as the nature and degree of the offense may deserve. In this discretionary sense, the following offenses are punishable, in the navy, with death: (1) The holding illegal correspondence with an enemy; (2) the not acquainting, within 12 hours after the opportunity to do so, the commander-in-chief, or other superior officer of the squadron, with any message from an enemy or rebel; (3) all spies bringing seducing letters from an enemy or rebel, or endeavoring to corrupt any one in the fleet to betray his trust; (4) the relieving an enemy or rebel in any way, directly or indirectly; (5) not preparing for fight when duty commands, or not making due preparations on likelihood of engagement, and not encouraging the inferior officers and men to fight courageously; (6) the treacherously or cowardly yielding or crying for quarter; (7) disobeying orders in time of action, or not using all possible endeavors to put the same effectually in execution; (8) being guilty of cowardice or neglect of duty in time of action; (9) through cowardice, negligence, or disaffection, forbearing to pursue the chase of any enemy, pirate, or rebel, beaten or flying, or not relieving or assisting a known friend in view to the utmost; (10) deserting to the enemy, or running away with any of her majesty's ships or their belongings, or any pieces to the weakening of the service, or cowardly or treacherously yielding up the same; (11) deserting simply, or enticing others so to do; (12) making, or endeavoring to make, any mutinous assembly on any pretense whatsoever; (13) uttering words of sedition or mutiny; (14) concealing traitorous or mutinous practices or designs; (15) striking a superior officer or offering any violence to him, being in execution of his office, on any pretense whatsoever; (16) unlawfully burning or setting fire to any ship, property or furniture, not then appertaining to an enemy, pirate, or rebel; (17) neglect in steering any of her majesty's ships, so that the same be stranded, split, or hazarded; (18) sleeping on watch, or negligently performing duty, or forsaking station; and (19) robbery.

It is stated by Mr. Prendergast, in the work to which we have referred (p. 244), that a sentence of death pronounced by a court-martial does not operate as an absolute dismissal from the service; for if the offender should be pardoned, he is restored to his former position.

But though a pardon operates as a restoration to the service, the greater question still remains to be judicially decided, whether a restoration to the service operates as a pardon. This question is inseparably connected with the fate of the gallant but unfortunate sir Walter Raleigh. He had been condemned to death for alleged participation in a treasonable plot to raise Arabella Stuart to the throne; and, after undergoing 13 years' imprisonment, he received from James I., by a commission under the great seal, the command of a fleet and army fitted out against the Spanish possessions in South America, with power of life and death over the king's subjects serving in the expedition. The enterprise failed; and on sir Walter's return to England, James caused his head to be struck off, according to the sentence originally pronounced. On showing cause against his execution, sir Walter pleaded that his commission was tantamount to a pardon, and quoted a case of a man who had been condemned for felony, having been pardoned on account of his subsequent service in the wars of Gascony. Lord chief-justice Montague, however, held that though an implied pardon of the kind cited might hold good in felony, that treason could only be pardoned by express words. There is the high legal authority of the late lord chancellor Campbell* for saying that the chief-justice declared and expounded the law soundly; and that in strictness sir Walter's attainder, under the former judgment, could only be done away with by letters-patent under the great seal, expressly reciting the treason, and granting a free pardon. See, on the subject of these two articles, ARTICLES OF WAR, and MUTINY ACT.

As to the mode of C. P. in the navy, the culprit, where he is an officer, is shot; where he is a common seaman, he is usually hanged at the yard-arm.

CAPITAL PUNISHMENT (*ante*) under the laws of the United States may be inflicted for treason, murder, arson, rape, piracy, robbery of the mails with jeopardy to the lives of persons in charge, rescue of a convict going to execution, burning a vessel of war, and corruptly destroying a private vessel. Until within a few years C. P. was the rule for the highest crimes in all the states, but it was abolished in Wisconsin and in Maine in 1874, and had been about that time abolished in Iowa; but in the latter state it was restored in 1878, the argument showing from the record that during its abolition crimes of violence had largely increased. Under the present law, a year must intervene between the sentence and execution, and the term may be further extended by reprieve. There is much difference of opinion as to the effect of the abolition of the death penalty, and perhaps no settled conclusion can be reached. The effect of its abolition has not thus far supplied any very strong reasons for the stand of those who would abolish it altogether. Perhaps the most notable suspension of this punishment in all history was during the war of the rebellion in the United States, when, in the face of the most pow-

* *Lives of the Chief-Justices*, vol. i. pp. 357, 358, 591.

erful, open, and dangerous treason, not one person was deliberately executed for that crime, the extreme penalty visited even upon the captured leader of the rebellion being the loss of the political (but not the personal) rights of a citizen.

CAPITALS (*majuscula*), in contradistinction to small letters (*minuscula*), are the large letters employed in writing and printing to help the eye, to relieve the uniformity of the page, to increase the facility of keeping and finding the place, to mark the beginnings of sentences, proper names, etc. Among the ancients, and during the earlier part of the middle ages, no distinction of C. and small letters was known; and after the practice had been introduced of beginning books and chapters with great letters often adorned or illustrated with much artistic ability, it was long before C. were employed in such a way as could afford much real advantage to the reader. At the present day, they are universally employed, even in the printing of Greek and Latin books. Considerable diversity has existed at different times with regard to the employment of them, the books of the 17th and 18th c. exhibiting a much greater proportion of them than those of the present day. In German books, all substantives usually begin with a capital letter; in English and French books of the present day, they in general appear only at the beginnings of sentences and of proper names. Adjectives formed from proper names, as *English*, *French*, etc., are generally begun with a capital in English books, but not in French nor in German ones.

CAPITANA' TA, or **FOGGIA**, a province of Italy, the *Davunia* of the ancients, is bounded n. and e. by the Adriatic, and on the s.w. by the Apennines. It stretches along the Adriatic about 70 m. in a straight line, and its average breadth is about 45 m.; but its coast-line, measuring round the great promontory of Monte Gargano, which has been called "the spur of Italy," is fully 100 m., and its breadth between the extremity of that projection and the Apennines, 75 miles. Pop. '71, 319,164. The greater part of the surface is a sandy plain sloping from the Apennines to the Adriatic, and watered only by some inconsiderable streams. The rearing and feeding of cattle form the chief occupations of the inhabitants. Wheat, wine, and fruits of various kinds are produced in quantities sufficient to admit of exportation. There are important salt-works, quarries of alabaster, and potters' clay. Foggia is the chief town.

CAPITATION, from the Latin *caput*, a head, means something applicable to all persons, or to the people by the head. A tax levied on all persons, without reference to property or other incidents, is called a C. tax, and sometimes a poll tax. The former term was often used in France for the tax better known as the *taille*, although this offensive impost was not imposed on all alike, the nobility enjoying many exemptions from it.

CAPITOL, the fortress of ancient Rome, and site of the national sanctuary the temple of Jupiter, was situated on the *Mons Capitolinus*, the smallest but most famous of the seven hills on which Rome was built. The hill itself was first termed *Mons Saturninus*, afterwards *Mons Tarpeius* and *Rupes Tarpeia*, and after the foundation of the capitol, *Mons Capitolinus*, though a particular portion of it retained its ancient name of *Rupes Tarpeia*. It was steep and abrupt in almost every part, formed a natural fortress, and was strengthened here and there by towers. The C. was founded by Tarquinius Priscus, and completed by Tarquinius Superbus, who tasked the people to work at it. The whole mount had a circumference of about 800 paces. During the civil wars under Sulla, the temple was burned (according to Tacitus, by design), and after its restoration, destroyed during the Vitellian riots. It was rebuilt by Vespasian, after whose death it was again destroyed by fire, but was once more restored by Domitian, who instituted here the capitoline games. Domitian's structure lasted to a late period of the empire. Regarding the site of the C., there has been great dispute; the German scholars, for the most part, maintaining that it occupied the s.w. summit of the hill, and the Italians, the n.e. The latter situation has the weight of probabilities in its favor. From that portion of the mount named the Tarpeian rock, state criminals were thrown down. According to the description given by Dionysius of Halicarnassus, the temple of Jupiter, with its peristyle of columns, was 200 ft. long by 185 ft. wide, and was divided into three cellæ, separated from each other by walls, and respectively dedicated to Jupiter, Juno, and Minerva. In the spacious portico, the people feasted on triumphal occasions. The scanty ruins remaining in the present day consist of a sub-structure of peperino or volcanic tufa, a wall of the same materials, and some remains of the s. front, together with a portion of the great flight of steps leading to the temple.

The modern C. (*Campidoglio*), built on the site, and partly on the foundation of the ancient C., was designed by Michael Angelo, but is one of his inferior works. The main entrance, however, presents a splendid view. It is used as a kind of hotel-de-ville and museum.

Besides the great temple of Jupiter, the most important structures on the Capitoline Mount were the temple of Jupiter Tonans, built by the emperor Augustus; and the magnificent *Tabularium*, containing archives, and, in connection with the *Ærarium* ("Treasury"), serving as a library and place for lectures, etc. The remains of this structure, built by Quintus Catulus, 73 B.C., have still an imposing aspect.—For the U. S. Capitol, see WASHINGTON.

CAPITOLINE GAMES, instituted 337 B. C., in commemoration of the preservation of the Roman capitol (fortress) from the Gauls. Nero revised them, modeled them after the Olympian games, and proposed to institute a new computation of time founded upon the 5-year period intervening between the celebrations.

CAPITOLINE HILL. See **CAPITOL**, *ante*.

CAPITOLINUS, JULIUS, a Latin historian of the 3d c., who wrote the lives of several of the Roman emperors, and was one of the authors of the *Historia Augusta*.

CAPITULARIES (Lat. *capitularia*). *Capitularium* is literally a book divided into chapters: and the plural of the word was the name given to the laws issued by the kings of the first and second of the Frankish races, from Charles Martel downwards. These laws proceeded from the great assemblies of the king, nobles, and bishops, which formed the states of the kingdom, and, from their general character, were opposed to the laws issued for the separate states, which were called *leges*. They were divided into general and special C., according to the more or less general nature of the interests which they embraced, and the mode of their publication. They have by no means been all preserved. The most famous are those of Charlemagne and of St. Louis. In 827, abbot Angenius, of Fontenelles, made a collection of the C. of Charlemagne, and of his son, Louis le Débonnaire. Other collections were made by private persons, and, in 847, one by authority of the king, but they are all very imperfect and ill arranged. After Charles the simple, in 922, no more C. were issued, and no similar laws or statutes exist from that period till the time of Louis le Gros, in 1100. The best collections are those of Baluze (Paris, 1677 and 1780), and of Pertz, in the *Monumenta Germanie*.

CAPITULATION, a treaty consisting of several specified conditions (Lat. *capitula*, heads). In the military sense of the word, a C. is a treaty of surrender to an enemy. When a place can no longer be defended, on account of failure of ammunition or provisions, or the progress made by the besieging-party, a white flag is commonly put up, as a sign that the besieged are willing to capitulate. According to the kind and degree of peril in which the fortress is placed, so are the terms which the governor may reasonably expect from his successful opponent. Sometimes the arms and military stores are left to the besieged, but more frequently they are taken by the besiegers, except articles of private property belonging to the officers and men. The "honors of war," the marching out with drums beating and colors flying, are usually stipulated for, unless the conqueror exacts very severe terms. The mildest form of a C. is a *convention*, agreed to when the conqueror is not strong enough to insist on stringent conditions.

CAPIZ, a t. on the island of Panay, in the Philippine archipelago. It is situated on a plain on the n. coast, near the rivers Panay, Panitan, and Ivisan, by which it is sometimes inundated during the rainy season. It is defended by a small fort, and is the residence of a Spanish alcalde. Pop. 11,000.

CAP'NOMANCY, a word formed from the Greek *capnos*, smoke, and *manteia*, divination. The ancients practiced it in two different ways—either they threw grains of jasmine or poppy on the burning coals, and watched the motions and the density of the smoke that rose from them, or they watched the smoke of sacrifices. This latter kind of C. was most generally employed, and that to which the greatest importance was attached. If the smoke was thin, and ascended in a right line, instead of being blown back by the breeze, or spreading over the altar, the augury was good. It was also believed that the inhalation of the smoke rising from the victims or from the fire which consumed them, gifted the priests with prophetic inspiration.

CAPO D'ISTRIA, a fortified seaport t. of Austria, situated on a rocky island in the gulf of Trieste, 8 m. s. w. of the city of Trieste. It is capital of the circle of Istria, with the peninsula of which it is connected by a stone causeway, nearly half a mile long. Its old buildings, ruinous walls, and narrow streets give the town a gloomy aspect. It has a cathedral, manufactures of leather and soap, and a trade in wine, oil, and salt. Pop. '69, 7,539. In ancient times, this place was known as *Ægida*, and afterwards as *Justinopolis*, in honor of Justin II., who restored it.

CAPO D'ISTRIA, or **CAPO D'ISTRAS**, JOHN ANTHONY, Count, president of the Greek republic from 1827 to 1831, was b. in Corfu, 1780. His family had been settled in that island since the 14th c., but originally came from the Illyrian town of Capo d'Istria (q. v.), near Trieste. He devoted himself to political life, and after having held a high position in the Ionian islands, he entered the diplomatic service of Russia. Here his diplomacy tended to the separation of Greece from Turkey. In 1827, he was elected president of Greece: and in Jan., 1828, he landed in Greece, and entered upon the duties of his office. He was a patriot, a philanthropist, and an able diplomatist, but by no means equal to the task which he now undertook. Everything was in disorder; the people had been long enslaved, and knew not how to use their freedom; and the president had been so much imbued with the centralizing principles prevalent at the courts which he had frequented, that some of his measures, especially that restricting the liberty of the press, gave offense to the most temperate of the enlightened lovers of civil liberty. His career was cut short by his assassination in a church at Nauplia on Oct. 9, 1831. The assassins were relatives of Peter Mauromichali, against whom he was urging on a prosecution, for alleged offenses against the state.

CAP OF MAINTENANCE, DIGNITY, is a cap worn by noble and royal personages on certain state occasions. Such a cap was sent by pope Julius II. to king Henry VIII., for writing his book against Martin Luther.

CAPONIERE, or **CAPONNIERE**, in fortification, is a parapet 8 or 10 ft. high, with a superior slope, terminating in a small glacis. It is placed in the ditch of a fortified place, to cover or screen the defenders while passing from one defense-work to another. Generally, it has a banquette, on which musketeers may stand to fire over the crest. If there is a passage between two such parapets, it is a *full caponnière*; if on one side only, a *half caponnière*. Generally, the parapets are of earth, and the passage open overhead; but sometimes caponnières are vaulted galleries of brickwork, loopholed at the sides for musketry; while in field-works, palisade caponnières are occasionally thrown across the ditches of redoubts.

CAPPADO CIA, anciently, a province, and subsequently a kingdom in the w. of Asia (in part the present Caramania). It was bounded by Lycaonia on the w., by Cilicia and Syria on the s., by Armenia on the e., and by Pontus on the north. During the time that it belonged to the Persian empire, however, it included Pontus, which was called Lesser Cappadocia. In 17 A.D., C. was erected into a separate province of the Roman empire, by Tiberius.

CAPPAGH BROWN, a bituminous earth, which yields pigments of various shades of brown, the two most strongly marked being known as light and dark Cappagh brown. The coloring matter are oxide of manganese and iron. The Cappagh browns are transparent and permanent; and when not applied too thickly, they dry well in oil. The name is derived from Cappagh, near Cork, in Ireland. C. B. is also called encombe mineral, and more frequently manganese brown.

CAPPARIDÆÆ, or **CAPPARIDÆÆ**, a natural order of exogenous plants, allied to *crucifera*, and including about 350 known species, herbaceous plants, shrubs, and trees, mostly natives of tropical and sub-tropical countries. The leaves are generally alternate, stalked, undivided, or palmate; the flowers solitary or clustered; the calyx of four sepals, sometimes cohering in a tube; the corolla of four, or sometimes eight petals, sometimes wanting, the stamens generally a multiple of four, or indefinitely numerous, placed on a hemispherical or elongated disk; the ovary one-celled, the style thread-like or wanting; the ovules curved; the fruit either dry and pod-like (tribe *cleomeæ*), or a berry (tribe *capparae*).—To this order belongs the well-known caper-bush. See **CAPERS**. Many of the species possess stimulant properties; some are poisonous. One of the most interesting plants of the order is the *siwák* (*capparis sodata*), a bush or small tree, one of the most characteristic features of the vegetation of Africa, from the Great Desert to the Niger, the small berries of which have a pungent taste like pepper, and, when dried, constitute an important ingredient in the food of the inhabitants of those regions; whilst the roots when burned yield no small quantity of salt.—*Barth's Travels*.

CAPPE, **NEWCOME**, 1732–1800; an English dissenting clergyman who studied under Doddridge, and adhered to Dr. Priestley's Unitarian doctrine. He was pastor of a dissenting congregation in York for more than 40 years, and was one of the ablest and most eloquent of his denomination. He was also the author of a number of devotional works.

CAPPEL, a village of Switzerland, in the canton of Zurich, and 10 m. s.s.w. of the city of that name. It is interesting as the place where the great reformer Zwinglius was killed in a conflict with troops of the Roman Catholic cantons, Oct., 1531. A monument has been erected here to his memory.

CAPPEL, a French family of scholars, theologians, and lawyers. **GUILLAUME**, in 1491, had the boldness to refuse the payment of tithes demanded by the pope. **JACQUES**, his son, was counselor of state under Francis I., and in 1537 made a powerful speech against Charles V. **LOUIS**, son of Jacques, was professor of theology at Sedan, and more than once risked his life in the cause of Protestantism. One of his acts was to present to Charles IX. the confession of faith drawn up by the Protestants of Paris. Two others, a son and grandson of Jacques, were distinguished, one in the law, and the other in theology, history, philology, and antiquities. Both these were named **JACQUES**; and the younger was the father of **LOUIS**, the most celebrated member of the family (1585–1658), who studied at Sedan, Oxford, and Saumur, and was professor of Hebrew at the latter place. He devoted much attention to the text of the Scriptures. On the revocation of the edict of Nantes, Louis fled to England, where he died. His life was published by his nephew **JAMES**, who at only 19 years of age was professor of Hebrew at Saumur.

CAPRA'RA, **GIOVANNI BATTISTA**, 1733–1810; an Italian statesman and bishop, who served as papal legate or nuncio at Cologne, Lucerne, Vienna, and to the French republic in 1801, where he arranged the concordat of that year re-establishing the Roman Catholic form of worship. In May, 1805, he crowned Napoleon as king of Italy.

CAPRE'RA, or **CABRERA**, one of a group of small islands called the **Buccinari islands**, in the strait of Bonifacio, to the e. of the n. point of Sardinia (q.v.). They belong to the Italian province of Sassari. C. is separated from the coast of Sardinia by a strait of

little more than a mile in breadth, and by a similar narrow strait from the island of Maddalena, which lies to the west. Its greatest length, from n. to s., is about 6 m., and its breadth is from 2 to 3 miles. Like Maddalena and the rest of the Buccinari isles, and the neighboring coast of Sardinia, C. is rocky, bare, and unfertile. It has no streams, and is in few places adapted either for the pasture of cattle or for the plow. In former times, it was the abode only of wild goats—whence its name (Lat. and Ital. *capra*, a goat)—and rabbits, and was occasionally visited by goat-herds and fishermen. It has of late years acquired celebrity as the ordinary residence of Garibaldi, who acquired a property and built a house here in 1854. He dwelt here from 1854 to 1858, and again made it his abode in the autumn of 1860. It was to C. that he was sent in Sept., 1867, in honorable banishment by the Italian government, after having been taken prisoner at Asinulunga, in consequence of his design of entering the Roman territory to promote an insurrection and overthrow the papal government, and in C. he still resides, when not in Rome.

CAPRI (the ancient *Capræa*), a charming island in the Mediterranean, at the entrance of the bay of Naples, about 3 m. from cape Campanella, and 20 m. s. of the city of Naples. On its small area of about 11 m. in circumference, it displays a rich variety of beautiful scenery, ruins of antiquity, and points of historical interest, and contains a pop. of about 6,000 souls. The island is composed of two mountain masses, separated from each other by a depression like the seat of a saddle. That on the w., called monte Solaro, which is the highest and largest, has an elevation of about 1900 feet. The eastern part does not attain a height of more than 860 ft. above the sea. At the base of the eastern mountain is situated the town of C., built on a shelving rock, and guarded by walls, gates, and draw-bridges, with a cathedral, and a pop., including the district, of about 4,000. It commands a beautiful prospect, and communicates with the little town of Anacapri, on the western table-land, by a flight of 535 rude steps, cut in the face of the rock. There are only two safe landing-places on the island, and these are at C. and near it. C. was a celebrated place, in the times of Augustus and Tiberius. Ruins are still found of Roman baths and aqueducts, and of the 12 grand villas or palaces built in honor of the 12 chief deities by the emperor Tiberius, who passed the last 10 years of his life here in the practice of the grossest licentiousness and cruelty. The inhabitants now consist of fishermen, sailors, and a few traders, with vine-dressers and cultivators of olives in Anacapri. Wherever a tree can be planted, the hopeful and industrious people have prepared for it a soil by persevering toil in terrace-culture. Delicious quails, which in vast numbers alight on the island during their migrations to and from Africa, in spring and autumn, are taken in nets, and form an important item in the resources of Capri. To the w. of the town of C. is situated the *Grotta Azzurra* (blue grotto), a remarkable cavern, entered from the sea by a narrow opening not more than 3 ft. high. Inside, however, it is found to be of magnificent proportions, and of marvelous beauty, the gorgeous coloring being said to be produced by the reflection and refraction of the sun's rays through the water. Elliptical in form, it has a length of 165 ft., a breadth of 100 in the widest part, and a height of 40 in the loftiest, with 48 ft. of water beneath.

CAPRICCIO (Ital.), in art, is applied to a picture or other work which designedly violates the ordinary rules of composition. Foliated ornaments, with cupids or other figures appearing in them in situations not strictly natural, are capriccios.

CAPRICCIO, in music, is a species of free composition, without being subject to rule as to form or figure. Locatelli, at the beginning of the 18th c., composed capriccios for the violin. The most celebrated C. of modern times is Mendelssohn's B minor C. for pianoforte and orchestra.

CAPRICORNUS, the *Goat*, a southern constellation, and the tenth sign of the zodiac (q. v.); denoted by the sign ♄ , representing the crooked horns of a goat. It is usually represented on the globe as having the forepart of a goat, but the hinder part of a fish. It is one of the least striking of the zodiacal constellations. It was, however, celebrated among the ancients, who regarded it as the harbinger of good-fortune, and as marking the southern tropic or winter solstice, wherefore they called it the "Southern Gate of the Sun." It contains no large stars, the two largest, which are situated in the horns, being only of the third magnitude. Neither of these rises above the horizon in our latitude. See **TROPICS**.

CAPRIDÆ, a family of ruminant quadrupeds, which, as defined by some naturalists, may be described as the *sheep and goat* family, including the Linnaean genera *ovis* (sheep, q. v.) and *capra* (goat, q. v.); but which is extended by others to include antelopes, their persistent horns being regarded as the great distinction between them and the *cervidæ* or deer family. In the more restricted sense, the name designates a very natural family, yet differing from the *bovidæ* or ox family more in general appearance than in other characters; whilst links of connection with the antelopes are not wanting, a very remarkable one being found in the prong-horn of America.

CAPRIFICATION, a method which has long been employed in the Levant for securing and hastening the maturation of figs, and which consists in suspending fruit-bearing branches of the wild fig above or beside those of the cultivated tree. The notion once

entertained, that this practice is analogous to that by which the fecundation of the female palm-tree is secured, is inconsistent with the now well-known fact, that the fig has both male and female flowers within its own receptacle; and it is therefore supposed that the effects of C. may result from the agency of a species of insect, of which the eggs have been deposited in the early wild figs, and which may promote fecundation by entering the receptacle of the cultivated fig, or perhaps by puncturing it may cause it to ripen sooner. In hope of a similar advantage, some French and English cultivators have inserted into figs straws dipped in olive-oil. But C. is scarcely practiced in the western parts of Europe, and has even been discontinued as unnecessary in some parts of the east where it once prevailed.

CAPRIFOLIA CEE, a natural order of exogenous plants, consisting of shrubs and herbaceous plants, which have opposite leaves without stipules, and flowers disposed in corymbs, in heads, or in whorls. The calyx is 4 to 5 cleft; the corolla monopetalous, tubular, or wheel-shaped, sometimes irregular. The stamens are adherent to the corolla at its base, and alternate with its lobes. The ovary is free, 1 to 5 celled. The fruit is generally a berry, sometimes dry, but not splitting open when ripe. The order is very nearly related to *cinchonaceæ*, differing chiefly in the want of stipules. More than 200 species are known, chiefly natives of the temperate and colder parts of the northern hemisphere. To this order belong the honeysuckle, elder, viburnum, and snowberry. Emetic and cathartic properties are prevalent in it.

CAPRIMUL'GIDÆ, a family of birds, of the order *insessores*, and tribe *fissirostres*, nearly allied to the *hirundinidæ* or swallow tribe, but differing from them in the still greater width of gape, and in having long stiff bristles at the base of the bill. They are insectivorous birds. They have very long wings, short legs, and toes united at the base by a membrane. The European goatsucker may be said to be the type of the family, which includes also the whip-poor-will and night-hawk of America, with many other species widely distributed over the globe, and now arranged by naturalists in a number of genera.

CAPROIC, CAPRYLIC, and CAPRIC ACIDS are represented by the formulæ $C_{12}H_{24}O_4$, $C_{16}H_{32}O_4$, and $C_{20}H_{40}O_4$, and are members of the acetic or fatty-acid series. They derive their names from *capra*, a goat, in consequence of their more or less resembling in smell the odor of that animal. They may all be obtained from butter by pressing out the portion which remains liquid at 60°, saponifying this oil, and distilling the soap which is thus formed with sulphuric acid. The liquid which passes over contains these three acids, together with butyric acid, which, by being converted into baryta salts, are separable from one another. All three of these acids are also obtained by the oxidation of oleic acid by nitric acid; and capric acid is also obtained by acting upon oil of rue with fuming nitric acid; hence it is frequently called *rutic acid*.

CAPSA'LI, a seaport t. of the Ionian islands, capital of Cerigo, or Cythera, is built upon a narrow ridge, terminating in a precipitous rock near the s. end of the island. It has an old castle and a good harbor. Pop. 5,000.

CAPS AND HATS, names of political parties in Sweden in the early part of the 18th c., the former favoring and the latter opposing the alliance with Russia.

CAPSICINE, an alkaloid, is the active principle in capsicum or Cayenne pepper, and can be obtained from it. It is a thick liquid, of a reddish color, and possessing such acrid properties that half a grain diffused through a large room causes every one therein to sneeze violently.

CAPUSICUM, a genus of plants of the natural order *solanaceæ*, having a wheel-shaped corolla, projecting and converging stamens, and a dry berry. The species are all of a shrubby, bushy appearance, and have more or less woody stems, although they are annual or biennial plants. The number of species is very uncertain, some botanists distinguishing many, whilst others regard them as mere varieties of a few. They are natives of the warm parts of America and of Asia, have simple leaves, and rather inconspicuous flowers, and some of them are in very general cultivation in tropical and sub-tropical countries for their fruit, which is extremely pungent and stimulant, and is employed in sauces, mixed pickles, etc., often under its Mexican name of *chillies*; and when dried and ground forms the spice called *Cayenne pepper*. As a condiment it improves the flavor of food, aids digestion, and prevents flatulence. In tropical countries, it counteracts the enervating influence of external heat. In medicine, it is used as a stimulant, rubefacient, and vesicant; is often administered in combination with cinchona; and is particularly valuable both internally administered and as a gargle; not only in relaxed conditions of the throat, but in some of those diseases in which the throat is most dangerously affected. As a medicine, C. is administered in *pills*, mixed with bread; in the form of *tincture*, obtained by digesting the bruised C. in alcohol, or of an *infusion*, procured by digestion in water, with varying proportions of salt and vinegar. A gargle of C. is prepared by infusing it in water, along with candy-sugar and vinegar, and thereafter adding a little infusion of roses. It has no narcotic properties. It owes its power chiefly to *capsicine* (q. v.). The fruits of the different species of C. differ in form, being round, oval, conical, heart-shaped, etc.; they vary from half an inch to 4 in. in length, and are sometimes of a bright red, sometimes of a yellow color. In all, the dry berry has an inflated appear-

ance, and contains numerous whitish flattened seeds, which are even more pungent than the leathery epidermis, or the spongy pulp. Cayenne pepper consists chiefly of the ground seeds. *C. annuum*, sometimes called common C., or Chilly pepper, is perhaps the most common species in cultivation; and in the southern parts of Britain, if raised on a hot-bed as a tender annual, it produces fruit in the open border. There are several varieties of it. *C. frutescens*, sometimes called goat pepper, and *C. baccatum*, sometimes called bird pepper, have great pungency, and the former is generally described as the true Cayenne pepper. *C. cerasiforme*, with a small cherry-like fruit, and therefore called cherry pepper, and *C. grossum*, with a large, oblong, or ovate fruit, known as bell pepper, are frequently cultivated.—The fruit is used either ripe or unripe, except for making Cayenne pepper, for which ripe fruit is employed. The fruit brought from South America is sometimes sold by druggists under the name *Guinea pepper*.

CAPSTAN, on shipboard, is a ponderous mass of timber, whose uses are to heave the anchor, hoist up masts and guns, take in and discharge cargo, etc. It has very firm supports on the deck underneath it. It comprises a *barrel*, round which a rope or a chain coils; *whelps*, or pieces of timber, which enlarge the diameter without greatly increasing the weight; the *drum-head*, a polygonal flat piece of timber at the top, pierced laterally with holes; the *step*, or lowest part, which rests upon and is bolted to the beams; the *saucer*, an iron socket let into the top of the step; the *pivot* or *spindle*, which, resting on the saucer, forms the axis around which the C. turns; the *paucis*, short bars of iron, to prevent the reaction of the C.; *bars*, which enter the holes, and are the levers for enabling the sailors to work the C.; *pins*, placed vertically through the drum-head, for temporarily retaining the bars in their places; and the *shifter*, a rope connecting the outer ends of the bars. Among many improvements made in the arrangement and action of capstans is Wardill's, for increasing the bite or holding of a chain-cable around the circumference. In large vessels they are generally worked by steam.

CAPSULE, in botany, a dry fruit, *syncarpous* (or formed of several carpels united together into one), and opening either by valves, as in the fox-glove, primrose, and rhododendron, or by pores near the summit, which some regard as a sort of valves, and of which beautiful examples may be seen in the poppy and snapdragon. Capsules are either one-celled or many-celled. The *pyridium* is a variety of C., which opens as if cut around near the summit, presenting the appearance of a cup with a lid, of which a very beautiful example may be seen in the *anagallis*, or pimpernel; and another in the great woody fruit of the different species of *lecythis* and other *lecythidaceæ*.

CAPTAIN, MILITARY, is perhaps the most general designation given to an officer of land forces; something equivalent to it being found in most European languages. As a word, it simply means a *head* or *leader*, and may be applied to a chief over any number of men. *Captain-general* is in some countries a very high command. In the time of queen Elizabeth, there was, among other high military officers, a capt.gen. of footmen. In the organization of the British army at the present day, there is one C. to every *company* of infantry, and every *troop* of cavalry. Formerly every battery of artillery had two captains—a first and a second, the latter being called capt.licut. Now, the first in command has the title of maj., and the second that of capt. The first in command of a battery of artillery, even when styled C.; was considered higher than a C. of infantry or cavalry, and was privileged to be mentioned by name in military dispatches like cols. and maj.s.

The duty of the C. is to see to the men of his company in everything that relates to discipline, exercises, billeting, pay, settlement of accounts, mess, kit, clothing, arms, ammunition, accoutrements, stores, barracks, cooking, etc.; to receive orders concerning these matters from the maj., and to enforce these orders among the men. He is responsible to the maj., and is assisted in his duties by the lieut. and sub-lieut. The number of captains on the peace establishment of the British army, in its several branches, are about 239 cavalry, 1236 infantry, 248 artillery, 115 for engineers, and 28 for colonial corps—1866 in all, in full commission. The former value of a C.'s commission, and the circumstances of purchase connected with it, are noticed under COMMISSIONS, ARMY.

CAPTAIN, MILITARY (ante). In the U. S. army a C. is responsible for the camp and garrison equipage and the arms and clothing of his company. The rank is between lieutenant and major.

CAPTAIN, NAVAL, is the general designation for the commander of a ship. It is not universal, for some vessels of war are commanded by officers lower in rank than C.; while the chief officer of a merchant-vessel is often called *master*. The commanders of all rated ships are capt.s. The capt.s. rise to the command of larger and larger ships, with increase of pay, according to length of service. The C. is responsible for everything on shipboard, in discipline, navigation, equipment—all, in short, that concerns the *personnel* or the *matériel* of the ship. If his ship belongs to a particular fleet or naval station, he is responsible to some admiral or commodore; if not, he is directly responsible to the admiralty. The C. of that particular ship in a fleet which carries the admiral is called *flag C.*, and is for the moment higher in rank than others. A naval officer is always on half-pay, except when attached to a ship in actual commission; and thus in

times of peace there have been always more naval capt. on half than on full pay; but recent measures have been adopted to assuage this evil. The number of capt. in the naval service during peace are about 83 in commission on full-pay. About 142 are on half-pay, under the designation of the *active* list; these are eligible for re-employment; while on the *reserved* list and the *retired* list there are 426 more. They rank in dignity with lieut. cols. in the army, and with cols. after three years' service.

The word C. is used in other ways also in the navy. The *C. of the fleet* is a temporary officer in large fleets; he promulgates the admiral's orders, and receives all the reports and returns, filling, in short, a post equivalent to that of *chief of the staff* in an army. Among the seamen on board a ship, the chief of each gang is called C.; such as the *C. of the after-guard*, of the forecastle, of the hold, of the main-top, of each gun, etc.

CAPTAIN, NAVAL (*ante*), in the U. S. navy, ranks with a col. in the army, and next below a flag-officer in the navy. Before the war of the rebellion there was no definite legal rank in the navy higher than captain. A C. of marines ranks with a lieutenant in the navy and with C. in the army.

CAPTION, in the practice of the law of England, may be defined as that part of a legal instrument which shows the authority under which it is executed, or taken, as the word implies. It also states the time and place of the execution. The word C. is also improperly used in England to signify an arrest—a meaning which it strictly and technically bears in Scotland, where, until the passing of the 1 and 2 Vict. c. 114, called the personal diligence act, which authorizes more simple forms of legal process, it was the only recognized civil warrant for the apprehension of a debtor or obligee. This word is also used in Scotland to denote a summary warrant of imprisonment, granted on the application of the clerk of court, for the purpose of forcing back the pleadings and other papers in a lawsuit, which had been borrowed by the party against whom the C. has issued, and by whom they are unduly and illegally retained. See on the subject of this article INDICTMENT, COMMISSION, DILIGENCE, WARRANT, HORNING.

CAPTIVES. It is laid down by Blackstone, that, as in the goods of an enemy, so also in his person, a man may acquire a sort of qualified property in him as a captive, or prisoner of war—at least till the ransom of the captive is paid. In Scotland, all legal proceedings against a captive are stopped till his liberation, although, in some cases, execution against his estate may proceed.

CAPTURE may be simply defined as prize taken in time of war. The law on this subject is stated with precision in a paper addressed on behalf of the British government to the American ambassador at London in Sept., 1794: "When two powers are at war, they have a right to make prizes of the ships, goods, and effects of each other, upon the high seas. Whatever is the property of the enemy, may be acquired by capture at sea; but the property of a friend cannot be taken, provided he observes his neutrality. Hence the law of nations has established—that the goods of an enemy on board the ship of a friend may be taken—that the lawful goods of a friend on board the ship of an enemy ought to be restored—that contraband goods going to the enemy, though the property of a friend, may be taken as prize; because supplying the enemy with what enables him better to carry on the war, is a departure from neutrality." The procedure to be adopted for determining whether the C. be or be not lawful prize, is now regulated by the 3 and 4 Vict. c. 65.

During the Russian war in 1854, there appeared in the *London Gazette*, under date the 28th Mar., of that year, a declaration stating, *inter alia*, that her majesty would waive the right of seizing enemy's property laden on board a neutral vessel, unless it be contraband of war, and that it was not her majesty's intention to issue letters of marque for the commissioning of privateers. The right of seizing enemy's property on board a neutral vessel, whether contraband of war or not, had always before been maintained by England. On the re-establishment of peace with Russia, a treaty was signed, and the following declarations adopted: 1. Privateering is and remains abolished; 2. A neutral flag covers an enemy's goods, with the exception of contraband of war; 3. Neutral goods, with the exception of contraband of war, are not liable to C. under an enemy's flag; 4. Blockades, in order to be binding, must be effectual—that is to say, maintained by force sufficient to prevent effectually access to the coast of the enemy.

As to the right to property captured from the enemy, and its distribution as prize or booty of war among the officers and men of the army and navy, see **BOOTY** and **PRIZE**.

CAPTURE (*ante*). See **INTERNATIONAL LAW**, *ante*.

CAPUA, a fortified city of Italy, in the province of Caserta, beautifully situated in a rich plain, on the left bank of the Volturno, about 18 m. n. of the city of Naples, with which it is connected by railway. It is a military station of the first class, its defenses having been greatly extended and improved by Vauban. As it is the only fortress which guards the approach to Naples from the n., it was regarded as one of the keys of the former kingdom of that name. The only objects of interest in the city are the cathedral, with some splendid granite columns from ancient *Casilinum*, upon whose site C. was built in the 9th c.; the church of the *Annunziata* with some bas-reliefs; and the arch of the *Piazza dei Giudici*, under which many ancient inscriptions still exist. Pop. '71, 12,174.

The ancient *Capua*, which enjoyed a reputation for wealth and population second only to Rome and Carthage, was situated about 2 m. s.e. of the present city, where its ruins are still to be seen, its site being occupied by the modern town of Santa Maria di Capua. C. was founded by the Etruscans, under the name of *Volturnum*, as early, according to some authorities, as 800 B.C., and was the chief city of the twelve said to have been founded by them in this part of Italy. Its present name was derived from the Samnites, who captured it in 423 B.C. After the battle of Cannæ, 213 B.C., the popular party opened the gates to Hannibal, whose army was greatly enervated by its luxurious winter-quarters here. The Romans obtained possession of the city in 211 B.C. In the 5th c., A.D., C. was devastated by the Vandals under Genseric. It recovered its prosperity again to some extent, but it was totally destroyed by the Saracens in 840. The citizens, who had fled to the mountains, were induced by their bishop to return some 16 years later, and found the modern Capua. From the existing remains of the walls and fortifications of ancient C., it has been estimated that it had a circumference of 5 or 6 miles. It had seven gates. Among the Roman antiquities, one of the most remarkable is the amphitheater, built of bricks, and faced with white marble. Well-preserved arches, corridors, and seats for spectators, still remain. It is calculated to have been capable of holding 60,000 persons, and must have been altogether one of the most magnificent buildings of the kind in Italy.

CAPUCHIN MONKEY, or CAPUCHIN SAPIJOU, a name often given to *cebus capuchinus*, and some other species of the genus *cebus*, South American monkeys, which have the head covered with short hair, so disposed as to resemble the cowl of a capuchin, the face being almost naked, or only covered with a little down. See *CEBUS*. *Pithecia chiropotes*, a South American monkey of a genus allied to *cebus*, is also sometimes called the C. M., or capuchin of the Orinoco.

CAPUCHINS, a branch of the order of *Franciscans* (q.v.), so designated from the *capuche* which is their head-dress.

CAPUCHINS, *ante*, a branch of the Franciscan order whose rule is essentially the same as that of the friars minor, or Minorites. They were founded by Matthew da Bassi, a Franciscan of Ancora, and were authorized by a bull of Clement VII. in 1528. At first they were persecuted by the other orders, but through the influence of the duchess Cibo, wife of the duke of Camerino, they obtained papal favor, and were permitted to impart their peculiar hooded habit to any who might be willing to join them, to live as hermits in wild and desolate places, to go barefoot, to wear beards, and to call themselves "Hermits Friars Minor." The pope, however, soon gave them the nickname "Cappucino," referring to the hood, one of their more conspicuous articles of apparel. They grew rapidly, and Matthew became the superior of the first convent. They have always had the reputation of great success in making converts. By late accounts they had 82 missions, in Europe, Asia, the East Indies, Africa, and South America. In the United States they have houses in the states of New Jersey, New York, and Wisconsin, Nuns of the order were first established at Naples in 1538.

CAPUDAN-PASHA', the high admiral of Turkey. He has the entire command of the navy and the management of all naval affairs. The port of Pera, the Turkish islands in the archipelago, and a number of seaports and maritime districts, are under him, even in their civil administration.

CAPULETS AND MONTAGUES, the English spelling of the names of the Cappelletti and Montecchi, two noble families of northern Italy, chiefly memorable from their connection with the legend on which Shakespeare has founded his play of *Romeo and Juliet*. According to tradition, both families belonged to Verona; but this does not appear to have been the case. The Cappelletti were of Cremona, and the fact that their burying-ground and the tomb of Juliet are shown at Verona, only proves how easy it is, in a country of ruins like Italy, to connect fact with fable. It has also been asserted that one family was Guelph and the other Ghibelline; but this is disproved by a reference to them in the *Purgatorio* of Dante (canto vi. l. 106). The poet is blaming the emperor Albert for neglecting Italy, the very garden of his domain. "Reckless man," he says, "come see how the Montecchi and the Cappelletti are oppressed;" and the context shows that the Guelphs were the oppressors in both cases of these great Ghibelline families. The emperor Albert was murdered in 1308, and this event has supplied the Veronese with a date for their legend. The first publication in which we recognize the essential incidents of Shakespeare's play is the novel *La Giulietta*, by Luigi da Porto, printed in 1535, after the death of the author. He states, in an epistle prefixed to the work, that the story was told him "by one Perigrino, a man fifty years of age, much experienced in the art of war, a pleasant companion, and, like almost all the Veronese, a great talker." In 1554, Bandello published in his collection of tales another Italian version of the legend. It was entitled *The unfortunate Death of two unhappy Lovers, one by Poison and the other of Grief*. Both writers fix the date of the event by saying it took place when Bartholomew dalla Scala or Scaliger ruled Verona. A French version of the tale was published by Pierre Borsteau in Belleforest's *Histoires Tragiques*. It was translated into English in 1567, and published in Painter's *Palace of Pleasure*. About the same time, Arthur Brooke published an English poem on the same subject, entitled *The Tragical*

History of Romeus and Juliet, written first in Italian by Bandell, and now in English. There is evidence that an English play had appeared previously, and that before Shakespeare's time the story was so well known in England that it had supplied subjects for tapestries. Shakespeare's play seems to have been principally based on the English poem. It was Brooke who first called the Montecchi Montagues, and the prince of Verona Escalus, instead of Scala. Wright and Cary, in translating Dante, have followed the example of Shakespeare, and render the Italian names of the *Divina Commedia* into the familiar "Capulets and Montagues" of *Romeo and Juliet*. The historical date of the tragedy has not, however, been adopted by modern stage managers and Shakespearian critics, who very properly bring down the action from the beginning to the close of the 14th c., when commercial opulence, and the revival of arts and letters, supply accessories more in keeping with the drama than the ruder age to which history must assign the "civil broils" and the fall of the Capulets and the Montagues.—See notes to Dante in *Classici Italiani*, and Knight's and Dyce's *Shakespeare*.

CAP UT MOR TUUM VITRIOLI, or COLCOTHAR, is the name given by the alchemists to the red powder (mainly red oxide of iron) which remains in the retorts when green vitriol or the sulphate of iron is calcined.

CAPYBARA, *Hydrochaerus capybara*, a quadruped of the order *gires* or *rodentia*, and of the family *caride*, strongly resembling the cavy or Guinea-pig, although it is the largest existing rodent known, and aquatic in its habits. It is a native of South America, and abounds in many of the large tropical rivers. It is equal in size to a small pig. The dentition resembles that of the cavy, except that the grinding teeth are composed of numerous transverse plates, the number of the plates increasing as the animal advances in age; an interesting point of resemblance to the dentition of the elephant, and a link of connection between the rodents and the pachydermata. The C. feeds exclusively on vegetable food, browsing on the grass near the rivers, and often committing great ravages in plantations of sugar-cane. It runs badly, but swims and dives well, and has the power of remaining under water for seven or eight minutes. It is very inoffensive, and easily tamed. The flesh, except that of old males, is good, and is eaten by all classes of persons. The C. is sometimes called water-hog, of which *hydrochaerus* is a Greek translation. In Demerara, it is called water-horse, a corruption of the Dutch *water haas*—i. e. water-hare.

CARABIDÆ, a tribe of beetles, or coleopterous insects, of the section *pentamera* (see COLEOPTERA), corresponding with the genus *carabus* of Linnæus, but of which the species are extremely numerous, those already known being numbered by thousands. They mostly feed on other insects, worms, etc., and are extremely voracious and active, habits which are fully shared by their larvæ. Some of them burrow in the earth; most of them live under stones, under the bark of trees, among moss, etc.; and their bodies are adapted to this mode of life, being very firm and hard. Their legs are in general pretty long, and most of them pursue their prey rather by the use of their legs than of their wings, some of them indeed being wingless, or having only rudimentary wings. Many of them exhibit much beauty of colors and metallic lustre. The largest British species is only about an inch long, but some foreign ones are much larger. Some of the species of the restricted genus *carabus* are among the most common British insects. Their wings are not fitted for flight.—A very large and singular insect of the tribe C. is *mormolyce phyllodes*, a native of Java, which, in consequence of the extremely depressed form of its body, resembles some of the *mantide* (q. v.), and the insects known as leaf-insects (q. v.). To this tribe belong also the bombardier beetles (q. v.).

CARBIDES, formerly termed CARBURETS, are compounds of carbon with metal. None of them occur in a natural state.

CARABO'BO, a state in Venezuela on the Caribbean sea; a fertile well-watered region, producing grains, fruits, and cattle. The chief exports are coffee, cacao, indigo, rice, corn, rum, and fruits. The climate is good in the inland region, but the coast is subject to fevers. Capital, Valencia.

CARABOU. See REINDEER.

CARACAL, *Felis caracal*, a species of lynx (q. v.), found in the warmer parts of Asia, and throughout the whole of Africa; and more probably than any European species, the lynx of the ancients. It is larger than a fox, about the same height, but much more powerful; of a uniform deep brown or wine-red color, except two spots near each eye, the under parts of the body, and inner parts of the legs, which are white, and tufts of long black hair which terminate the ears. The C. is powerful enough to tear a hound to pieces. It is often represented as of a very savage disposition; but it is capable of being tamed, and has been employed in hunting.

CARACALLA, properly named MARCUS AURELIUS ANTONINUS BASSIANUS, a Roman emperor, the son of the emperor Septimius Severus, was b. at Lyon, 188 A. D. He was playfully named by his father Caracalla, from his long hooded tunic, made in the fashion of the Gauls, and so called in their language. After his father's death, 211 A. D., he ascended the throne as co-regent with his brother Publius Septimius Antoninus Geta, whom he afterwards caused to be murdered. Having bribed (at enormous cost) the Prætorians to overlook this foul deed, and to make him sole emperor, C. next directed his

cruelty against all the friends and adherents of Geta, of whom twenty thousand of both sexes—including the great jurist Papinianus—were put to death. Innumerable acts of oppression and robbery were employed to raise supplies for the unbounded extravagance of the despot, and to pay his soldiers. In his famous constitution, he bestowed Roman citizenship on all his free subjects not citizens—who formed the majority, especially in the provinces—but simply in order to levy a greater amount of taxes on releases and heritages, which were paid only by citizens. In his campaigns, he imitated, at one time, Alexander, at another time, Sulla; while his main object was to oppress and exhaust the provinces which had been in a great measure spared by the tyranny of former emperors. In 217, he was assassinated, at the instigation of Macrinus, prefect of the Praetorians, by one of his veterans named Martialis, on the 8th of April, 217, on the way from Edessa to Carrhae. Historians paint the life of C. in the darkest colors. Among the buildings of C. in Rome, the baths—Thermae Caracallae—near Porta Capena were most celebrated, and their ruins are still magnificent.

CARACARA, or **CARACARA EAGLE** (*polyborus*), a genus of birds of prey peculiar to America, and regarded as a connecting-link between eagles and vultures; agreeing with the former in their strongly hooked bill and claws, but with the latter in their naked face and propensity to prey on carrion. The name C. is originally Brazilian, and is derived from the peculiar hoarse cry of a common Brazilian species (*P. Braziliensis*), a bird of very fine plumage, and about 50 in. in expanse of wings, which is of frequent occurrence over a large extent of the American continent, and is sometimes to be seen even in the southern parts of the United States.

CARACAS, the province of which the following city is the capital, extends in n. lat. from 7° 38' to 10° 46', and in w. long. from 65° 30' to 68°, and contains 300,000 inhabitants. With a generally mountainous interior, the immediate coast is flat, presenting, besides La Guayra mentioned below, several harbors or roadsteads. The exports of the province are cocoa, coffee, dye-woods, hides, indigo, and sarsaparilla.

CARACAS, the capital of the republic of Venezuela, the most northerly state in South America, with Guiana on the e., and Columbia on the w., is situated in lat. 10° 30' n., and long. 67° 5' w., 16 m. s. of La Guayra, its port, with which it is joined by railway. It is 2,880 ft. above the tide-level, enjoying from this elevation a healthy air and a temperature so moderate as to average 68° and 72° F. in Feb. and June respectively. Standing immediately above the confluence of four streams, it is well supplied with cool water, which is distributed by means of fountains, pipes, and reservoirs. The neighborhood is subject to earthquakes—12,000 citizens having, in 1812, perished from this cause. The pop. in 1873 amounted to 48,897. The streets are straight and regular. The most splendid edifice is the church of Alta Gracia for the people of color, excelling the cathedral in the richness of its decorations. C. has a university founded in 1778.

CARACCI, a celebrated family of Italian painters, the founders of the Bolognese school of painting.

CARACCI, LUDOVICO, the son of a butcher, was born at Bologna, 1555. As a student, he was so inapt that his master recommended him to abandon the pursuit; but instead of that, he went to Venice and Parma, making acquaintance with the works of the great masters there, and returned to Bologna imbued with art principles quite opposed to the superficial mannerism then prevailing in his native city. In conjunction with two of his cousins, who, instructed by him, had imbibed the same ideas, he founded, in spite of great opposition, the school which afterwards became so famous in the history of painting. The first principle of this new school was, that "observation of nature ought to be combined with imitation of the best masters." The allied artists found numerous pupils, to whom they gave practical instructions in drawing from natural and artistic models, with theoretical lessons on perspective, anatomy, etc. So great was their success, that, in the course of a short time, all other schools of painting were closed in Bologna. Some of the finest works of this master are preserved in the *Accademia delle Belle Arti*, Bologna—among others, the "Madonna and Child Throned," "Madonna and Child Standing," the "Transfiguration," and the "Nativity of St. John the Baptist." Ludovico died in 1619.

CARACCI, AGOSTINO, cousin of Ludovico, was b. (1558) in Bologna. He became a disciple of his cousin, but he was of too versatile a genius to devote himself closely to any subject, though his magnificent painting of the "Communion of St. Jerome" proves that he might have attained to very great eminence had he devoted his undivided attention to the art; but he was in the habit of abandoning his easel for literature, poetry, and engraving on copper. As an engraver, indeed, he holds an important position in Italian art. He accompanied his younger brother, Annibale, to Rome, and there assisted in some of the paintings in the Farnese gallery; but his brother, who was a slave to his art, soon quarreled with him for his inattention, and he left Rome, and went to Parma. He died in 1602.

CARACCI, ANNIBALE, brother of Agostino, was b. (1560) in Bologna, where he learned, under his father, the business of a tailor, from which he was called away by Ludovico Caracci. His progress in the study of painting was rapid, and at first he took principally for his models Correggio, Titian, and Paul Veronese. His picture of "St. Roche distributing Alms" first gained for Annibale C. a wide reputation. His fame reached Rome, and he was employed to paint the Farnese gallery there, which is

considered his greatest work, and the manner of which partakes somewhat of Raphael and Correggio. On this gallery he was employed some eight years, and he received for his work the incredibly paltry sum of 500 crowns. In disgust and vexation, the artist threw aside his palette. He died in Rome in 1609, where his remains were interred, close to Raphael's tomb, in the Pantheon. Annibale C. was one of the greatest followers of Correggio, and in composition approached most nearly to the style of Raphael. Ludovico had a greater talent in teaching, and Agostino had a more versatile invention, but Annibale was unquestionably the greatest artist of the three Caracci.

CARACCI, ANTONIO, natural son of Agostino, was b. at Venice 1583; d. in 1618. He was a pupil under Annibale, and painted some excellent pictures.

CARACCI, FRANCESCO (styled FRANCESCINI), brother of Agostino and Annibale, was b. in 1595, and distinguished himself as an eminent designer. He died 1622.—The best Italian masters of the 17th c.—Domenichino, Guido Reni, Albani, and others—proceeded from the school of the Caracci.

CARACCIOLI. The name of a Neapolitan family unfortunately associated with the memory of lord Nelson. Several members of this family were employed in political offices.—LOUIS ANTOINE DE C., b. in Paris, 1721, d. 1803, was the author of a pseudograph, entitled *Lettres Intéressantes du Pape Clement XIV.*, which mystified many readers throughout Europe.—FRANCESCO C., a meritorious Neapolitan admiral, entered in early life the marine service, and distinguished himself at Toulon, 1793. In the year 1798, the offensive conduct of the court of Naples toward C. induced him to return from Palermo, where the court was then residing, to Naples, where he entered into the service of the republic established by the French invaders, and, with a few vessels, prevented the attempted landing of a Sicilian and British fleet. In 1799, when Ruffo took Naples, C. was arrested, contrary to the terms of capitulation, sentenced to death by the junta, hanged on the mast of a frigate, and his corpse thrown into the sea. This affair, to which lord Nelson was a consenting party, is a stain on the reputation of the English admiral.

CARACOLE, in horsemanship, a sudden half turn, sometimes performed frequently in an attack of cavalry to mislead the enemy as to the point at which the assault is to be made.

CAEACTACUS, a king of the Silures, who inhabited s. Wales, was one of the most persistent enemies of the Romans in Britain. For nine years he warred gallantly against the invaders, but at length was completely overthrown. His wife and daughters fell into the hands of the victors, and his brothers surrendered. C. himself fled to Cartimandua, queen of the Brigantes, who delivered him up to the Romans. He was carried to Rome, 51 A.D., and exhibited to the people by the emperor Claudius. When he approached the imperial seat, we are told, he addressed Claudius in so noble a manner, that he and his relatives were immediately pardoned. They appear, however, to have lived during the remainder of their lives in Italy.

CARADOC SANDSTONE and **BA'LA BEDS**, a division of the lower Silurian system, so named from their development at Caer Caradoc, in Shropshire. They consist of sandstones, grits, and slates, with occasional beds of limestone. Enormous masses of contemporaneous igneous rocks are interstratified with them. They attain a thickness of 9,000 ft., not including the igneous rocks. Fossils are very abundant in some beds. They consist chiefly of trilobites (q.v.), brachiopoda (q.v.), and graptolites (q.v.).

The Silurian rocks in the southern districts of Ayrshire belong to this division.

CARAFÀ DE COLOBRANO, MICHELE, 1785–1872; an Italian composer; in early life a soldier in the French army. Among his operas are *Masaniello* and *Le Solitaire*. He was a member of the Paris academy of fine arts, professor in the conservatoire, director of military music at the gymnase, and a member of the legion of honor.

CARAGLIO, a t. of northern Italy, in the province of Coni, 6 m. w. of the city of that name. It is situated on the Grana, and has manufactures of silk. Pop. '72, 3,379.

CARAITES. See JEWISH SECTS, *ante*.

CARAMA'NIA. See KARAMAN.

CARAM'BOLA, an East Indian fruit, of the size and shape of a duck's egg, but with five acute angles, or longitudinal ribs. It has a yellow, thin, smooth rind, and a clear watery pulp, in some varieties sweet, in others acid, of very agreeable flavor. It is often used in making sherbets, and in tarts and preserves; and is known to the British in India as the *Coromandel gooseberry*. It is one of the most universally cultivated and abundant of the fruits of India. It is produced by the *aerrhoa carambola*, a small evergreen tree, or bush, of the natural order *oxalidæ*. The **BILIMBI**, or **BLIMBING**, is the very acid fruit of another species of the same genus, *A. bilimbi*, also East Indian. Both species are now much cultivated in the tropical parts of America. Both exhibit an irritability of leaf resembling that of the sensitive plant; they also display in a remarkable degree the phenomena known to physiologists as those of sleep of plants (q.v.).

CARAMEL is the name applied to the dark brown and nearly tasteless substance produced on the application of heat to sugar (q.v.). It is likewise formed during the roasting of all materials containing sugar, such as coffee, chicory, and malt (see BEEB), and is one cause of the dark color of porter and infusions of coffee. It is also employed in the coloring of whisky, wines, vinegar, etc.

CARAMNASSA, a river in the presidency of Bengal, which rises in lat. $24^{\circ} 34'$ n., and long. $83^{\circ} 46'$ e., and, after a course of about 150 m., enters the Ganges from the right in lat. $25^{\circ} 28'$ n., and long. $83^{\circ} 58'$ east. It is remarkable on several grounds. Though, on issuing from its source, it is clear as crystal, it is yet said to be both nauseous and noxious—a peculiarity which the natives impute to various supernatural causes; about 50 m. from its mouth, it is crossed by a stone bridge of three wide arches, which forms part of the grand road from Calcutta to Delhi; and lastly, it is so exceptionally subject to floods, that it has been known to rise 25 ft. in a night, when scarcely any rain had fallen in the adjacent plain of the Ganges itself.

CARANA RESIN, more commonly, but less correctly, called GUM CARANA, is a resinous substance imported from the tropical parts of America. Its properties and uses resemble those of tacamahac. It is entirely soluble in alcohol, and melts in a slight heat. It is not well known what tree produces it.

CARANJA, an island on the e. side of the ordinary entrance of the harbor of Bombay (q.v.), separated from the mainland by a narrow and unserviceable channel of 4 m. in length. It is itself 2 m. broad, being comparatively level and fertile, with the exception of two hills—the Little Hill in the n., and the Great in the south.

CARANX. See SCAD.

CARAPÁ, a genus of plants of the natural order *meliacæ*, natives of warm climates. *C. Guianensis* or *guaroides*, sometimes called the anderaba, also the C. tree, is a large tree with beautiful shining pinnate leaves, which have many leaflets, a native of Guiana and the adjacent countries, where its bark has a great reputation as a febrifuge, and the oil obtained from its seeds is much used for lamps. Masts of ships are made of its trunk. The oil, which is called oil of carapa, is thick and bitter, and is anthelmintic.—*C. Touloucouna*, or *Guineensis*, an African species, yields a similar oil, which is employed by the negroes for making soap, and for anointing their bodies, its bitterness protecting them from the bites of insects, a purpose to which the oil of C. is also applied in South America.—These species are very similar, and are supposed by some botanists not to be essentially distinct.

CARAPACE, the dorsal shield or buckler of chelonian reptiles (tortoises and turtles), and of the *crustacea malacostraca* (crabs, lobsters, etc.). In animals so widely different, however, there is only a general similarity in the appearance of the C., and the purpose which it serves; its organic relations are very different. For notice of these, we refer to the articles CHELONIA and CRUSTACEA.

CAR'AT, originally, it would seem, the name given to the seeds of the Abyssinian coral flower (q.v.) or coral-tree (*erythrina Abyssinica*); but these, which are small, and very equal in size, having been used in weighing gold and precious stones, C. has become the designation of the weight commonly used for weighing precious stones, and particularly diamonds. The seeds of the carob (q.v.) tree have also been said to be the original C. weights of jewelers, but with less probability.

Goldsmiths and assayers divide the troy pound, ounce, or any other weight, into 24 parts, and call each a C., as a means of stating the proportion of pure gold contained in any alloy of gold with other metals. Thus, the gold of our coinage and of wedding-rings, which contains $\frac{22}{24}$ of pure gold, is called "22 carats fine," or 22 C. gold. The lower standard used for watch-cases, etc., which contains $\frac{18}{24}$ of pure gold, is called 18 C., and so on. The C. used in this sense has therefore no absolute weight; it merely denotes a ratio. This, however, is not the case with the C. used for weighing diamonds, which has a fixed weight, equal to $3\frac{1}{8}$ troy grains, and is divided into quarters, or "C. grains," eighths, sixteenths, thirty-seconds, and sixty-fourths. These C. grains are thus less than troy grains, and therefore the jeweler has to keep a separate set of diamond weights.

CARAUSIUS, a supposed native of Holland, of whom nothing is certainly known except that he had a conspicuous part as an ally of the Romans in the conquest and ruling of Britain near the close of the 3d century. He had been put in command of the fleet in the English channel for the purpose of protecting the coasts of Britain and Gaul from the Frisian pirates; and his conduct had been such that the Roman emperor Maximilian gave an order for his death. C. immediately assumed the title of emperor of Britain, and held power for about seven years, his independence having been acknowledged by the Romans, whose empire was rapidly falling into ruin. He was assassinated at York in 293 by his chief officer and rival, Allectus, who held the imperial title for three years, at end of which time (296) Constantine Chlorus re-established the rule of Rome.

CARAVACA, a t. in Spain, in the province of Murcia, about 39 m. n.w. of the city of that name, is situated on the slope of a hill crowned with a fine old castle. Its principal

streets are wide, clean, and well paved; it has a fine church, with a miraculous cross, that is annually taken down and bathed in the waters of the town, to which it is supposed to communicate sanitary properties. It has manufactures of linen and woolen fabrics, soap, paper, leather, etc. Pop. about 10,000.

CARAVAGGIO, a t. of northern Italy, in the province of Bergamo, about 24 m. e. of Milan. In the principal church are some esteemed paintings by Campi; and C. is also celebrated as the birthplace of the painters Polidoro Caldara, and Michael Angelo Merighi, both surnamed Caravaggio. In the neighborhood is a sanctuary of the Madonna, built from designs of Pellegrini (1575). Pop. about 7,000.

CARAVAGGIO, MICHAEL ANGELO AMERIGHI or MERIGHI DA, a celebrated Italian painter, was b. 1569, at Caravaggio, in Lombardy, northern Italy. His father, who was a mason, employed him in making paste for the fresco-painters, and in this way the artistic genius of the boy was stirred. After studying the works of the great masters in Milan and Venice, he went to Rome, where he lived for some time in very reduced circumstances. At length a picture of his attracted the notice of cardinal del Monte, who now patronized the young artist; but the ferocious and quarrelsome character of C. soon involved him in difficulties. Having fled from Rome to Malta, on account of manslaughter, he obtained the favor of the grand-master by painting an altar-piece in the church of St. John, and other pictures. His quarrelsome nature soon forced him to flee from Malta; and, in making his way back to Rome, he was wounded, lost all his baggage, caught a violent fever, and on reaching Porto Ecole, lay down on a bank and died (1609), at the age of 40. Trueness to nature was the object aimed at by C., who left all schools, and devoted himself to paint life as he found it in lanes, alleys, and other resorts of the lower classes. He studied no such matters as refined sentiment or elevation of realities, but gave in his paintings expression to his own wild and gloomy character. One of his best paintings, "The Fraudulent Gamblers," is preserved in the Sciarra gallery, at Rome. His shadows are deep, his backgrounds very obscure; in consequence of which the whole picture seems to possess a kind of mysterious greatness, that is very imposing. Even Rubens confessed that C. was his superior in chiaroscuro. When he painted sacred subjects, he remained falsely faithful to the low realities of Italian life; so that several of his pictures painted for churches, had to be removed from their places, because they could not be harmonized with sacred associations. Kugler, the German critic, has justly said of one of C.'s most celebrated works, a "Burial of Christ," that it appears "like nothing better than the funeral of a gypsy chieftain."—An earlier Italian painter of less eminence, **POLIDORO CALDARA DA CARAVAGGIO**, was born in 1495, and murdered in 1543.

CARAVAN (from the Persian *karvan*, i. e., trader), the name given to the great assemblages of travelers which, at stated times, traverse the deserts of Asia and Africa. Many caravans are entirely for the purposes of trade, the merchants associating themselves for mutual help and protection. A C. sometimes has so many as 1000 camels, which follow each other in single file, so that it may be a mile or more in length. The most celebrated caravans are those formed by pilgrims going to Mecca, particularly those which annually assemble at Cairo and at Damascus. The latter consist of 30,000 to 50,000 pilgrims, and is under the special protection of the Turkish sultan. The caravan by which the Persians travel to Mecca starts from Bagdad, and is the vehicle of a very important trade. The great Indian C. to Mecca, which started from Muscat, has been long given up. Mecca, upon the arrival of the caravans, bringing goods from so many different parts of the world, presents all the appearance of a vast fair. The trade between Tripoli and the interior of Africa is exclusively carried on by caravans, likewise that between Darfur and Egypt. The great trade between Russia and China is also a C. trade. In the east, caravans in which the camels have a load of 500 to 600 lbs. are called *heavy* caravans; *light* caravans are those in which the camels have only half that weight, so that the daily journeys may be longer. *Heavy* caravans travel from 17 to 18 m. a day; *light*, from 22 to 25. The caravans are generally conducted with great regularity, and assemble at and start from stated places on stated days. The leader of the Mecca caravans is called *emir-el-hadsch*, i. e., prince of the pilgrims. In trade-caravans, a leader, who is called *karwan-baschi*, is elected by the merchants from their own number.

Among the knights of Malta, caravans meant the troops of knights appointed by the order to serve in garrisons, and also the cruises of their galleys against the Turks.

CARAVANCES. See CHICK PEA.

CARAVANSARAI, or KHAN, an eastern institution, a sort of unfurnished inn to provide travelers with a shelter. Those in towns and cities, which are generally built for traders, and charged a small sum a day, are handsomer and more convenient—having doors to the apartments—than those met with on the roads or outside the walls of the cities. They commonly consist of a square building of four wings built round a courtyard, in which the beasts of burden may be inclosed, and where there is usually a well of water; the lodgings are small rooms, about 7 or 8 ft. high, which run round the courtyard, and are bare of every article of furniture.

These caravansarais are an institution of very ancient date, being the "inns" of Gen.

xlii. 27, xliii. 21; and it was in the stable of such a place, there being no room for his parents in the lodging apartments, that our Savior was born (Luke ii. 7). They belong either to government, to some private individual, or are the property of the church (mosques); those situated in towns or cities are charged, but not more than two or three Turkish piastres a day; those situated on the road are usually free. There are some large and very handsome caravansarais at Cairo, Damascus, Beyrout, Aleppo, etc. The steward or keeper of a C. is called a *caravanseraskier*.

CARAVEL/LAS, a seaport of Brazil, in the province of Espiritu Santo, near a bay of that name; pop. about 5,000. It is the principal port of the surrounding country, and the head-quarters of the whale fishery of the Abrothos islands, which lie off the coast.

CARAWAY, *Carum carui*, a plant of the natural order *umbelliferae*, growing abundantly in meadows and rich pastures in the middle and s. of Europe, and in some parts of Asia, naturalized in many places in Britain. In some parts of Holland and Germany, and also in the counties of Kent and Essex in England, it is extensively cultivated for its aromatic seeds—in more strict botanical language, *carpels*—which are used medicinally as a carminative and tonic, and are also very much used as an aromatic condiment, and by confectioners, distillers, and perfumers, entering into the preparation of liqueurs, cakes, sweetmeats, scented soaps, etc. They depend for their aromatic properties on a volatile oil called oil of C., which is obtained by bruising C. seeds, and distilling them with water, and is at first limpid and colorless, but becomes yellow and subsequently brown by keeping. Oil of C. is used medicinally to relieve flatulence, and to correct the nauseating and griping tendencies of some cathartic medicines; also in the preparation of *spirit of C.* and *C. water*.—Spirit of C., which may be prepared either by dissolving the oil of C. in proof-spirit, or by distilling bruised C. seeds along with proof-spirit, is much used in Russia and Germany as a liqueur (*kümmel-branntwein*), sweetened with sugar.—C. has a branching stem 1 to 2 ft. high, with finely divided leaves, and dense umbels of whitish flowers. The fruit is oblong, each carpel having five thread-like ribs, with a single *villa* (see *UMBELLIFERÆ*) in each of the interstices. The white carrot-shaped root of C. is sometimes used like carrots or parsnips, but has a very strong flavor.—C. has a great enemy in the **CARAWAY MOTH** (*hæmylis daucella*), the larva of which destroys both its stem and flowers.

CARBAZOTIC ACID, or **PICRIC ACID**, is a substance of great importance in dyeing, which is obtained by the action of strong nitric acid and heat on many complex organic materials, such as silk, indigo, salicine, and a variety of resins. On a commercial scale, it is best obtained from the oil of tar, which distills over from crude tar between 300° and 400°, or from the resin of *xanthorrhæa hastilis*. The hot nitric acid solution is strained from impurities, and on cooling, yellow crystals separate of C. A., which can be purified by washing with cold water. These crystals are readily soluble in alcohol and ether, and dissolve in 80 or 90 times their weight of cold water, yielding a yellow solution, which has a very bitter taste, and stains the skin yellow; and when silk which has been treated with a mordant of alum, or cream of tartar, is immersed in a solution of C. A., it is dyed of a beautiful permanent yellow color. The bitter taste of C. A. has led to its being fraudulently employed, instead of hops, in communicating a bitter taste to beer.

CARBINE is a light kind of musket, named probably from the Carabins. See next article. It is now used by the cavalry, the yeomanry cavalry, the Irish constabulary, and other corps. The best carbines are now rifled. A considerable number of American carbines, rifled and breech-loading, were purchased at a high price by the English government in 1856. This American C. has a barrel only 22 in. in length, and a total weight of 7½ lbs. It is simple in construction, has a great range, hits a mark with accuracy, may be fired with rapidity, requires little cleaning, can be loaded without a ramrod, and supplies itself with caps from a reservoir in the hammer. Among English makers, Mr. Prince has successfully applied the breech-loading principle to carbines. The Victoria cavalry C. has a barrel 26 in. long, with 0.733 in. bore; its weight is 7½ lbs., and it is fired with 2½ drams of powder.

CARBINEERS, or **CARABINEERS**, are said to have derived their designation from the Arabs, among whom the *Carabins* or *Karabins* were light horsemen, stationed at outposts to harass the enemy, defend narrow passes, etc.; in action, they took the place of skirmishers. A corps under the same name was raised in France in 1560; but the designation has not been much used in that country since the introduction of hussars and lancers. In the English army, C. was at one time a frequent designation for cavalry; but now there is only one regiment, the 6th dragoon guards, known by this title; and the distinction between them and other cavalry is little more than nominal.

CARBOHYDROGENS, or **HYDROCARBONS**, are a series of compounds belonging to organic chemistry, which are composed of carbon and hydrogen, in such proportions that the various members of the group differ from each other in definite and regular numbers of atoms of carbon and hydrogen. The best marked group of hydrocarbons commences with methylene (C_2H_2), which may be regarded as the first step in the ladder, and by the successive addition of other two atoms of carbon and hydrogen, we

obtain ethylene or olefiant gas (C_2H_4), propylene (C_3H_6), butylene or oil gas (C_4H_8), amylene (C_5H_{10}), etc. There are also series beginning with methyl (C_1H_3), then ethyl (C_2H_5), and with hydride of methyl or marsh gas (C_2H_6), then hydride of ethyl (C_2H_5). The members of these groups are likewise characterized by a gradual ascending difference in their chemical and physical properties, especially the boiling-point, which rises by a given amount.

CARBOLIC ACID, or **PHENIC ACID** (C_6H_6O), is the principal acid substance procured during the distillation of coal-tar. It is produced also by the distillation of gum benzoin and the resin of *xanthorrhoea hastilis*, and is present in the urine of the cow and some other animals. It crystallizes at ordinary temperatures in colorless needles. It smells like tar or creosote, and has a hot taste. It is a powerful antiseptic, and quickly arrests all putrefactive and fermentive changes. Hence it is used, freely diluted in water, as a dressing in the antiseptic system of treating wounds, first practiced by Mr. Lister, when professor of clinical surgery in Edinburgh university. It is also used for purifying or rendering inoffensive sewage (q. v.), etc.

CARBOLIC ACID. Since the article on this substance first appeared in the *Encyclopædia*, much has been ascertained regarding its uses, both as a therapeutic agent and as a disinfectant. It has been introduced into the new British pharmacopœia (1867), where its characters and tests are thus described: "In colorless acicular crystals, which at a temperature of 95° become an oily liquid, having a strong odor and taste resembling that of creosote, which it also resembles in many of its characters and properties. Its specific gravity is 1.065; boiling point, 370° . The crystals readily absorb moisture on exposure to the air, and they are thus liquefied; the acid, however, is but slightly soluble in water, but it is freely soluble in alcohol, ether, and glycerine. It does not redden like litmus paper; a slip of deal dipped into it, and afterwards into hydrochloric acid, and then allowed to dry in the air, acquires a greenish-blue color. It coagulates albumen. It does not affect the plane of polarization of a ray of polarized light." It may be taken internally in doses of from one to three grains in the same class of cases as those in which creosote is prescribed. Its principal uses are as external applications, in which, in various degrees of dilution, it is serviceable in unhealthy ulcerations, gangrenous sores, oozana and all fetid discharges, gleet, the destruction of lice, and especially, as prof. Lister has shown, as an application in compound fractures (in which it coagulates all albuminous effusions, and forms a solid crust, impermeable to air, over the broken surface), and to abscesses immediately after they have been opened. Indeed, it is most probable that his investigations on the treatment of abscess will, like those on the treatment of compound fractures, lead to a total alteration in this department of surgery. The observations of Pasteur and others have shown that, in even apparently the purest air, numerous organic germs are always floating. In a hospital ward, these germs are multiplied to an extraordinary degree. In any wound exposed to the atmosphere (as a compound fracture), decomposition takes place by the action of these germs, and hence it is necessary to introduce the C. A., which has the power of destroying these germs, into the interior. In an unopened abscess, no septic organisms are present, and the object of the surgeon is to guard against their introduction from without, and at the same time to afford a free exit for the discharge of the contents of the abscess. The following are the outlines of prof. Lister's mode of proceeding: A square piece of rag is dipped in a solution of one part of crystallized C. A. and four parts of boiling linseed oil, and is laid upon the skin where the incision is to be made. The lower edge being raised, a scalpel dipped in the oil is plunged into the cavity of the abscess, and a sufficient opening made; and the moment the knife is drawn, the raised part of the rag is dropped upon the skin as an antiseptic curtain, beneath which the pus escapes. The cavity of the abscess is firmly pressed, so as to remove as nearly as possible all the existing pus, and if it should seem expedient, a piece of lint dipped in the oily mixture may be introduced, so as to check bleeding and prevent primary adhesion of the cut surfaces. "Thus," says prof. Lister, "the evacuation of the original contents is accomplished with perfect security against the introduction of living germs. This, however, would be of no avail unless an antiseptic dressing could be applied that would effectually prevent the decomposition of the stream of pus constantly flowing out beneath it." He finds that the most suitable dressing is made as follows: Six tea-spoonfuls of the oily solution are mixed with common whiting (carbonate of lime) so as to form a putty, which is spread upon six inches square of common tinfoil, strengthened with adhesive plaster to prevent its tearing. The tin thus spread with putty is laid upon the skin, so that the middle of it corresponds with the point of incision, the antiseptic rag used in opening the abscess being removed the moment previously. The tin is then fixed with adhesive plaster, the lowest edge being left free for the escape of the discharge into a folded towel placed over it, and secured with a bandage. The dressing must be removed every day, and a piece of rag dipped in the oily solution must be placed on the incision when the first tin is removed, so as to guard against the possibility of the entrance of germs during the cleansing of the skin with a dry cloth, and pressing out any discharge that may exist in the cavity. If a piece of lint was inserted into the wound, it must be removed when the tin is applied. From the absence of the irritation excited by decomposition, pus almost at once ceases to be formed under this treatment; and large

abscesses, after their original contents have been evacuated, often yield in 24 hours only a few drops of serum in the course of a few days. The pharmacopœia gives the glyceride of C. A. (consisting of one part of the acid to four of glycerine) as a good form for local application; but the proportion of acid must vary with the case.

The value of C. A. as a disinfectant was placed beyond all doubt by the investigations made at the request of the royal commissioners, who were appointed to obtain information and report on the cattle disease. In the same way, C. A. is highly serviceable in military camps, on board ship, in disinfecting dunghills, in purifying the air of sick-rooms, stables, bird-cages, and any place where the germs of disease do or may lurk. It is extensively used for preserving wood, as in railway sleepers. It has recently acquired importance as a source of dye-stuffs, Victoria orange, phénicienne or phenyl brown, coralline, etc. C. A. acts as a powerful poison on animal and vegetable life in general. The creosote (q.v.) obtained from coal-tar is often simply a form of carbolic acid.

CARBON is one of the elementary substances largely diffused in nature. It occurs uncombined in the mineral graphite, or black-lead (q.v.), and in the diamond (q.v.), which is pure crystallized carbon. It is much more abundant, however, in a state of combination. United with oxygen, it occurs as carbonic acid (CO_2) (q.v.) in the atmosphere, in natural water, in limestone, dolomite, and ironstone. In coal, it is found combined with hydrogen and oxygen; and in plants and animals, it occurs as one of the elements building up wood, starch, gum, sugar, oil, bone (gelatine), and flesh (fibrine). Indeed, there is no other element which is so characteristic of plant and animal organisms, and it ranks as the only element never absent in substances obtained from the two kingdoms of organic nature. Wood-charcoal, coke, lampblack, and animal charcoal are artificial varieties, more or less impure, of carbon. The atomic weight or equivalent of C. is 6 (new sys. 12); the specific gravity greatly varies; that of the diamond is 3.330 to 3.550 (water being 1.000), and of graphite 1.800. C., in its ordinary forms, is a good conductor of electricity; in the form of diamond, it is a non-conductor. Of heat, the lighter varieties of C., such as wood-charcoal, are very bad conductors; graphite in mass has very considerable conducting powers. At ordinary temperatures, all the varieties of C. are extremely unalterable; so much so, that it is customary to char the ends of piles of wood which are to be driven into the ground, so as by this coating of non-decaying C. to preserve the interior wood; and with a similar object, the interior of casks and other wooden vessels intended to hold water during sea-voyages, are charred (coated with C.) to keep the wood from passing into decay, and thereby to preserve the water *sweet*. Its power of arresting odors and colors likewise varies much. See BONE-BLACK. In the simple property, even of combustion, there is a marked difference. Wood-charcoal takes fire with the greatest readiness, bone-black less so; then follow in order of difficulty of combustion—coke, anthracite, lampblack, black-lead, and the diamond. Indeed, black-lead is so non-combustible, that crucibles to withstand very high heats for prolonged periods without breakage or burning, are made of black-lead; and the diamond (q.v.) completely resists all ordinary modes of setting fire to it. In the property of hardness, C. ranges from the velvet-like lampblack to diamond, the hardest of gems. In 1879, it was announced that a method of producing pure crystallized carbon, or diamond, had been discovered in Glasgow.

Carbon for electrical purposes.—When C. is obtained of sufficient density, it is found to be a good conductor of electricity, and to make an excellent electro-negative element in a galvanic pair. Graphite displays these qualities to advantage, and so does the hard incrustation of C. that is found sublimed in gas retorts. Coke and wood-charcoal are too porous to possess them to any great extent. The scarcity of graphite, and the precarious supply of retort C., preclude the possibility of obtaining much practical advantage from the electrical properties of C. with these substances alone. We are indebted, however, to prof. Bunsen, of Heidelberg, for the discovery of a process whereby a C. of the requisite density can be manufactured with great ease and economy. The carbons thus obtained for galvanic batteries rival platinum in electric energy, and they have aided in no small degree, from their cheapness, in heightening the utility of galvanic electricity. The Bunsen carbons, as manufactured in Germany, are of the form of hollow cylinders, whereas those made in France and this country are solid rectangular prisms. The following are the more important details of the process. Two parts of coke, and one of baking-coal—the proportion varying to some extent with the materials—are ground to a fine powder, and passed through a sieve. The powder so got is transferred to iron-plate molds of the required shape, the seams of which are merely clasped together, and luted with clay. No pressure is employed in filling them, other than that of shaking. When the molds are filled, they are placed in a furnace, and kept there till all carburetted hydrogen has escaped from them. They are then taken out, and allowed to cool before the mass within is removed, which is now found to have taken a solid form, and to be so hard that it may be turned or ground to the exact size wanted. At this stage, the carbons are destitute of electrical action, and they must consequently be rendered more dense by a subsequent process. This consists in soaking them thoroughly in thick sirup, or, better still, in gas-tar thickened by boiling, and laying them aside till dry, after which they are packed with charcoal-dust in fire-proof crucibles,

and exposed for a considerable time to a high heat. If one soaking and charring is not enough, the same may be repeated until sufficient density is obtained. Throughout the process, it is essential that all flaming matters be driven off, so as to leave only the C. in the mold; and care must be taken that no air be admitted to the mold when under the action of heat, otherwise there would be a loss of C. from combustion. The manufacture of these carbons may be carried on contemporaneously with that of gas. The sticks of C. used for the electric light are obtained by sawing up either C. made by this process or the C. of the gas retorts.

CARBON, a co. in e. Pennsylvania; 400 sq.m.; pop. '70, 28,144; a mining region, on the Lehigh river, and the Lehigh Valley and other coal-transporting railroads. Next to the mining of anthracite coal, the chief business is agricultural. Co. seat, Mauch Chunk.

CARBON, a co. in Wyoming territory, extending entirely across the territory, from Montana to Colorado; 15,000 sq.m.; pop. '70, 1368. The co. is crossed by the Union Pacific railroad. Co. seat, Rawling's Springs.

CARBONARI (literally "colliers" or "charcoal-burners"), the name of a secret political society, first, in some degree, made known in 1820. The constitution, like the precise objects of the C., still remains in a great measure secret; though they have printed instructions, catechisms, statutes, rituals, etc., for their associates. The statements respecting the high antiquity of this secret confederacy are quite fabulous. There is every reason to believe that it originated during the last French *régime* in Naples. Botta, in his *Storia d'Italia*, states that, under Murat's government, the Neapolitan republicans, equally hating the French and king Ferdinand, escaped into the wild defiles of the Abruzzi, and here, naming themselves "C.," formed a secret society. It is said that their leader, Capobianco, had great powers of popular eloquence, and that their motto or war-cry was, "Vengeance for the lamb torn by the wolf."

The peculiar phraseology of the C. is taken from the vocation of charcoal-burners. For instance, they are (or were) wont to speak of "clearing the forest of wolves." The "wolves" probably meant at first foreign tyrants; but in the course of time, after the restoration of the Neapolitan Bourbons, such symbolical expressions had reference to their despicable misrule. Among themselves the initiated were styled "good cousins." The various societies do not seem to have possessed a common center, or to have been properly organized for combined action. A place of meeting was styled "a hut" (*baracca*); the external neighborhood "the forest;" and the interior of the hut was the *vendita* or "place for selling coal." A union of several of these huts formed a "republic." The superior huts (*alte vendite*) at Naples and Salerno, endeavored, but without success, to effect a centralization of the Carbonari. The society, soon after its institution, numbered 24,000 to 30,000 adherents, and increased so rapidly in Italy, that in Mar., 1820, it is said as many as 650,000 new members were initiated, including considerable numbers of the military and the clergy. The religious and Protestant character of the order is expressed in its statutes, which include the article: "That every carbonaro has the natural and unalterable right of worshiping God according to his own convictions." Though carbonarism did not arise from the lodges of freemasons (as several have supposed), it has borrowed many forms of masonry.

After the restoration of the Bourbons several secret political unions were formed in France, and in 1820 were confederated with the Carbonari. Paris, after the prosecutions against the secret societies of Italy, was made the head-quarters of a carbonarism which, adopting all the symbolic phraseology, rules, and regulations of the Italian societies, received from the rapidly systematizing genius of the French, an organic character which it had never before possessed. The initiated styled themselves *bons cousins*, and spoke of the uninitiated as *pagani* (heathens). Written documents and communications were strictly prohibited by the heads of the union, and treachery was to be punished by assassination. After the close of the French and Spanish war, the C., whose activity in contriving plots had excited the terror of the French prefects, restricted its endeavors to the circulation of republican ideas, without direct attempts towards insurrection. After the July revolution, several of the leading French C. attached themselves to the new régime, and their society was gradually dissolved. In its place the new *Charbonnerie Démocratique* was founded, having for its object the establishment of a republican government, founded on the principles of Babeuf (q.v.). The endeavor of these new C. to make Paris the center of all political movements, led to the secession of the Italian refugees, who associated themselves under the title "Young Italy." French carbonarism is not known to exist at present, and it is possible that even in Italy the triumphs of constitutional patriotism during recent times have rendered its existence no longer necessary, but it certainly was alive at the commencement of the Franco-Sardinian war with Austria; and one of the rumors of the time was, that the French emperor—who, in his young republican days, had been a member of this society—had entered on the war of liberation, to conciliate his old associates, who had menaced him with the fate of a traitor.

CARBONATED or **ACIDULOUS WATERS** are those which contain a great excess of carbonic acid gas. The amount of gas in ordinary spring and well waters does not amount to more than 3 to 8 cubic in. in 100 cubic in. of the water; but in waters enti-

tled to be called C., the proportion of gas to 100 cubic in. of water rises 30 to 60, when they are considered rich; 100 to 200 when they are very rich; and in the waters of St. Nectaire it is said that the proportion of gas is as high as 400 volumes to 100 of the water. These waters sparkle much when poured from one vessel to another. The carbonic acid is free, but is generally accompanied (1) by bicarbonate of soda, when the water is called *carbonated-alkaline* or *acidulo-alkaline*, as in the Seltzer, Pymont, Salzbrunn, Altwasser, and Reinerz acidulous mineral springs; or (2) by carbonate of iron, when the water is named *carbonated* or *acidulous chalybeate*. See CHALYBEATE WATERS. The mineral spring at Irkeston, near Nottingham, is the only water of this nature in Britain. The C. or acidulous waters are very refreshing and exhilarating, and are useful in certain disordered states of the stomach; they relieve nausea, and generally increase the discharge of liquid from the system. They are objectionable in the case of persons of a full and inflammatory state of body.

CARBONATES, chemical substances which are compounds of carbonic acid with a base; e.g., carbonates of lime, potash, soda, iron, lead, copper, silver, etc. Their formulae are: carbonate of lime (marble), CaO, CO_2 ; carbonate of potash, KO, CO_2 ; carbonate of iron (protioxide), FeO, CO_2 , etc. As affinities of carbonic acid are very weak, carbonates are easily decomposed: by heat, as in reducing marble and limestone to lime; by a more powerful acid, as in the preparation of certain kinds of bread, which are made light by the carbonic acid set free from the bicarbonate of soda, the carbonate of potassa, or the carbonate of ammonia, by the acid of sour milk; by the acid tartrate of potash (cream of tartar); by an acid phosphate, prof. Horsford's method; or by hydrochloric acid; or as in the preparation of so-called soda-water, which is merely common water surcharged with carbonic acid set free from marble chips by sulphuric acid.

CARBONDALE, a city in Luzerne co., Penn., near the head of the Lackawanna river, and on the Delaware and Hudson railroad; 110 m. n.w. of Philadelphia; pop. '70, 6,393. The city was incorporated in 1851, and is in the midst of one of the most important coal-mining districts in the state.

CARBON DISULPHIDE, or **BISULPHIDE**, also called by workmen sulphur alcohol, a chemical compound produced by burning carbon in an atmosphere of sulphur, or by distilling certain metallic sulphides with charcoal. It is a colorless liquid, of specific gravity of 1.268, and boils at 114° Fahrenheit. It does not combine with water, but readily mixes with alcohol, ether, and other hydrocarbons. It readily dissolves India rubber, gutta-percha, resins, oils, camphor, phosphorus, sulphur, and iodine, and is very inflammable. With oxygen or atmospheric air it forms an explosive compound. It is of great use in manufacturing in many ways, such as vulcanizing India rubber, extracting fat from bones, dissolving oil from seeds, removing sulphur and bitumen from rocks, making pure spices, purifying paraffine; also for destroying vermin, producing artificial cold, making photographic light, cleaning greasy rags, preserving hides and fresh meat, and making delicate perfumes. It is also used to some extent in medicines. The odor of the crude article is most sickening. It has a high refracting power, and is used in prismatic glass bottles for producing, on a large scale, a spectrum, with an electric or a lime light.

CARBONIC ACID, **FIXED AIR**, or **CHOKE-DAMP**, is a substance occurring free as a gas in the atmosphere, to the extent of 1 volume to 2,500 of air, and also in combination with a variety of substances. It is most easily prepared for experimental purposes from chips of marble, water, and hydrochloric acid, which are placed in a gas bottle with tubes. The hydrochloric acid (HCl) acts on the marble (CaO, CO_2), and forms chloride of calcium (CaCl), water (HO), and carbonic acid (CO_2), which escapes as gas with effervescence, and may be conducted by a proper tube under the mouths of jars filled with water and placed on a pneumatic trough. Where C. A. is required in large quantities, it is prepared in a leaden vessel from chalk (CaO, CO_2) and sulphuric acid (SO_2) diluted with water, when sulphate of lime (CaO, SO_2) is formed, and C. A. escapes as gas.

The atomic weight or equivalent of C. A. is 22; it is a clear, colorless gas, with a pleasant acidulous smell and taste. Under great pressure and cold, it can be condensed into a liquid, and even a solid resembling snow in appearance. Under ordinary atmospheric pressure, C. A. dissolves in water to the extent of 2 volumes of gas in 3 of water; but under increased pressure, a very much larger amount of gas is taken up by the water, and in this way the various kinds of **AERATED WATERS** (q.v.) are prepared. The gas is more than half as heavy again as ordinary air, being 1529. It is incombustible, and a non-supporter of combustion, at once extinguishing a lighted candle, gas jet, or even a piece of burning phosphorus, when these are placed in a jar filled with the gas, or even in a mixture of C. A. and air. This power of putting out flame and fire has been turned to account in the extinguishing of burning coal-mines, where, all the openings to the mine being properly secured, C. A., in the form of the spent air from an ordinary coal-furnace, has been passed into the mine, with the result of successfully stopping the fire. It is irrespirable in a concentrated form, producing spasm of the glottis, which prevents the admission of the gas into the system; and when mixed with air, it can be breathed without suspicion, and then acts as a narcotic poison, even when present only to the extent of 4 or 5 per cent of the air. The deadly effects of C. A. are

observed, in the combustion of charcoal, coal, or *coal-gas*, in chauffers, furnaces, or in fireplaces with the dampers down, when the deadly fumes of C. A. steal more or less quickly over the inmates of the room, and they almost unconsciously become its victims—thus unknowingly following the course of the Parisian suicide, who purposely lights a charcoal fire in the center of his room, and prepares for death; and in overcrowded rooms where the C. A., exhaled from the lungs of each inmate at every breath, poisons the air of the apartment, and day by day slowly but surely robs the robust of health, and ultimately of life. In such cases as the Black Hole of Calcutta (q.v.), where there was scarcely any outlet for the poisonous gas, only a few hours may be required to complete the catastrophe.

Though poisonous when inhaled by the lungs, C. A. is rather refreshing when taken into the stomach. Thus, aerated beverages of all kinds—beer, champagne, and carbonated mineral waters—owe their refreshing and invigorating qualities to the presence of C. A.; and if the gas be allowed to escape, they become almost tasteless, stale, and mawkish.

Besides abounding everywhere in the atmosphere, C. A. is largely evolved from fissures in the earth, especially in volcanic districts. In the *poison or Upas valley* of Java, which is a valley of an oval form, about $\frac{1}{4}$ of a mile in circumference, and 30 to 35 ft. deep, the carbonic rises to a height of about 18 ft. from the surface, and the whole bottom of the valley is devoid of vegetable and animal life, and is strewn here and there with the bleached bones of man and other animals that have unluckily stepped within the deadly circle. A dog thrown in dies in 14 seconds; and birds attempting to fly across the valley, instantly drop down dead. In the neighborhood of the lake of Laach, in Rhenish Prussia, the amount of C. A. evolved every day has been estimated at 600,000 lbs. weight. In a state of combination, C. A. forms an ingredient in a great number of minerals called *carbonates*, such as chalk, limestone of various kinds (CaO, CO_2), black-band iron-stone (carbonate of iron, FeO, CO_2), malachite (carbonate of copper, $\text{CuO}, \text{HO}, +\text{CuO}, \text{CO}_2$), etc. C. A. is the principal product of combustion: the carbon of the burning substance (coal, candle, coal-gas, wood, paper, etc.) uniting with the oxygen of the atmosphere, and forming C. A. (CO_2). It is also a product of respiration (q.v.), and is evolved more or less largely by all animals, not only by the mouth, but in exhalations from the skin, and is present in blood, urine, etc. It is evolved during the fermentation (q.v.) of beer, wine, etc., and often remains in brewers' vats when the liquor has been drawn off. During the decay of vegetable and animal matter, C. A. is produced, and in explosions of fire-damp in coal mines, it is formed in large quantity, and fills the underground passages.

C. A. forms the largest ingredient in the food of vegetables, and is therefore abstracted in large quantity from the air by plants. It enters into combination with the majority of the oxides of the metals and other compounds, to form a class of salts called *carbonates*, several of which have been referred to. C. A. when present in a vessel in quantity may be recognized by the power of extinguishing a lighted candle, or by not burning itself. C. A. in the form of gas may be readily recognized in the atmosphere by exposing a little lime-water in a saucer, or other shallow vessel, when the lime (CaO) abstracting the C. A. (CO_2) from the air, a white film of carbonate of lime or chalk (CaO, CO_2) is formed on the surface of the liquid. A solution of baryta (q.v.) in water is more delicate in its action on the C. A. of the air, and more readily indicates its presence.

CARBONIC OXIDE is a compound of one atom of carbon and one atom of oxygen, is represented by the symbol CO , and has the atomic weight 16. It does not occur naturally, but may be observed burning with a pale-blue flame in fire-places and stoves, especially in frosty weather. During the combustion of the fuel at the lower part of the grate, the oxygen of the air unites with the carbon of the fuel to form carbonic acid (CO_2); and this gas rising up through red-hot coal or carbon (C), has part of its oxygen abstracted by the carbon, and two atoms of C. O. (CO) are produced, which, taking fire on the top of the coals, burn with the characteristic blue flame, abstracting more oxygen from the air, and re-forming carbonic acid (CO_2). C. O. can be prepared for experimental purposes by heating a mixture of oxalic acid ($\text{HO}, \text{C}_2\text{O}_3$) and sulphuric acid (SO_2) in a retort, when the latter abstracts the water from the oxalic acid, and the other elements (C_2O_3) escape as carbonic acid (CO_2), and C. O. (CO). On passing the mixed gases through a solution of potash (KO), the carbonic acid is retained as carbonate of potash (KOCO_2), whilst the C. O. remains as gas. C. O. is a transparent, colorless gas, a little lighter than air, being 967, and has never been liquefied nor solidified. It burns with a blue flame, but is a non-supporter of combustion, and at once extinguishes a lighted candle introduced into it. It is very poisonous, and even when largely diluted with air, if inhaled, it produces a sensation of oppression and tightness of the head, and ultimately acts as a narcotic poison. It does not take part in any natural phenomena, nor is it put to any use in the arts and manufactures, and in these respects, affords a striking contrast to carbonic acid, which has so many duties to perform in nature and in the arts.

CARBONIFEROUS LIMESTONE, or MOUNTAIN LIMESTONE, one of the lower rocks of the carboniferous system, generally of coralline formation, containing magnesia, and rich in organic remains. Some varieties make good building stone.

CARBONIFEROUS SYSTEM, the name given to the strata which, in geological order, rest upon the Devonian measures, and are capped by the Permian series. They derive their designation from the amount of carbon contained in them, for to them the great coal-fields of the world belong. In an economic sense, they are the most valuable series of rocks in the earth's crust, forming the great store-house from which is obtained the chief supply of coal, iron, and lime.

The rocks of the system are composed of a vast series of beds of sandstone, limestone, shale, and coal. In some coal-fields, these are so interstratified, that it is impossible to subdivide the strata in the order of time. In the Edinburgh district, there are nearly 100 coal-seams, omitting all under 6 in. in thickness. Out of the whole depth of the strata, amounting to about 6,300 ft., these seams occupy only 204 feet. The remainder consists of sandstone and shale in the upper half; towards the middle, limestones appear, and these increase downwards in the number and thickness of the beds, but are still intermixed with seams of coal. The same arrangement exists in the other coal-fields of Scotland, as well as in those of the n. of England. In other districts, the limestone is confined to the lower portion of the measures, and separated from the coal-bearing strata, so as to form a natural subdivision of the system into—1. *The coal measures*, consisting of shale, sandstone, and grit, with occasional seams of coal; and 2. *The mountain or carboniferous limestone*, a calcareous rock, containing marine shells and corals, and devoid of coal. A coarse quartzose sandstone, passing into conglomerate, is occasionally developed to a considerable extent between these two divisions. This is a local deposit, being almost confined to England, and may be considered as one of the coal sandstones, of coarser texture than usual. Being occasionally used for millstones, it is called *millstone grit*. It is accompanied with shales containing the usual coal plants, but generally without any true coal seams. Another locally developed series of beds, consisting of indurated shales, sandstones, and grits, occurs below the carboniferous limestone in South Wales and Ireland, and is known as the *lower limestone shales*. These rest conformably on a series of yellow sandstones, which have been generally referred to the Devonian measures, but which, from their organic contents, as well as from their stratigraphical position, seem to be basement beds of the carboniferous series. The existence and development of these various beds in the United Kingdom will be better understood by an examination of the following table. The maximum thickness of the beds is given in feet when known; the blanks show the absence of the division from the particular coal-field:

	Edinburgh.	Glasgow.	N. York.	Derby.	S. Wales.	Kerry.	Clare.	N. Ireland.
Coal Measures.....	6,300	2,800	2,000	2,700	12,000	2,000	2,900	2,200
Millstone Grit.....	400	1,600	1,000	1,800
Mountain Limestone..	1,659	1,000	1,500	1,500	3,000	6,400
Lower Limestone Shales	500	4,650	150	1,300
Yellow Sandstone.....	3,000	unknown depth	2,000

In the midland countries, the coal measures are the only portion of the C. S. present, and these rest on the Silurian or older rocks. In Devonshire, there occurs an extensive series of shales and sandstones, with a few beds of earthy anthracite or culm, associated with argillaceous rocks, probably belonging to the lower limestone shales, much indurated, and traversed by slaty cleavage.

From the great economic value of the contents of the C. S., we are better acquainted with its fossils than with any fauna or flora that flourished before the tertiary epoch. As coal is the result of the mineralization of vegetable matter, the coal measures must necessarily abound in the remains of plants. No less than 294 species have been described as found in Britain alone. Numerous impressions of plants, as well as traces of structure, are found in the seams of coal themselves; but the more distinct forms are preserved in the interstratified beds of mud and ironstone, often in great number and exquisite beauty. Such remains consist chiefly of impressions of leaves separated from their branches; of casts of trunks, more or less in a broken state; and of roots much compressed, yet occupying their original position in the clay soil now indurated into shale; with these occur pieces of wood, or remains of trees, in which the vegetable texture is to some extent preserved. The great proportion of the plants seem to have flourished in marshy swamps, and to have accumulated where they grew, like peat, the material afterwards converted into coal. Hence a stratum of shale in which are imbedded the roots of sigillaria, calamites, etc., is the invariable *floor* on which the coal seam rests. The chief coal plants are lepidodendron (q. v.), sigillaria (q. v.), calamites (q. v.), trigonocarpus (q. v.), and ferns (q. v.). The existence of cone-bearing trees during this epoch has been proved from the microscopic examination of prepared sections of fossil woods, in which the small discs occur that are characteristic of and peculiar to the conifera.

The animal remains are as numerous and as well preserved as the vegetable. They are found chiefly in the limestone; the greater part, indeed, of this rock, is made up bodily of corals and crinoids. No other such accumulation for extent and variety is known; it has its nearest parallel in the somewhat similar formation now going on in the southern archipelago. The corals and crinoids were specifically as well as individually numerous. The terebratulæ and other allied forms of bivalve shells, though belonging to a comparatively limited number of genera, were very abundant. The more highly developed mollusca were also numerous; they belonged to a great number of

generic types. But the most remarkable group was the fishes. At no time were they more abundant. They belonged to the ganoid and placoid groups of Agassiz. The ganoids, having their entire surface covered with scales, were numerous; some of them inhabited shallow water near the shore, and fed on crustaceans and shell-fish, for crushing which they had a formidable apparatus of conical teeth of a very complicated structure. Others were inhabitants of deep water, and were more powerful and predaceous, and more rapid in their movements. Their jaws were produced into a long snout, like the crocodile of the Ganges, and armed with a double series of enormous teeth, which were sometimes as much as 4 in. long by 2 in. broad, as in *megalichthys* (q.v.), dimensions rarely attained even by the largest known reptiles. Associated with these were a great number of sharks belonging to the cestraciontidae (q.v.), a family of which we have only a single living representative. They were furnished with a long bony spine to strengthen the dorsal fin, and thus enable them to turn speedily in the water, as they required to do in seizing their prey. These spines are often found fossil. The only remains referred to a higher division of the animal kingdom yet found belong to the saurian *archegosaurus* (q.v.).

CARBONIFEROUS SYSTEM (*ante*). Most of the great coal fields of the world belong to this system of formation. In this country, coal is widely distributed over Pennsylvania, Ohio, Illinois, Kansas, Virginia, and other states. It is estimated that there are 400,000 sq. m. of the earth's surface now covered by productive coal fields. Now as there are about 3,100,000 sq. yards in a m., and as a cubic yard of coal weighs nearly a ton, and as in some of the fields the vein or deposit is from 30 to 60 ft. thick, there would not seem to be any immediate danger of failure in the supply of coal. See **ANTHRACITE**, and **COAL**.

CARBON PRINTING. See **POSITIVE PRINTING**.

CARBUNCLE, a name given by lapidaries to the beautiful mineral called *pyrope* (q.v.) by mineralogists. The C. of the ancients appears to have been either pyrope, or the deeper variety of noble garnet (see **GARNET**), which is in every respect very similar to it, or probably included both.

CARBUNCLE (Lat. *carbunculus*, a little coal) derives its name from the two prominent symptoms—a glowing fiery redness, and a burning pain. It consists of an inflammation, caused by some vitiated condition of the blood, or some atmospheric influence, attacking a patch of skin on the shoulders, nape of the neck, or indeed on any part of the body. The part swells slightly, feels hard, and this hardness extends deeply into the tissues; the pain is very severe, and the patient much depressed with loss of appetite, and general derangement of the secretions. As the disease advances, the redness assumes a dark purple or livid hue, the cuticle rises in blisters, and many small specks of matter appear on its surface, which discharge, and leave apertures like those in the rose of a watering-pot; through this a thin viscid fluid escapes, and occasionally a small slough or core of the true skin which has been killed by the disease. Sometimes these apertures meet, forming large openings, and in others the whole patch of skin sloughs and comes away.

The treatment of C. consists in restoring the secreting organs to a healthy condition, the agents for which must depend on the individual case; in supporting the patient's strength by easily digested food, wine, brandy and bark, with nitric acid; relieving pain by opiates, and encouraging suppuration with warm poultices; carrot, turnip, and yeast poultices being favorite applications in this disease. To prevent excessive loss of skin, the C. must be divided freely with a knife from one margin of the inflamed patch to the opposite one.

CARBURETS. See **CARBIDES**, *ante*.

CARBURETED HYDROGEN is a term in chemistry applied to several compounds of carbon and hydrogen. Thus, light carbureted or monocarbureted hydrogen (CH_2) is the gaseous compound popularly known as marsh gas and fire-damp, and is the principal constituent of coal-gas. See **GAS**. Heavy carbureted or bicarbureted hydrogen (C_2H_2) is otherwise known as olefiant gas (q.v.).

CARCAJENTÉ, a t. of Valencia, Spain, about 28 m. s.s.w. of the city of Valencia, situated on a rich plain near the right bank of the Juncar. It is well built, with good streets, and has a palace belonging to the marquis of Calzada. It has some manufactures of linen and woolen, and a trade in the agricultural produce of the district. Pop. about 7,000.

CARCANET, a jeweled chain or necklace. Venice was famous for the manufacture of carcanets in the 15th century.

CARCASS, in military pyrotechny, is a hollow case of iron, sometimes globular, and sometimes ovate, filled with combustibles. It is fired from a mortar. Its chief use is to ignite buildings in the enemy's quarter, and to give sufficient light to aim the shot and shells. Carcasses are said to have been first used by one of the princely ecclesiastics of Germany, the bishop of Munster, when he fought against the duke of Luxem-

bourg at Groll, in 1672. The oval carcasses, being uncertain in their flight, are now nearly abandoned. The round carcasses now made are chiefly those here indicated:

Diameter.	Composition.	Weight.
13 inch.....	18 lbs.....	213 lbs.
10 ".....	7 ".....	100 "
8 ".....	3 ".....	51 "
5 ".....	19 ozs.....	17 "
4½ ".....	7 ".....	9 "

Carcasses are not intended to burst, but to send out, through holes, a furious and inextinguishable fire, which lasts from 3 to 12 minutes. The composition with which they are filled consists of saltpeter, sulphur, meal gunpowder, pitch, rosin, tallow, and Venice turpentine, about half being saltpeter. The composition is packed in tightly through one of the holes; and the holes are stopped with fuses adjusted to ignite the composition after a certain space of time. Sometimes old pistol barrels, loaded to the muzzle, are introduced with the composition. Compare those details with CASE-SHOT, and SHELLS.

CARCASSONNE, a t. in the department of Aude, France, situated on the river Aude, and the *Canal du Midi*, about 55 m. s.e. of Toulouse. It is divided into two parts, the old and new towns. The modern town is well built, with streets running at right angles to each other, squares adorned with trees, pleasant boulevards, and several marble fountains. The old town, built on a height, is much more picturesque, with its ramparts and towers, some parts of them dating from the time of the Visigoths, and the rest, with the castle, from the 11th or 12th century. This old town suffered greatly at the hands of the fierce bigot Simon de Montfort and his crusaders, who here burned 400 of the Albigenes. In the 14th c. it effectually resisted the black prince. The cloth manufactures are important, employing, it is said, upwards of 7,000 people. C. has also manufactures of paper, leather, linen, and soap. Pop. '76, exclusive of garrison, 23,517. The ancient name of the town was Carcaso, which was a place of some note in the time of Cæsar.

CARCHARIAS. See SHARK.

CARCINO'MA. See CANCER, *ante*.

CARDAMINE. See CRESS, BITTER.

CARDAMOMS are the capsules of certain species of plants of the natural order *scitamineæ* (q.v.), and belonging to at least two genera, *amomum* and *elettaria*. They are three-celled, and contain numerous wrinkled seeds, which form an aromatic pungent spice, weaker than pepper, and with a peculiar but agreeable taste. On account of their cordial and stimulant properties, they are employed in medicine, very generally to qualify other medicines; they are also used in confectionery, although not to a great extent in Britain; but in Asia they are a favorite condiment; and in the n. of Germany, they are used in almost every household to flav or pastry.—The C. recognized in the British pharmacopeias, and called *true* or *official* C., also known in commerce as *Malabar C.*, are the produce of *elettaria cardamomum*, a native of the mountains of Malabar and Canara. They depend for their qualities on a peculiar pungent essential oil, called *oil of cardamom*, which may be obtained from them by distilling them with water, and when fresh, is colorless. Other kinds of C. occur in commerce, but none is equal to the true C. in commercial value. The different kinds of C. differ not only in strength, but in the character of their aroma. The plants producing them have much general similarity.

CARDAN, JEROME, a celebrated mathematician, naturalist, physician, and philosopher, b. at Pavia, Sept. 24, 1501, was the illegitimate son of a physician and juriconsult at Milan. He received his early education at home, and completed his studies in Pavia and Padua. After some years, he became professor of mathematics at Milan. Here his reputation began to grow. After a few years, he began to lecture on medicine, to the practice of which he ultimately betook himself. By 1546, his reputation had so increased, that he was invited by the king of Denmark to accept a professorship at Copenhagen, which, however, he declined; and, in 1552, we find him proceeding to Scotland, on an invitation from Hamilton, primate of that country. He managed to cure the primate of an inveterate asthma, which had defied the skill of the most celebrated physicians, and returned to Milan enriched by the bounty of his patient. Here he again settled for some time. In the autumn of 1559, however, he removed to Pavia as professor of medicine, whence, again, in the same capacity, he removed to Bologna, where he continued teaching till 1570, when we find him imprisoned for debt. Having regained his liberty in 1571, he went to Rome to avoid his creditors. Here he was speedily admitted a member of the medical college, and pensioned by pope Gregory XII. The rest of his life he spent, without public employment, in Rome, where he died Sept. 2, 1576, a few weeks after finishing his autobiography. Some writers assert, but on no sufficient authority, that he starved himself to death, to fulfill a prediction which he had made as to the time when he should die. It is certain, however, that he was a devoted astrôloger, and cast horoscopes for himself and others. The fancifulness necessary to

support the faith of an astrologer imbued all his scientific writings. These were very voluminous. A summary of his notions on physics and metaphysics is given in his two works—*De Sublimitate*, in 21 books, and *De Rerum Varietate*, in 17 books. On the whole, he wrote 122 treatises on physics, mathematics, astronomy, astrology, rhetoric, history, ethics, dialectics, natural history, music, and medicine. These, it need scarcely be said, abound in incoherent paradoxes, contradictions, and capricious abstractions, more than enough to overwhelm the few profound ideas which he originated. A formula for the solution of certain kinds of cubic equations is called "Cardan's formula," and was published by him, as his own invention, in the *Ars Magna sive de Regulis Algebraicis* (1545); but it would appear that the formula was really the invention of one Tartalea or Tartaglia. In religion, C. was heterodox, and commonly reputed an atheist. His numerous writings were collected and edited by Charles Sphon (10 vols., Lyon, 1663).

CARD-BOARD, or **CARD**, is made by pasting together several layers of paper, according to the thickness and quality required. *Bristol-board*, used by artists, is made entirely of white paper; ordinary card-board, of fine white paper outside, with one or more sheets of coarse cartridge-paper between. According to the number of layers, they are called *three, four, six, or eight sheet boards*. *Mill-board*, used by book-binders as the basis of book-covers, is made of coarse brown paper, glued and strongly pressed.

The workman arranges the paper in the order required for pasting, and the pile, called a *head*, is placed at his left hand, the paste-tub on his right. He lifts a sheet from the head with his left hand, brushes it over with paste with his right; then another is laid upon that and pasted, until he comes to the last required to complete the thickness of one board, when he removes two sheets, and only pastes the upper one, which thus forms the lower sheet of another board. This is repeated till the whole head is pasted, when it is removed to a press, and the water of the paste squeezed out at the edges. The boards are then separated, and dried by hanging them in a room artificially heated. The card-board, which is now rough and warped, is smoothed and flattened by making a pile consisting alternately of sheets of rough card-board and copper plates, with a copper plate at top and bottom. This pile is passed between iron rollers, and the smooth surface of the copper impressed upon the card-board, which is thus flattened and beautifully polished.

The enameling of address-cards is produced by brushing over the card-board a mixture of *china* or *kremnitz white* (a fine variety of white lead) and size. After drying, this surface is rubbed lightly over with a piece of flannel, previously dipped in finely powdered talc; it is then polished by rubbing vigorously with a hard, close-set brush.

CARDENAS, a seaport and city of Cuba, capital of a district, 105 m. e. of Havana, on a bay of the n. coast, and having railroad communication with Matanzas and Havana. There is good anchorage in the harbor. Sugar is the chief article of export. Pop. 11,000. The streets are well laid out and lighted, and the houses are usually neat and solid. There is a bronze statue of Columbus in one of the squares. Much of the business is done by people from the United States, a fact that gives it the name of the "American city." In 1850, the city was plundered by Lopez.

CARDIA, the upper orifice of the stomach, called, on account of its vicinity to the heart, by the same Greek name, *cardia*, and probably hardly distinguished from it in the earliest times of Greek medicine.

CARDIAC MEDICINES, stomachic and stimulating remedies—cordials, so called from their action on the heart through the stomach. See **CARDIA**.

CARDIADÆ, a family of bivalve lamelli branchiate mollusks, of which the cockle is a specimen.

CARDIALGIA, pain of the heart or stomach (**CARDIA**). The name is commonly applied to the particular variety of pain called *heartburn*, arising from a disordered stomach, and accompanied with acid eructations. See **INDIGESTION**.

CARDIFF (*Cuer-Taff*, Fort of the Taff), a parliamentary and municipal borough and seaport, one of the county towns of Glamorgan, South Wales, situated on the river Taff, 170 m. w. of London by railway. The population has risen from 2,000 in 1801, to 56,911 in 1871, with a floating population of about 5,000. C., with Cowbridge and Llantrisant, returns one member to parliament. The town extends about one mile in each direction from the town-hall. Among the public buildings are the Glamorganshire and Monmouthshire infirmary, town-hall, free library and museum, county jail, law-courts, an infirmary, a county lunatic asylum, baths, and a theater. There are also many private buildings of a superior character, and a public park. Of about 30 places of worship in C., only 4 belong to the church of England.

The port of C. is the outlet for the large mineral and manufactured produce of the central portion of the South Wales mineral-field, in which are the populous districts of Merthyr-Tydvil, Rhymney, Aberdare, and the Rhondda valley, with which this port is connected by the Taff Vale, the Rhymney, and the Ely Valley railways, and the Glamorganshire canal. The town is also one of the chief stations on the Great Western line from London to Milford-Haven. The Bute docks, e. and w., with an area of 76 acres, constructed at the expense of the Bute estate, have cost upwards of a million sterling, and belong entirely to the present marquis. There are about 40 staths on the

quays of the docks, with machinery of a peculiar construction for the purpose of loading vessels with coal, by which the breaking of the coal is almost entirely prevented. Each of these staiths is capable of shipping 560 tons of coal in a day of 12 hours. There is also a tidal harbor, with 7 staiths, each capable of shipping 400 tons of coal per day, and a lower-water pier 1400 ft. in length. Height of water at spring-tide, 31 ft. 8½ inches; at neap-tide, 21 ft. 7½ inches. Width of sea-gates, 55 ft.; length of quays, 11,100 ft.; width of dock, 300 ft. southern, and 500 ft. northern part; depth, 25 feet. Exports during 1873—coal, 3,591,218 tons; iron, 154,570 tons; coke, 1276 tons. The quantity of coal exported has immensely increased. In 1875, 5,450 vessels, of 1,170,122 tons, entered the port, and 10,105, of 2,428,721 tons, cleared it. The imports to C. include copper ore, live cattle, salted provisions, foreign fruit and vegetables, corn and flour, etc. The Penarth docks, about 3 m. to the westward, form another outlet for the trade of the district. Steamers ply between the port of C. and New York, London, Liverpool, Glasgow, Bristol, Cork, Whitelaven, and Burnham.

The assizes (half-yearly, alternately with Swansea) and the quarter-sessions are held at the town-hall. The ancient city of Llandaff, now a mere village, is almost connected with Cardiff. Cardiff castle, built in the 11th c., is partly now in ruins, and partly occupied by the marquis of Bute, to whom nearly the whole of the modern town belongs. Robert duke of Normandy, brother of Henry I., died in the castle, after being a prisoner for 28 years. Cromwell (1648) got possession of the castle by treachery, after bombarding it three days; and he afterwards hanged the traitor, as an example to his own soldiery. This town was anciently an important one, successively under the British, Romans, and Normans.

CARDIFF GIANT, a rude statue of a man 10½ ft. high, cut (in Chicago) from a block of gypsum sent from Iowa. It was secretly buried near the village of Cardiff, Onondaga co., N. Y., where it was pretended to have been found in Oct., 1869, and was exhibited with great success for several months as "the petrified giant," deceiving even some men of science. The fraud, one of the most notable in recent times, was finally confessed.

CARDIGAN (anciently, *Aberteifi*, Mouth of the Teify), the co. t. of Cardiganshire, a parliamentary and municipal borough and seaport, in the s.w. corner of the county, on the right bank of the Teify, 3 m. from its mouth, and 239 m. n. by w. of London. The vicinity exhibits romantic scenery on the Teify, and grand rocks on the coast. The streets, except the chief one, are narrow and steep, the houses built of slate-rock. Pop. of the municipal borough, '71, 3,461; of the parliamentary borough, 4,939. With Aberystwith, Lampeter, and Adpar, C. returns one member to parliament. In 1875, 983 vessels, of 31,486 tons, entered and cleared the port. The general trade is confined to vessels of 20 to 100 tons. Vessels of 400 tons reach the town by spring-tides. C. became an important town about the Norman conquest. The Normans were frequently defeated before mastering it. There are the remains of a castle on a low cliff on the Teify, which is supposed to have been founded, in 1160, by a Norman baron. The town suffered much in the struggles between the Welsh and the Normans. The Teify is said to have been the last British resort of the beaver.

CARDIGAN, JAMES THOMAS BRUDENELL, 7th earl of; also baron Brudenell, lieut. gen.; 1797-1868. He was educated at Oxford, and went into parliament in 1818. In 1824, he entered the army in the hussars, and rose (1832) to be lieut. col. He was overbearing and quarrelsome, and treated his men with great severity, so that out of a regiment of 350, he made within two years 700 arrests, and held 105 courts-martial. In 1837, he succeeded to the peerage. In 1840, he fought a duel with capt. Tuckett, an officer of his regiment, in which his adversary was wounded. The house of lords subjected the earl to a show of trial, and he was acquitted. The Crimean war sent him to the field as commander of the light cavalry, and he led that body of 600 through the desperate charge at Balaklava, cutting his way through six times the number of Russian heavy cavalry, but leaving half his men dead or wounded on the field. This charge, celebrated in Tennyson's poem, was desperate and brilliant work, but in the opinion of many critics a wanton and needless sacrifice of his men. In 1861, he was made lieut. gen. He left no children, and the titles passed to his relative, the marquis of Ailesbury.

CARDIGAN BAY, a semicircular bend of St. George's channel, on the w. coast of Wales, 45 m. wide from n. to s., and 20 m. deep, with a sweep of coast of 110 miles. Its exterior points are Brachy-y-Pwll, off which lies Bardsey isle, in Caernarvon, and Sturm Head, in Pembroke. It receives the rivers Mawddach, Dovy, Ystwith, Yren, and Teify. It has 3 to 30 fathoms water, with three reefs. A strong current sweeps round the bay from s. to north. Almost all the harbors on the coast are obstructed by bars. A great part of C. B. is said to have been once dry land, protected, as Holland now is, by dams and dikes, and containing 16 towns, and the land is said to have been submerged about 520 A. D.

CARDIGANSHIRE, a maritime co. in South Wales, on Cardigan bay, with an area of 675 sq. m., a half being waste. The surface is hilly, interspersed with fertile valleys. A rugged, bleak range of hills runs through the middle of the co., from the s.w. to the n.e., between the coast and the Teify, ending abruptly in a shelving beach in the middle

of the coast, but on other parts there are rich flat tracts. The co. contains little wood. The chief rivers are the Teify, which rises in a small lake near the center of the co., and runs 70 m. s.e. and e. along the s. border of the co., the Claerwen, Ystwith, and Rheidol. C. contains some romantic water-falls, especially the Rheidol falls and the Devil's bridge, and above 20 small lakes or llyns, noted for their wild beauty. C. reposes on lower Silurian slates and shales, containing few or no organic remains. Rich veins of copper, lead, zinc, and silver occur. The climate is cold and wet, but mild though wet on the coast. Snow lies long on the hills in winter. Summer is delightful in the valleys. C. is an agricultural co., and its chief branch of industry is the rearing of live-stock. The chief crops are oats, barley, and potatoes on the poor clay and peat soils of the mountains, and wheat, barley, and potatoes on the flat loams of the coast and valleys. The cattle and horses are small. There are some manufactures of coarse woollens and gloves, stockings, and hats. Oats, barley, cattle, sheep, pigs, butter, slates, and woollens are exported. Cardigan is the co. town; the other chief towns being Aberystwith, Lampeter, Adpar, Aberayron, Tregaron. C. sends one member to parliament. Pop. '71, 62,712; registered electors, 5,554. In 834, the king of C. became king of all Wales, under the title of Roderick the great. He divided Wales among his three sons. After this, the Danes and Normans overran Cardiganshire. The co. has many remains of British and Roman camps and roads, Druidical circles, cairns, and castles. Many Welsh princes and bards were buried in the abbey of Strata Florida, 16 m. s.e. of Aberystwith, and some of the records of the principality were kept here. In C. there is a curious practice of sending presents (*biddings*) to a new-married couple, which, when sold, often realize £50 or £60. C. was disturbed, 1843-44, by the Rebecca riots.

CARDINAL (Lat. *cardinalis*, principal, from *cardo*, a hinge). Cardinals are the highest dignitaries in the Roman church after the pope, whose electors and councilors they are. The title, however, had at first a more general application. The pope being the sovereign bishop over the whole Romish church, and having, as such, many duties to fulfill inconsistent with those of a particular diocese, had, from very early times, a number of bishops, priests, and deacons whom he appointed his vicars and coadjutors for the management of the diocese of Rome. The bishops exercised the episcopal function in the pope's stead, each having a peculiar church within the diocese. The priests were titular parsons of the churches in the city of Rome, and had the cure of souls. The deacons had charge of some churches and chapels of devotion, which they held as deaneries, with the additional duty of assisting the pope when he officiated in public. These three classes of ecclesiastics were called *cardinati* or *cardinales*, to denote that they were the first or chief over the rest, and that all the affairs of the diocese of Rome were under their direction. At a subsequent period, the priests and deacons of other cities of importance assumed the title of C., to distinguish them from other priests and deacons over whom they claimed supremacy; but the popes subsequently ordained that none but those whom they had chosen should be honored with that title. Amongst those whom the popes thus appointed were the seven bishops *suburbicarii*, who took their titles from places in the neighborhood of Rome. These bishops were called *hebdomadarii*, because they attended the pope for a week each in his turn. These cardinals took part with the Roman clergy in the election of the pope, who was generally chosen from their number. About the beginning of the 12th c., the popes having formed a regular court, began to bestow the rank of C. priest or C. deacon on any individual of the clergy, or even of the laity, whom they chose to select; and to each, whether Roman or foreign, they gave the title of some particular church in Rome, but without attaching to it any obligatory service. Thus the cardinals became a separate body elected for life, and the officiating priests of the Roman parishes were gradually deprived of the title. In 1159, Nicholas II. limited the right of election to the popedom to the cardinals thus appointed, leaving to the rest of the clergy and people of Rome merely the right of approving of the election of a new pope, and to the emperor that of confirming it. Even these prerogatives, in course of time, were withdrawn. Notwithstanding the great powers thus intrusted to them, the bishops in the great councils of the church continued to take precedence of the cardinals; and it was not till 1614 that Louis XIII. of France, in the sitting of the parliament of Paris, adjudged precedence to the cardinals over the ecclesiastical peers—bishops and abbots. The power of the popes to appoint cardinals has often been contested, and their right to precedence denied, by the other dignified ecclesiastics. In 1567, pope Pius V. forbade any clergyman not appointed by the pope to assume the title of C.; and Sixtus V., in Dec., 1586, fixed their number at 70—viz., the 6 bishops *suburbicarii*, 50 priests, and 14 deacons, and on this footing they have since remained, though the number is seldom complete, the pope generally leaving some vacancies for extraordinary cases. The number has frequently fallen greatly under 70. When Nicholas III. was chosen pope, there were but eight cardinals; and a little before the death of Alexander IV., there were but four. Sometimes before Sixtus V. the number was exceeded, as in the pontificate of Pius IV., when there were 74. The body of cardinals is styled the sacred college. Most of the cardinals reside in Rome, and either enjoy ecclesiastical benefices, or are employed in the administration. When not so provided for, the cardinals receive an allowance of 100 dollars monthly from the papal treasury. Some cardinals belong to monastic

orders, and reside in their convents even after their election. The jurisdiction of the C. bishops in the place in which they are established is truly episcopal, but they are not obliged to reside. That of the C. priests and deacons is almost episcopal, but extends no further than the church and sacristy. They have there an episcopal seat under a canopy, like bishops, and they there solemnly give the people their blessing. The creation of cardinals is wholly in the pope. If the new-created C. is at Rome, he goes the same day to visit the pope, who puts the red cap on his head. The red hat, which Innocent IV. ordained that cardinals should wear, to show that they ought to expose themselves to the shedding of their blood in the cause of the church, is afterwards given in a public consistory. A number of symbolical ceremonies accompany this investiture. The cardinals that are absent, when chosen, have the cap sent them by a special messenger from the pope. The hat is given by the pope's own hands; and many cardinals who do not visit Rome, die without ever having received it. The only exception is in favor of members of royal houses, to whom the hat is sent. Pope Urban VIII., in 1630, gave to the cardinals the title of eminence, which they shared with the grand-master of the order of Malta, and the ecclesiastical electors of the German or Roman empire. The pope often employs cardinals as ambassadors, and the individual thus employed is styled *legate a latere*. A C. legate acts, or recently acted, as governor of the northern provinces of the Papal states, which thence received the name of legations. The chief secretary of state, the *camerlengo* or minister of finances, the vicar of Rome, and other leading officials, are always chosen from among the cardinals. The council of cardinals, when assembled under the presidency of the pope to discuss matters of church and state, is called the consistorium. There are public consistories, which are held on great occasions, and correspond to the levees of other sovereigns; and private and secret consistories, which are the privy council of the pope. Moreri's *Dictionary*, *voce Cardinal*, contains a list of cardinals from 1119 to 1724, with their names, countries, etc., and the dates of their election and death.

CARDINAL BIRD, or RED BIRD, *Guarica cardinalis*, also called cardinal finch, cardinal grosbeak, and Virginian nightingale, one of the finest song-birds of America, belongs to the family of *fringillidæ*, and differs from the true grosbeaks (*coecothraustes*) in having the beak slightly bulging. The general color of the male is red, the head being vermilion, and only a small portion of the plumage around the base of the bill being black. The feathers of the crown are long, and erected into a conical crest, like a red cap. The C. B. abounds in Texas, Florida, and the southern states of America generally, migrating northwards in spring, but never further than Massachusetts, where only a few stragglers are seen. Its loud, clear, sweet, and varied song is to be heard chiefly in the mornings and evenings. In size it exceeds any of the British *fringillidæ*, being about equal to the starling.

CARDINAL FLOWER. See LOBELIA.

CARDINAL POINTS. See COMPASS, MARINERS'.

CARDINAL VIRTUES (Lat. *cardinalis*, chief, from *cardo*, a hinge). The C. V. of the ancients were justice, prudence, temperance, fortitude. They were so called because the whole of human virtue was supposed to hinge or turn upon them. In other words, they were considered as a full and comprehensive classification of man's various duties.

This mode of dividing the virtues is to be found as far back as Socrates. The ancient moralists treated under ethics the whole sum of human duty and virtue. Thus, Aristotle considers the great problem of the science to be the determination of man's highest good, together with the means of realizing it. Hence, he includes both the social virtues and the prudential regard to the welfare of the individual in the same scheme. Of the four C. V., it will be seen that the first, justice, is the social virtue; that prudence (which, properly speaking, includes temperance also) regards the well-being of the individual; while fortitude is necessary to both. This last was a virtue greatly esteemed in the ancient world, each one's lot being much less secure than with us in the present day; it was impossible to say what sufferings might be in store for the most prosperously situated of men.

Dr. Whewell has made an attempt to correct the more obvious defects of the classification, and has substituted one which he deems free from those defects. The most notable omission, in the ancient scheme, judged from the modern point of view, is the absence of all reference, either expressly or by implication, to the virtue of goodness or benevolence. This was characteristic of the pagan moralists; for although good deeds were abundantly practiced among the ancients, they did not account it a part of human virtue to flow out spontaneously in every kind of active benevolence, including the most wicked and worthless among the objects of it. Aristotle, in discussing the various acts and outgoings of friendship, never loses sight of the *reciprocal* obligations on the other side; so that when a rich man befriends, with his wealth, one that is poor, the inequality must be made good by a greater amount of honor or respect on the part of him that is so befriended.

Accordingly, to adapt the classification to the altered point of view, benevolence has to be added to the list. This is Dr. Whewell's first virtue; the others are justice, truth, purity, and order. But the scheme, as thus amended, is scarcely less objectionable than before. The virtue named last, order, which means obedience to authority, cannot but

contain a very large portion of all the rest; seeing that justice, truth, etc., are enjoined by positive law. Then, what is understood by purity, including the control of the two powerful appetites, hunger and sex, is partly prudential and partly social.

The ethical discussions of modern times may be very much aided, if we divide the totality of human virtue on the following plan. There are three distinct classes of human actions, which are all approved of or accounted virtuous, but on different grounds, and in a different manner.

1. There are actions which are forbidden by society under penalties; in other words, men are punished for committing them. Such are theft, breach of bargain, slander, violence to the person, and all the offenses against our fellow-men that are prohibited by the law of the land. The avoiding of all these actions is signified to be a part of our duty, by the suffering inflicted on the doers of them. The law fines, imprisons, or puts to death those who will not conform to its regulations.

The law of the land is not the only power that prescribes conduct enforced by penalties. The public opinion of the country at large forbids certain actions, and punishes transgressors by excluding them from social intercourse; such, for example, are acts of unchastity, more especially when committed by women. There are also codes enacted by particular societies, as the code of honor among gentlemen, which constitutes some actions offenses that are not so by law, or by universal opinion. Cowardice is one of the qualities most obnoxious to the code of honor.

The actions prohibited by law are obviously such as could not be allowed without the entire subversion of human society. If murder and theft were to go unpunished, the principal end for which men associate together in communities—that is, protection and security—would not be attained. It is impossible that we should not disapprove of all such actions, and approve of the contrary.

2. There are some actions that are accounted virtuous, while their opposites are not punished, as in the case of those now mentioned. Doing good to persons that have no claim upon us—in other words, benevolence or philanthropy—is considered highly praiseworthy; but the neglecting of this is not usually visited with any punishment or censure; so that if it be a duty to perform acts of benevolence, it is a duty generically different from paying our debts, and respecting the person and property of our neighbor. The motives brought to bear on the two cases are widely contrasted: in the one, we *punish* for doing the action forbidden; in the other, we *reward* for doing the thing enjoined, and inflict no punishment if that is neglected. Here lies the difference between *duty*, strictly so called, and *merit*. In the bare performance of duty there is no merit; a man would not even be commended for the punctual payment of his just debts, if it were not that many people are deficient in this respect, and in the comparison with these the correct person excites in our minds a feeling of satisfaction. *Disapprobation* is the sentiment properly concerned with duty, or rather, with breach of duty; *approbation* is bestowed on all who do something over and above their duty. This distinction is known in every department of practical life; while speculative moralists habitually lose sight of it.

3. The virtues included under prudence are in a different position from either of the foregoing classes. Bearing the common names, virtue and duty, by which they are recognized as worthy of approbation or commendation, they are nevertheless unaccompanied with the sanctions either of punishment or of reward. The imprudent man is subject to no legal penalty, unless he clearly involves other persons in his imprudence; and the prudent man is not rewarded with the praise, esteem, or other benefits conferred upon the benevolent man. It is true that the young are punished by parents or teachers for imprudences; and some governments take such a paternal care of their subjects, as to punish them for sins against themselves. Men have been sent to prison, because of their endangering their own salvation by embracing heresy; but at the present day, such a proceeding is considered beyond the function of government. Men and women, arrived at maturity, are expected to take care of their own interests; even if they do not, no one punishes them; if they do, no one rewards them. We have, it is true, a certain feeling of disesteem in the one case, and of esteem or commendation in the other; neither of which, however, attains any considerable strength until more than the individual's self is involved. In short, although we cannot divest ourselves of all sentiment as lookers on, when men behave prudently or imprudently, our rule is *non-interference*; and this constitutes a marked distinction between the self-regarding and the social vices and virtues.

Accordingly, when ethical writers are endeavoring to probe the foundations of the moral sense in man, they ought to consider separately those three different species of conduct, for the sentiment excited by each is marked by strong peculiarities. To class social duties enforced by punishment, social virtues stimulated by rewards, and prudence, which is accompanied by neither, under one common designation, and discuss them as if they were essentially the same, is to confuse, instead of clearing up, the first principles of morality.

In Roman Catholic systems of theology, there are declared to be four *cardinal virtues*—"prudence, fortitude, temperance, and justice"—from which all other "moral" virtues are represented as flowing. But there is a prior division of virtues into the two classes of *theological* and *moral*; the theological virtues being faith, hope, and charity.

The distinction between these two classes is represented as consisting in this, that the theological virtues "*immediately* regard God;" and the moral virtues do not immediately regard God, but are commanded and rewarded by God, and are beneficial to ourselves.

CARDING OF COTTON, etc., the process of disentangling and arranging in parallel rows the fibers of cotton. This operation may be compared to the combing and brushing of one's hair, and the *card* combines the properties of the comb and brush, being a brush with wire teeth instead of hairs. These teeth are inserted in strips of leather which are fixed upon the surface of a cylinder. Several such cylinders are arranged so that the ends of the teeth are nearly in contact; and the cotton being brought to them, is caught up, passed from one to the other, and combed out as the cylinders revolve in the form of beautiful films or fleeces, which are removed by a smaller drum-card, called the "doffer," and again from this by the "doffing-knife." These films, which are of the width of the drum, are next contracted to a narrow ribbon, by being passed through a funnel; and thus narrowed, are called the "card ends" or "slivers," and are now ready for the next process of "drawing" or "doubling." See SPINNING.

CARDINIA, a genus of fossil conchiferae, containing 85 species, which extend from the Silurian to the inferior oolite. They have an oval or oblong shell, attenuated posteriorly, and marked with lines of growth, and an external ligament. They occur abundantly in the valuable layers of clay-ironstone called "mussel-bands." In Derbyshire, this material is wrought, like marble, into vases.

CARDITIS, or inflammation of the heart, a form of disease of very rare occurrence, if the term be limited in its application to cases of true acute inflammation of the muscular structure of the heart itself. C., however, was commonly understood in a wider sense, so as to include certain forms of disease of the external and internal lining membrane of the heart; and it is only since the beginning of the present century that, owing to the improvements in medical pathology and diagnosis, the names of pericarditis and endocarditis (q.v.) have come prominently into view as indicating the most ordinary inflammatory affections of the heart. See HEART, DISEASES OF THE.

CARDIUM AND CARDIA'CEÆ. See COCKLE.

CARDONA, a t. of Catalonia, Spain, about 44 m. n.w. of Barcelona. It is situated on a declivity on the right bank of the Cardener, is surrounded by walls, pierced with six gates, and commanded by a castle on a height. It is celebrated on account of a mountain of salt in its vicinity, which has a height of about 500 ft., and measures a league round. When the sun shines on this gigantic mass, the effect is of the most brilliant and gorgeous description. Pop. about 2,500.

CARDOON, *Cynara cardunculus*, a perennial plant of the same genus with the artichoke (q.v.), a native of the s. of Europe and the n. of Africa. It very much resembles the artichoke, but is of larger size, whilst the flowers (heads of flowers) are smaller. It has long been in cultivation, for the sake of the blanched leaf-stalks and midribs of the leaves, which are used as a salad, or more generally as a boiled vegetable during winter.

CARDS. All that we know of C., for certain, is, that they are of ancient and eastern origin. What is asserted by count de Gebelin and the earliest writers upon the subject, that in their primary stage they constituted some sort of symbolic and even moral game, is not so well established. The Hindu and Chinese C. are, however, emblematic in a very high degree—the former illustrating the ten avatars, or incarnations of the deity Vishnu; and the so-called paper-tickets of the Chinese typifying the stars, the human virtues, and, indeed, almost anything you please. The learned sir William Jones expresses himself convinced that the Hindu game of *chaturaji*—the four rajahs or kings—a species of highly, complicated chess, was the first germ of that parti-colored paste-board which has been the ruin of so many modern fortunes. In the wardrobe accounts of Edward I., there is an item of money paid for the use of that monarch for playing at the four kings—"ad opus regis ad ludendum ad *quatuor reges*, viii.s. v.d."—which is supposed to have been a game at C.; but how and when painted C. took the place of carved figures, is still but matter of conjecture.

A pack of Hindustani C., in the possession of the royal Asiatic society, and presented to capt. Cromline Smith in 1815 by a high-caste Brahman, was declared by the donor to be actually 1000 years old. "Nor," quoth the Brahman "can any of us now play at them, for they are not like our modern cards at all." Neither, indeed, do they bear any remarkable resemblance to our own—the pack consisting of no less than eight suits of divers colors, the kings being mounted upon elephants, and the viziers, or second honors, upon horses, tigers, and bulls. Moreover, there are other marks by which the respective value of the common C. may be distinguished, which would puzzle our club quidnuncs not a little—such as "a pine-apple in a shallow cup," and "a something like a parasol without a handle, and with two broken ribs sticking through the top." In the Chinese dictionary, called *Ching-tsee-tung*, it is asserted that dotted C. were invented in the reign of Seun-ho (1120 A.D.), and devised for the amusement of his numerous wives; there are 30 C. in each of these packs, 3 suits of 9 C. each, and 3 single C. superior to all the others. The name of one of the suits is *Kew-ko-wan*—that is to say, the nine ten-thousands of *kwap*—strings of beads, shells, or money; and the titles of the other two suits are equally con-

cise and significant. The Chinese C. have, however, a decided advantage over those of Hindustan in being oblong instead of circular.

C. do not appear to have been known in Europe until towards the end of the 14th century. "In the year 1379," writes Carelluyzo, "was brought into Viterbo the game at cards, which comes from the country of the Saracens, and is with them called *naib*." "Whence afterwards," says Mr. W. Chatto (*Origin and History of Playing Cards*, Lond., 1848), "perhaps Jackanapes, Jack of cards." This entry occurs in the accounts of the treasurer of Charles VI. of France, in 1393: "Given to Jacquemin Gringonneur, painter, for three packs of cards, gilt and colored, and variously ornamented, for the amusement of the king, 56 sols of Paris." From the date of this year being immediately subsequent to that in which the king lost his reason, the story goes that C. were invented to divert his royal melancholy; but they were certainly of earlier use in France. The French clergy took greatly to C. about this time; we are afraid, too, it was to the ungentle game of all-fours, since we find them specially forbidden that amusement by the synod of Langres, in 1404.

Card-making became a regular trade in Germany 14 years after this, and it, as well as card-painting, seems to have been carried on for some time exclusively by females; the wood-engraving of C., however, did not begin until some time afterwards. The pips were then very prettily imagined, the suits consisting of hearts, bells, acorns, and leaves. The place of her majesty the queen was filled by a knight in those days; and it is to Italy, and not to Germany or France, that the glory of giving *place aux dames* must be conceded. There was also no ace whatever! By 1420, gambling by means of C. had grown to such a pitch as to provoke St. Bernardin to preach against it at Bologna: and that so eloquently as to cause his hearers to make a fire in the public place and throw all the C. in their possession into it—a proceeding which must have been hailed with joy by the Messrs. De la Rue of that period. The signs upon Italian C., which seem to have been the first imported into England, were cups, swords, money, and clubs; but in the third year of Edward IV., their further importation was forbidden, and the home-trade of card-making protected. C. were played by that time, we read, "in all places of worship" in this country, by which it was meant, not in the churches, but in the houses of all the gentry. Henry VII. was a card-player; and there are not a few entries in that mean monarch's privy-purse account of his majesty's little losings. His daughter Margaret, at the age of 14, was found by James IV. of Scotland—the first time he ever saw her—in the act of playing cards; and it was most probably *écarté*, for he at once "proposed" to her, and she "accepted" him. There was a sum regularly allotted to the princess, afterwards queen, Mary, as pocket-money for this especial purpose; the sums given her at a time for immediate disbursement ranging from 20s. to 40s., but one entry being so disgracefully low (for a princess) as "two and tuppence." James I. likewise played a good deal, but so sleepily that he required somebody to hold his C. for him.

About the year 1660, heraldic C. were first introduced into England, the king of clubs being represented by the arms of the pope; of spades, by those of the king of France; of diamonds, by those of the king of Spain; and of hearts, by those of the king of England. From these heraldic C., we suppose, Mr. Chatto derives the word coat-card, instead of court-card, which is certainly in more general use. In 1679, a pack was published containing the history of all the popish plots, "excellently engraved on copper-plates, with very large descriptions under each card. Aspersers of this pack," it is added by their disinterested publisher, "plainly show themselves to be popishly affected."

The French, from whom we derive our ordinary suits of diamond, heart, spade, and club—*carreau*, *cœur*, *pique*, and *trèfle*—were continually changing their court-cards, and representing on them all sorts of historical characters. In the earlier periods, their kings were David, Alexander, Cæsar, and Charlemagne, or Solomon, Augustus, Clovis, and Constantine; about all of whom, as well as their queens, Père Daniel has the most ingenious theories. Troops, says he, however brave and numerous, require to have prudent and experienced generals. The *trèfle* or clover-plant, which abounds in the meadows of France, denotes that a chief ought always to encamp his army in a place where he may obtain forage for his cavalry; *piques* and *carreaux* signify magazines of arms, which ought ever to be well stored—the *carreau* being a sort of heavy arrow shot from a cross-bow, and which was so called from its head being squared (*carré*); *cœurs*, hearts, signified courage of both commanders and soldiers; the *ace* was the Latin *as*, and represented money, the sinews of war; and so on.

At the time of the French revolution, the places of the card-kings were filled by four philosophers—Molière, Lafontaine, Voltaire, and Rousseau; and those of the queens by four virtues—prudence, justice, temperance, and fortitude.

Many attempts have been made to put down card-playing by the strong hand of the law; but the history of the four kings has, nevertheless, always retained its students. Not a few enthusiastic players have absolutely died in harness, with cards in their hands, such as the great Bath player Lookup, who expired at his favorite "double dummy," not even being permitted by inexorable death to play out the game. The four kings, like their flesh-and-blood originals, are likely to lose all sway over the new world; for Mr. Chatto informs us, that the court-cards, if they can be called so, of a republican

pack manufactured in 1848 at New York, have neither kings nor queens; the president of hearts being Washington; of diamonds, John Adams; of clubs, Franklin; and of spades, Lafayette. One of the queens is Venus, modestly concealing her charms; and the others are respectively Fortune, Ceres, and Minerva; while the knaves are fitly represented by Indian chiefs.

The manufacture of playing-cards comprises many interesting processes. The card-board employed for this purpose is formed of several thicknesses of paper pasted together; there are usually four such thicknesses; and the paper is so selected as to take paste, paint, and polish equally well. The sheets of paper are pasted with a brush, and are united by successive processes of cold-drying, hot-drying, and hydraulic pressure. Each sheet is large enough for 40 cards. The outer surfaces of the outer sheets are prepared with a kind of flinty coating, which gives sharpness to the outline of the various colored devices. Most packs of cards are now made with colored backs. The ground-tint is laid on with a brush, and consists of distemper color, or pigments mixed with warm melted size. The device impressed on this ground-tint is often very beautiful. Messrs. De la Rue, the leading firm in the manufacture, employ tasteful artists, and invest a large amount of capital, in the introduction of new patterns. On cards sold at moderate prices, the colors at the back are generally two—one for the ground, and one for the device; but some of the choicer specimens display several colors; and many of the designs are due to the pencil of Mr. Owen Jones. The printing of the design is done on the sheets of paper, before the pasting to form card-board. The pips or spots on the faces of playing-cards are now *spades, clubs, hearts, and diamonds*; but at different times, and in different countries, there have been leaves, acorns, bells, cups, swords, fruit, heads, parasols, and other objects similarly represented. In English cards, the colors are red and black; Messrs. De la Rue once introduced red, black, green, and blue for the four suits; but the novelty was not encouraged by card-players. The same makers have also endeavored to supersede the clumsy devices of kings, queens, and knaves, by something more artistic; but this, too, failed commercially; for the old patterns, like the old willow-pattern dinner-plates, are still preferred—simply because the users have become accustomed to them. Until within the last few years, the printing of cards was generally done by *stenciling*, the color being applied through perforated devices in a stencil-plate. The color employed for this purpose is mixed up with a kind of paste. When there is a device at the back, the outline of the device is printed from an engraved wood-block, and the rest filled in by stenciling. The stenciling of the front and back can be done either before or after the pasting of the sheets into card-board. One great improvement in the manufacture, has been the substitution of oil color for paste or size color; and another, the substitution of printing for stenciling. Messrs. De la Rue have expended large sums of money on these novelties; for many experiments had to be made, to determine how best to employ oil color so that the spots or pips may be equal-tinted, the outline clear and sharp, the pigment well adherent to the surface, and the drying such as to admit of polishing without stickiness. The plates for printing are engraved on copper or brass, or are produced by electrotype, or are built up with small pieces of metal or interlaced wire. The printing is done in the usual way of color-printing, with as many plates as there are colors (usually five), and one for the outlines; it is executed on the sheets of paper, before being pasted into card-board. When the printing, drying, and pasting are all completed, a careful polishing is effected by means of brush-wheels, pasteboard wheels, heated plates, and heated rollers, in such a way that the polish on the back may differ from that on the face—since it is found that two equally polished surfaces do not slide quite so readily over each other. Every pack of cards made in England for home-use pays a duty of threepence, which duty is levied on the ace of spades. The makers of cards pay £1 per annum for a license, and formerly the venders had to pay 2s. 6d. per annum, but this latter tax was repealed on the 5th July, 1870. The carboard, when all the printing is finished, is cut up into cards; every card is minutely examined, and placed among the “moguls,” “harrys,” or “highlanders,” as they are technically called, according to the degree in which they may be faultless or slightly specked; and the cards are finally made up into packs. Persons wishing the best cards should ask for “moguls,” the usual retail price for a pack of which is $\frac{2}{3}$ to $\frac{3}{9}$.

A few years ago, it was estimated that about half a million packs of cards are made annually in England, by about seven or eight firms. Card-playing is not now so general in England as it was early in the century, and the number made has consequently lessened, although the quality has greatly improved. All the cards used in Russia, with a few exceptions, are made at an imperial manufactory in St. Petersburg, where the operations are conducted on a large scale, and where the number of packs made exceeds manifold the whole produce of England. The French cards are somewhat smaller and thinner than those of England.

CARDUC'CI, BARTOLOMMEO, 1560–1610; an Italian artist; b. in Florence; studied under Zuccherò, whom he accompanied to Madrid, where he painted the ceiling of the Escorial library. He died in Spain, where most of his works are to be found, the most celebrated being a “Descent from the Cross,” in a church in Madrid. His brother, Vincenzo, was also a painter of celebrity, and the author of a dialogue on the excellencies of painting.

CARDU'CHI, a warlike people once inhabiting the mountains of Kurdistan, supposed to have been the ancestors of the Kurds of the present day. The Greeks, in the famous retreat of the 10,000, had to pass through their country, and were greatly harassed by them.

CARDUE LIS. See **GOLDFINCH**.

CARDUUS. See **THISTLE**.

CARDWELL, a co. in central Ontario, Canada, formed recently from Peel and Simcoe cos.; pop. '71, 16,500.

CARDWELL, EDWARD, 1787-1861; an English clergyman and ecclesiastical historian, educated at Oxford. In 1826, he was chosen Camden professor of ancient history, and during his period of office he wrote a translation of the *Ethics* of Aristotle, with notes, and *The Coinage of the Ancient Greeks and Romans*. In 1831, he was made principal of St. Alban's hall, and held the place through life. Among his publications were a student's edition of the Greek Testament; Josephus's history with notes; *Documentary Annals of the Reformed Church of England from 1546 to 1716*; *History of Conferences, etc., connected with the Revision of the Book of Common Prayer*; *Synodalia, a Collection of Religious Canons, and Proceedings of Convocation from 1547 to 1717*; and *Reformatio Legum Ecclesiasticarum*.

CARDWELL, EDWARD, Viscount, b. 1813; nephew of the Rev. Edward; graduated at Baliol college, and admitted to the bar, but preferred political life and entered parliament in 1842, being several times thereafter re-chosen. In 1845, he was secretary of the treasury and president of the board of trade. He was subsequently chief secretary for Ireland, chancellor of the duchy of Lancaster, and secretary of state for the colonies. In Gladstone's cabinet, 1868, he became secretary for war and a member of the committee of the council on education. In the war office he proposed and effected a re-organization of the army. With earl Stanhope he was one of the literary executors of sir Robert Peel, and one of the editors of Peel's *Memoirs*.

CARE or **CARLE SUNDAY**, the Sunday before Palm Sunday, said to be so called because it was the practice in many parts of the country to eat gray peas, called earlings, fried in butter, pepper, and salt, on this day. This practice apparently had its more immediate origin in the custom of the Roman Catholic Church of eating hallowed beans fried at this time—these beans being described in some religious books as symbolical of confession, and their steeping before use, of meditation. It appears, however, to have been adopted by this church from a heathen custom. See Brand's *Popular Antiquities*.

CAREEN'ING is the operation of heaving down a ship on one side, in order to expose the other side for cleaning by the process of *breaming* (q.v.). C. is seldom now performed upon English ships, partly because the use of copper-sheathing lessens the fouling of the bottom, and partly because caissons and hydraulic lifts afford means for raising ships out of the water. The *Great Eastern*, in 1860, was placed upon an open scaffolding or frame, called a *gridiron*, in Milford Haven, and floated so as to render cleansing possible without the dangerous and difficult process of careening.

In sea-phrases, a vessel is said to "careen" when she leans over very much through press of sail.

CARET (from the Latin *careo*, I am wanting), a character of this form, ^, denoting that something has been omitted, and is interlined.

CAREW, GEORGE, 1557-1629; Earl of Totness and Baron of Clopton; educated at Oxford and joined the army, holding an important command in the Irish wars against the earl of Desmond. He filled several offices, among them that of one of the lord judges of Ireland, in which by a vigorous but prudent policy he speedily reduced the rebels to submission. His crowning exploit was the capture of Dunboy castle, an event that greatly disappointed the Spanish allies of the Irish, and ended the war. For these services he was raised to the peerage and made governor of Guernsey. His last office was that of privy councillor to James I. He wrote *Hibernia Pacata*, a history of the wars in Ireland.

CAREW, Sir GEORGE, d. about 1613; educated at Oxford, and knighted by queen Elizabeth. He was secretary to sir Christopher Hatton, and was sent as ambassador to the king of Poland. Under James I. he was employed in negotiating the treaty of union between England and Scotland, and afterwards as ambassador to France. He was the author of a *Relation of the State of France*.

CAREW, RICHARD, 1555-1620; an Oxford student who at the age of 14 was chosen to dispute extemporaneously with sir Philip Sidney in the presence of an audience of noblemen. He was sheriff of Cornwall, and the author of a *Survey* of that county, a work that enjoyed a high reputation. He also wrote, or translated from the Italian, *The Examination of Men's Wits*; *The True and Ready Way to Learn the Latin Tongue*; and made a translation of the first five cantos of Tasso's *Jerusalem Delivered*.

CAREW, THOMAS, a poet of the reign of Charles I., descended from an old family in Gloucestershire, was b. 1589. Having been educated at Oxford, he traveled abroad for some time, and on his return was received at court, and patronized by Charles I. C. deserves mention chiefly as the precursor and representative of what may be called the

courtier and conventional school of poetry, whose chief characteristic was scholarly ease and elegance, with a spice of indelicacy, and even indecency. C.'s poems, mostly lyrical, and treating of trifling subjects, are among the best of their kind, and exhibit much fancy and tenderness. He died 1639. Several editions of his poems, which first appeared in 1640, have been published.

CAREX, a genus of plants of the natural order *cyperaceæ*, of which the species are very numerous—more than 450—principally abounding in the temperate and colder parts of the world. More than 60 are natives of Britain. The English name **SEDGE** or **SEG** is sometimes employed as synonymous with C., but is popularly applied only to some of the species. This genus is distinguished by unisexual flowers, the male flowers with one glume, the female inclosed in a flask-shaped involucre. Some of the species are plants of the very humblest growth, others are 2 or 3 ft. in height; all are of unpretending, grassy, or rush-like appearance. Some grow in wet, and others in dry situations; some are of great value in the economy of nature, as forming the principal part of the vegetation of swamps, when they gradually convert into fertile ground. The running roots, or rather *rhizomes*, of some help to bind the sands of sea-shores, particularly *C. arenaria*, which is carefully planted for this purpose on the dikes of Holland. None are valued by the agriculturist, as they are very deficient in nutritive quality, and in general they abound only in very inferior pastures, and good tillage and drainage lead to their speedy disappearance. The rhizomes of *C. arenaria*, *C. hirta*, and *C. disticha*, are sometimes used under the name of *German sarsaparilla*, as a diaphoretic and demulcent medicine—a bad substitute for sarsaparilla. The two former are common in Britain. The dried leaves of *C. sylvatica* are used by the Laplanders to cover their legs and hands as a protection from frost-biting and chilblains, being worn in the inside of their shoes and gloves.

CAREY, HENRY, d. 1743; an English musical composer and poet, an illegitimate son of George Saville, marquis of Halifax. Carey's ballads and songs, though of no great merit as compositions, were very popular at the time. He wrote a number of dramatic pieces, among which were *Chrononhotonthologos*, a burlesque on tragedy; the *Honest Yorkshireman*, an operetta; *Nancy and Thomas and Sally*, interludes; *The Dragon of Wantley*, *Margery and the Dragoness*, burlesque operas. One of his songs, *Sally in our Alley*, is still remarkably popular in England.

CAREY, HENRY C., a political economist of the United States, b. at Philadelphia in 1793. In 1836, he published an essay on the *Rate of Wages*, which was expanded into the *Principles of Political Economy* (1837–40). The value of this work may be estimated from the fact, that no less an authority than Frederic Bastiat copied its leading ideas. It was translated into Italian and Swedish, and favorably noticed in all the important politico-economic journals of Europe. In 1838, C. published *The Credit System of France, Great Britain, and the United States*; and in 1848, *The Past, the Present, and the Future*, a work marked by great vigor and originality. In 1853, appeared the *Letters on the International Copyright*; in 1858, *Principles of Social Science*; in 1867, *Review of the Decade 1857–67*; and, in 1873, *The Unity of Law*. C. was originally a free trader, but was ere long recognized as the head of a new school of political economy. According to this system, free-trade may be the ideal towards which we should tend, but a period of protection is an indispensable stage in the progress towards it.

CAREY, MATHEW, b. Ireland, 1760, d. Philadelphia, 1839; an author and publisher. In consequence of publishing an address to the Irish Roman Catholics on their oppression by the penal code (about 1778) he was compelled to leave Ireland, but returned within a year and established, in 1783, the *Volunteer's Journal*. His attacks upon parliament and the ministry caused his imprisonment in Newgate until the dissolution of parliament. He arrived in Philadelphia by the aid of Lafayette, who sent him \$400, and immediately started *The Pennsylvania Herald*, one of the first papers in the country to furnish accurate reports of legislative debates. In Jan., 1786, he fought a duel with col. Oswald, another editor, and was seriously wounded. He was subsequently connected with the *Columbian Magazine* and the *American Museum*. In 1791, he began trade as a bookseller, and with his sons built up a prosperous business. During the epidemic of yellow fever in 1793 he was active in the work of relief, and afterwards wrote a history of the disease. In 1793, he, with others, founded the Hibernian society, and in 1796 he assisted bishop White in establishing the first Sunday-school society. Carey was a constant writer, and published a great number of essays on party politics, political economy, and social questions. Among his favorite ideas were internal improvements and a protective tariff. His son Henry C. (see *ante*) was one of the foremost American writers on political economy.

CAREY, WILLIAM, D.D., a distinguished minister and missionary belonging to the Baptist body, was b. at Paulersbury, a village in Northamptonshire, Aug., 761. He served his time as a shoemaker, but began to preach about his 20th year. A pamphlet which he published about this time, attracted the attention of his co-workers in the ministry to the subject of foreign missions, and ultimately a missionary society, chiefly through C.'s exertions, was formed. C. and a Mr. Thomas were chosen its first missionaries to India in 1793. From that time until his death in 1836, C. was indefatigable

(under many difficulties, especially in his early years) in his efforts to spread the knowledge of the Gospel among the heathen. Under his direction, the Serampore mission, of which he was the principal founder, had up to 1832 issued above 200,000 Bibles, or portions thereof, in about forty oriental languages or dialects, besides a great number of tracts and other religious works in various languages. A great proportion of the actual literary labor involved in these undertakings was performed by C. himself, whose Sanskrit and other grammars have been very highly spoken of by the late Mr. Wilson Boden, professor of Sanskrit at Oxford. C. was professor of oriental languages at Fort-William college, Calcutta, from 1800 to 1830.

CARGILL, DONALD, 1610-81; a leader of the covenanters appointed to a church in Glasgow, where he made himself so obnoxious to the government that he was forced to leave. He was wounded in the battle of Bothwell, and fled to Holland; but returned almost immediately and joined Richard Cameron in publishing the Sanquhar declaration, and boldly excommunicated the king and his officials. He was soon afterwards arrested and beheaded at Edinburgh, July 27, 1681.

CARGO is a general name for all the merchandise carried on board a trading-ship. Sometimes it is applied also to the invoice of the cargo. The term *deck-cargo*, is given to the commodities on deck, which are not usually included in the policy of insurance.

For the security of the customs' revenue, the master of every coasting-vessel is bound to keep a *cargo-book*, recording the name of the vessel, the name of the owner, the port of departure, the port of destination, the goods taken, the name of the shippers and consignees, the time of departure and other particulars. The custom-house officers may demand to see this book at any time. The C. of passenger ships is placed, in some degree, under the control of the emigration officers by an act passed in 1852.

CARHEIL, ETIENNE DE, a Jesuit missionary among the Indians of Canada about 1668. He was among the earliest to master the native languages. The time of his death is not known, but he was at missionary work as late as 1721.

CARIA, in ancient geography, the south-westernmost country of Asia Minor, bounded n. by Lydia, e. by Phrygia, s.e. by Lycia, and w. and s.w. by the Mediterranean. A large portion of what was C. is mountainous. The chief ranges were called the Cadmian and the Latmian. The most important river was the *Meander*, famous for its windings. C. was, at an early date, governed by petty princes or kings; it afterwards became a part of the Persian empire, the former princes continuing to rule as satraps; and it subsequently came into the hands of the early Macedonian kings of Egypt; and finally, with the rest of Asia, into those of the Romans. Among the chief towns were Cnidus, Ialicanassus, and Miletus.

CARIA CO, a seaport of Venezuela, at the mouth of a river, and at the head of a gulf of the same name. It is 40 m. to the e. of Cumana, in lat. 10° 30' n., and long. 63° 40' west. Pop. 7,000. The gulf, long and narrow, with good anchorage, and well-wooded shores, is open only on the w., and that to a portion of the Caribbean sea, which is itself breasted by a chain of islands.

CARIACOU, CARJACOU, OF VIRGINIAN DEER, *Cervus Virginianus*, a species of deer found in all parts of North America, from Mexico to about n. lat. 43°, and from the Atlantic to the Pacific ocean. It is the species commonly called deer by the Anglo-Americans. It is smaller and more elegant than the common stag; of very variable color—light reddish brown in spring, slaty blue in autumn, and dull brown in winter; the belly, throat, chin, and inner parts of the limbs white. The horns of the adult male are of moderate size, bent strongly backward, and then suddenly forward, so as to bring their tips nearly above the nose; they have several snags. The fawn is profusely decked with white spots, arranged in lines, and sometimes running into stripes. The name C. is extended generically to several nearly allied species, found in Mexico, California, etc.

CARIA MA, *Microdaetylus cristatus*, a bird of the order *grallæ*, allied to the cranes, but exhibiting also points of strong resemblance to gallinaceous birds, among which it has therefore been proposed to rank it, next to the guans. It is a native of Guiana, Brazil, and Paraguay, inhabiting open plains and the outskirts of forests, where it feeds chiefly on serpents, lizards, and insects. It is larger than the common heron; the plumage is brown, finely waved with darker brown, whitish on the lower parts. When pursued, the C. seeks safety by running, and does not readily attempt to use its wings. Its voice resembles that of a young turkey. It is much esteemed for the table, and it is sometimes reared in a domesticated state.

CARIBBEAN SEA, the grandest inlet of the western hemisphere—corresponding, in several respects, to the Mediterranean in the eastern—is separated from the gulf of Mexico by Yucatan, and from the Atlantic ocean by the great arch of the Antilles, between Cuba and Trinidad inclusive, stretching in n. lat. from about 8° to about 22°, and in w. long. from about 61° to about 89°. The C. S. forms the turning-point in the vast cycle of waters known as the Gulf stream (q. v.), that wheels round, with the regularity of time itself, from southern Africa to northern Europe. It pours its waters into the gulf of Mexico on the w., which shoots forth, on the e., the Florida stream with the computed volume of 3,000 Mississippi. To supply this enormous efflux, the C. S. draws on the Atlantic, laying under contribution nearly all the trade-wind regions of that ocean,

so as literally to become the receptacle of the Amazon and the Orinoco. To the British isles, it is, in this connection, an object of peculiar interest. Rendering still warmer the warm floods which it concentrates, it imparts to the Florida stream that high temperature which tends, with the aid of the prevalent winds, to mitigate climate from Guernsey to Shetland. In common with the islands of its eastern boundary, the C. S. takes its name from their now extinct aborigines, the Caribs.

CARIBBEE BARK, or **PITON BARK**, is the bark of *exostemma Caribæum*, a small tree which grows in the West Indies and in Mexico, and belongs to the natural order *cinchonaceæ*. The genus *exostemma* is very nearly allied to *cinchona*, from which it differs in having the stamens exerted, whereas in *cinchona* they are included within the corolla. *E. Caribæum* has ovate lanceolate leaves, and is known in the West Indies as the *sea-side beech*. C. B. has a very bitter taste, and a very faint smell. It contains none of the characteristic alkaloids of cinchona, yet very much resembles it in some of its properties, and is one of the barks sometimes substituted for the true cinchona barks.

CARIBBEE ISLANDS. See **ANTILLES**, *ante*.

CARIBOU. See **REINDEER**, *ante*.

CARIBS, Indians of the West India islands, who were in the time of Columbus numerous and powerful; a warlike and aggressive people, who pertinaciously opposed the advances of the Europeans. It is supposed, though not proved, that they were addicted to cannibalism. They have almost entirely disappeared from the islands; and at present their chief settlement is in Honduras, where they form an industrious and prosperous portion of the people, though still retaining their language and many of their customs. In 1796, the English, weary of the continual disturbances occasioned by the Caribs, transported them in a body from Dominica and St. Vincent to the island of Ruatan. There are two great tribes, the red, and the black; the former were descendants of the ancient stock, and the latter mixed with negro blood. Some of the Indians in South America are apparently of the same race.

CARICA. See **PAPAW**.

CARICATURE (Ital. *caricatura*, from *caricare*, to load or overcharge). The etymology of this word indicates its meaning very distinctly, which is that of a representation of a face, form, or character, in which the salient features are exaggerated or overloaded, to the extent of producing a ludicrous effect, without entirely, or even essentially destroying the resemblance. C. may be regarded as the opposite of idealization; the former consisting in a disproportionate development of some, very frequently of one only, of the characteristics of the subject treated, the latter in a proportionate elevation of them all. Nay, further, the destruction of harmony is essential to C., and where harmony is the prevailing quality of its subject, the required effect may frequently be produced by this means alone; whereas harmony belongs of necessity to idealization, and where its absence was the characteristic defect of the object as a real existence, an ideal of a humble kind may frequently be produced by simply restoring it.

When used with reference to sensible representation, C. stands, to the genuine productions of the plastic and pictorial arts, in the same relation in which farce stands to the legitimate drama. Both C. and farce are thus degenerate forms of art; and though requiring much cleverness for their successful execution, and often affording lively satisfaction to the spectator, can scarcely be said in general to have an elevating object, or any other tendency than to amuse. When used as ancillary to well-directed and merited satire, C. assumes a noble character, and it is to the credit of our nation that it is so frequently thus employed in our ephemeral literature. The best examples of C. which have ever appeared in the literature of any people, are to be found in the pages of *Punch*.

CARIES (*rottenness*) is a disease of bone analogous to the ulceration of soft tissues. It is characterized by a gradual loss of substance, from the particles of bone being absorbed, or being cast off and washed away in a purulent discharge. It begins as an unhealthy inflammation, followed by exudation of new materials, and softening of the part affected. On examination, the bone-cells are found filled with a reddish glairy fluid, and in scrofulous patients, deposits of tubercle. After C. has existed for some time, an abscess forms, and bursts; its aperture remains open, discharging a thin fluid, which contains particles of the bone. If a probe be passed through this opening, it will be felt to sink into some soft gritty substance; this is the carious bone, which, if removed, and well washed, will be found to resemble in whiteness and fragility loaf sugar softening in hot water.

C. may attack any bone, but it usually selects the vertebræ, those of the wrist and foot, and the soft ends of long bones forming joints. To this terrible disease most deformities, not congenital, are owing. The carious vertebræ yield under the weight of the trunk, and the spine curves forwards, or to one side. In the joint-ends of bones, the part enlarges, the cartilages become affected, matter forms, and amputation of the limb, or excision of the joint, is frequently necessary to save the patient's life. Too often the disease recurs with night-sweats, hectic, and death.

The causes of C. are constitutional, though it may be accidentally determined to some

particular part of the body by any irritation, such as a blow, or exposure to atmospheric changes. Scrofulous persons, and those who have had syphilis or mercury in excess at any period of their lives, are more subject to it than others. If affecting a small bone, the latter may be entirely removed; and if the disease is strictly limited to the ends of bones forming a joint, these may be excised. Within the last 30 years, great advances have been made in this department of surgery, and C. of the joints is but seldom counted a sufficient reason for amputation; the knee, hip, shoulder, elbow, ankle, and wrist joints have all been repeatedly excised successfully in this country. In situations where the part cannot be reached by instruments, lotions of dilute acid may be injected, with the view of stimulating the carious surface to assume a healing action.

The treatment of C. consists in supporting the patient's strength by judicious change of air, and tonics, with the administration of medicines, such as cod-liver oil in scrofula, which appear to combat the constitutional predisposition to the disease. In those parts where the diseased bone can be reached, it should be gouged or scraped away, so as to leave a healthy surface of bone, which may granulate up, and heal.

CARIES OF THE TEETH depends, it is supposed, on an original faulty formation of their substance, when, after any depressing cause, especially in scrofulous and ill-nourished persons, they soften and crumble away, at last laying open the cavity which contains the nervous pulp of the tooth, and producing toothache. *Treatment.*—The carious surface should be removed, and, as a substitute for the lost substance, gold or some other substance should be stuffed into the cavity. If the pulp be exposed, the hole should be stuffed with some softer material, till the parts are somewhat hardened; for this, Mr. Tomes of London recommends a plug of cotton-wool dipped in a mixture of mastich, a dram, and rectified spirit or eau-de-Cologne, 1½ oz.; or of gutta percha dissolved in chloroform.

CARIGNANO, a t. of Piedmont, in the province of Turin, about 11 m. s. of the city of that name. It is situated near the left bank of the Po, in the midst of a most beautiful country; has some fine churches, manufactures of silk-twist, and a pop. of 7,712. This town gives name to a branch of the house of Savoy.

CARILLON. See BELL.

CARIMATA, a name applied to the passage between Borneo and Billiton; also to a cluster of islets in the same passage; and lastly, to the principal member of the group, whose highest point, a peak of 2,000 ft., is in lat 1° 36' s., and long. 108° 54' e.

CARINARIA, a remarkable and interesting genus of gasteropodous mollusks, of the order called *heteropoda* or *nucleobranchiata*, having a thin shell, in form somewhat like that of a limpet, which, however, only covers the visceral sac (heart, gills, etc.), leaving the greater part of the animal exposed. The shells of some of the species have been sometimes denominated *Venus's slipper* and *glass nautilus*. The body is gelatinous, and so transparent that much of its interior organization can be seen. Nearly opposite to the part of the back occupied by the shell is a sort of vertical fin, answering to the foot of the other gasteropods. The species of C. are all marine, are found only in the seas of the warmer latitudes, and generally swim with the back downward. Closely allied to C. is the genus *firola*, in which there is no shell at all.

CARINI, a t. of Sicily, in the province of Palermo, and 12 m. w.n.w. of the city of that name. It has an old castle; and a pop. of 9,600, chiefly engaged in fishing.

CARINOLA, a t. of s. Italy, in the province of Caserta, 20 m. s.e. of Gaeta. It has a cathedral, and a Franciscan convent. The district produces excellent wine. Pop. 6,620.

CARINTHIA (Ger. *Kärnthen*), a crown-land of the Austrian empire, forming part of the old kingdom of Illyria, with an area of 3,958 sq.m., and a pop. in 1869, of 337,694, which is rather less than what it was in 1854. The principal river is the Drave, which passes through the country from w. to e., in a course of almost 150 miles. The general aspect of the country is mountainous, with long deep valleys, that of the Drave widening at Villach and Klagenfurt into a great plain. The valley of the Drave divides the *Noric* from the *Corinthian Alps*. Agriculture is carried on to a limited extent, owing to the mountainous character of the country, great part of which is occupied in pasture, or covered with brushwood. Many horses and cattle are reared and exported. The principal products are mineral. One of the principal branches of industry is the manufacture of hardware; the other manufactures include woolens, silk stuffs, and cottons. The capital is Klagenfurt.—The ancient inhabitants were the *Carni*, who derived their name from the Celtic word *carn* or *corn*, Lat. *cornu*, Eng. *horn*—an allusion to the craggy, horn-like pinnacles of their hills. Before the time of Augustus, it belonged to Noricum, afterwards to the Roman empire. By and by the Carni were swept away in the deluge of immigration from the e., and Slaves settled in the country. After some time the Slaves themselves were so heavily oppressed by the Avari, that they called to their assistance a Frank, named Samo, who founded the kingdom of Carantania, which included much more than the present C., but fell to pieces after his death. Finally, it came into the possession of Austria (q.v.). Only about two sevenths of the present population is Slavic (Slovenians), the remainder being Germans.

CARINUS, MARCUS AURELIUS, son of Carus, succeeded his father as emperor of Rome in 283 A.D. He was a cruel and profligate ruler, and the soldiers naturally

rebelled, proclaiming Diocletian. Carinus marched into Mæsia to quell the revolt, and won a decisive victory, but at the moment of triumph he was killed by one of his soldiers whose wife the profligate emperor had led away.

CARIPE, a t. of Venezuela, South America, situated in a fertile valley of the same name, 50 m. s.e. of Cumana. The valley is noted for a cavern frequented by the remarkable bird called guacharo (q.v.). Pop. of town and valley, 5000.

CARISBROOKE, a village in the isle of Wight almost adjoining Newport, chiefly noted for its castle, which is supposed to have been built by the Saxons in the 6th century. It was enlarged in the 11th c. by the first lord of Wight; was captured by Stephen in 1136, and in the time of Richard II. successfully resisted attacks by the French. During Elizabeth's reign it was further enlarged until its outer walls inclosed 20 acres. It was in this castle that Charles I. took refuge in Nov., 1647, but he soon found his asylum a prison. After his execution his two youngest children were confined in the castle, and the princess Elizabeth died there. The remains of the castle are still extensive. Opposite the castle-hill are the remains of a Cistercian priory founded in the 11th c., and the parish church claims even a greater antiquity. Pop. of parish '71, 8198.

CARISSA, a genus of plants of the natural order *apocynacea*. *C. carandas* is a thorny shrub, much used for fences in India; and the fruit, called carandas—a berry about the size of a small plum—for tarts and preserves.

CARISIMI, GIOVANNI GIACOMO, b. about 1604 near Rome; became chapel-master, or director of music, at the age of 20. By education he belonged to the old Roman school of music, but his compositions mark the turning-point from the traditions of the renaissance period to the incipient aspirations of modern music. His numerous compositions include masses, cantatas, motets, and oratorios.

CARLEE, or **KARLI**, a village in India, 40 m. e. of Bombay, remarkable only for a Buddhist temple hewn into a rocky precipice which rises 800 ft. above the plain, the temple being about two thirds of the way up. The temple is 130 by 40 ft., with a high arched roof. An arch rises over the entrance to the artificial cavern, and before each of the side entrances are screens of stone-work ornamented with naked male and female figures in *alto-relievo*. In front are three large lions, and around the portico are figures of elephants, each one surmounted by a driver and a howdah or saddle containing figures of two persons. The interior is finished with a double row of sculptured pillars forming a semicircle. This curious temple is well preserved.

CARLEN, EMILIE, a well-known Swedish novel-writer, was b. 8th Aug., 1807, at Strömstad, near the frontier of Norway. She was the youngest of 14 children of a merchant named Smith. During childhood her talent in imaginative fiction was remarked by her friends; but it was not till 1838 that her first novel, *Waldemar Klein*, was given to the world. She was then a widow, having been married, in 1827, to Dr. Flygare. In 1841, she was again married to J. G. Carlen, a lawyer, and known as a poet, in Stockholm. Her literary productiveness has been very remarkable, her fictions being chiefly founded on the characteristics of the lower orders in Sweden; and, although faulty in many respects, they are especially rich and striking in incident; and her characters, without exhibiting any very deep insight or subtle analytic power, are yet intelligent and consistent. Among her many works, which have been translated into English, are *The Rose of Thistland*; *The Birthright*; *The Hermit*; *The Events of a Year*; *The Lover's Stratagem*; *Gustavus Lindurn*; *The Maiden's Tower*; *Woman's Life*, etc. Her works are largely circulated both in Europe and in America.

CARLETON, a co. in New Brunswick, Can., on the Maine border, drained by the St. John and its tributaries; 3,008 sq.m.; pop. '71, 19,938. The surface is rough, with forests and excellent timber. Chief town, Woodstock.

CARLETON, a co. in e. Ontario, Can., on the Ottawa river; 647 sq.m.; pop. '71, 21,739. The co. is traversed by the Ottawa and Prescott railroad, and the Rideau canal. Lumbering is the principal business of the people. Chief town, Ottawa City.

CARLETON, Sir GUY, Lord Dorchester, 1724-1808; a British officer distinguished at Louisburg, Quebec, and Belle Isle, and wounded in the siege of Havana in 1762. He was a lieut. gen. in the British army, and the successor of sir Henry Clinton in chief command in the American colonies during the war of the revolution and till its close.

CARLETON, WILLIAM, one of the most popular writers of tales describing Irish life and manners, was b. 1798, at Prillisk, in the co. of Tyrone, Ireland. Bred and educated among the peasantry, he passed through the common sufferings and privations of Irish poverty, and, after receiving some scanty instruction in a hedge-school, he, in his 17th year, went to an academy which a relative had opened at Glasslough, where he remained two years. Afterwards, a vague ambition led him to Dublin, where he arrived with only some three shillings in his pocket, and where, in 1830, he published his *Traits and Stories of the Irish Peasantry*. Their freshness of style pleased the public, and won the favor of critics. A second series, issued in 1832, was also well received; and, in 1839, he published a powerful story, entitled *Fardorougha the Miser*, in several passages of which, however, his humor becomes extravagant. Subsequently, C. published a series of tales (3 vols., Dub. 1841), mostly of pathetic interest, but including a very genial

and humorous sketch of the *Misfortunes of Barney Branagan*, which proved a great favorite. The story of *Valentine M'Clutchy* is half-political and half-religious in its tendency, defending the Irish Catholic priesthood, and advocating repeal of the union, it appeared in 1845. Other narratives—*Rody the Rover*, 1846; *The Black Prophet*, 1847; and *The Tithe Proctor*, 1849—contain many proofs of the author's genius. *Willey Reilly*, 3 vols., appeared in 1855, and *The Evil Eye* in 1860. C. is the true historian of the Irish people. Sharing in their qualities of mind and temperament, he has a true sympathy with all their joys and sorrows, and a graphic and picturesque pen with which to describe them. In consideration of his literary services, he enjoyed a government pension of £200 a year, and on his death in Jan., 1869, the queen granted a pension of £100 to his widow.

CARLI, GIOVANNI RINALDO, a distinguished Italian economist and archæologist, was b. at Capo d'Istria, April, 1720. Educated at home and at Flambro in the Friuli, he was, in his 24th year, appointed professor of astronomy and navigation at Padua. In 1754, he published the first volume of his great work *On the History of the Coins and Currency, and on the Institution of the Mints of Italy*, the fourth and last volume of which appeared six years later. The book treats of the monetary history of Italy from the fall of the western empire until the 17th c., and is profusely illustrated with representations of coins, national and foreign, circulating in Italy during the various ages; and their value as compared with the price of provisions at different periods is also calculated. His merits as a financier were not overlooked. He was made president of the council of commerce and public economy at Milan, and afterwards president of the new council of finances, into which branch of administration he introduced many admirable reforms. The inhabitants were also indebted to his influence for the abolition of the inquisitional tribunal. He also wrote some valuable works on Istrian and other antiquities; dissertations on classical subjects; against sorcery; against Rousseau's theory of natural religion, etc. He died Feb., 1795. His works, exclusive of his *Italian Antiquities*, were published in 19 vols. 8vo (Milan, 1784-94).

CARLINE THISTLE, *Carlina*, a genus of plants of the natural order *compositæ*, closely allied to the true thistles, from which they are distinguished by the inner scales of the involucre spreading like rays, and being colored and shining. These involucre scales are remarkably hygrometric, expanding in dry and closing together in wet weather, and this property they retain for a long time; the heads of flowers are therefore often nailed on cottage-doors in many parts of Europe, to indicate the weather. The name C. T. is derived from a legend, that an angel showed the root of one of the species to Charlemagne, as a remedy for a plague. This species, *C. acaulis*, grows on hills and mountains, especially in calcareous soils in the middle latitudes of Europe. It has a very short stem, and very large heads of flowers, and was formerly in high repute for the medicinal virtues of its root—which is in large doses a drastic purgative—but its use is now almost confined to veterinary practice.—The only British species is the common C. T. (*C. vulgaris*), not unfrequent in England and some parts of Scotland, and sometimes rather a troublesome weed, but always indicative of a poor soil. It has a stem about a foot high; and many purplish heads of flowers set amidst straw-colored rays.

CAR LINGS, in ship-building, are small beams laid fore and aft, and resting upon the main or deck beams. These, with other pieces called *ledges*, laid at right angles to them, form a framework by which the deck is supported.

CARLINVILLE, a t. and seat of justice in Macoupin co., Ill., on the Chicago and Alton railroad, 39 m. s.w. of Springfield. C. is the seat of Blackburn university, and is an important center for local trade. Pop. township, 1870, 5,808.

CARLISLE (*ante*), the seat of justice of Cumberland co., Penn., on the Cumberland Valley railroad, at the junction of the Pine Grove branch, 18 m. w. by s. of Harrisburg; pop. about 7,000. It is in a highly productive agricultural region; is well built, with wide and handsome streets, and several fine public buildings. Dickinson college was founded here in 1783 by the Methodist denomination. Near the town are the well-known C. barracks; and in the mountains 4 m. n. is C. Springs, a famous watering-place. Washington had his head-quarters in C. during the whisky rebellion in 1794, and in July, 1863, the place was bombarded by the confederates.

CARLISLE, a parliamentary and municipal borough, episcopal city, and ancient town in North Cumberland, the capital of the co., 12 m. e. of the Solway firth, 300 m. n.w. by n. of London, 101 m. s. of Edinburgh, and 60 w.s.w. of Newcastle. It is a chief station on the w. railway route from London to Edinburgh, and is the terminus of seven different lines of railway. It stands on an eminence in a wide plain at the confluence of, and nearly surrounded by, the Eden, Caldew, and Peteril. Many fine new streets and buildings have been lately added to the city. The chief branches of industry are cotton, gingham, and check manufactures; print, iron, and dye works; and salmon-fisheries. It has a small cathedral of red freestone, of which Paley was archdeacon. The castle was founded in 1092, and is now a barracks; the remains of the keep form a massive lofty tower, with a very deep well. Mary queen of Scots was confined in the castle after the battle of Langside. A canal of 11 m., from Bowness on the Solway

firth to C., formerly admitted vessels of 100 tons; but the bed of the canal has now been converted into a railway, from which a line also branches to the newly formed port of Silloth, where an extensive dock has been constructed on the Solway, at a distance of 20 m. from Carlisle. Pop. in 1763, 4,000; 1801, 10,221; 1851, 26,310; 1861, 29,417; 1871, 31,049. C. returns two members to parliament. The total number of vessels that entered the port of C. in 1876 was 568, of 109,905 tons; cleared 695, of 123,305 tons. Roman remains have been found here—coins, altars, inscriptions, brass incense vases, etc. Being near the w. end of Hadrian's wall, C. was probably a Roman station. It was the seat of the ancient kings of Cumbria. The Picts and Scots ravaged it. About 900, it was destroyed by the Danes, after which it remained desolate for 200 years. Thence to the union of England and Scotland, it was closely connected with the border wars, and underwent many sieges. To its being long a fortified border town it owed much of its importance and privileges, but it declined much after the union. The C. corporation, in 1745, proclaimed prince Charles king of Great Britain. The duke of Cumberland afterwards took the city, and punished the chief actors with death, and the inhabitants with other cruelties. In 1133, Henry I. made C. a bishopric.—The C. tables of mortality, based on the deaths which occurred in C. 1779-87, were drawn up by Dr. Heysham, and have been ever since much used by life-insurance offices, as being nearest the average.

CARLISLE CATHEDRAL was commenced about 1092 by Walter, a Norman. It was founded by William Rufus, and dedicated in 1101 by Henry I.; and in 1133, was made the cathedral church of the newly formed diocese. A great part of the original Norman building was destroyed by fire in 1292. The new edifice contains specimens of all the styles of early English—simple pointed, geometric, and flowing. Two thirds of the fine Norman nave, originally 141 ft. long, were destroyed by Cromwell; the portion that was left has long been used as a parish church. In 1853, the restoration was commenced. The choir is one of the finest in England, 138 ft. long, and 72 high, and consists of 8 pointed arches. The e. window, consisting of 9 lights, is considered the finest decorated window in England. The tower is very low, rising but one story above the choir. It formerly supported a timber spire, which was removed in 1661. This cathedral has four canons.

CARLISLE, the capital of Cumberland co., Penn., U. S., 18 m. s. by w. of Harrisburg, the center of a rich agricultural country; seat of Dickinson college, a flourishing Methodist institution; with 13 churches, 2 banks, 2 newspapers, machine shops, rail-car factory, and U. S. barracks; was shelled by the Confederates, July 1, 1863. Pop. '70, 6,650.

CARLISLE, FREDERICK HOWARD, Earl of, 1748-1825; an English statesman; one of the commission sent to the American colonies by lord North about 1778 to endeavor to effect a reconciliation, which effort was a failure, not from mismanagement but because of the unpopularity of North's administration. In 1780, C. was made viceroy of Ireland, where, in a very critical period, he managed to maintain peace and promote prosperity. In the discussion concerning the regency, C. favored the prince of Wales, and in the period of the French revolution he was a vigorous supporter of the war. After opposing the corn laws in 1815, he took no further part in public affairs.

CARLISLE, GEORGE WILLIAM FREDERICK HOWARD, Earl of, K. G., was b. April 18, 1802. Educated at Eton and Oxford, he, in 1821, obtained the Chancellor and Newdegate prizes for his Latin and English poems. He entered the public service in 1826 as an attaché. In 1830, he (then lord Morpeth), along with Henry (afterwards lord) Brougham, was elected one of the representatives of the important constituency of Yorkshire, and after the reform bill for the West Riding, a position which he held in the liberal interest for several years. Under the administration of lord Melbourne, he held the office of chief secretary for Ireland (1835-41), and his impartial distribution of patronage made him very popular in Dublin. Rejected in 1841 by the West Riding, he was again elected in 1846, and remained one of its representatives until the death of his father (1848) called him to the house of lords. Under lord John Russell's ministry (1846-52), he was chief commissioner of woods and forests, and afterwards chancellor of the duchy of Lancaster. When lord Palmerston was made prime minister in 1853, C. was appointed lord lieutenant of Ireland, a post which he held until the advent of the earl of Derby's government in 1858; and he succeeded to the same office again when lord Palmerston was reinstated in 1859. C. obtained some reputation as a literary man, chiefly by his lectures on his travels in the United States, on the life and writings of Pope, and his *Diary in Turkish and Greek Waters*. He died in 1864.

CARLISTS. See **CARLOS DE BOURBON** (*ante*) and **CARLOS**, DON.

CARLOS, DON, Infante of Spain, b. July 3, 1545, at Valladolid, was a son of Philip II. After his recognition as heir to the throne, in 1560, Don C. was sent to study at the university of Alcalá de Henares; where, however, he profited so little, that the king, regarding him as unqualified to reign, invited a nephew, the archduke Rudolf, to Spain, intending to make him heir to the throne. Excluded from all participation in the government, Don C. conceived a strong aversion toward the king's confidants, and especially was unwilling that the duke of Alva should have the government of Flanders.

In confession to a priest, on Christmas eve, 1567, he betrayed his purpose to assassinate a certain person; and as the king was believed to be the intended victim, this confession was divulged. The papers of Don C. were seized, and being tried, he was found guilty of conspiring against the life of the king, and of traitorously endeavoring to raise an insurrection in Flanders. The sentence was left for the king to pronounce. Philip declared that he could make no exception in favor of such an unworthy son; but sentence of death was not formally recorded. Shortly afterwards, he died, July 24, 1568, and was interred in the Dominican monastery, El-Real, at Madrid. The suspicion that he was poisoned or strangled, has no valid evidence to support it. Schiller, in his tragedy *Don Carlos*, has widely departed from historical testimonies.

CARLOS, LUIS MARIA FERNANDO, DON, 1818-61; son of Don Carlos Maria Isidor. In 1846, he lived in England with his father, under the name of Montemolin. In April, 1849, he went in disguise to Spain, was discovered and kept in prison for a few days, but returned to England before the end of the month. In 1860, he invaded Spain with 3,000 men, and was defeated and made prisoner at Tortosa. Being again set free, on condition of renouncing his claim to the throne, his first act was to repudiate that renunciation.

CARLOS, MARIA DE LOS DOLORES JUAN ISIDOR JOSEF FRANCESCO QUIRINO ANTONIO MIGUEL GABRIEL RAFAEL, DON, b. Mar. 30, 1848; nephew of Luis Maria Fernando; present claimant of the throne of Spain as the legitimate heir of Charles VIII. As Charles VI. died without issue, his rights devolved upon his brother Don Juan, who had married the archduchess Maria Theresa of Austria, princess of Modena. Their son, the present Don Carlos, was educated principally in Austria, and married Margaret de Bourbon, princess of Parma, daughter of the late duke Ferdinand, Charles III., and sister of the present count de Chambord, who claims to be Henry V. of France. In Oct., 1868, Don Juan abdicated in favor of his son, whose standard was raised by some of his partisans in the n. of Spain in April, 1872. On the 16th of July following, Don Carlos published a proclamation calling upon the people of Catalonia, Aragon, and Valencia to take arms in his cause, promising to restore their ancient liberties; and in Dec. his brother, Don Alfonso, assumed command of the Carlist forces in Catalonia. Don Carlos himself made his entry to Spain, July 15, 1873, announcing that he came for the purpose of saving the country. Thenceforward there was incessant war in the n. part of the kingdom or the republic, in which there were victories on both sides; but for the most part the battles were unfavorable to the Carlists, until Feb., 1876, when their cause was completely crushed at Tolosa, the defenders of that last stronghold flying in a panic toward France. Don Carlos went to Paris, where, Mar. 3, 1876, he proclaimed: "Being desirous of putting a stop to bloodshed, I forbear continuing a glorious but at present fruitless struggle. In the face of a great superiority of numbers, and in view especially of the sufferings of my volunteers, it becomes necessary to return the sword to the scabbard. I will never sign a convention [abandonment of all claims]. My flag remains furled until the moment which God shall fix as the supreme hour of redemption." Don Carlos has five children, four daughters and a son.

CARLOS, SAN, a t. of Venezuela, South America, in a valley on the Aguaré, a feeder of the Orinoco, 120 m. s.w. of Caracas. Before the wars of independence it was a place of considerable importance, having been one of the richest towns in the province. The town is handsome and well laid out. The pop. was formerly 10,000, but is now considerably less. The inhabitants are engaged chiefly in the rearing of cattle, and the cultivation of indigo, cotton, and coffee, of which there are still considerable plantations in the neighboring savannas.

CARLOS DE BOURBON, DON MARIA ISIDOR, b. Mar. 29, 1788, was the second son of Charles IV. of Spain, and was educated chiefly by priests. After the expulsion of the French from Spain, his brother, Ferdinand VII., reascended the throne; but having married thrice without issue, Don C. began to cherish the hope of succeeding his brother. An insurrection in his interest broke out in 1825, in Catalonia; but was put down, Don C. himself not participating in it. A fourth time, however, the indefatigable Ferdinand married, and the result was a daughter, the infanta Maria Isabella (late queen of Spain), b. Oct. 10, 1830. Now, as the Salic law, excluding females from succession to the throne, had been abrogated, the hopes of the Carlists, as the followers of Don C. were called, were destroyed. During the illness of the king, in Sept. 1832, the Carlists succeeded so far as to win from him a re-institution of the Salic law; but he revoked it again as soon as he had partially recovered, and thus Don C. was again disappointed. As he still continued his agitation, he was banished, in 1833, to Portugal, and soon afterwards was commanded to reside in the papal states. But before C. had embarked for Italy, king Ferdinand VII. died, Sept. 29, 1833. Don C. was now recognized as heir to the throne of Spain, not only by the Carlists but also by Dom Miguel in Portugal; and having refused to obey the queen-regent's order for his deportation to Italy, he was declared a rebel, Oct. 16, 1833. By the quadruple alliance of Spain, Portugal, England, and France, both C. and Dom Miguel were banished from Portugal, and in June, 1834, the former embarked for England. In the following month, he returned to the continent, passed in disguise through France into Spain, where he excited an insurrection in the northern provinces, but was ultimately com-

pelled to escape into France. In 1836, his claims to the throne were unanimously rejected by the constituent cortes. In 1844, he abdicated in favor of his eldest son, and died at Trieste, Mar. 10, 1855.—DON CARLOS, his son, b. 1818, was better known as the count de Montemolin. This second pretender made an attempt, in 1849, to pass under a disguise through France into Spain, but failed. In 1860, a Carlist insurrection was once more attempted, in consequence of which the count de Montemolin and his brother were arrested, but liberated after the former had signed a renunciation of all his claims to the Spanish throne. He d. in 1861. The present representative of his pretensions is his nephew, Don Carlos, son of his brother Juan, b. 1848. On his behalf, Carlist risings—speedily repressed—took place in 1869, 1870, and 1872; but the insurrection headed by Don Carlos, after the abdication of king Amadeo, in 1873, proved much more formidable, and kept the northern provinces of Spain in great confusion till the beginning of 1876, when it was crushed.

CARLOVINGIANS, the second dynasty of Frankish kings. The origin of the family is traced to Arnulph, bishop of Metz, who d. in 631. His son, Anségise, married a daughter of Pepin, of Landen, in Austrasia. His sons, Martin and Pepin d'Heristall (q. v.), as the greatest territorial lords in Austrasia, were called to the office of mayor of the palace. Martin was assassinated; Pepin, by force of arms, compelled the weak Merovingian king, Theodoric III., to invest him with the office of mayor of the palace in all the three Frankish states, Neustria, Austrasia, and Burgundy. Pepin allowed the Merovingian kings to remain upon the throne, but they were kings only in name. He d. on 17th Dec., 714, and left as his successor, his young grandson, Theodoald—but Charles Martel (q. v.), a natural son of Pepin, was made mayor of the palace by the Austrasians, and in this capacity subjected the three states to his power. He d. in 741. His two sons, Carloman and Pepin le bref, divided the kingdom, although for a time the nominal Merovingian dynasty still subsisted; but Pepin at last formally assumed the royal power, and was crowned king of the Franks on 3d May, 752. This is the formal commencement of the Carolingian dynasty. Pepin began the conquest of Italy. His sons, Carloman and Charles the great or Charlemagne (q. v.), succeeded him, of whom the latter soon reigned alone, and prodigiously extended his dominions. In 800, pope Leo III. set upon his head the crown of the western Roman empire. He divided his dominions amongst his sons, of whom, however, only one, Louis le débonnaire, survived him, who, in the list of the kings of France, appears as Louis I., but who was properly emperor and king of the Franks. With Charlemagne, however, the high abilities of his family suddenly disappeared, and his successors showed much weakness of character. Family feuds broke out during the life of Louis le débonnaire, who had divided his dominions in part amongst his sons, and he terminated an inglorious reign in 840. By a treaty concluded in Aug., 843, Lotharius I., the eldest son of Louis, obtained the imperial crown and the kingdom of Italy, with Lorraine, Franche Comté, Provence, and the Lyonnais; Louis, his brother, called Louis the German, obtained the German part of his father's dominions; and Charles the bald, the son of a second marriage, obtained Neustria, Aquitania, and the *Spanish Mark*, and may almost be regarded as the founder of the French monarchy. The emperor Lotharius I. died in 855, and his dominions were again dividid—his eldest son, Louis II., being emperor and king of Italy, and his two other sons kings of Lorraine and of Provence, but their kingdoms reverted to the emperor.—Charles the fat, a son of Louis the German, having become emperor, was elected by the French nobles to be their king in 882; and being previously in possession of Italy and Germany, united under his sway great part of Charlemagne's empire. But he was a weak monarch, and was deposed in 887. The imperial dignity passed by the marriage of the daughter of the emperor Arnulph with Fritzlar, count of Franconia, to another family. The French dynasty, of which Charles the bald may be deemed the founder, continued in a succession of weak monarchs for about a century, till it terminated with the reign of Louis V., on whose death, Hugh Capet, the most powerful nobleman in France, seized the crown in 987. The Carolingian kings had for some time previous possessed no real power. A subsequent marriage, however, connected their family with that of the Capets, and enabled the kings of France to trace their descent from Charlemagne.

The Carolingian dynasty figures in the early history of France as the ally of the church. It aided the popes against the Lombards; made war on the Aquitanians, who pillaged and despoiled the churches; established the temporal power of the successors of St. Peter; subdued and converted the still pagan Saxons; and fought the Mohammedans in Spain. Nor, on the other hand, do we find the church ungrateful: it sanctioned, by benediction and prayer, the conquests of this powerful family; in various ways impressed its sacred stamp of approbation upon it, and for its sake resuscitated the imposing idea of an empire of the west. But this alliance, which was advantageous to the policy of kings like Pepin le Bref and his son Charlemagne, because they had genius, vigor, and design, became at a later period, under their feeble successors, a chief cause of the overthrow of the dynasty, for the clergy, after 814, grew stronger and more exacting every day, and forced the monarchs to new concessions.

CARLOVITZ, or **KARLOVITZ**, a t. of the Austrian empire, in the "kingdom" or province of Slavonia. It is situated on the right bank of the Danube, about 8 m. s.s.e.

of Peterwardein, and is noted for its excellent wine, and for the treaty concluded here in 1699. The wine—especially the red variety—ranks with the best and strongest obtained in Hungary, and in some years the product has amounted to about 1½ million of gallons. Pop. '69, 4,419. The important treaty or peace of C. was concluded, in 1699, between the allies Austria, Russia, Poland, and Venice on one side, and the porte on the other, and included the following articles: "That Austria should repossess the territories captured by the Turks during two centuries (which included Hungary and Slavonia, and she also acquired Transylvania); that Venice should hold the Morea as far as the isthmus; that Poland should take back Podolia and the lands in the Ukraine conquered by Mohammed IV., but should cede certain places in Moldavia; and that Russia should have the territory of Azof."

CARLOW, the capital t. of Carlow co., Ireland, situated at the confluence of the Burren and the Barrow, 56 m. s.w. of Dublin by rail. It is a well-built town, with two principal streets, from which branch many smaller ones, and a suburb, Graigue, in Queen's co., on the opposite side of the river, with which it is connected by a bridge. It has a Roman Catholic cathedral and divinity college. C. has extensive flour-mills, and is the emporium for the agricultural produce of the district, largely exported from this place. Pop. '71, 7,842. It returns one member to parliament. There are here the remains of a castle, picturesquely situated on an eminence on the Barrow, founded in 1180 by sir Hugh de Lacy. In 1361, the duke of Clarence established the exchequer of the kingdom in this place. It constituted one of the boundaries of the PALE, beyond which the king's writ was not recognized by the "Irishry." Its first charter was granted in the 13th c. by William Marshall, earl of Pembroke. The town grew up around this castle, which was several times besieged by, and alternately in the possession of, the English and Irish. The castle (one of great extent) was in the possession of the insurgents in 1650, when it was closely invested by gen. Ireton and the republican army. The garrison surrendered on conditions to sir Hardress Waller, whom Ireton had left to conduct the siege. It was then dismantled; and about one half of this once stately castle now remains a picturesque ruin. In the Irish insurrection of 1798, the insurgents attacked the town, but were repulsed by the garrison and yeomanry, and 600 of them killed. The Barrow is here navigable for small-craft to its junction with the Grand canal at Athy.

CARLOW, a small inland co. of Ireland, in Leinster province, with an area of about 346 sq. m., of which 24ths are arable. C., except in the southern extremity, where it is lilly, is a triangular fertile level, or gently undulating plain, between the Wicklow and Wexford range of hills on the e., and the highlands beyond the Barrow on the west. The chief rivers are the Barrow and Slaney. C. consists chiefly of granite, covered in the middle plain, or richer tracts, by limestone gravel, on which are fine loams and pasture. In the uplands, the soil is gravelly. Lower, carboniferous limestone crops out in the valley of the Barrow. On the w. side of the co. begins the great coal district of Leinster. In 1876, 79,345 acres were under crop, the chief crops being oats, potatoes, barley, and wheat. There are many dairies on the plains. The chief exports are corn, flour, meal, butter, etc. Along the Barrow, which falls above a foot per mile, are a great many extensive corn-mills. Pop. '41, 86,228; '51, 68,059; '71, 51,472. It returns three members to parliament—two for the co. at large, and one for the borough of Carlow. The chief towns are Carlow, Tullow, and Bagenalstown. At Old Leighlin a synod was held, in 630, to settle the time of Easter. Several engagements occurred in the co. during the Irish rebellion of 1798. The chief antiquities of C. are cromlechs, castles, and the cathedral church of Old Leighlin. A cromlech near Carlow town has a covering stone 23 ft. long, and of nearly 90 tons.

CARLOWITZ, or **CARLOVITZ**, a t. in Hungary, on the right bank of the Danube, 8 m. s.e. of Peterwardein; pop. '73, 4,419. It is the seat of the Greek archbishop for the Austrian dominions, and has seminaries for Greek and Roman Catholic clergy, a gymnasium, a lyceum, and a hospital. It was here that peace between Austria, Turkey, Poland, and Venice was concluded in 1699.

CARLSBAD, or **KAISER-KARLSBAD**, a t. in Bohemia, much celebrated for its hot mineral springs, and frequented in summer by visitors of the most aristocratic character from all parts of Europe. The permanent population does not amount to more than about 7,000, who are very industrious, making carpets, knives, scissors, needles, wood-work, and articles of Bohemian glass, such as are likely to induce visitors to purchase. The visitors in a season, which usually lasts from 15th June to 15th Aug., amount to 15,000 or 18,000. The wells have been frequented from a very early period, but have been of great celebrity since the 14th century. The scenery is extremely beautiful. The town is well built, the accommodation for guests good, and the place free from some of the abuses too common at other German spas. No gaming-houses exist here. The temperature of the hot springs varies from 117° to 165° Fahrenheit. The principal spring, the Sprudel, has a very large volume, and is forced up to a height of 3 ft. from the ground. Altogether, the daily flow of the springs of C. is estimated at 2,000,000 gallons. The principal ingredient in the water is sulphate of soda. The whole town of C. appears to stand on a vast caldron of boiling water, which is kept from bursting only by the safety-valves the springs provide. On one occasion, after an

explosion, poles of 30 fathoms in length, thrust into the aperture, did not reach the bottom. A congress of German powers was held here in Aug., 1819, in which various resolutions, denunciatory of a free press and liberal opinions, were arrived at, and measures of repression determined on.

CARLSBURG, or **KARLSBURG**, a t. of Transylvania, situated on the right bank of the Maros, here crossed by a bridge some 200 yards in length, 48 m. s. of Klausenburg. It is built partly on a hill, and partly in a valley, is fortified, and has a citadel surrounded by walls with bastions. Gold and silver, obtained from the mines of Transylvania, are purified and coined here. The only manufacture of importance is saltpeter. Maros Porto, the chief shipping-place for Transylvanian rock-salt, is within half a mile of the town. C. occupies the site of the ancient *Apulum*, remains of which are still found. Pop. '69, 7,955.

CARLSCRO'NA, capital of the province of the same name in Sweden, is situated on the rocky island of Trotsö, and its adjoining islets in the Baltic, which are connected by bridges, in lat. 56° 9' n., long. 15° 35' east. The town was built in 1680 by Charles XI., who gave it his own name, and conferred upon it several important privileges, besides making it the great naval station and arsenal of Sweden, instead of Stockholm. It has a magnificent harbor, with a sufficient depth of water to float the largest vessels. The only practicable entrance for large ships is defended by two strong forts. The dry-docks, blasted out of the granite rock at vast expense, are an attraction to strangers. The inhabitants are chiefly employed in connection with the arsenal. Pop. '75, 16,877.

The province of C. or Blekinge is situated in the s. of Sweden, in lat 56° to 56° 30' n., long. 14° 30' to 16° east. It has the Baltic on its s. and e. margins. It has an area of about 1120 sq. m., with a pop. of 131,812. It is hilly without being mountainous, and generally fertile, yielding rye and potatoes abundantly, and also wheat, oats, and peas. The fisheries employ a considerable number of the inhabitants.

CARLSHAMN, a fortified t. on the s. coast of Sweden, about 30 m. w. of Carlscona, at the end of a beautiful valley. The harbor is small but secure, and a considerable trade in iron, timber, pitch, and tar is carried on. There are manufactures of sail-cloth, tobacco, hats, soap, and leather; there are also dye-works and ship-building yards. Pop. 5,731.

CARLSRUHE, the capital of the grand duchy of Baden, is situated a few miles eastward from the Rhine. It was founded by the Markgraf Charles-William of Baden-Durlach, in 1715, and built on a curious and regular plan in connection with the palace, which constitutes the center point from which the streets, so far as constructed, diverge in the shape of an extended fan. The streets are wide and well paved. There are a number of fine buildings; flourishing educational institutions; the court library contains 80,000 volumes; a public library, 90,000; and there are valuable collections of antiquities, objects of natural history, etc. An aqueduct from the Durlach supplies the town with water. In the market-place, which is the finest of the public squares, a stone pyramid incloses the remains of the founder of the city. The manufactures include machines of various sorts, engines, locomotives, railway carriages and wagons, jewelry, carpets, chemical products, and cloth. C. is generally spelled *Karlsruhe*. Pop. '75, 42,768.

CARLSTAD, a t. of Sweden, on the island of Tingvalla, in lake Wenern, about 160 m. w. of Stockholm. It is connected with the mainland by two bridges, one of which is a large and very handsome structure. The town is well built, has a cathedral, cabinet of natural history, etc., and commands extensive views of the most beautiful scenery. Its trade is large, consisting in exports of iron, copper, timber, and corn. Pop. '76, 6,622.

CARLSTADT, a t. of Croatia, in Austria, situated in a rich plain between the rivers Kulpa and Korona, 33 m. s.w. of Agram. It is fortified—the original fortress having been erected in the 16th c. to resist the Turks—has an old castle, and armory of 30,000 stand of arms. It has a large garrison, the Austrian executive looking upon it as a place of considerable importance, on account of its position on a navigable river, and on the great road into the center of Croatia from the coast. It has few manufactures, but an active transit trade. Pop. '69, 5,175.

CARLSTADT. **KARLSTADT**, or **KAROLOSTADT** (real name, **ANDREAS RUDOLF BODENSTEIN**), 1480–1541; a German reformer, at first a friend and afterwards an opponent of Luther. He became a professor in Wittenberg, first in philosophy and then in theology, and in 1511 was rector of the university, about which time he became a personal friend of Luther. Carlstadt went to Rome to study canon law, returning to Wittenberg in 1515, where he took up the defense of Reuchlin, the scholar against whom a violent persecution was raging. In 1517, he published arguments asserting the supreme authority of the Scriptures, and declaring that in the silence of Scripture, appeals from the fathers of the church must be made to reason. When Luther nailed his thesis to the door of the church, Carlstadt supported him. In the bill against Luther, Carlstadt was especially named and condemned; and he was the first to appeal from the pope to a general council. In 1521, by invitation of the king, he went to Denmark to

teach the doctrines of the reformation; but he soon returned. About this time, differences sprang up between Carlstadt and Luther, owing to the former's hot-headedness; he demanded violent measures, where Luther desired prudence and patience. While Luther was imprisoned, Carlstadt greatly impaired the cause by his extreme course, and at last Luther declared against him. Being compelled to leave Wittenberg, Carlstadt became a pastor in Thuringia, where his violence created a suspicion that he was associated with Anabaptists, and that he might be implicated in the schemes of the peasant revolt. The elector sent Luther to find out the true state of affairs; and when Luther preached against Carlstadt at Jena, they held a discussion on the "real presence," which Carlstadt was the first to deny, and an open quarrel broke out between them. Carlstadt was ordered out of Saxony, and wandered from place to place exciting tumults, and prompting the people to destroy pictures and images in the churches. Again suspected of provoking insurrection, he was pursued and exposed to hardships, and even danger to his life. In this extremity he appealed to Luther, through whose influence he was permitted to return to Saxony, where for some years he led a quiet life. This quiet was unendurable by his restless spirit, and he once more attacked Luther; the controversy, in which Zwingli agreed with Carlstadt in his views of the Lord's supper, grew fiercer than ever, and Carlstadt, who was no longer permitted to dwell in Saxony, fled to Friesland, and thence to Switzerland, where Zwingli's influence made him a pastor, and afterwards an archdeacon at Zurich. In 1534, he settled as professor of theology in Basel, remaining there until his death. He was the first priest to write against celibacy, and the first Protestant clergyman to take a wife.

CARLTON, a co. in n.e. Minnesota, on the Wisconsin border, intersected by the Northern Pacific and Lake Superior railroads; 900 sq. m.; pop. '70, 286. Surface uneven, and for the most part covered with maple and pine trees.

CARLTON, THOMAS, D.D., 1809-74; b. N. H.; a Methodist minister, who in 1829 began his work in the Western New York conference in Rochester, Buffalo, and other places. He was for 20 years the principal agent of the Methodist book concern, in New York city.

CARLUDOVICA PALMA'TA, a South American shrub or tree bearing the leaves from which Panama hats are woven, the best of which are plaited from a single leaf, the work requiring many weeks of labor.

CARLUKE, a municipal burgh in the middle of Lanarkshire, near the right bank of the Clyde, 6 m. n.w. of Lanark. Pop. '71, 3,423. The neighborhood is rich in coal, iron, and limestone, and mining is the chief industry of the place. The orchards around cover 130 acres. Not far off is Lee, the seat of the Lockharts, where is preserved the famous Lee penny, noticed by sir W. Scott in the *Talisman*. Roman coins have been found here. Gen. Roy, the antiquary, author of the *Military Antiquities of the Romans in North Britain*, was a native of Carluke.

CARLYLE, JOSEPH DACRE, 1759-1804; educated at Cambridge, and a fellow of Queens' college. He succeeded Dr. Paley as chancellor of Carlisle, and in 1794 was appointed professor of Arabic at Cambridge. He had already published a translation of an Arabic history of Egypt, and in 1796 he issued a volume of *Specimens of Arabic Poetry*. Lord Elgin procured Carlyle's appointment in the Turkish embassy, which gave him an opportunity to travel in the east, where he collected Greek and Syriac manuscripts for a contemplated revision of the New Testament, but he did not live to do the work.

CARLYLE, THOMAS, was b. 4th Dec., 1795, in the t. of Ecclefechan, parish of Hoddam, Dumfriesshire, Scotland. Educated first at the parish school, and afterwards at Annan, he passed to Edinburgh university, with a view to entering the Scottish church, in his 15th or 16th year. Here he studied irregularly, but with amazing avidity. The stories which are related of his immense reading are almost fabulous. About the middle of his theological curriculum, C. felt wholly disinclined to become a clergyman, and, after a short period spent in teaching at Dysart, in Fifeshire, he embraced literature as a profession. His first efforts were contributions to Brewster's *Encyclopaedia*. In 1824, he published a translation of Legendre's *Geometry*, to which he prefixed an essay on proportion, mathematics having, during his college years, been a favorite study with him. In 1823-1824, had appeared in the *London Magazine* his *Life of Schiller*, and, during the same year, his translation of Goethe's *Wilhelm Meister*. In 1825, the *Life of Schiller* was recast, and published in a separate form. It was very highly praised; indeed, one can discern in the criticisms of the book certain indications of the genius of Carlyle. The translation of *Wilhelm Meister* met with a somewhat different fate. De Quincey, in one of his acrid and capricious moods, fell foul both of Goethe and his translator; while lord Jeffrey, in the *Edinburgh Review*, admitting C. to be "a person of talents," slashed in cavalier fashion at the book. In 1827, C. married Miss Welch, a lineal descendant of John Knox, and, during the same year, appeared his *Specimens of German Romance* (4 vols., Tait, Edinburgh). From 1827 to 1834, he resided chiefly at Craigenputtock, a small property in Dumfriesshire, belonging to his wife—the "loneliest nook in Britain," as he says himself in a letter to Goethe, "fifteen

m n.w. of Dumfries, among the granite hills and the black morasses which stretch westward through Galloway almost to the Irish sea." Here C. revolved in his mind the great questions in philosophy, literature, social life, and politics, to the elucidation of which—after his own singular fashion—he has earnestly dedicated his whole life. Here, also, he commenced to write the splendid series of critical and biographical essays which first familiarized Englishmen with the riches of modern German thought. For this work, he was incomparably better fitted than any man then living in Great Britain. Possessing a knowledge of the German tongue such as no foreigner ever surpassed, he was also inspired by the conviction, that the literature of Germany, in depth, truthfulness, sincerity, and earnestness of purpose, was greatly superior to what was admired and relished at home. Gifted, moreover, in a degree altogether unexampled, with a talent for portraiture, he soon painted in ineffaceable colors on the British memory, the images of Schiller, Fichte, Jean Paul Richter, and other foreign magnates, until then almost unheard of. Gradually, educated circles awoke to the fact, that a literary Columbus had appeared among them, who had discovered a "new world" of letters, the freshness and grandeur of which were sure to attract, sooner or later, multitudes of adventurous spirits. One of his most beautiful, eloquent, and solid essays written at Craigenputtoch, was that on *Burns* (*Edinburgh Review*, 1828). It has given the tone to all subsequent criticism on the Scottish poet. The article on *German Literature*, in the same periodical, is a masterly review of a subject, the importance of which C. at length succeeded in compelling his countrymen to acknowledge. But his *chef-d'œuvre* written on the moorland farm, was *Sartor Resartus* ("the tailor done over," the title of an old Scottish song). This work, like all his after-productions, an indescribable mixture of the sublime and the grotesque, was offered to various London firms, and rejected on the advice of their sapient "tasters," and at length published in successive portions in *Fraser's Magazine* (1833-34). It professes to be a history or biography of a certain Herr Teufelsdröckh ("Devil's Dirt"), professor in the university of Weissnichtwo ("Kennaquhair"), and contains the manifold opinions, speculations, inward agonies, and trials of that strange personage—or rather of C. himself. The whole book quivers with tragic pathos, solemn aspiration, or riotous humor. C. now removed to London, where he still resides. In 1837, appeared the first work which bore the author's name, *The French Revolution, a History*. Nothing can be more gorgeous than the style of this "prose epic." A fiery enthusiasm pervades it, now softened with tenderness, and again darkened with grim mockery, making it throughout the most wonderful image of that wild epoch. C. looks on the explosion of national wrath as a work of the divine Nemesis, who "in the fullness of times" destroys, with sacred fury, the accumulated falsehoods of centuries. To him, therefore, the revolution is a "truth clad in hell-fire." During the same year, he delivered in London a series of lectures on *German Literature*; in 1838, another series on *The History of Literature, or the Successive Periods of European Culture*; in 1839, another on *The Revolutions of Modern Europe*; and a fourth in 1840, on *Heroes, Hero-Worship, and the Heroic in History*; of these only the last has been published. Meanwhile, the first edition of his *Miscellanies* (contributions to the reviews) had appeared in 1838, and his *Chartism* in 1839. In 1843, followed *Past and Present*, which, like its predecessor, showed the deep, anxious, sorrowful interest C. was taking in the actual condition of his countrymen. In 1845, he published what is by many considered his masterpiece—*Oliver Cromwell's Letters and Speeches, with Elucidations and a Connecting Narrative*. The research displayed in this book is something marvelous, but the author has been nobly rewarded for his toil, inasmuch as his vindication of the protector's character is most triumphant. To C. has thus fallen the unspeakable honor of replacing in the pantheon of English history the statue of England's greatest ruler. In 1850, the *Latter-Day Pamphlets*, the fiercest, most sardonic, most furious of all his writings, came out. The violence of the language in these pamphlets offended many. Next year (1851) appeared the *Life of John Sterling*—a biography of intense fascination for the younger intellects of the age. In 1858-1860, C. published *The History of Frederick the Great*; and, in 1875, *Early Kings of Norway: Also The Portraits of John Knox*. C. was elected lord rector of Edinburgh university in 1865; and, in 1873, received the Prussian royal order "for merit." In 1875, he was offered but refused the order of the bath.

That C.'s *genius* will never want ample recognition, is most certain; but his *writings* derive so much of their interest and power from what is peculiar to, or at least characteristic of, the present time, that future ages may possibly wonder at their fiery splendors, and fail to sympathize with their prophetic enthusiasms.

CARMAGNOLA, a t. of n. Italy, situated near the left bank of the Po, about 16 m. s. of Turin. It has a massive old tower, the remains of a very strong castle, which formerly served as a defense for the town. The *condottiere*, Francesco Bussone, afterwards Conte di Carmagnola, was a native of this place. It has manufactures of jewelry, and a trade in silk, flax, linen, cattle, and agricultural produce. Pop. 12,512.

CARMAGNOLA, FRANCESCO BUSSONE, Count of, 1390-1432; a celebrated brigand, at first in the service of the duke of Milan, who made him count and governor of Genoa. Having fallen from the duke's favor, Carmagnola became a gen. in the Venetian army, and took Brescia from his former master, whom he defeated in 1427. In 1431, he incur-

red the suspicion of the Venetian senate because of certain military failures, in consequence of which he was tortured and finally beheaded.

CARMAGNOLE, the name of a popular song and dance, which was notorious as the accompaniment of many excesses in the French revolution. It first became popular in the s. of France, where it was named after Carmagnole, in Piedmont, the home of many Savoyard boys who played the tune. The song began with:

Madame Vêto avait promis,

and every verse ended with the refrain:

Dansons la Carmagnole—vive le son—du canon!

Fashion soon adopted the word, which was next applied to a sort of jacket, worn as a symbol of patriotism. Afterwards it was applied to the bombastic and fanatical reports of the successes and glory of the French arms. With the reign of terror, the song and the jacket, associated with so many dismal recollections, together disappeared.

CARMARTHEN. See CAERMARTHEN, *ante*.

CARMEL is a mountain-ridge, 6 or 8 m. long, stretching nearly n. and s. from the plain of Esdraelon into the sea, the only great promontory on the low coast of Palestine. It is composed of a whitish stone, in which flints, sometimes curiously shaped, are imbedded. The height has been variously stated, but is probably about 1000 ft. above the level of the plain. On the e. is the river Kishon, and the plain of Esdraelon; on the w., a small plain descending to the sea. Oaks, pines, olives, laurels, and other trees grow abundantly on the mountain; and various wild-fruits evince its ancient fertility and cultivation. The name C. means *the garden of God*, or "a very fruitful region." Mt. C. is renowned in Jewish history, and is often alluded to in the imagery of the prophets. On the summit of Mt. C., there is a monastery called Elias, after the prophet Elijah, the monks of which take the name of "Carmelites." It is built on the supposed site of the grotto where Elijah lived, and the spot where he slew the priests of Baal. For an invalid in search of retirement, with every beauty that climate and natural scenery can offer, there can be no place superior to the convent on Carmel.

CARMEL, KNIGHTS OF THE ORDER OF OUR LADY OF MOUNT, were instituted by Henry IV. of France, and incorporated with the order of the knights of St. Lazarus of Jerusalem. The order of Mt. C. consisted of 100 gentlemen, all French, who were to attend the king in his wars, and had considerable revenues assigned to them. The order was confirmed by bull by pope Paul V., in 1607. The great master was created by the king putting about his neck a tawny ribbon, suspending a cross of gold, with the cloak of the order, and granting him power to raise 100 knights. None were admitted but those who had four descents of nobility both by father and mother.

CARMELITES, OF ORDER OF OUR LADY OF MOUNT CARMEL, a monastic order probably founded as an association of hermits on Mt. Carmel by Berthold, count of Limoges, about 1156. A legend, however, ascribes the foundation of the order to the prophet Elijah; and another makes the Virgin Mary to have been a Carmelite nun. Driven out by the Saracens in the 13th c., the C. wandered over Europe; and Simon Stoch, their general, changed them into a mendicant order in 1247. From that time, they shared in the usual vices of the mendicant orders. They subsequently divided into several branches, more or less rigid in their rules, one distinguished by walking barefooted. They exist at the present day in many Roman Catholic countries.—The order of *Carmelitesses*, or *Carmelite nuns*, was instituted in 1452, and is very numerous in Italy.

CARMICHAEL, GERSHOM, 1672–1729; a Scotch metaphysician, educated at Edinburgh university, in which institution he became a master, an office which was converted to the professorship of moral philosophy in 1727. He was a successful teacher, but often in difficulty with his superiors in consequence of his hasty temper. His works are a treatise on logic and the psychology of the intellectual powers, in which he affirms that all knowledge may be resolved into immediate judgments known in their own light; a synopsis of natural theology; and an edition of Puffendorf's *De Officio Hominis et Civis*.

CARMINATIVES (from Lat. *carmen*, a charm), medicines to relieve flatulence and pain in the bowels, such as cardamoms, peppermint, ginger, and other stimulating aromatics.

CARMINE, OR CARMIN (Arabic, *kermes*), is a beautiful red pigment obtained from cochineal, and which is employed in the manufacture of the finer red inks, in the dyeing of silk, in coloring artificial flowers, and in miniature and water-color painting. It was first prepared by a Franciscan monk at Pisa, who discovered it accidentally, while compounding some medicine containing cochineal; and in 1656, it began to be manufactured. It is the finest red color known, and was more largely used formerly than now for imparting a healthy aspect to the cheek of beauty. One process for its preparation is to digest 1 lb. of cochineal in 3 gallons of water, for 15 minutes; then add 1 oz. of cream of tartar; heat gently for 10 minutes; add half an oz. of alum; boil for 2 or 3 minutes; and after allowing any impurities to settle, the clear liquid is placed in clean glass pans, when the C. is slowly deposited. After a time, the liquid is drained off, and the C. dried in the shade. In the preparation of C., much depends on a clear atmosphere, and a bright sunny day, as the pretty color of the C. is never nearly so good when it has been prepared in dull weather, and this accounts in great part for the superiority of

French C. over that prepared in England. The great expense of pure C. has led to the fabrication and vending of substitutes. The *rouge* of the theaters is made from red sandal-wood, Brazil wood, benzoin, and alum, which are boiled in brandy or vinegar till a paint of an intense red color remains. A more harmless material is obtained by evaporating the mixture till the liquid is driven off, and making up the red residue with balm of Mecca, spermaceti, or butter of cacao. The depth of the red tint may be lessened by the addition of chalk. The little color-saucers called *rouge dishes*, obtained from Portugal, contain pure C.; but imitations are made in London. *Spanish wool* and *oriental wool*, which are impregnated with red paint, intended for use on the cheek for improving the complexion, are seldom genuine.

CARMÖE, or **KARMÖE**, an island of Norway, at the entrance of the Bukke fiord, in the North sea, and 20 m. n.w. of Stavanger, in lat. 59° 20' n., long. 5° 15' east. A strait 2 m. in width separates it from the mainland. With a length of 21 m., and an average breadth of 5, it has a population of 6,400, who are principally engaged in the fisheries, and in cattle-rearing.

CARMONA, a t. of Andalusia, Spain, 20 m. n.e. of Seville. It is situated on an elevated ridge, overlooking a rich and olive-clad plain, and its old massive Moorish walls and castle give it a very picturesque appearance. It has a fine old Gothic church, and the gate of Cordova is a most interesting piece of architecture. It has manufactures of woolen cloth, hats, leather; also flour and oil mills, and an important annual cattle-fair. Pop. 18,000.

CARNAC, a village in the department of Morbihan, France, 17 m. s.e. of Lorient. It is remarkable on account of the great Celtic monument situated about three quarters of a mile from the village, on a wide desolate plain near the sea-shore. The monument consists of 10,000 to 12,000 rude broken obelisks of granite, resting with their smaller ends in the ground, rising, many of them, to a height of 18 ft., though a large proportion does not exceed 3 ft., and arranged in 11 parallel rows, forming 10 avenues extending from e. to w., and having at one end a curved row of 18 stones, the extremities of which touch the outer horizontal rows. The origin and object of the monument remain a mystery. Similar but smaller structures are found to the w. of C., at Erdevan and St. Barbe. Pop. '76, 636.

CARNAHUBA PALM, or **CARANAIBA PALM**, *Copernicia cerifera*, a very beautiful species of palm, which abounds in the northern parts of Brazil, in some places forming vast forests. It attains a height of only 20 to 40 ft.; but its timber is valuable, is used in Brazil for a great variety of purposes, and is imported into Britain for veneering. The fruit is black, and about the size of an olive; it is sweet, and is eaten both raw and prepared in various ways. Scales of wax cover the under side of the leaves, and drop off when the fallen and withered leaves are shaken. Being collected in this way, the wax is melted into masses; and bees-wax is often adulterated with it. It has been imported into Britain, and used in the manufacture of candles, but no method has yet been devised to free it of its yellowish color.

CARNARIA (Lat. *caro*, *carnis*, flesh), the Latinized form of the French *carnassiers*, the name given by Cuvier to a great order of *mammalia*, which, according to his system, includes all the not marsupial *feræ* of Linnæus, and along with them the bats, from the Linnæan order *primates*. The C. have the toes terminated by claws; none of them have an opposable thumb on any of the extremities; they have incisors or cutting teeth, canine teeth or tusks, and molar teeth or grinders, but their dentition varies according to their kind of food, some preying on insects, others on the higher animals, whilst many of them are by no means exclusively addicted to animal food, but subsist in great part, and a few bats entirely, on vegetable substances. Cuvier at first included the marsupial quadrupeds in this order; but afterwards, recognizing more fully the great importance of the characteristic from which they derive their name, constituted them into a distinct order, the remaining C. being divided into *cheiroptera* (bats, q.v.), *insectivora* (q.v.), and *carnivora* (q.v.).

CARNARVON, HENRY HOWARD MOLYNEUX HERBERT, fourth earl of, b. in Grosvenor square, 1831. His family is a branch of the house of Herbert, earls of Pembroke, springing from maj.gen. the Hon. W. Herbert, whose son, Henry, was created, in 1780, baron Porchester of Highclere, Hampshire, and advanced to the earldom of Carnarvon in 1793. The present earl was educated at Christ church, Oxford, where he was first-class in classics in 1852. His father dying before he was of age to sit in the house of commons, he lost the advantage of the training in public speaking and statesmanship which the sons of peers usually enjoy during the lifetime of their parents, in the lower house. He took his seat on the conservative benches, and soon showed himself ambitious of parliamentary distinction. His earlier speeches in the house of lords were not thought to exhibit much vigor and grasp of intellect, and were marred by a simpering and affected delivery. He was appointed governor of Carnarvon castle in 1854. In 1858, he became under-secretary of state for the colonies, in the administration of the earl of Derby. In 1859, he received the degree of D.C.L., and was elected high steward of the university of Oxford. He resigned office with the conservative ministry in 1859, and availed himself of the period of leisure thus obtained to visit the east. The feuds of the

tribes in the Lebanon had broken out in a massacre of the Christians; and the earl of C. gave the world the benefit of his investigations, in an interesting work, entitled the *Druses (q. v.) of the Lebanon*. On his return, he delivered lectures in the country, and speeches in the house of lords, on prison discipline, education, and other social subjects. When the conservatives again returned to power in 1866, C. accepted from lord Derby the office of secretary of state for the colonies, with a seat in the cabinet. In this he obtained for his colonial administration a large share of public confidence. He censured in calm and measured language the misconduct of the courts-martial during the Jamaica insurrection, and especially the trial and execution of Mr. Gordon; and the pacification of the colony satisfactorily progressed under his instructions. During the recess, he developed and framed a plan for the confederation of the British North American colonies; and when parliament met in 1867, he explained the provisions of the measure in an elaborate speech. The bill met with general approval in both houses, and it passed; but before it obtained the royal assent, C. had, with two other colleagues in the cabinet, resigned office upon the reform bill of the Derby government, which he regarded as democratic in its operation, and dangerous in its results. When the reform bill came before the house of lords, C., in an animated speech, vindicated his consistency at the expense of his colleagues; and in the discussions in committee, he addressed the house with great vigor and argumentative ability. He edited in 1869 a work by his father, who was an accomplished scholar. It is entitled *Reminiscences of Athens and the Morea; Extracts from a Journal of Travels in Greece during 1839, by the late Earl of Carnarvon*. He has also published one or two of his lectures. On Mr. Disraeli's return to power in 1874, lord C. resumed office as secretary of state for the colonies; but resigned in Jan., 1878, in consequence of the sending of the British fleet to the Dardanelles. Lord C. married, in 1861, the only daughter of the sixth earl of Chesterfield.

CARNARVON. See **CAERNARVON**, *ante*.

CARNATIC, a country of somewhat indefinite dimensions on the e. or Coromandel coast of the peninsula of Hindustan. While some carry it as far inland as the Western Ghauts, others limit its breadth to about 75 miles. The length is generally taken from cape Comorin to about 16° north. The C. is no longer a recognized division of the country, and exists only in history as the grand theater of the struggle of last century between France and England for supremacy in India.

CARNATION, one of the finest of florists' flowers, a double-flowering variety of the clove pink (*dianthus caryophyllus*, see **PINK**), and existing only in a state of cultivation. It has long been a universal favorite, both on account of its beauty and fragrance, although it does not appear to have been known to the ancients. The stem is about 3 ft. high, and generally receives support. There are varieties, called *tree carnations*, with much taller stems, but they are not amongst the varieties esteemed by florists. The flowers are often three inches or more in diameter. Scarlet, purple, and pink are the prevailing colors; but whatever are the colors of a C., it is of no value, in the eyes of a florist, unless they are perfectly distinct. Fullness and perfect regularity are also deemed essential. The varieties are extremely numerous: those which have only two colors, disposed in large stripes through the petals, are called *flake carnations*; those which have three shades of color, also in stripes, *bizarre carnations*; and those which have the flowers spotted with different colors, and the petals serrated or fringed, receive the name of *picotees*. Great attention is at present paid in Britain to the cultivation of the C., and very fine specimens are often to be seen in the gardens of cottagers, especially about towns and villages. The soil for carnations must be rich, rather open, and the manure well rotted and intimately mixed. The finest kinds are generally grown in pots, and receive protection from cold winds and heavy rains, although free access of air is indispensable. Carnations are propagated in summer either by layers or by *pipings*, which are short cuttings of shoots that have not yet flowered, each having two joints. The young plants are transferred in spring to the bed in which they are to flower.

CARNATION (from Lat. *caro*, flesh). Flesh-tints in painting are called carnations. The art of producing the true color of flesh, from the rarity with which it is acquired by artists, would seem to be one of the most difficult branches of coloring. Whether from their painting less from the nude than the old masters, or from some other cause, it is certain that the moderns, and particularly the English, have been very unsuccessful in this respect. It is said that the pigments must be laid on thick and pasty. The ochres are preferable to vermilion for the local colors; and ultramarine ashes, or Veronese green, mixed with asphaltum, may be used for the shadows.

CARNEADES, a Greek philosopher, b. at Cyrene, in Africa, about 213 B. C. He studied logic at Athens under Diogenes, but became a partisan of the academy, and an enemy of the stoics, whose stern and almost dogmatic ethics did not suit his skeptical predilections. Conspicuous for his eloquence and skill in "tongue-fence," he was destitute of any convictions moral or intellectual, and had even arrived at the conclusion that no criterion of truth existed in man. In 155 B. C., along with Diogenes and Critolaus, he was sent as ambassador to Rome, where he delivered two orations on justice, in the first of which he eulogized the virtue, and in the second proved that it did not exist. Honest Cato, who had no relish for intellectual jugglery, and thought it a

knavish excellence at the best, moved the senate to send the philosopher home to his school, lest the Roman youth should be demoralized. C. died at Athens, 129 B.C. He was remarkable for his industry, negligent habits, and impatient temper.

CARNEIA, a festival in honor of Apollo among the ancient Spartans, taking its name from the Greek name of the month (August) in which it was celebrated. The celebration lasted nine days.

CARNE LIAN, or **CORNELIAN**, in mineralogy, the name given to some of the finer varieties of chalcedony (q. v.). The color is blood red or flesh-color, reddish brown, reddish white or yellow, more rarely milk white. The fracture is in the common C. perfectly conchoidal, but there is a variety of a somewhat fibrous structure with a splintery fracture. C. is found in pieces of irregular form and in lamellar concretions. The finest specimens are brought from the east, but it is found in Scotland and in many parts of Europe and America. It is much used by the lapidary, and in the east it is prized beyond every other stone, the gems excepted. Bright red C. of unmixed color is most highly valued, but a mass of considerable size is seldom found with the color equal throughout.

CARNIFEX FERRY, in Nicholas co., Va., near which, Sept. 10, 1861, there was an engagement between the union forces under gen. Rosecrans, and the confederates under gen. Floyd, the latter being defeated with the loss of camp equipage and war material. Floyd escaped by retreating over Gauly river, and destroying the bridge.

CARNIOLA (Ger. *Krain*), a crown-land of the Austrian empire, formerly part of the kingdom of Illyria, has an area of 3,850 sq. m., with a pop. (1869) of 466,334, being a decrease of nearly 40,000 as compared with the census return of 1854. A continuation of the Carinthian Alps passes through it in the north, and the Julian Alps in the south. The scenery of the country abounds in interesting and singular features, amongst which one of the most notable is the rock-bridge of St. Kanzian, 130 ft. high, and 160 ft. broad, with a perfect arch 62 ft. high, and 154 ft. long. The Save is the principal river; the Kulpa is its chief tributary. The singular lake of Zirknitz (q. v.) is in Carniola. The climate of C. is in general mild, except in the high mountainous parts. The country does not produce corn or cattle enough to supply the wants of its inhabitants. Millet, pulse, and wild fruits are principal articles of food with many of the lower classes. Maize is cultivated in some places, and some districts yield excellent wines and much fine fruit. Flax is largely cultivated; silk is produced in some places, and much honey and beeswax. The principal products of the mineral kingdom are iron, quicksilver, and marble; the quicksilver mines of Idria are the most important in Europe. Linen-weaving, and the manufacture of a coarse lace, are common among the peasantry. Layback is the capital.

C. received its present name after the settlement here of the Slavonic Wends. Charlemagne conquered it and gave it to the dukes of Friuli. From 973 it had markgraves of its own, sometimes called dukes, who possessed, however, only a part of the country. On the extinction of the male line of the markgraves, part of the territory passed to the dukes of Austria, in the 13th c., and the remainder was acquired by them in the 14th. The vast majority of the inhabitants are Slavs of the Slovenian branch.

CARNIVAL (from the Lat. *caro*, flesh, and *vale*, farewell—"farewell to flesh"), a festival in Italy, which originally began on the feast of the Epiphany, and continued to Ash-Wednesday, when the fast of Lent made an end of the preceding feasting, masquerading, and buffoonery. In later times, the C. was limited to the time of from three to eight days before Ash-Wednesday. Without doubt, the forms and customs still preserved in the celebration of the C. originated in the heathen festivals of spring-time; and they still remind us, partly of the Lupercalia and Bacchanalia of southern Europe, and partly of the Yule-feast among northern peoples. Banquets of rich meats and drinking-bouts were the chief attractions of the C. during the middle ages. Shrove-tide (q. v.), or Shrove-Tuesday, called also Fasten-even or Pancake-Tuesday, was a relic of the English C., and formerly a season of extraordinary sport and feasting. The rich commenced the festive time at the feast of Epiphany, or on "Three Kings' Day;" but the middle classes restricted their days of revelry to the week immediately preceding Lent; while the poor indulged in only a few days of mad mirth. According to a papal order, the clergy were allowed to commence their bacchanalia two days before the laity. The several chief days of C. had distinct names, such as "fat" or "greasy Sunday," "blue Monday" (or "fool's consecration"), etc. The Tuesday before the beginning of Lent was especially styled C.—the *Fastnacht* of the German people. The customs of making presents of green nosegays or garlands, and planting fir-trees before houses during C., remind us of the *thyrsus* of the ancient Bacchanals, and equally of the decorations of the Yule-tide or Christmas season among northern people. The ancient custom, also, of scourging women accidentally met with during the Lupercalia (q. v.), was preserved in the mediæval observance of the carnival. In most countries, especially where Protestantism prevails, the observance of the C. is now limited to dancing and masked balls on certain days; but in Italy, as Goethe says in his charming sketch of the Roman C., it is still a general popular festive time. In former times, Venice was distinguished by the pomp and splendor of the C.; but afterwards, Rome became most prominent. The years of

angry politics, 1848 and 1849, had a discouraging effect on the attempts which had been made to restore the gayety of C. in the Roman Catholic towns of Germany.

CARNIVORA (Lat. flesh-devouring), in Cuvier's system of zoology, a principal division of the order of *mammalia* called *carnassiers* or *carnaria* (q.v.), and including the most *carnivorous* or sanguinary of the order—the quadrupeds which chiefly prey on the vertebrate and warm-blooded animals. The C. have six incisors or cutting teeth in each jaw; their tusks or canine teeth are very strong, and even their molar teeth or grinders are usually furnished with cutting edges. But even the C. are carnivorous in very different degrees, and some of them have teeth and other organs adapted to a partial use of some kinds of vegetable food. Cuvier subdivided the C. into three tribes, *plantigrada* (q.v.), *digitigrada* (q.v.), and *amphibia* (seals, q.v., etc.). The digestive apparatus of carnivorous animals is more simple than that of the herbivorous; the stomach is single, and in general of comparatively small size, and the intestines are comparatively short and unvoluminous. Their muscular energy is very great, their respiration and circulation very active, and their demand for food very constant. Some of them are adapted for seizing their prey by leaping, others by running, a few by swimming and diving. Most of them can only seize it with their mouths; but some have also, for this purpose, sharp retractile claws.

CARNOCHAN, JOHN MURRAY, b. Georgia, 1817; educated in Edinburgh; studied medicine and surgery with Dr. Mott of New York, beginning practice in 1847. Dr. Carnochan rapidly rose to the first rank among practicing physicians and surgeons, and acquired great celebrity for the boldness and success of his operations, such as the removal of the lower jaw; the cure of elephantiasis by ligature of the femoral artery; excision of the ulna and still preserving the arm with most of its functions; amputating the hip joint; and particularly for removing, in a case of neuralgia, the entire trunk of the second branch of the fifth pair of nerves. He has been professor of the principles and operations of surgery in the New York medical college, and health officer of the port. He has published a number of important papers on medicine and surgery.

CARNOT, LAZARE NICOLAS MARGUERITE, b. May 13, 1753, at Nolay, in the department of *Côte d'Or*, Burgundy, gained distinction at an early period by his talents in mathematical science and military engineering. In 1791, he became a member of the legislative assembly, and, in the convention, voted for the death of Louis XVI. After taking the command of the army of the north, and gaining the victory of Wattignies, he was elected into the committee of public safety, in which he was intrusted with the chief direction of military affairs, and greatly contributed to the successes of the French army. Though he endeavored to restrict the power of Robespierre, he was accused, with others, after the reign of terror; but the charge was dismissed. In 1797, having opposed the extreme measures of Barras, his colleague in the directory, C. as a suspected royalist, was sentenced to deportation. He escaped into Germany, where he wrote his defense, which conduced to the overthrow of his colleagues in 1799. The 18th Brumaire brought him back to Paris, where he was made minister of war, 1800; and by his energy, skill, and fertility of administrative resource, helped to achieve the brilliant results of the Italian and Rhenish campaigns. He retired, however, from his office when he understood the ambitious plans of the emperor, but hastened, when he witnessed the reverses of the empire, to offer his services to Napoleon, who gave him the command of Antwerp in 1814, which he heroically defended. During the hundred days, he held office as minister of the interior; and after the second restoration, retired first to Warsaw, and next to Magdeburg, where he died, Aug. 2, 1823. Among C.'s numerous writings on mathematics and military tactics, etc., we may notice his *Essai sur les Machines en Général* (1786); *Réflexions sur la Métaphysique du Calcul Infinitésimal* (1797); and the *Géométrie de Position* (1813).—His son, LAZARE HIPPOLYTE CARNOT, b. at St. Omer, April 6, 1801, one of the leaders of the French democracy, was in early life a disciple of St. Simon, but, like others, left that school on account of the lax morals advocated by *Enfantin*—protesting against "the organization of adultery"—and devoted himself to the inculcation of a more orthodox and virtuous socialism in various periodicals. In 1847, he declared himself a republican in his brochure, *Les Radicaux et la Charte*; and, after the Feb. revolution, was appointed minister of public instruction, but not finding himself in sufficient rapport with his colleagues, he resigned. In 1863, he entered the corps législatif, and the national assembly in 1871. He has written an *Exposé* of St. Simonianism and *Mémoires* of Henri Gregoire and of Barrère. *Carnot 1793-91 etc*

CARNUNTUM, an ancient t. in upper Pannonia, on the Danube, founded by the Celts, but at an early period a Roman post. Marcus Aurelius resided here for three years during his wars with the Marcomanni. In the 4th c. C. was destroyed by German invaders; it was afterward rebuilt, and finally destroyed in the Magyar wars of the middle ages.

CAROB, ALGAROB, or LOCUST-TREE, *Ceratonia siliqua*, a tree of the natural order *leguminosæ*, suborder *casalpinieæ*, a native of the countries around the Mediterranean sea, in size and manner of growth much resembling the apple-tree, but with abruptly pinnate dark evergreen leaves, which have about two or three pair of large oval leaflets. The flowers are destitute of corolla; the fruit is a brown leathery pod, 4 to 8 in. long, a

little curved, and containing a fleshy and at last spongy and mealy pulp, of an agreeable sweet taste, in which lie a number of shining brown seeds, somewhat resembling small flattened beans. The seeds are bitter and of no use, but the sweet pulp renders the pods an important article of food to the poorer classes of the countries in which the tree grows. They are very much used by the Moors and Arabs. They are also valuable as food for horses, for which they are much employed in the s. of Europe, and have of late years begun to be extensively imported into Britain, under the name of *locust beans*, which name and that of *St. John's bread* they have received in consequence of an ancient opinion or tradition, that they are the "locusts" which formed the food of John the Baptist in the wilderness. It seems probable that they are the "husks" (*keration*) of the parable of the Prodigal son.—The Arabs make of the pulp of the C. a preserve like tamarinds, which is gently aperient.—The C. tree is too tender for the climate of Britain. Dr. Royle thinks its introduction into the n. of India would be an important addition to the resources of that country, and a valuable safeguard against famine. The produce is extremely abundant, some trees yielding as much as 800 or 900 lbs. of pods. The wood is hard, and much valued, and the bark and leaves are used for tanning.—The locust tree (q.v.) of America is quite distinct from this.

CAROL, a Christmas hymn that may be traced to the primitive church. It was customary to call upon such as could sing to praise God in a hymn, either out of the Scriptures or of their own invention; and it was also customary for bishops on Christmas day to make sport with their clergy, and to sing; which custom was in imitation of the *Gloria in Excelsis* of the angels. See CHRISTMAS CAROL, *ante*.

CAROLAN, or **O'CAROLAN**, **TURLOGH**, 1670–1738; one of the most noted of native Irish bards. When but 18 years old he became utterly blind, and thenceforward followed the profession of wandering minstrel, in which character he won great fame. The number of his compositions, to the greater part of which he fitted words, was about 200.

CAROLINA, **NORTH**, an Atlantic state of the American union, having South Carolina and Georgia on the s., Tennessee on the w., and Virginia on the n.; in lat. 33° 53' to 36° 33' n., and long. 75° 25' to 84° 30' w., being about 450 m. long, and about 180 broad, with an area of about 50,704 sq. miles. The census of 1870 gave 678,470 whites, 391,650 negroes, and 1241 civilized Indians—1,071,361 in all. North Carolina was restored to a place in the union in 1868, after a new constitution had been adopted by the state government, and approved by congress. It sends 8 members to the lower house of congress, returning also, in common with every other state, 2 senators to the upper. The public debt of North C., in 1874, was 38,921,848 dollars, and its valuation of property was 143,723,813 dollars. Annual expenses of government, 1,400,000 dollars. Of railways, there were, in the year 1875, in actual operation, 1346 miles. The principal rivers are the Chowan, Roanoke, Tar, Neuse, and Cape Fear. Of these, the first four divide themselves equally between Albemarle and Pamlico sounds—inlets which, besides being shallow and difficult in themselves, are almost entirely cut off from the sea by a nearly continuous series of low islands—and the last of the five, though it does fall into the open ocean, is yet not materially superior to the others, never showing more than 14 ft. of water on the bar. With this insular breast-work, the mainland is geologically connected to a depth of about 60 m., being everywhere alluvial, and in many places swampy. To the w. of this belt, the country, after undulating into hills, is traversed by the ridges of the Alleghanies, which, culminating in Mt. Mitchell to an elevation of 6470 ft., bear aloft between them a table-land of fully one third of that altitude. Through the maritime tract, and even beyond it, the rivers are generally practicable for steam-boats. Among the productions, the most characteristic is the pitch-pine of the lower level; so that, in the matter of naval stores, this state surpasses all the rest of the union taken together. In mineral resources, also, North C. takes a lead, more especially in gold, copper, iron, and coal. The value of the manufactured products of North C. in 1870 was 19,021,327 dollars; the value of the cotton brought to its shipping ports in 1876 was £1,122,959. The chief towns are Raleigh, the capital, near the Neuse; Wilmington and Fayetteville on the Cape Fear (the former within reach of tide-water, and the latter at the head of the navigation); New Berne, and Charlotte. North C. was first permanently colonized from Virginia in 1653. Down to 1693, it continued to form one province along with South Carolina, the two being frequently still called the Carolinas. In a local declaration of independence of May, 1775, 14 months before the 4th of July, 1776, North C. first demanded a separation from Great Britain.

CAROLINA, **SOUTH**, an Atlantic state of the American union, of a triangular form, with North Carolina and Georgia on its inland sides. It extends between 32° and 35° 10' n. lat., and 78° 25' and 83° 20' w. long., having an area of 34,000 sq. miles. In 1870, the total pop. of South C. was 705,606; of whom 289,667 were whites, 415,814 negroes, and 124 civilized Indians; in 1875, the population was 923,447. The total population in 1800 was 345,591. South C. formerly differed from all the other states in appointing its presidential electors, and its executive, not by the popular suffrage, but by the joint vote of the two branches of the local legislature, being thus pre-eminent in the aristocracy of its constitution. In 1868, however, in the reconstruction of the southern states, South C. was restored to a place in the union, with a new constitution adopted by a majority of voters, and approved by congress. It is represented in congress by 5 members in the

lower house, besides the 2 senators which each state possesses alike. Physically a continuation of its northern neighbor, South C., behind a breast-work of islets, presents a low belt, generally swampy, of about 100 m. in depth, rising backward through an undulating region to a height of 4000 ft. in the Alleghanies. With such a range of soil and climate, the productions are very various—cotton, rice, tobacco, indigo, sugar, silk, maize, and wheat. In the first two articles, South C. stands pre-eminent, yielding nearly as much rice as all the other states together, and more cotton, in proportion to area, than any other state. Its mineral treasures are chiefly granite, sienite, marble, and gneiss, from the primitive formations of the state, for building; along with gold, lead, and iron: it is probable that no coal will be found. The public indebtedness of South C. in 1874 was 17,017,651 dollars, and the assessed value of property in 1873 was 176,956,502 dollars. Since the reconstruction of the state, public institutions have made great progress. With not much more than 50 m. of canal, South C. has 1400 of railway. The chief rivers, each the receptacle of considerable affluents, are the Great Pedee, Santee, and Edisto, and also the Savannah, as common to Georgia and South C., the whole being said to furnish an inland navigation of 2400 miles. The cotton product of South C. in 1866 amounted to 112,273 bales; in 1868, to 240,225; and in 1873-74, to 438,194 bales. The value of the cotton brought to the shipping ports of South C. in 1876 was £4,320,568. The chief towns are Charleston. Columbia (the capital), Georgetown, and Greenville.

CAROLINA PINK. See SPIGELIA.

CAROLINA, MARIA, 1752-1814; daughter of Francis I. and Maria Theresa of Austria, and queen of Naples by her marriage with Ferdinand IV. in 1768. She had great influence with the king, leading him in 1798 to declare war against France, the consequence of which was the marching of the French upon Naples and the flight of Ferdinand and Carolina to British protection. After returning to Naples she conspired against Napoleon, and, with her husband, was again expelled. She died in Vienna before any further restoration to the throne.

CAROLINE, a co. in e. Maryland, on the Delaware border, intersected by the Maryland and Delaware and the Dorchester and Delaware railroads; 300 sq.m.; pop. '70, 12,101—3,758 colored. It has a level sandy surface, producing corn, oats, potatoes, etc. Co. seat, Denton.

CAROLINE, a co. in e. Virginia, on the Rappahanock river, and the Richmond, Frederick and Potomac railroad; 480 sq.m.; pop. '70, 15,128—8,038 colored. Productions, wheat, corn, oats, and tobacco. Co. seat, Bowling Green.

CAROLINE, AMELIA ELIZABETH, wife of George IV. of Great Britain, was the second daughter of Charles William Ferdinand, duke of Brunswick Wolfenbüttel, and of the princess Augusta of Britain. She was born on the 17th May, 1768, and spent her youth under great restraint at her father's court. In 1795, she was married to the prince of Wales. The marriage was disagreeable to him, and although she bore him a daughter, the princess Charlotte, he separated from her immediately on her recovery from childbed; and she lived by herself in a country residence at Blackheath, the object of much sympathy, the people regarding her as the victim of her husband's love of vice. Reports to her discredit led the king, in 1808, to cause investigation to be made into her conduct, which was found to be imprudent, but not criminal. In 1814, she obtained leave to visit Brunswick, and afterwards to make a further tour. She visited the coasts of the Mediterranean, and lived for some time on the lake of Como, an Italian, by name Bergami, being all the while in her company. When her husband ascended the throne in 1820, she was offered an annuity of £50,000 sterling to renounce the title of queen, and live abroad; but she refused, and made a triumphal entry into London, whereupon the government instituted proceedings against her for adultery. Much that was very offensive was proved as to her conduct; but the manner in which she had been used by her husband, and the splendid defense of Brougham, caused such a general feeling in her favor, that the ministry were obliged to give up the divorce bill, after it had passed the house of lords. She now fully assumed the rank of royalty, but was refused coronation, and turned away from the door of Westminster abbey on the day of the coronation of her husband. She died on 7th Aug., 1821.

CAROLINE BOOKS, four works drawn up at the request of Charlemagne against the decrees of the second council of Nice on the adoration of images, and contained in the *Capitulare Prolirium* of Charlemagne,

CAROLINE ISLANDS, or **NEW PHILIPPINES,** a widely scattered archipelago in the Pacific, n. of New Guinea and e. of the Philippines, between 3° and 11° n., and 135° and 137° e. The westernmost are known as the Pelew (q.v. *ante*) or Palau islands, and cover 346 sq.m. of land, being nearly encircled by a coral reef. The surface is well wooded, and the soil fertile, producing bread-fruit, cocoa-nuts, sugar-cane, oranges, bananas, etc., in abundance. Cattle, sheep, and hogs have been domesticated; there is a great variety of birds, and the lagoons abound with fish. The inhabitants are dark-colored, and evidently of Papuan and Malay blood. The islands, and most of the villages, form independent but co-operative republics. One of the most remarkable institutions is the "clöbbergall," a kind of union for mutual aid and defense. The women, too, have clöbbergalls of their own, and exercise much political influence. Up to the

close of the last century the people used stone instruments and weapons. Their currency consists of pieces, or prieds, of ancient glass and enamel, to which they ascribe a divine origin. The population, supposed to be about 10,000, seems to be decreasing. The central islands, or Carolines proper, consist of 48 groups, and comprise between 400 and 500 islands, of about 360 sq.m. in all. The Matelotas group lies n.e. of the Pelews, and consists of three islands, thinly inhabited. Yap, or Guap, further n.e., is 10 m. long, and has a good harbor. The natives of Yap are more advanced in civilization than their neighbors; they cultivate the betel-nut with great care, build good boats, lay out regular villages, pave the streets, and build stone piers and wharves. A Spanish mission was established in 1856. The Ulea, Swede, and Lutke islands are unimportant; but the Hugoleu (or Rug) group, discovered in 1824, consists of five large and about 40 small islands, with 35,000 inhabitants of two races, red and black, who are often at war with each other. The Mortlack, or Young William's, group consists of three islands, with a population of about 3,400, of Samoan origin, who are the only idol-worshippers in all the archipelago. To the n.e. lies Ruvca island, inhabited by immigrants of mixed foreign blood. The Seniavine group, comprising three islands, has a small colony of whites, and one of the islands has been the seat of an American mission since 1851. This island, called Ascencion by the French, is a rendezvous for whaling vessels. In the center is a remarkable pile of ruins which seem to have belonged to a fortification. Strong's island, in the center of the Carolines proper, is a volcanic upheaval, discovered by Crozier in 1804, and is now the seat of an American mission. The eastern Carolines, otherwise the Mulgrave archipelago, comprise the Radak or Marshall group, and have a population estimated at 100,000. See POLYNESIA, *ante*.

CAROLINE MATILDA, 1751-75; sister of George III. of England; queen of Denmark, having married Christian VII. in 1768, by whom she became the mother of Frederick VI. Through the jealousy of the queen dowager and the king's step-mother, she was accused of infidelity, and the king, who had become weak-minded, if not idiotic, caused her and Struensee, her physician, to be arrested. The interference of the British minister saved the queen from death, but she was sent into Hanover, where she died of grief in the castle of Celle. See STRUENSEE, *ante*.

CARON, RENÉ ÉDOUARD, b. Canada, 1800; a lawyer and statesman; educated in the Quebec seminary, and admitted to the bar in 1826. He was mayor of Quebec from 1827 to 1837, and again from 1848 to 1853, after which he abandoned political life and was appointed judge of the queen's bench. In 1857, he was commissioner for codifying the laws of Lower Canada, and in 1873 he was appointed lieutenant-governor of Quebec.

CARORA, a t. of Venezuela, South America, in the province of Caro, 210 m. w.s.w. of Caracas, and 60 m. e. of lake Maracaybo, on the Tocuyo. The town is well built, has a handsome parish church, convent, hermitage, etc. There are manufactures of leather, ropes, and fine hammocks from the fiber of the *agave foetida*. A trade is carried on in agricultural produce, and in the aromatic balsams, resins, gums, and wild cochineal for which the district is famous. The pop., which was formerly much larger, is now about 6,000.

CAROTID ARTERY. The great artery which on each side distributes blood to the different parts of the head, appears to have derived its name either from Gr. *kara*, the head, or, more probably, from Gr. *karos*, sleep, there being an old idea, which the researches of Dr. Alexander Fleming have shown to be correct, that there was some connection between deep sleep and compression of these vessels.

Each C. A. consists of the primitive or common carotid, which, at the upper margin of the larynx or organ of voice, separates into two great divisions, of nearly equal size—the external and the internal carotid. The external carotid supplies the larynx, tongue, face, and scalp with blood; its principal branches being the superior thyroid, the lingual, the facial, the occipital, the posterior aural, the internal maxillary, and the temporal. The last-named artery is occasionally opened by the surgeon in preference to a vein, as, for example, in certain cases of cerebral apoplexy. The internal carotid enters the cavity of the cranium through a somewhat tortuous canal in the temporal bone, and after perforating the dura mater, or fibrous membrane of the brain, separates into the anterior and middle cerebral arteries, which are the principal arteries of the brain; while in its course through the dura mater, it gives off the ophthalmic artery, which subdivides into several small branches that supply the eye and surrounding parts. See CIRCULATION.

Surgery.—Wounds of the carotid trunks are generally from stabs. Suicides have a vague desire to cut them, but rarely cut sufficiently deep by the side of the windpipe. Of course, should either vessel be wounded, death results almost immediately. Punctured wounds, however, may not be immediately fatal; they may heal, or a false aneurism (q.v.) may result. Such an occurrence happened about twenty years ago in Scotland. A young man was stabbed close to the root of the neck; a pulsating tumor formed, which rapidly increased, and would undoubtedly have burst before long, had not prof. Syme of Edinburgh cut into it, and, by an operation requiring extraordinary courage and dexterity, tied the common C. A. above and below the part stabbed; thereby saving

not only the life of the patient, but that of the man who had inflicted the wound, and who was then in prison awaiting his trial.

Sir Astley Cooper was the first to tie the common carotid for spontaneous aneurism, in Nov., 1805; and since then, the operation has been successfully performed in a number of cases. Owing to the numerous interchange of branches between vessels of both sides of the head, cutting off the supply of blood through one carotid is seldom followed by affections of the brain. Such have, however, occurred in a few instances; but Dr. Mussey of America tied both carotids within twelve days of each other without any such result.

The common carotid in the horse is the termination of the right arteria innominata. It is a large vessel, about an inch long, which emerges from the chest below the wind-pipe, and divides into the *right* and *left* carotids. These bend upward, having the wind-pipe between them, gradually inclining inwards at the upper part, where each divides into external and internal carotid, and a large anastomosing branch arising from between these two.

CAROUGE, a t. of Switzerland, canton of Geneva, about 2 m. from the city of that name, with which it is connected by a bridge across the Arve. It has cotton-spinning, leather, and pottery manufactures; and in 1780 the king of Sardinia, as ruler of Savoy, tried to set it up as the industrial rival of Geneva, but failed. Pop. '70, 5,871.

CAROUGE, a t. of Switzerland, in the canton and about 1 m. s. of Geneva, on the left bank of the Arve. It is beautifully situated, regularly built, and surrounded by villas, orchards, and meadows. It has a handsome Roman Catholic and a Protestant church. There are manufactures of thread, clay pipes, leather, watches, and pottery. There is a bridge across the Arve connecting the town with Geneva. Pop. '70, 5,871. [From Suppt.]

CARP, *Cyprinus carpio*, a fish of the family *Cyprinidæ* (q.v.), of which, indeed, it may be regarded as the type, a native of the central countries of Europe, and corresponding latitudes in Asia, but on account of its value as an article of food, long naturalized in many countries in which it is not indigenous. No fish, indeed, except its congener the goldfish, has been so much transported by man from one place to another; and this has been the more easily and successfully accomplished, that the C. can subsist longer than most fishes out of the water, if only kept moist. The C. is said not to be originally a native of England, but the statements sometimes made as to the time of its introduction are untrustworthy; it certainly existed in England before the 16th century. It is mentioned in the famous Boke of St. Albans, in 1496, by Dame Juliana Barnes, as a "dayntous fyssh, but scarce." The C. spawns in May, and is out of condition until July. It does not succeed so well in Scotland, of which country it is certainly not a native, as in the s. of England; and in northern countries generally, it neither increases so rapidly in size, nor exhibits so great fecundity, as in more congenial climates. Its fecundity, in favorable circumstances, is prodigious; more than 700,000 eggs have been found in the ovaries of a single C. of moderate size. The C. is rather an inhabitant of lakes and ponds than of rivers, in which, if it is found, it shows a preference for the stillest parts. It feeds chiefly on aquatic plants, and may be fattened on lettuces and similar soft vegetables, for which its teeth are remarkably adapted, being few, mostly large, flat, and situated on the pharynx very far back in the mouth; worms, mollusks, and insects, however, form part of its food. It deposits its spawn on weeds. It is said to live to a great age, even 150 or 200 years; its scales, "like the productions of the cuticle in some other animals, becoming gray and white with age." It is known to attain the weight of 3 lbs. when six years old. A C. of 18 or 19 lbs. weight is deemed of extraordinary size in England, but one of 70 lbs. weight, and nearly 9 ft. long, was taken near Frankfort-on-the-Oder, and 30 or 40 lbs. is not an unusual size in some of the German lakes. In Austria and Prussia, many lakes and ponds are let at a high rent for the C. which they contain.—Of the other species of the genus *cyprinus*, as now restricted, which are found in Britain, none belong to the section having barbules at the angles of the mouth. See CRUCIAN, GIBEL, and GOLDFISH.

To the angler, the C. is not a very valuable fish, as he is by no means a free biter. When hooked, however, he runs strongly, and fights with considerable determination and cunning. In still water, the best means of fishing for C. is with a very light quill-float. A small piece of dead rush will answer the purpose equally well, or better. The float should be fixed on the line so that the bait may be *upon* the bottom, and if that be clear of weeds (the angler must take care that it is so), the C. will easily see and pick up the bait. It is advisable, however, in fishing for C., to use two rods, and the float to one of these should be so placed that the bait may be just *off* the bottom. The former tackle should be baited with well-scoured red worms, gentles, or grubs of some sort; the latter with a green pea, boiled wheat, or paste. The hooks should be of No. 8 size, and tolerably stout in the wire, and the gut perfectly round and good, and as fine as is consistent with the size of the fish angled for. In using green peas or wheat, boil until the skin cracks. Very small potatoes of the size of a bean have been known to attract good carp. The best paste is bread worked up with a little brandy or gin. Gentles, wasp grubs, flies, and other insects, worms, or caterpillars, may all, at times, take carp. When a C. bites, he nibbles at the bait for

some seconds before he takes it, and often takes off the tail of the worm, or strips the hook completely. But it is quite useless to strike until the float disappears entirely.

CARPEA, a dance in ancient Thessaly; a pantomime represented by two men, one a robber and the other a plowman, in which there was a contest for the possession of the plowman's oxen, which are finally captured by the robber. All the action was rhythmical, and performed much like a pantomime of the present day.

CARPATHIAN MOUNTAINS, the mountains which inclose Hungary and Transylvania on the n., e., and s. in a great semicircle (whose concavity is towards the s.w.), extending over a space of 800 m. from Presburg on the Danube to Orsova on the same river, between lat. 44° 30' to 49° 40' n., long. 17° to 26° east. The C. M. form part of the great mountain system of central Europe, separated from the mountains of Silesia and Moravia by the valley of the March, and from the Alps and Mt. Hæmus by the valley of the Danube. Almost the whole of the C. M. lie within the Austrian dominions. They form two great masses, one in Hungary to the n.w., and one in Transylvania to the s.e., with ranges of lower and wooded mountains between. The highest group of the Hungarian Carpathians is that of *Tatra* or the *Carpat*, in the very n. of Hungary, a majestic mass of granite mountains, exhibiting much grandeur in its naked precipices, and in some of its peaks rising to the height of more than 8,900 ft., the Lomnitz peak being 8,133 ft. high. On the northern declivity of the Eisthal peak exists the only glacier in the Carpathians. The Tatra group is penetrated by no valleys, but only by wild ravines, and is separated from the rest of the range by deep depressions. There is a great difference of climate between its southern and northern sides. These higher mountains yield few minerals, but the lower Carpathians of Hungary, which stretch around them in groups and ranges, abound in minerals of various kinds. The mines of Schemnitz (q.v.) are of great celebrity. Many of the Hungarian mountains are of limestone. The mountains of Transylvania are mostly of primitive rocks. On the eastern and southern borders, they reach the height of 9,000 ft. and upwards. Mt. Butschetje, the culminating peak, has an elevation of 9,528 ft. above the sea. The C. M. are generally clothed with wood to a height of more than 4,000 ft.—in some parts, forests are found at 5,500 ft.—and with steep precipices, narrow ravines, extinct craters, and cones of volcanic origin, they exhibit scenes of grandeur rarely exceeded. The lower parts of the mountains are beautifully clothed with vineyards, walnut groves, etc., above which ascend forests of cherry, beech, and pine. The ranges which connect the high mountains of Hungary with those of Transylvania are in great part composed of sandstone, have an unfruitful soil, and comparatively little population or cultivation.

CARPATHOS. See **SCARPANTO**, *ante*.

CARPEAUX, JEAN BAPTISTE, b. 1827; a French sculptor, whose more conspicuous works are "The Fisher Boy," "Ugolino and his Children," "Neapolitan Fisherman," "Girl with a Shell," "France enlightening the World, and protecting Agriculture and Science," and the noted group, "La Danse," on the façade of the Paris opera-house.

CARPEL (Gr. *karpos*, fruit), in botany, a modified leaf forming the whole or part of the pistil of a flower. The number of ovaries and stigmata in the pistil depends on the number of carpels of which it is composed, but sometimes several are so intimately united that they appear as one. It is the upper surface of the leaf which forms the inner surface of the carpel. At its margins, the ovules are developed, like the buds formed on true leaves of some kinds of plants. The fruit, as well as the pistil, may therefore be said to be composed of one or more carpels.

CARPENTARIA, GULF OF, a broad and deep indentation of the n. coast of Australia, stretching from 11° to 17° 30' s. lat., and from 136° to 142° e. longitude. It is said to have been named from Carpenter, a Dutchman, who discovered and partly explored it in 1627. The gulf of C. contains many islands. The shores of the mainland are generally low; and, in the rainy season, the floods are such as materially to freshen the sea.

CARPENTER, FRANCIS B., b. 1830; a painter whose portrait of Lincoln, and "Emancipation Proclamation," have gained some celebrity. He published *Six Months in the White House*.

CARPENTER, LANT, LL. D., 1780–1840; an English Unitarian minister, successor of Dr. Kenrick at Exeter; afterwards in charge of a church in Bristol. He was much interested in the religious instruction of children, and established several Sunday-schools. Among his works are *An Introduction to the Geography of the New Testament*; *Unitarianism the Doctrine of the Gospel*; *Examination of the Charges against Unitarianism*; and *Harmony of the Gospels*.

CARPENTER, MARY, daughter of the Rev. Dr. Lant Carpenter, of Bristol, and sister of Dr. William Carpenter (b. 1807, d. 1877). She took an active part in the movement for the reformation of neglected children, and besides advocating their cause in her writings, she founded several reformatories for girls, one of which, the Redhedge reformatory, she superintended. In the prosecution of her philanthropic labors she visited India three times, and, in 1871, instituted the national Indian association, whose journal

she edited. Besides her reformatory writings, she published *Our Convicts* (1864), a book which drew public attention to the treatment of young criminals; *The Last Days of the Rajah Rammohun Roy*; and *Six Months in India*.

CARPENTER, MATTHEW II., b. Vt., 1824; studied law with Rufus Choate; and in 1848 settled in Wisconsin, from which state he was returned as U. S. senator in 1868, and was re-elected in 1879. He is an able lawyer and a brilliant debater.

CARPENTER, WILLIAM BENJAMIN, M.D., LL.D., F.R.S., F.L.S., F.G.S., one of the most distinguished physiologists and writers on physiology of the present day. Soon after his graduation in Edinburgh in 1839, he published his *Principles of General and Comparative Physiology*, which was one of the earliest works giving a general view of the science of life. As the treatise grew in size in successive editions, it was divided into two—*The Principles of Comparative Physiology*, and *The Principles of General Physiology*. These works, together with *The Principles of Human Physiology*, which originally appeared in 1846, and reached a fourth edition in 1853, and *The Principles of Mental Physiology* (Lond. 1874), form a perfect cyclopædia of biological science. C. has likewise published *A Manual of Physiology*; *The Microscope, its Revelations and its Uses*; a prize essay upon *The Use and Abuse of Alcoholic Liquors*; and numerous memoirs on various departments of physiology, microscopical anatomy, and natural history, in the *Philosophical Transactions*, etc. His most important original researches are *On the Structure of Shells*; *On the Development of Purpura Lapillus*; and *On the Structure, Functions, and General History of the Foraminifera*. For several years he edited *The British and Foreign Medico-Chirurgical Review*, and he was one of the editors of *The Natural History Review*. In 1848, he was appointed professor of medical jurisprudence at university college, and soon afterwards examiner in physiology and comparative anatomy in the university of London; but he resigned these offices on his appointment, in 1856, as registrar to that university. In 1861, the royal medal was awarded to him by the royal society; and in 1873, he was elected a corresponding member of the institute of France. He took a chief part in the government expeditions sent out in 1868–69–70 for deep-sea exploration in the n. Atlantic; and since then he has contributed largely to the discussion of the vexed question of ocean circulation in the journal of the royal geographical society and other periodicals. In the art. ATLANTIC in the *Ency. Brit.*, 9th ed., his views will be found summarized. He advocates the doctrine of a vertical circulation sustained by opposition of temperature only, independent of and distinct from the horizontal currents produced by winds; see GULF STREAM. This doctrine was first advanced by prof. Lenz of St. Petersburg in 1845; but Dr. C. was ignorant of this, when the deep-sea observations begun in 1868 led him to an identical theory. Dr. C. has written largely on another controverted subject—that of spiritualism, which he maintains to be a delusion. He entered this field as early as 1853, in an article on animal magnetism in the *Quarterly Review*; a late contribution to the controversy is *Mesmerism, Spiritualism, etc., historically and scientifically considered* (Longmans & Co., 1877).

CARPENTER BEE, a name given to those bees that excavate their nests in wood. One of these, *Zylocopa violacea*, has been already noticed, and its nest briefly described, in the article Bee (q.v.).

CARPENTER. SHIP'S, a naval officer whose duty is to keep a ship of war in repair, specially during action in case of damage that may endanger sinking.

CARPENTRAS, a t. of France, in the department of Vaucluse, is situated on the left bank of the Auzon, about 15 m. n.e. of Avignon. This town was known to the Romans as *Carpentoracte*, and among other remains, a triumphal arch attests their former presence here. C. has manufactures of cottons, woollens, and leather; brandy distilleries, dye-works, etc. It is the entrepôt for the products of the district. Pop. '72, 7,857.

CARPENTRY is the art of framing timber for architectural and other purposes. Technically, the term is restricted to the framing of heavy work, such as the roofs, floorings, partitions, and all the wood-work concerned in maintaining the stability of an edifice, while the minor and ornamental fittings are called joinery; but popularly the workman who does either kind of work is called a carpenter.

The present article will be confined to a popular description of the most useful methods of framing timber and smaller wood-work.

The preliminary preparation of timber is the work of the sawyer, who, by the saw-mill or pit-saw, divides the trunks of trees into planks, etc.; these are further divided by the carpenter, who uses hand-saws of various kinds, according to the work. For dividing wood into separate pieces in the direction of the fiber, the *ripping-saw* is used; for cross cutting, or sawing thin pieces in the direction of their length, the common *hand-saw* or the finer toothed *panel-saw*; for making an incision of a given depth, and for cutting small pieces across the fiber, the *tenon-saw*, the *sash-saw*, or *dovetail-saw* is used. These are thin saws, stiffened by a strong piece of metal at the back to prevent crippling. When a curved cut is to be made, a very narrow saw without a back, called a *compass-saw* or a *heighole-saw*, is used. The general name for these is *turning-saws*; they have their plates thin and narrow towards the bottom, and each succeeding tooth finer, and the teeth are not bent on contrary sides of the plate for clearing, as in broad saws.

The surface of wood is smoothed by planing. According to the work, different kinds of planes are used: the *jack-plane*, which is large and rough, for taking away the rough of the saw; the *trying-plane*, for bringing the surface perfectly level and true, or the *long-plane* for the same purpose, where the work is of great length, as for the joining edges of long boards to be glued together. The *smoothing-plane*, which is much smaller than these, gives the smooth finished surface. The *spoke-shave*, a sort of plane with a double handle, is used for paring and smoothing rounded work.

Ornamental moldings are cut by means of molding-planes, which have their cutting edges curved to the required pattern. A good stock of these is one of the most expensive items of the tool-chest.

The paring of wood, and the cutting of rectangular or prismatic cavities, notches, etc., are done by means of *chisels*. Those for cutting across the fiber are called *firmers* or *paring-chisels*; those for cutting deep and narrow cavities, *mortise-chisels*, which are made very thick and narrow, and fitted in the handles with a strong flange, to bear heavy blows with the mallet. Chisels for paring concave surfaces are called *gouges*. For boring holes, *brad-awls*, *gimlets*, *centerbits*, and *gouges* are used—the two latter are fixed in a *stock* or revolving handle, and are used for large holes. When it is required to ascertain if an angle be square, or of any given inclination, the *square*, or the *bevel* set to the required angle, is applied to test the work as it proceeds. When parallel edges are required, the *marking gauge* is used to draw the line to be worked to. When a simple straight line is required for working to, a piece of string is chalked, then stretched tightly over the wood and lifted in the middle, when, by its recoil, it strikes the wood and leaves a straight chalked line. The *straight-edge*, a strip of wood with one of its edges perfectly straight, is applied to detect superficial irregularities. The operation of planing the edge of a board straight is called *shooting*, and such edges are said to be *shot*. When the joiner requires to ascertain whether the surface of a piece of wood is all in one plane, he takes two slips of wood with edges perfectly straight and parallel, and of equal width; these slips, called *winding-sticks*, are placed edge upwards, one at each end, across the board, and the workman looks in the longitudinal direction of the board over the upper edges, and if the two edges be not in the same plane, the board is planed down at the elevated parts until it is *out of wind*. For setting work level, a spirit-level, set in a wooden frame, or a plumb-level is used. For further description of the tools alluded to above, and in the rest of this article, see the special articles.

When two pieces of timber have to be united at their ends, as in lengthening the beams for roofing, partitions, the masts and keels of ships, etc., the operation is called *scarfing*, and the joint a *scarf*. The methods of scarfing are very numerous; those figured below will serve to illustrate the principal.

The following are the principal rules for scarfing as stated by Tredgold.

The length of the scarf should be, if bolts are not used—in oak, ash, or elm, six times the depth of the beam; in fir, 12 times the depth of the beam. If bolts and indents are combined, the length of the scarf should be—in oak, ash, or elm, twice the depth of the beam; in fir, four times the depth. In scarfing beams to resist transverse strains, straps driven on tight are better than bolts. The sum of the areas of the bolts should not be less than one fifth the area of the beam, when a longitudinal strain is to be borne. No joint should be used in which shrinking or expansion can tend to tear the timbers. No joint can be made so strong as the timber itself. When two pieces of timber are connected so that the joint runs parallel with the fibers of both, it is called a *longitudinal joint*; but when the place of the joint is at right angles to the fibers of both, an *abutting joint*. A very short tenon is called a *stub tenon*. When a second minor tenon is made projecting from the principal tenon, it is called a *tusk tenon*.

For lighter joiner's work, other methods of framing are used, and adapted to the work—to boards generally instead of beams; thus, for example, the mortise and tenon joint, made oblong instead of square, is used in framing doors, shutters, drawing-boards, or any other kind of extended superficial work liable to warping. An outside frame or skeleton is made with a panel or panels in the middle, and each piece of the frame has the grain at right angles to the piece into which it is mortised, in order that they shall eventually correct the warping.

Dovetailing is extensively used for connecting boards at right or other angles, as in making boxes, drawers, etc. Common dovetailing is usually glued. Nails or pins and glue are used with the miter and other notched joints.

Boards may be united at their edges to form an extended surface, as a flat plank partition, etc., either by simple gluing of the shot edges, by a *rebate*, or by a plowed groove and a corresponding projection. The rebate is cut by means of a rebating plane; that in the figure is combined with a bead, the usual joint for wooden partitions. The groove, a sort of extended mortise, is cut by a plane with a projecting iron called the *plow*.

In all cases where glue is used in joints, it should be applied to both surfaces, which should be rubbed and pressed together until nearly all the glue is forced out, then kept pressed by a clamp or weights. White lead is used for outside joints.

Special departments of this subject, such as roofs, staircases, etc., will be treated under their respective heads.

CARPET-BAGGER, a term of contempt applied by the people of the southern United States to a man who came from any other part of the union to live in the south, or to transact business there after the close of the rebellion. The term has been extended so as to designate any person in any part of the country who has no fixed residence. One offense of the carpet-bagger in the south was in teaching negroes to read and write, and helping them to assert their new political rights, which the greater majority of native whites were in no hurry to see exercised. In the unsettled condition of the southern states after the rebellion, they furnished an inviting field for adventurers and demagogues, who gave some ground for the stigma which has largely attached to the name of carpet-bagger.

CARPETS. Woven C., such as are now so common in this country, were first used in the east, where the custom of sitting cross-legged on the floor still renders them especially useful. Our rude forefathers, covered the floors of their houses with rushes, hair, or straw; and in Norwegian farm-houses, where so many of our ancient customs still exist, the floor of the best room is commonly strewn with juniper-twigs. The first step towards a woven carpet was made by plaiting rushes to form a matting.

The principal varieties of C. now in use are the Turkey, the Axminster, the Brussels, the Wilton, the Venetian, the Dutch, the Kidderminster or Scotch, Whytock's tapestry and velvet pile, and the printed felt carpet.

The real Turkey carpet is made in one piece; those manufactured for the orientals are usually too small for use in this country. The patterns consist merely of curved and angular strips, of variegated but dark and unobtrusive colors. The warp is of strong linen or cotton, to which bunches or tufts of colored worsted are tied according to the pattern, a drawing of which is placed before the weaver to copy. The surface is afterwards shorn level. Rugs are made in a similar manner; the colored worsteds are tied very rapidly by young girls.

The *Axminster carpet* is merely the English-made Turkey carpet, formerly manufactured as above at Axminster, in Devonshire. They are usually made to order, and of the size required for the room; from the tedious nature of the process of manufacture, they are very expensive.

Templeton's patent Axminster carpet is a very beautiful fabric, very much resembling that from which it derives its name, but it is wrought on the chenille principle.

The *Brussels carpet* is a mixture of linen and worsted, but, like the Turkey carpet, the worsted only is shown on the upper surface. The basis or cloth is a coarse linen fabric, and between the upper and under threads of the weft, several (usually five) worsted threads of different colors are firmly bound in. The pattern is produced by drawing to the surface, between each reticulation of the cloth basis, a portion of the worsted thread of the color required at that spot to produce the pattern; these updrawn portions are formed into loops, by being turned over wires, which are afterwards withdrawn, and the loops thus left standing above the basis form the figured surface of the carpet. The machinery and processes by which this arrangement is produced are rather complex, and require to be seen to be fully understood.

The *Wilton carpet* is made like the Brussels, but the wire has a groove in its upper surface, and instead of being drawn out, it is liberated by passing a sharp knife through the worsted loop into this groove, and thus making a velvet pile surface instead of the looped thread.

The *Venetian carpet* is produced in a common loom, and the pattern is all in the warp, which alone is visible, as it incloses the weft between its upper and under surfaces. The patterns are generally checks or stripes; the latter are chiefly used for stair carpets.

The *Dutch carpet* is a coarser and cheaper variety of plain Venetian, sometimes made wholly of hemp, or of a mixture of coarse wool and cow-hair.

The *Kidderminster* or *Scotch carpet* has usually a worsted warp and woollen weft, and the pattern is made by the combination of the colors of each. Three-ply C. of this kind are made especially in Kilmarnock. This is the most durable of the moderate-priced C.: the patterns are not so brilliant as those of the Brussels or the tapestry, but, being ingrained and woollen throughout, they retain their character until worn through. This, and the three immediately preceding descriptions of carpet, exhibit their patterns nearly similar on both sides, and are therefore reversible.

Whytock's tapestry and velvet pile carpet, as it is now frequently called, is becoming very extensively used as a cheap substitute for Brussels and Wilton, which it is made to resemble very closely in the brilliancy and variety of pattern. The manufacture of this carpet is very curious and ingenious. Instead of five colored yarns, only one of which is drawn to the surface at any one place, while the other four remain buried between the upper and under threads of the cloth basis, a single colored yarn is used, and the variety of color produced by dyeing it of various colors at intervals of its length. The yarn is coiled upon a drum, and printed by means of rollers in such a manner that when the threads that encompass the roller shall be uncoiled and laid in line side by side, they shall present an elongated printing of the pattern, so that a rose, for example, the outline of which should be nearly circular, will be an oval, with length equal to four times its breadth. When, however the thread is looped over the wire,

4 in. of yarn being used for an inch of the carpet pattern, this elongation is exactly compensated, and the rose appears in its proper proportions. The machinery required for this is, of course, much simpler than that for the Brussels, only one yarn having to be looped, and that always in the same manner.

The *printed felt carpets* are, as the name implies, simply made by printing colors on felt. These are chiefly used for bedroom carpets.

A very beautiful fabric has also been introduced, called the *patent wool mosaic*, formed by cementing a velvet pile upon plain cloth. It is used for rugs, etc. The pile is formed by stretching lengths of woolen yarn between plates of finely perforated zinc, placed several yards apart, the colors of the threads being arranged so that their ends shall show the pattern. The mass of yarn is then inclosed in a case, open at both ends, and compressed without deranging the fibers; and by means of a piston or ram at one end, a portion of this mass of yarn is forced forwards, the ends thus projecting are glued to the plain cloth, and when dried, are cut off to the length required for the pile. In this manner, several hundred slices are made from one setting of the yarn mosaic, and as many rugs produced.

CARPI, a t. of northern Italy, 10 m. n. of the city of Modena. It is surrounded by walls, defended by a citadel, has a cathedral, and manufactures of silk and straw hats. Pop. 5,000.—**CARPI** is also the name of a t. of Venetia, in the province of Verona, 28 m. s.e. of Verona, celebrated for the victory obtained here by prince Eugene over the French in 1701. Pop. 1200.

CARPI, **GIROLAMO DA**, 1501–56; an Italian painter who became infatuated with the works of Correggio, and so closely imitated them as to pass off his own as originals. Very probably some of these imitations are now figuring as true Correggios. Da Carpi's best works are the "Descent of the Holy Spirit," "Adoration of the Magi," and the saints Catherine, George, and Jerome, in churches at Rovigi, Bologna, and Ferrara.

CARPINI, **JOHANNES DE PLANO**, a celebrated Franciscan monk, b. in Capitanata, Naples, about 1210; was one of the six friars selected by pope Innocent IV. to proceed to the court of the emperor of the Mongols, whose warlike advances in 1246 threw Christendom into consternation, in order to pacify the terrible nomadic warriors, and, if possible, convert them to Christianity. The mission, accomplished under dreadful hardships, though without results so far as its main objects were concerned, was nevertheless far from unfruitful. Prior to this, the most monstrous fables had prevailed regarding the Tartars; and C.'s narrative, which gave a truthful and striking picture of their numbers, character, and civilization, was the first to bring these myths into discredit. In this book he also argued, with great good sense, for a union amongst Christian princes, as the only means of resisting those fierce hordes in their progress westward. As a book of travels, its accuracy has been attested by modern travelers. Hakluyt copied most of this work, at second-hand, into his first volume of *Navigations and Discoveries*. The date of C.'s death is not certainly known.

CARPINO, a t. of southern Italy, in the province of Foggia, 22 m. n.e. of San Severo, with a pop. of about 6,000.

CARPOCRATES, or **CARPOCRAS**, flourished under Hadrian (130 A.D.) at Alexandria, where he founded the Gnostic sect of Carpocratians. According to him, the essence of true religion consisted in the union of the soul with the Monas or highest God, by means of contemplation, which elevated it above the superstitions of the popular faith, and liberated it from the necessity of submitting to the common laws of society. He only is to be reckoned wise who attains to this. Among those who have done so, are Jesus, Pythagoras, Plato, and Aristotle. The cosmogony of C. was of the usual Gnostic character, the central peculiarity of which was the belief that the worlds were created by angels. C. also held the doctrine of the transmigration of souls. His followers existed down to the 6th century. Whether or not they were guilty of the abominations ascribed to them, is more than we can positively affirm; our only information concerning them being derived from *orthodox* writers, who were in the habit of slandering heretics.

CARPOLITES, a generic term applied to fossil fruits, which, in the present state of our knowledge, it is impossible to refer more precisely to their place in the vegetable kingdom. Of 100 species described, 70 belong to the carboniferous system.

CARPUS, **CARPAL BONES**. See **HAND**, **FOOT**, **SKELETON**.

CARPZOV, a Saxon family descended from Simon Carpzov, burgomaster of Brandenburg about the middle of the 16th century. He left two sons—Benedict and Simon. **BENEDICT**, 1565–1634, was a jurist and professor of law at Wittenberg; and in 1602, chancellor to Sophia, electress of Saxony. He died at Wittenberg, leaving five sons. **JOACHIM**, the eldest son of the burgomaster, reached a high position in the Danish army. **BENEDICT**, the second of the five, 1595–1666, was a professor at Leipsic, ordinary of the faculty of jurists at the same university, and in 1653, privy councilor at Dresden. He published several works which had much influence in the administration of justice. His later years were spent in religious study. **AUGUST**, 1612–83, his brother and the fourth son of the first Benedict, was distinguished as a diplomatist, was chancellor of the consistory at Coburg, and at the time of his death a privy councilor at Gotha. He was a man of

piety, and the author of several devotional works. JOHANN BENEDICT, 1607-57, fifth son of the first Benedict, was professor of theology at Leipsic, and the author of a system of theology and other works of that nature. He also left five sons, all of whom obtained conspicuous reputation. One of the five was JOHANN GOTLOB, 1679-1767, who became an eminent theologian and professor of oriental languages at Leipsic. He wrote an introduction to the canonical books of the Old Testament, and a *Critica Sacra Veteris Testamenti*. JOHANN BENEDICT, grandson of the first Johann Benedict, 1720-1803, was professor of philosophy at Leipsic, and professor of poetry and Greek at Helmstadt, and professor of theology. He wrote many philological works, and ended his life as an abbot.

KARQUINEZ, or **KARQUENAS**, a strait in California, between Suisun and San Pablo bays, 7 m. long, navigable for steam-boats, and for large vessels as far as Benecia.

CARR. DABNEY, 1744-73; a son-in-law of Thomas Jefferson, and an eloquent member of the Virginia colonial legislature.

CARR, Sir **ROBERT**, d. Rhode Island, 1667; one of the English commissioners to New England, appointed by Charles II., the others being Nichols, Maverick, and Cartwright. After the capture of New Amsterdam (New York) from the Dutch in 1664 by Nichols, C. compelled the Dutch and Swedes on the Delaware to submit to a capitulation. He then went with the other commissioners to Boston, where they administered the government.

CARRACA, LA, a t. of Andalusia, Spain, one of the chief naval arsenals of the kingdom, is situated 4 m. e. s. e. of Cadiz. It has been completely isolated from the mainland by artificial means; and so low is its situation, that it was necessary to erect the buildings on piles. It is defended by four forts, and is altogether very complete as an arsenal.

CARRAC'CI. See **BOLOGNESE SCHOOL**.

CARRAGEEN, often incorrectly called **C. moss**, or **IRISH MOSS**, a sea-weed (natural order, *algæ*; sub-order, *ceramiaceæ*), or rather several species of sea-weed, now used to a considerable extent both medicinally and as an article of food. The name **C.** is originally Irish; and the use of these sea-weeds appears to have been entirely confined to the peasantry of the coasts of Ireland, until, about 30 years since, they were recommended to general notice, and their medicinal virtues proclaimed by Mr. Todhunter, of Dublin. They are, however, found on the rocky sea-shores of most parts of Europe, and of the eastern shores of North America. The species which principally constitutes the **C.** of commerce is *chondrus crispus*, of which the varieties are remarkably numerous. It is 2 to 12 in. long, branched by repeated forking, cartilaginous, flexible, reddish-brown. *C. mamillosus* also frequently occurs. **C.**, after being collected, is washed, bleached by exposure to the sun, dried, and packed up for the market. Its composition is as follows:

Vegetable jelly (carrageenin).....	79.1
Mucus.....	9.5
Two resins.....	0.7
Ash.....	2.0
Fiber and water.....	8.7

100.0

When treated for ten minutes with cold water, in the proportion of half an ounce of **C.** to three pints of water, and then boiled and strained, it yields, with or without spices, a very pleasant drink. With a larger proportion of **C.**, a thickish liquid or *mucilage* is obtained; and on boiling down this decoction, and cooling, a stiff *jelly* is procured. Milk may be employed, instead of water, in the preparation of the various decoctions; and with the stronger one, along with sugar and spices, when thrown into a mold, a kind of *blanc mange* is obtained. **C.** is valued on account of its emollient and demulcent properties, and is likely to be found useful in most of those cases in which iodine might be exhibited; but its value seems to depend not a little on its being at once nutritious, a pleasant article of food, and easy of digestion. See **GELATINE**. It has been much recommended in pulmonary consumption. In some parts of Ireland, **C.** boiled with water (*mucilage*) is used instead of size for mixing with the more common colors in house-painting.

CARRANZA, **BARTOLEMÉ DE**. 1503-76; a Spanish theologian of the Dominican order, a man of great learning and eloquence. Charles V. sent him as envoy to the council of Trent, where he maintained that it was the duty of priests to reside in their benefices. He accompanied the prince, afterwards Philip II., to England, where he went to settle the marriage with Mary. In England, Carranza became queen Mary's confessor, and worked hard for the re-establishment of Roman Catholicism. Philip made him archbishop of Toledo, an appointment that aroused such jealousy that Carranza was denounced as a heretic. He was kept in prison eight years, thence taken to Rome and kept in prison, being at last compelled to abjure opinions which he had never held. He was then degraded from his office and sent to a convent, where he died seven days afterwards. He was afterwards honored as a saint by the Spanish people.

CARRAPA TO, a species of tick (q.v.) of the genus *Ixodes*, which infests dry bushy places in the interior of Brazil, hanging in clusters of many hundreds on very slender twigs, and ready to attach itself to any quadruped or man that passes, instantly burying its beak in the skin, from which it cannot be detached without considerable force. Horses and oxen suffer very much from the attacks of the C., of which in dry seasons the numbers are so great that whole herds of cattle are destroyed by the exhaustion which they produce.

CARRARA, a t. of northern Italy, 60 m. s.w. of Modena. It is situated on the Avenza, near its mouth in the Mediterranean, and is surrounded by the marble hills which have made its celebrity. Many of the principal buildings are wholly or partially constructed of the inferior kinds of white marble. There are upwards of 30 marble quarries in the vicinity of the town, but not more than 6 or 7 furnish the marble used for statuary. Extensive works, fitted up with English machinery for saving the marble, have been established near the town, in which are several shops for the sale of marble ornaments. Many foreign artists have set up their studios here, in order to save the expense which the export of the marble in its rough state entails. C. has a fine collegiate church of the 13th and 15th centuries, with some good sculptures, an academy of fine arts, and a pop., in 1872, of 23,827. The quarries have been worked for more than 2,000 years, and yield £75,000 worth of marble yearly.

The famous **CARRARA MARBLE** is a white saccharine limestone, which derives its value to the sculptor from its texture and purity. It was formerly supposed to belong to the primitive rocks, but is now known to be a limestone of theoolitic period, highly altered by plutonic action.

CARBEL, ARMAND, a celebrated French publicist and republican leader, was b. at Rouen in 1800, and was educated in the military school of St. Cyr. After serving for some years in the army, he went to Paris, and devoted his attention to political and historical studies. In 1830, in connection with Thiers and Mignet, he became editor of the *National*, the most spirited and able of the journals opposed to the government of Charles X. C.'s colleagues being employed by the new government, he was left to conduct the *National* himself, which he did with a spirit and a freedom such as had not been witnessed in France for a long time—which on more than one occasion checked the arbitrary power government attempted to exercise, and gained for him the high admiration and esteem of the popular party. Government prosecutions of course followed his outspokenness, and heavy fines were decreed against him; but these were paid by public subscription, and each conviction only made his journal more famous. C., however, dreaded revolution as much as he hated despotism, and had no sympathy with many of those who looked up to him as a leader. Provoked into a duel with Emile de Girardin, by an attack on his personal character, C. was mortally wounded, and died July 24, 1836. His funeral was attended by many of the most distinguished men in France.

CARRERA, RAFAEL, 1814-65; a Guatemalan of Indian and negro blood, who in 1837 led a band of insurgents and the next year captured the city of Guatemala. In 1839, he again held the city by force. In 1847, he was elected president of the republic, and in 1851, re-elected for life. In 1863, he made war on San Salvador, captured the capital, and expelled the president. Though almost a savage, and without education, his government on the whole was mild and reasonable.

CARRIACOU, one of the West India islands, 20 m. n.e. of Grenada; 7 m. long by 3 wide. Cotton is the chief production.

CARRIAGE. See COACH, CART, WAGON.

CARRIAGE DEPARTMENT, ROYAL, at Woolwich, is one of the great national manufacturing establishments maintained for warlike armaments—its duty being the construction of gun-carriages, for army and navy, military wagons, and vehicles of all kinds, and the joinery of the army generally. The department was organized as a distinct establishment in 1803, and has been undergoing gradual enlargement ever since. Since the recent introduction of iron carriages for heavy guns, the department has had a new section added for ironwork. Until 1855, the board of ordinance had the direction of this department, but in that year it passed under the direct control of the secretary for war, who, since 1869, administers it through the surveyor-general of the ordinance. The works, store-rooms, and yards are of vast size, often employing from 2,000 to 3,000 hands. There are many steam-engines in various parts of the establishment; and the iron and wood cutting and shaping machines are of the highest order of excellence. The internal communications are carried on by locomotives on a tramway of 18 in. gauge. See GUN-CARRIAGE.

CARRICAL, or KARIKAL, a French port within the limits of Tanjore, a district of the presidency of Madras. It stands in lat. 10° 55' n., and long. 79° 53' e., on the estuary of a small branch of the Cauvery, a tributary of the bay of Bengal. C. is accessible from the sea only after the periodical rains, and then only for coasting craft. The town and territory contain 63 sq.m., and about 50,000 inhabitants. The settlement, originally ceded to France by a native grant in 1759, and subsequently subdued by the British, was restored in 1814, on condition of being neither fortified nor garrisoned.

CARRICKFERGUS, a seaport t. of Ireland, is situated on the lough of Belfast, about 10 m. distant from the town of that name. Though locally within the co. of Antrim, it forms a co. of itself. C. extends nearly a mile along the north-western shore of the lough. Its chief feature is its castle, a fine picturesque object, supposed to have been erected by De Courcy in the 12th century. It is situated on a rock about 30 ft. high, projecting boldly into the sea, by which it is surrounded on three sides. The balium or keep is 90 ft. in height. From the top of the keep a splendid view is obtained, extending, in a clear atmosphere, to the Mourne mountains and the Scotch coast. The castle contains a barrack, bomb-proof magazine, and ordnance store-rooms; and for many years, 22 pieces of ordnance, 12-pounders, were mounted on the works. A total change has, however, been made in the defense of the castle, and cannon of a very large caliber are now mounted, in order to command the entrance of the lough. In 1575, a wall 16 ft. high and 7 thick, with 7 bastions, to surround the town, was commenced, and completed in the year 1608; a considerable portion of the wall is still standing, and one of the 4 entrance-gates. On the 14th June, 1690, king William III. landed here with his army, 12 days before the battle of the Boyne. The rock on which the king stepped on landing is at the end of the quay, projecting from it, and still forming the landing-place. In 1760, commodore Thurot captured the castle, but on the approach of troops from Belfast, was forced to abandon it. The parish church, said to have been founded in the year 1164, on the site of a pagan temple, is a fine old building, dedicated to St. Nicholas. There are several other churches and chapels in the town, and several good day and Sunday schools in connection with the religious bodies, and a fine model school has been erected by the national board. There is a literary and scientific society, with reading-room, library, and museum. The fishery of the bay, which is famous for oysters of an unusual size, employs a good number of the inhabitants. There are four spinning-mills, one for weaving linen, one bleaching establishment, a starch manufactory, and a tan-yard. A market is held every Monday and Saturday, and a fair twice a year. Pop. '71, 9,397. The town returns one member to parliament. There are several barrows or tumuli in the vicinity. C. is connected by railway with Belfast, Portrush, and Larne. A few years since, a shaft was opened by the marquis of Downshire, in the hope of finding coal—without success; but salt of a superior quality, and in great abundance, was found. A company has been formed, and are working the mine. The length and breadth of the co. are nearly equal—about 5 statute miles.

CARRICK-ON-SUIR, a t. of Tipperary, situated, as its name implies, on the Suir, which is navigable at this point, 12 m. e. of Clonmel, in the midst of very fine scenery. Pop. '71, 7,792. C. was formerly celebrated for its woolen manufacture, which has recently been considerably revived, and there are also linen and flax factories. It exports much agricultural produce. The town has recently much improved. C. became a place of note soon after the Norman conquest. There are the remains of a castle built in 1309, on the site of an old priory of the knights of St. John of Jerusalem.

CARRICK'S FORD, on Cheat river in West Virginia, where, July 13, 1861, a confederate force under gen. R. B. Garnett was routed by a federal force under gen. T. A. Morris, and of the confederates several were killed.

CARRIER, JEAN BAPTISTE, one of the most infamous and blood-thirsty members of the French national convention, was b. at the village of Yolai, near Aurillac, in Haut-Auvergne, in 1756. Entering the national convention in 1792, he took an active part in the formation of the revolutionary tribunal, voted for the death of the king, demanded the arrest of the duke of Orleans, and assisted in the overthrow of the Girondists. At Nantes, whither he was sent on a mission against the moderates, in Oct., 1793, he found ample means for indulging his insatiable thirst for human blood. The utter defeat of the Vendéans had filled the prisons with captives, and C. proposed and carried a resolution for murdering the unhappy prisoners *en masse*. Accordingly, on Nov. 15, he compelled 94 priests to embark in a vessel, under pretense of deportation, and during the night drowned the whole of them, by having the ship scuttled. Another of these *noyades*, as they were called, in which 138 persons were sacrificed, took place soon after, and they were repeated to the number of 25, their perpetrators facetiously terming them "vertical deportations." Other cruelties C. committed here. Men and women were tied together feet and hands, and thrown into the Loire; and this was called *mariage republicain* (republican marriage). With such recklessness were these murders committed, that, in one instance, a number of foreign war-prisoners were drowned by mistake. The water of the Loire was so poisoned by corpses, that its use for drinking and cooking was prohibited. Five hundred political prisoners were shot, as in a battue, on the bridge near Nantes. Even Robespierre was offended by these enormities, and recalled C., who boldly justified his own conduct before the convention. The fall of Robespierre was, however, soon followed by outeries against Carrier; judgment was decreed against him, and he perished under the guillotine, Dec. 16, 1794—dying with the protestation that, in all his cruelties, he had acted according to orders, and as a true republican patriot.

CARRIERE, MORITZ, b. 1817; a German scholar, professor of philosophy at Geissen and Munich, and author of many works on philosophy, religion, æsthetics, poetry, etc.

He is a pronounced liberal, going so far as to advocate the conversion of the cathedral at Cologne into a free church. He is also an art critic of high rank.

CARRIÈRES, LOUIS DE, 1662-1717; a Roman Catholic theologian of France, who published a literal commentary on the Scriptures, in which most of the comments were in the words of the Bible itself.

CARRIER PIGEON, a variety of the domestic pigeon (q. v.), remarkable for the degree in which it possesses the instinct and power of returning from a distance to its accustomed home; and which has been, therefore, much employed to convey letters from one place to another. In eastern countries, where such messengers are most frequently employed, it is the practice to bathe the pigeon's feet in vinegar to keep them cool, and to prevent it from alighting in quest of water, by which the letter might sustain injury. Pigeons intended for this use, must be brought from the place to which they are to return, within a short period, not exceeding a fortnight of their being let loose, and at a time when they have young in their nest; the remarkable fecundity of the C. P. affording particular facilities for its employment in this way. The bird is also kept in the dark and without food, for at least eight hours before being let loose. The instinct by which it is guided, like most other instincts, has received no sufficient explanation. That it recognizes objects by sight, and so directs its course, is nothing more than a conjecture, and as such, is only very partially supported by the fact of the great power of vision which these birds, in common with so many others, are known to possess, and by that of the C. P., on being let loose, immediately rising spirally to a great height in the air, as if to obtain opportunity for the exercise of this power. The C. P. has probably been more used in the Turkish dominions than in any other part of the world; and during the siege of Paris in 1871, it safely conveyed many important messages. Its rate of flight is not less than 30 m. an hour, and it has been known to pass over great distances still more rapidly. The variety generally described as the C. P. (*columba tabellaria* of Linnæus, *C. Turcica* of some authors, but not generally regarded by naturalists as a distinct species), is of remarkably large size, about 15 in. in length from the point of the bill to the extremity of the tail, and has the cere very large and carunculated, the eyes surrounded with a broad circle of naked red skin, and the wings reaching nearly to the extremity of the tail. There is, however, a smaller variety, which is said to be superior to it, and which has not the carunculated cere, nor the broad circle around the eye. Carrier pigeons are trained by being conveyed, when young, to short distances of a few miles from home and then let loose, the distance being gradually increased; and this training is said to render them much more secure as messengers.

CARRIERS, a class of persons who, in various forms, by land and sea, undertake the carrying of goods, particularly articles of commerce. In all countries aspiring to commercial intercourse, the **CARRYING TRADE**, as it is called, has been less or more developed. The method of carrying in Arabia, Persia, and some other countries in the east has, till the present time, been chiefly by means of the camel, an animal of great value, on account of its strength, patience, and power of endurance. See **CAMEL**. In England and Scotland, previous to general use of the wheel-carriages, goods were carried on pack-horses, as is still practiced in some parts of Spain with mules. See **PACK-HORSE**, also **MULE**. After the pack-horse came the one-horse cart and the four-wheeled wagon, as engines of land-conveyance. Carrying with one-horse carts settled down as a universal practice in Scotland, where it is still conducted in all districts not traversed by railways. The Scotch C., winding their way by roads over hill and dale, at the rate of about 20 m. a day, have ever been a respectable and useful body of men, exceedingly trustworthy, and moderate in their charges. In connection with Edinburgh, Glasgow, and other centers of traffic, they travel to and from provincial towns for the most part once a week on certain days, so that their arrival at any particular place may be reckoned on with great exactness. In England, the employing of wagons for carrying goods in connection with the metropol's and provincial towns is now of old date. These carriers' wagons, greatly limited in their range by the introduction of canals and railways, are still to be seen in some of the rural districts. A wagon of this kind is provided with four broad huge wheels; and being a heavy and clumsy engine of conveyance, is drawn by four horses, though, when roads were bad in old times, six horses were not unusual. The driver ordinarily rode on a pony alongside the vehicle; now he more frequently walks, carrying a long whip. The wagon has a hooped top with movable covering; and the hinder part has always been left vacant for the use of passengers, who are necessarily huddled together on straw. Traveling in the "tail of the wagon" is now entirely gone, or nearly so; but with all its rude inconveniences, it was common till past the middle of the 18th c., and has afforded scope for some of the most grotesque descriptions of Fielding and Smollett. The tedious process of carriage by these wagons largely increased the prices of goods, and retarded the growth of commerce. The first modification in the carrying trade took place by means of inland navigation, to which reference has already been made. See **CANAL**. The conveyance of cotton goods from Lancashire, of earthenware from Staffordshire, of metal goods from Birmingham, of salt from Cheshire, etc., became much more easy than before, owing to the large quantity which could be packed in each barge, and to the great amount of work done by each horse. The chief owners of the old wagons became, in time, the chief owners of the

canal-boats; they paid rates or tolls to the canal companies. The celebrated English firm of Pickford & Co. has been for many generations, and still is, at the head of the goods carrying trade.

When railways were established, a great struggle ensued; the owners of the road-wagons and canal barges had a formidable competition. They wisely accommodated themselves to a state of things which they could not prevent, and added the trade of railway goods C. to their former business. Three systems were tried: 1. The company purchased road-wagons or vans, collected goods at the various towns, conveyed them by railway, and then distributed them at their several destinations. 2. The company confined their attention to the mere conveyance on their railway, leaving the collection and delivery to the ordinary carriers. 3. The company combined both systems, conveying on the railway everything that offered, and competing with the C. for the road-traffic. During the greater portion of the period in which the railway system has been in operation, the second of the above three plans has been adopted more extensively than either of the others. Taking as examples the greatest railway company and the greatest carrying firm, Messrs. Pickford had warehouses or depots at all the principal towns where the London and North-western railway had stations. The merchants and manufacturers were customers, not to the company, but to the firm, for the conveyance of merchandise. Messrs. Pickford employed their own wagons and horses, clerks and porters, in collecting and delivering goods, and paid to the company so much per ton for the conveyance along the railway, the toll varying according to the nature of the goods and the distance run. There was seldom any quarrels or disputes under this system. The carrier was responsible to the customer from first to last for the safety of the merchandise; and he had a claim against the company for any injury while the merchandise was on the railway. Under the third system, disputes were much more frequent. The companies were bound by law to carry goods for all persons at certain tolls; but when they became road C. as well, they competed with the ordinary C. in a way which the latter could barely contend against. The Great Western railway has been unfavorably distinguished for jealousies and law-suits between the company and the carriers.

At the present time, the tendency is for the companies to take the responsibility of the whole conveyance, the C. acting as their agents, if willing so to do, or else endeavoring to maintain a fair competition. One of the greatest of the companies, the Midland, have in this way become C. on their own account, in order to obtain a share of the profit which accrues from road-traffic. The goods-vans traversing the streets of the metropolis, and other great towns, are now more frequently inscribed with the names of railway companies than with those of private carriers.

The goods-depots of the several railways are scenes of great activity during the night; for it is then that the arrival-trains are mostly unpacked, and the departure-trains mostly made up. During the day, vans are collecting goods from manufactories and warehouses; these goods are sorted at the depots, and are, when evening comes on, distributed among different trains, according to the part of the country to which they are to be conveyed. On the other hand, goods-trains arriving during the evening and night are unpacked, the goods classified according to districts, and sent out for delivery by road-vans on the following day.

The four-horse broad-wheel wagons, as already said, have almost disappeared from English roads; vans of lighter construction sufficing to convey merchandise from and to the various railway stations. Canals still command a trade, but it is chiefly in coal, stone, lime, *ores*, slate, bricks, and other articles very bulky in proportion to their value. The conveyance of manufactured goods has, for the most part, passed over to the railways.

In towns, there are C. whose business is confined wholly to short distances. Taking the metropolis as an example, there are C. residing in all the villages and hamlets round about, each possessing one or more single-horse covered carts. Every morning the cart, containing miscellaneous articles collected in the village or hamlet, goes to London, and delivers each article at the particular house or establishment to which it is addressed. When thus emptied, it receives a supply of packages or other articles going *from* London to the suburbs, and makes its return-journey in the evening. The plan is cheap and convenient, and does not seem likely to be supplanted by any other; for no amount of railway extension would wholly accommodate *short* traffic. For the metropolis more strictly, however, an excellent system has been established by the "London parcels delivery company." Two or three times a day, parcels are conveyed from receiving-houses all over the metropolis to a central depot near Fetter lane, there sorted, and sent out again for delivery. The metropolis, out to a wide distance, is separated into districts, and one or more carts, filled with parcels, are sent to each district at certain hours of the day. The speed is rapid, the times are punctual, and the service in general well conducted. The suburban C. have arranged among themselves a sort of central depot or "house of call" in the Old Bailey, for the exchange of traffic; but their system is not so well organized as that of the company just named.

The progress of improvement in the English CARRYING TRADE is a type of the advances similarly made in the United States, where canals, railways, and coasting steam-vessels have generally superseded the old tedious methods of conveyance; and it is chiefly on

the long and almost trackless routes to the shores of the Pacific that are now seen the old processes of carriage by pack-mules and horses and bullock-wagons, the cost of transit by these means being very great.

The term CARRYING TRADE has latterly been applied more specially to all kinds of conveyance of merchandise by sea, whether across the ocean or along the coast. In this broad view, it, in reality, involves the whole question of mercantile marine, British and foreign.

CARRIERS, LAW RESPECTING. A carrier, in law, is one who offers to the public to convey passengers, or goods, from one place to another, for hire. The offer must be general; for a private person who contracts with another for carriage, is not a carrier in the legal sense, and does not incur the peculiar responsibilities which, in almost every country, it has been found expedient to attach to the occupation of a public or common carrier. Carriage, in law, is thus a peculiar modification of the contract of hiring. In Rome, the responsibilities of carriers by water were regulated by a prætorian edict, which was applicable also to inn-keepers and stablers (*Nautæ, Cauponæ, Stabularii*, Dig.; lib. iv. t. 9); and from that edict the law of carriage in modern Europe has been mainly borrowed, sometimes directly, as in Scotland, sometimes indirectly, as in England. The ground on which the edict increased the responsibilities attaching to an ordinary contract of hiring was, that the persons whom it enumerated were under peculiar temptations to consort, either personally or through their servants, with thieves and robbers, without the connection being such as to admit of proof; and that the public safety consequently required that they should be held responsible for whatever had been intrusted to them, till its safe delivery at the place to which they had undertaken to convey it. This responsibility in our own law extends not only to the acts of the carrier's servants, but also to those of the other guests in an inn, or the other passengers in a conveyance. The only exception to this liability at common law is in the case of loss arising from the act of God (*q.v.*) or the queen's enemies—i.e., the fury of the elements, or war. But there are several statutory limitations. The liability for gold and silver, and articles of unusual value, is restricted to £10, unless the extra value has been previously stated and paid for as insurance against the greater risk (11 Geo. IV. and 1 Will. IV. c. 68, and 17 and 18 Vict. c. 31); and the proof of value is laid on the person claiming compensation. But the last-mentioned act, commonly called the railway and traffic act of 1856, provides, on the other hand, that the company shall be liable for neglect or default in the carriage of goods, animals, etc.; notwithstanding any notice or condition or declaration made by the company, for the purpose of limiting their liability. The decisions of the courts have also somewhat limited the universal responsibility of the carrier. For example, it has been decided that he is not liable, *qua C.* (and the same applies to an inn-keeper), for money taken from the pockets of the traveler; but that, if the money has been taken from the pockets of clothes which have been stolen, or from trunks which have been broken into, his responsibility comes into operation.

Under C. are included carters and porters, who offer themselves for hire, to carry goods from one part of a city to another. Whether the same be the case with hackney-coachmen, is more doubtful; though, from the extent to which they are now employed in the transport of luggage, there seems no sound reason for an exemption in their case. Wharfingers and warehousemen are liable only under the special contracts into which they may have entered, or in accordance with mercantile usage. In England, it has been decided that lodging-house keepers are in a different position from carriers and inn-keepers, on the ground that they do not profess to entertain all-comers, or to receive their goods. C. are liable to make good to the owners of goods intrusted to them all losses arising from accidental fire. This rule was introduced into Scotland by the mercantile law amendment act of 1856. Carriers have a lien upon the goods they have carried for payment of the carriage only. The lien is, however, restricted to the particular goods to which the carriage refers, and ceases on possession of them having been given up. It does not cover any account or balance due either by the sender or consignee to the carrier.

CARRIERS (*ante*). In the United States, common carriers are such as transport for hire for all persons indifferently. They operate both on land and water, and embrace stage-coach proprietors, railway and steamboat companies, truckmen, teamsters, express companies, etc., including owners and masters of every kind of vessel or water-craft who come before the public as the carriers of freight of any kind for whomsoever may choose to employ them, for either a long or a short voyage. Common C. are responsible for loss or damage during transportation from whatever cause, "except the acts of God, or of the public enemy." The act of God means only such inevitable accidents as occur without man's agency. The carrier is not responsible for losses occurring from natural causes, such as fermentation, evaporation, freezing, the ordinary decay of perishable articles, or the natural wear in the course of transportation, provided he exercises reasonable care to have such dangers as little as practicable. C. who undertake general business are bound to carry all matter that offers, under liability of legal action if they refuse without just excuse; but any carrier may restrict his business to certain goods, in which case he is not bound to accept things out of his line. A carrier may

require payment of freight in advance; and he is entitled to a lien upon the goods for his freight and for what he advances to other carriers. But all common-law responsibility may be qualified by special contracts. The bill of lading, or receipt for the goods, is an acknowledgment of the carrier's responsibility, and is presumed to name exceptions from responsibility if any there be. Railway companies, steamboat owners, and other C. who allow express companies to carry parcels and packages on their cars, boats, or other vehicles, are liable as common C. to the owners of the goods for loss or damage without regard to the contract between them and such express carriers. Railways, steamers, etc., carrying passengers, although not liable for injury to passengers without the C.'s fault, are responsible for the baggage of such passengers intrusted to them as common C., and the responsibility continues until the delivery of the baggage to the owner, or to his order. The baggage-check is the same as a bill of lading for goods, and is evidence of the responsibility assumed. Jewelry and a watch in a trunk are considered baggage, but money, beyond a reasonable amount for expenses, is not so considered. The responsibility of C. begins upon the delivery of the goods for immediate transportation. A delivery at the usual place of receiving freight, or to those employed by the company in the usual course of business, is sufficient. But where C. have a house at which they receive goods that are not to be forwarded until further order or a later time, such C. are in the mean time responsible only as depositaries; and where goods are received as by wharfingers, or warehousemen, or forwarders, and not as C., liabilities are incurred only for ordinary negligence. The responsibility of the carrier terminates when, after the arrival of the goods at their destination, a sufficient time has elapsed for the owner to receive them in business hours. After that the carrier may store them, and is responsible only for ordinary care. The agents of corporations which are common C., such as railway and steamboat companies, bind their principals to the full extent of the business intrusted to their control, whether they follow their instructions or not; nor will it excuse the company to show that the agents acted willfully in disregard of instructions. The carrier has an insurable interest in the goods both in regard to fire and marine disaster, except such as result from inevitable accident, such as fire by lightning-stroke. If a particular time is set for the delivery of goods, damages may be recovered for exceeding that time. The carrier is liable upon general principles where the goods are delivered through his default, to the extent of their value at the place of destination; and this includes the profits of the adventure. If the goods are only damaged, or not delivered in time, the owner is bound to receive them. He will be entitled to damages, but he cannot repudiate the goods and recover for the total loss.

CARRIERS OF PASSENGERS. (See *CARRIERS, ante.*) Persons who carry passengers are not held responsible as insurers of the safety of their freight as carriers of goods are held. But they are held to the highest degree of watchfulness and care in all the conduct of their business. So far as human foresight and prudence can secure the passenger from harm, there is a right to demand it of all who assume the transportation of persons. It is a practice to print on passes or free tickets a notice that such a passenger assumes the risk of personal injury, but the courts have again and again decided that this in no degree lessens the carrier's liability, holding even that the transporting party was as much responsible for a non-paying as for a paying passenger. Passenger-carriers are responsible for the baggage of their passengers, and for the safety of parcels intrusted to them or their agents. Many decisions of American courts touch various points in the case of passengers, but all sustain the principle that if anything more could have been done by the carrier to insure the safety of his passengers, and injury occur in consequence of the omission, he is liable. Passenger-carriers are not responsible where the injury occurs through the negligence of the passenger; but when there is intentional wrong on the part of the carrier, the injured party may recover notwithstanding his negligence. And so also, where the carrier's negligence contributed only remotely to the injury and the passenger's culpable want of care was its immediate cause, a recovery may still be had. Passengers leaping from a conveyance in consequence of any just sense of peril may recover for injury. Carriers are bound to carry for the whole route for which they stipulate, and according to their public notices and the general customs of their business; but they are not bound to carry persons disorderly in conduct, or those having contagious diseases, or who are in any way dangerous or offensive to other passengers. The carrier is liable for damages if he fail to deliver the passenger in a reasonable time, or according to the published schedule. The sale of through tickets for a route operated by several successive companies of carriers having no partnership connection, renders each company liable for injuries to passengers occurring only in the part of the route which pertains to it severally. One decision in case of the death of a passenger was that the jury are to estimate damages for the death as they would for an injury to health, by the probable financial accumulations of the deceased had he survived, or not been injured through the culpable negligence of the carrier; therefore he or his estate is entitled to recover not only the damages sustained up to the time of trial, but all prospective damages likely to accrue from the injury. Passengers must conform to the rules of the road or company with regard to purchasing, showing, and giving up tickets, and in respect to trains and cars. But it has been held that when one purchased a ticket indorsed "good for this trip only," and was

unexpectedly detained, he could lawfully demand transportation by another train, even on the next day. Railway companies may exclude merchandise and articles known as "express" matter from the passenger cars. When an accident occurs to a train, or a stage-coach is overturned, the fact is considered *prima facie* evidence of fault on the part of the company or its agents. With regard to steam and other vessels, very strict rules are enacted by governments for the safety of passengers and property, regulating the number of passengers, the amount of provisions, the navigating of the ship, pilotage, etc.

CARRION CROW. (See *Crow*.) C. C., also called *black vulture*, is not in America, as in Britain, the name of a species of crow, but of one of the vulture family. See **VULTURE**.

CARRION FLOWERS, a name which, on account of their smell resembling that of putrid meat, has been given to the flowers of many species of *stapelia*. The genus *stapelia* belongs to the natural order *asclepiadææ*, and is remarkable for the excessive development of the cellular tissue of the stem and reduction of that of the leaves, resulting in a general aspect like that of the *cactus* family. The species are natives of the cape of Good Hope. The flowers are often large, and not devoid of beauty, but the carrion stench is very strong. It is not yet known to what chemical substance it is owing.

CARRO', JEAN DE, 1770-1857; b. Geneva; a German physician in Vienna and Carlsbad, noted for his advocacy of Jenner's system of vaccination as a guard against small-pox. Through his efforts, kine-pox inoculation was introduced into India, where the people, hearing that the vaccine matter came from a cow, ascribed its origin to their sacred cow, and called it by a name meaning "immortality." Carro wrote several works on medical subjects.

CARROLL, a co. in n. w. Arkansas, on the Missouri border, and King and White rivers; 700 sq. m.; pop. '70, 5,780-37 colored. Surface varied, and soil generally fertile. There are quarries of excellent yellow marble. Co. seat, Carrollton.

CARROLL, a co. in w. Georgia, on the Alabama border, and the Chattahoochee and Tallapoosa rivers; 572 sq. m.; pop. '70, 11,782-1,309 colored. The surface is mostly mountainous; but the soil is generally fertile, producing corn, wheat, cotton, etc. One or two gold-mines have been profitably worked. Co. seat, Carrollton.

CARROLL, a co. in n. w. Illinois, on the Mississippi river, and crossed by the Western Union railroad; 416 sq. m.; pop. '70, 16,705. The surface is uneven, occupied by prairie and forest, and the main products are cereals, butter, and wool. Co. seat, Savannah.

CARROLL, a co. in n. w. Indiana, on the Wabash and Tippecanoe rivers, traversed by the Toledo, Wabash and Western railroad, and the Wabash and Erie canal; 378 sq. m.; pop. '70, 16,152. It has a diversified and well-timbered surface, and productive soil, agriculture being the chief business. Co. seat, Delphi.

CARROLL, a co. in central Iowa, on the Chicago and Northwestern railroad, drained by the North and Middle Raccoon rivers; 600 sq. m.; pop. '70, 2,451. The climate is good and the soil fertile. Co. seat, Carrollton.

CARROLL, a co. in n. Kentucky, on the Ohio and Kentucky rivers, and Louisville, Cincinnati and Lexington railroad; 200 sq. m.; pop. '70, 6,189-540 colored. It has a calcareous soil, with abundance of limestone. Productions chiefly agricultural. Co. seat, Carrollton.

CARROLL, a parish in n. e. Louisiana, on the Mississippi river and bayou Bœuf; 1050 sq. m.; pop. '70, 10,110-7,718 colored. It has a level surface, producing corn and cotton. Seat of justice, Providence.

CARROLL, a co. in n. Maryland, on the Pennsylvania border and the Patapsco and Monocacy rivers, reached by the Baltimore and Ohio, and crossed by the Western Maryland railroad; 500 sq. m.; pop. '70, 28,619-2,175 colored. It has a hilly surface, and rather thin but well-cultivated soil; its productions are wheat, corn, butter, tobacco, etc. Co. seat, Westminster.

CARROLL, a co. in w. Mississippi, on the Yalabusha, Yazoo, and Big Black rivers, and crossed by the Mississippi Central railroad; 900 sq. m.; pop. '70, 21,057-11,550 colored. The surface is level, and the soil is remarkably fertile; chief productions, corn and cotton. Co. seat, Carrollton.

CARROLL, a co. in n. w. Missouri, between the Missouri and Grand rivers, traversed by a branch of the North Missouri railroad; 700 sq. m.; pop. '70, 17,446-827 colored. It has an uneven surface, in many parts covered with black walnut and oak forests; its soil is generally productive. Chief business, agriculture. Co. seat, Carrollton.

CARROLL, a co. in n. e. New Hampshire, on the Maine border and Winipisogee lake, reached by the Portland and Ogdensburg, and the Portsmouth, Great Falls and Conway railroads. The surface is mostly mountainous; productions chiefly agricultural. Co. seat, Ossipee.

CARROLL, a co. in e. Ohio, traversed by the Tuscarawas branch of the Cleveland and Pittsburg, and the Carrollton and Oneida railroads; 360 sq.m.; pop. '70, 14,491. It is hilly, but well-watered and fertile. Iron and coal are found. The chief productions are grain, hay, butter, and wool. Co. seat, Carrollton.

CARROLL, a co. in n. Tennessee, on the Big Sandy and Obion rivers, and the Louisville and Memphis, and the Nashville and Northwestern railroads; 625 sq.m.; pop. '70, 19,447—4,799 colored. It is level and fertile, with forests of black walnut, hickory, maple, and oak. Chief productions, corn, wheat, cotton, and butter. Co. seat, Huntingdon.

CARROLL, a co. in s.w. Virginia, on the North Carolina border, drained by the Kanawha river; 440 sq.m.: pop. '70, 9,147—328 colored. The surface is rough, but well adapted to grazing. Copper, iron, and lead are found. The Grayson sulphur springs are much visited. Productions chiefly agricultural. Co. seat, Hillsville.

CARROLL, CHARLES, OF CARROLLTON, b. Md., Sept. 20, 1737; d. Nov. 14, 1832, aged 95 years; the last survivor of the fifty signers of the declaration of American independence. He was educated in the Jesuit colleges of St. Omer and Rheims; studied law at Bourges, Paris, and London, returning to America in 1764. He inherited the last and the largest of the old manorial estates of Maryland, a property estimated in 1775 at \$2,000,000, and he was then considered the wealthiest private citizen in the colonies. In 1775, he was chosen a member of the "committee of observation" at Annapolis, and in the same year sent to the provincial convention. In 1776, he was one of the commissioners sent to persuade the Canadians to join in the revolt against England. Returning to Maryland, he was prominent in bringing the colonial delegates to agree upon union for independence; and July 4, 1776, he was sent to congress, where, Aug. 2, he signed the declaration. At the time of signing, a delegate, alluding to Carroll's great wealth, remarked, "There goes a few millions; but there are many Charles Carrolls, and the British will not know which one it is;" whereupon Carroll immediately added after his name of *Carrollton*, an addition that was ever afterward respected. In congress, he was one of the board of war. About the close of 1776, he was one of the committee that drafted the Maryland constitution, and was chosen to the senate of that state. In 1777, he was again sent to congress, and in subsequent years was repeatedly elected to the state legislature. In 1789, he was United States senator; in 1799, one of the Maryland and Virginia boundary commission. July 4, 1821, but four of the signers of the declaration were living: Carroll, William Floyd of New York, and ex-presidents Adams and Jefferson. Floyd died in the next month, and Adams and Jefferson both died July 4, 1826, leaving Carroll the sole survivor. His last public act was the laying of the corner-stone of the Baltimore and Ohio railroad, July 4, 1828, when in his 90th year. Carroll's grand-daughter, Miss Caton (d. 1853), was the Marchioness of Wellesley.

CARROLL, JOHN, D.D., LL.D., 1735—1815; cousin of Charles Carroll of Carrollton; an American Roman Catholic prelate, educated in Europe, and for a time professor at Bruges. Returning to America, he was selected, with his cousin and Dr. Franklin, to go to Canada to urge the people to join the colonies in their effort for freedom. After the revolution, C. was appointed vicar-general, and in 1789, was promoted to bishop, being the first bishop of the Roman Catholic church in the United States. A short time before his death he was made archbishop.

CARROLLTON, a city in Green co., Ill., 34 m. n.w. of Alton, on the Jacksonville and Alton railroad; pop. 2,700. Its trade is in lumber, agricultural products, and coal.

CARROLLTON, a city in Louisiana, on the Mississippi, 7 m. above New Orleans, in Jefferson parish; pop. 6,495. Its trade is chiefly in sugar and molasses. Horse railroads connect with New Orleans.

CARRON, a village in Stirlingshire, Scotland, on the right bank of the Carron Water, 3 m. e.n.e. of Falkirk. It is celebrated for its ironworks, which are among the largest of the kind in Britain. The works were established in 1760; and are carried on by a company, who employ a great number of men. Pop. '71, 1088.

CARRONADES' are short iron guns, invented by Mr. Gascoigne, and named after the Carron iron works in Scotland, where they were first made. They are lighter than ordinary guns, and have a chamber for powder, like mortars. They were made standard navy guns in 1779, to be carried on the poop, fore-castle, and upper works. Being manageable by a smaller number of hands than guns, and being very useful in close engagements, they were held in much favor during the great war; the seamen called them "smashers." A 68-pounder carronade weighed not much more than half as much as the 42-pounder gun in use in 1779. They range from 68-pounders down to 6-pounders. The denominations, weights, lengths, caliber, etc., of the chief varieties of carronade are noticed under **CANNON**.

Some C. are made shorter with a given bore. C. are but little used, except by the English and French. Though valuable at close quarters, they are no match for long guns at a distance; and therefore a ship armed only with C. would fare badly in a general action. In recent years, C. have to a considerable extent been replaced in the English navy by howitzers, long guns, and shell guns.

CARRON OIL. See **BURNS**

CARROT, *Daucus*, a genus of plants of the natural order *umbelliferae*. They are mostly natives of the countries surrounding the Mediterranean sea. The common C. (*D. carota*) is a biennial plant, common in Britain and most parts of Europe, also in the Caucasus; and is universally cultivated not only in Europe and the European colonies, but in China, Cochin China, etc., for the sake of its root. The root of the wild plant is slender, woody, and of a very strong flavor; that of the cultivated variety is much thicker and more fleshy, much milder in its flavor and qualities, generally red, but sometimes orange or yellowish white. The sub-varieties in cultivation are also distinguished by their form—some being longer and more tapering than others—by their size, and by the duration of their growth; the *early* kinds being also comparatively small, and almost exclusively cultivated in gardens for culinary use, whilst the larger and *late* kinds are often also grown in fields, for feeding cattle. The field cultivation of the C. is carried on to a much greater extent in some parts of France, Germany, and Belgium, than in Britain; but it is increasing in Britain. The C. appears to have been cultivated at an early period in Flanders and Germany, and to have been introduced into the gardens of England in the beginning of the 16th century. In the reign of Charles I., ladies wore C. leaves as an ornament instead of feathers; and the beauty of the leaves is still occasionally acknowledged by placing a root, or the upper portion of one, in water, that it may throw out young leaves to adorn apartments in winter. The C. prefers a light and rather sandy soil, and often succeeds very well on a peat soil. It is very liable to the attacks of the larva of the crane fly (q.v.), by which the greater part of a crop is sometimes destroyed when the young roots are about the thickness of a quill; on which account, in gardens where there is particular reason to apprehend danger from this enemy, it is the practice to make a number of successive sowings, some of which may probably escape. As an article of food, C. contains a large amount of what are called heat-producing compounds, with a small proportion of flesh-forming matter. It consists essentially of starch, sugar, and albumen, along with a volatile oil, which communicates a flavor to many dyspeptics very unpleasant. The following is the composition of dried carrot:

Starch and sugar.....	93.71
Albumen.....	4.35
Red neutral substance (carotin).....	0.34
Fixed and volatile oils.....	1.00
Ash.....	0.60
	<hr/>
	100.00

C. is easy of digestion, and gently laxative. Boiled C. is used as a poultice for foul ulcers and other sores, and as a vermifuge. Grated C. forms an agreeable cooling but also stimulant application. A sirup is prepared from carrots; and when cut into small pieces and roasted, they are occasionally used in Germany as a substitute for coffee. A strong ardent spirit is distilled from them in some parts of Europe, 10 lbs. of carrots yielding about half a pint. C. seeds are employed as a diuretic, also as a carminative and stimulant; those of the wild C. being preferred.—Besides the crane fly, already noticed, carrots have numerous other insect enemies. One of the most troublesome is the carrot fly (*psila rosæ*), a small dipterous fly, the larvæ of which, by eating away the surface of the root, cause what is commonly known as *rust* in carrots, and prepare them for the further operations of millepedes and other destroyers. The larvæ of several species of moth (*depressaria*) are very injurious to them when in flower and seed. An aphid (*A. dauci*) often kills the young plants.

CARROUSEL (Fr.), a species of knightly exercise, which, down even to the beginning of the 18th c., was very common in all the courts of Europe. C. was a kind of imitation of the tournament, and for a time after the discontinuance of the latter, seems to have supplied its place. The dresses, for the most part, were those of the knights of former times, and the combatants, or rather competitors, were divided into two parties, usually according to their different nationalities. One of the favorite exercises in France consisted in running at the pasteboard head of a Moor or Turk with a lance, cutting it down with a sword, or firing at it with a pistol. Another of these tests of skill and horsemanship, if not of courage, consisted in carrying off a whole line of rings, which were suspended for the purpose. The C. in France was not known earlier than the reign of Henry IV.; but it had existed for some little time previously in Italy. There were brilliant carrousels under Louis XIII., and two celebrated ones were given in honor of Mademoiselle de la Vallière—the one at Paris in 1662, the other at Versailles in 1664. The place where the first of these fêtes was held, has ever since been called the place du carrousel. A revival of the C. was attempted at Berlin in 1750; and in 1828 the cavalry school at Saumur held one in honor of Madame la Duchesse de Berry. The so-called Eglinton tournament—an entertainment given some years ago by the chivalrous earl of Eglinton—was in reality a carrousel.

CARSE is a term applied in Scotland to low lands adjoining rivers. The word is of uncertain origin. In Stirlingshire, it is restricted in its sense to the level alluvial soils which are only a few feet above the river Forth. In Perthshire, it also applies to the whole of the slightly undulating lands to the n. of the Tay, which form the C. of Gow-

rie. C. soils usually consist of argillaceous deposits, which produce crops of great luxuriance, although there are some which consist of hungry and barren clays. The richest of them are of a hazel color, and become friable when exposed to the action of frost; the poorest, on the other hand, are of a yellow color, containing little vegetable matter to render them amenable to cultivation. The best kinds of C. soils are generally farmed on the six-course shift—1. Grass; 2. Oats; 3. Beans; 4. Wheat; 5. Potatoes; 6. Turnips or fallow. Large crops of grass are grown when the clover-plant catches. It is mostly made into hay, and the after-math is used for soiling horses and cattle in the straw-yards. The land is seldom pastured, as the feet of animals trample and destroy the grasses, when the weather is wet. The oat-crop is more uncertain on the carses, but in favorable years, the yield is large, and the quality of the grain is excellent. Beans are very successfully grown, indeed the best of the C. soils are the best bean-soils in Scotland. Where the land is rich, and not too stiff, the potato is sometimes largely grown. On the poorest description of the C. soils, the potato does not thrive. Wheat can be grown in closer succession on the C. lands, than on any other description of land with the same expenditure of manure. A large stud of horses are required on C. lands, to enable the farmers to prepare the land for the various crops, at the moment when the season suits. A small portion of the land is still usually summer-fallowed, as it is found that it cannot be kept thoroughly clean by green crops in rainy seasons.

CARSON, ALEXANDER, LL. D., 1776-1844; an Independent or Congregational preacher of the n. of Ireland, officiating at Tubbermore for 30 years, within which time he became a Baptist and an earnest advocate of their views.

CARSON, CHRISTOPHER, or "Kit Carson," b. Ky., 1809, d. Col., 1868; one of the most famous pioneers and scouts of the west. When about 24 years old he was appointed hunter to Bent's fort, where he remained eight years; he was then engaged as a pioneer in Fremont's explorations among the Rocky mountains. In 1847, he was made lieutenant in a rifle corps of the regular army. In 1853, he drove 6,500 sheep over the plains and mountains to California. He was afterward Indian agent in New Mexico, and was instrumental in making a number of treaties of importance. In the civil war he did good service on the borders, and was brevetted brig. gen. The remarkable adventures of "Kit Carson" often surpass the most extravagant romance, though the most daring of them are literally true. Personally he was as modest as he was brave.

CARSON CITY, the capital of Nevada, in Eagle valley, Ormsby co., 4 m. from Carson river, 178 m. n. e. of San Francisco, on the Virginia and Truckee railroad. It is in a picturesque region near the base of the Sierra Nevada, and only about 10 m. from lake Tahoe. There is a branch mint in Carson City which receives immense deposits of silver and gold ore. There are a state-house, several churches and schools, and many mining and manufacturing establishments. Pop. '70, 3,042. The state prison is 2 m. n. e. of the city.

CARSON RIVER, a stream in Nevada, rising in the Sierra Nevada, passing n. near Carson City and Lyon, and emptying into Carson lake, a body of water about 15 miles long, that appears to have no outlet.

CARSTAIRS, WILLIAM, a distinguished political and ecclesiastical character of the 17th c., who took a very active part in bringing about the revolution of 1688, was b. at Cathcart, near Glasgow, Feb. 11, 1649. He was educated at the village school of Ormiston, in East Lothian, and subsequently at the university of Edinburgh, where he displayed a remarkable aptitude for learning. In his 24th year, Scotland being then in a most unsatisfactory state, alike from a political and religious point of view, C. went to study theology at Utrecht. His scholarship, polite address, knowledge of men, and great political information, especially regarding his own country, recommended him to the notice of the prince of Orange, who chose him as his confidential adviser in all matters relating to Britain. In 1682, being in England on a mission of observation from Holland, he was employed to negotiate between the English and Scotch conspirators in the Rye House plot. With others implicated, he was arrested and put to the torture of the thumbscrew, but refused to confess anything that had not been previously revealed, and that only on condition that what he said should not be used in evidence, either directly or indirectly, against any other person. At this time, he had secrets from Holland of the greatest importance in his possession, which he carefully concealed, although there can be no doubt that their revelation would not only have saved him from torture, but have obtained for him great reward and honor. Britain, therefore, owes very much indeed to the firmness of C. at this juncture. He returned to Holland about the beginning of 1685; and, acting mainly on his advice, the prince of Orange planned and carried out the invasion of 1688. He accompanied the prince as chaplain, and after the settlement of the crown, when the prince had been firmly established as William III., C. was instrumental in effecting a reconciliation between him and the Scottish church, when the ill advice of other counselors had nearly led to an open rupture. From 1693 to the death of the king in 1702, he could not have had more influence in Scottish affairs if he had been prime-minister of the country; and his authority in church matters was such, that he was popularly called "cardinal Carstairs." He was elected principal of the university of Edinburgh in 1704, and in this capacity used all his influence with

government to obtain an increase of patronage for the Scottish colleges. In the same year, he was presented to the church of Greyfriars, and was appointed moderator of the general assembly next succeeding, an office to which he was four times elected in the course of eleven years. He died Aug., 1715, deeply regretted by the whole nation, and leaving a reputation for scholarship and sincere piety, as well as for unbounded charity and political sagacity rarely equaled. See *Life of U.*, by Rev. Dr. Story (1874).

CARSTENS, ASMUS JACOB, an eminent German artist, was b. near Schleswig, May 10, 1754. In 1762, he went to Copenhagen, where, when first introduced to the royal gallery of paintings and casts from the antique, he was so excited that he shed tears of joy. After staying seven years in the Danish capital, where he produced his "Baldur's Death," and "Eolus and Ulysses," supporting himself chiefly by portrait-painting, he commenced a journey on foot to Rome, but was obliged to return for want of means after reaching Mantua. He resided in Lubeck for some time, but through the kindness of a wealthy amateur artist named Rodde, he contrived to reach Berlin, where his great composition, the "Fall of the Angels" (with 200 figures), gained for him an appointment as professor in the academy, while his decoration of a saloon in the Dorville palace obtained for him an introduction to the king and a pension. He was now enabled to visit Rome, where he devoted himself to the study of the works of Michael Angelo and Raphael. His first work in Rome, a "Visit of the Argonauts to the Centaur Chiron," was distinguished by purity of style, beauty of forms, and fine distribution of light. His numerous subsequent drawings mostly represented scenes from the ancient classic poets, with subjects from Ossian, Dante, and Shakespeare. C. died May 26, 1798.

CART, a species of carriage with two wheels, in which respect it differs from the ordinary wagon that has four wheels. There are different kinds of carts, according to the nature of the goods or articles to be carried, and they also differ considerably in different countries. The C. is little seen in England, where the heavy and more capacious wagon takes its place. It is, however, used for agricultural and other purposes in Cumberland and adjoining northern counties. There, it differs only in a slight degree from the C. universally used in Scotland. The Scotch C. is an exceedingly convenient form of carriage for general merchandise, or for agricultural produce, and well adapted for being drawn on roads in a hilly country. A material advantage consists in its weight, being about only half a ton, while its usual load is from a ton to 22 cwt.; from which circumstance it is a particularly handy vehicle for comparatively light loads, and so far is superior to the English wagon, which is best adapted to carry huge loads of from two to three tons. In carrying hay, straw, or grain from the harvest-field, Scotch farmers employ a peculiar kind of C. without sides to admit of a bulky load; but they also, as occasion serves, use for a similar purpose an ordinary C., on which they place a movable frame. All grain for market is carried in the one-horse C., and a driver takes charge of two carts. The following advantages of one-horse carts are well enumerated by lord R. Seymour: "A horse, when he acts singly, will do half as much more work as when he acts in conjunction with another, that is to say, that two horses will, separately, do as much work as three conjunctively. This arises, in the first place, from the single horse being so near the load he draws; and in the next place, from the point or line of draught being so much below his breast, it being usual to make the wheels of single-horse carts low. A horse harnessed singly has nothing but his load to contend with; whereas, when he draws in conjunction with another, he is generally embarrassed by some difference of rate, the horse behind or before him moving quicker or slower than himself; he is likewise frequently inconvenienced by the greater or less height of his neighbor: these considerations give a decided advantage to the single-horse cart. The very great ease with which a low C. is filled may be added; as a man may load it, with the help of a long-handled shovel or fork, by means of his hands only; whereas, in order to fill a higher C., not only the man's back, but his arms and whole person must be exerted." To these just observations it need only be added that in many parts of England there is a wasted expenditure in horse-power, a pair of horses being often set to draw a clumsy wagon to market, containing a load which could with the greatest ease be drawn by one horse in a less ponderous machine.

The one-horse C. is employed by carriers all over Scotland, the load being usually piled high in a square form, and covered in with a woolen wrapper, in which state the C. is drawn 18 to 20 miles a day. See **CARRIERS**. In France and Germany, the carrier's C. is a more gigantic machine. Long in the body, very strong in construction, and poised on two high wheels with broad rims, this continental C. carries enormous loads, almost equal to what are seen in the large wagons of England. The ingenious manner in which the load is adjusted to rest exclusively on the wheels, and so relieve the single horse in the shafts, is matter of surprise to all strangers. All carts, whatsoever, in Great Britain, must bear the name and address of the owner, painted conspicuously on them, according to statute 1 and 2 Will. IV. c. 22. See **WAGON**.

CARTAGENA, a fortified seaport of Spain, on a bay of the Mediterranean, in lat 37° 36' n., long. 0° 57' w. It is built partly on the declivity of a hill, and partly on a plain extending down to the sea, and is inclosed by hills which screen it from all winds. The harbor is one of the best in the Mediterranean, capacious enough to hold the largest

fleets. The entrance is narrow, and completely commanded by the fortifications on an island called La Isoletta, on the south. It was formerly the largest naval arsenal not only in Spain but in Europe. The city, which is surrounded by walls, has a Moorish aspect; its streets, cathedral, and the ruins of an old castle being of that architecture. C. has manufactures of sail-cloth and glass, besides extensive blast-furnaces and smelting-works, and a trade in barilla, agricultural produce, and esparto grass. The tunny fishery is important, and its ancient silver and lead mines, recently re-opened, are again productive—the export of lead to Great Britain and France in 1873 being 32,000 tons. The zinc and iron ores amounted to 496,000 tons. In 1873, C. was seized by a communal junta, but was retaken by the national forces in 1874. Pop. of town and suburbs about 54,000. C., which was a colony of the Carthaginians, was built by Hasdrubal 242 B.C., under the name of New Cartage. It formed the head-quarters of the Carthaginians in Spain, and soon became a city of much wealth and influence. It was captured by P. Scipio in 210 B.C., and became of importance under the Romans, who are said to have employed 40,000 men daily in the mines in the neighborhood. It was sacked by the Goths, and did not again attain any note until the time of Philip II.

CARTA GO, a city in the state of Cauca, United States of Colombia, 130 m. n.w. of Bogota. It is in a salubrious and well cultivated region, and has a considerable trade in cotton, fruits, coffee, cocoa, and tobacco. Pop. 8,000.

CARTE, THOMAS, an English historian, distinguished for his industry and research, was b. at Clifton, in Warwickshire, where his father was parish minister, in 1686. Educated at Oxford, he afterwards took the degree of M.A. at Cambridge, and entering holy orders, was appointed reader at the Abbey church, Bath; but being attached to the Stuarts, he resigned his office rather than take the oaths to the new government. In 1722, he was suspected of having been concerned in the conspiracy of bishop Atterbury, whose secretary he was, and £1000 was offered for his apprehension; but he escaped to France, where he remained for some years. On his return to England, he published a life of the duke of Ormond, remarkable for the fullness of its information. In 1747–55, he published a *History of England*, bringing it down to the year 1654. This work is very valuable for its facts, but the author had not the capacity to grapple with these philosophically. Hume and other historians, however, have been much indebted to him for the materials of history. Among his other works was an edition of *Thuanus*; and at his death, in 1754, he left behind him 20 folio and 15 quarto volumes of MSS., in further illustration of the history of England to 1688, which have proved of great utility to subsequent writers. These are preserved in the Bodleian library, Oxford.

CARTEL, during a time of war, is an agreement between the belligerents for an exchange of prisoners. Sometimes the name is given to a ship, called by the French a *bâtiment parlementaire*, commissioned to convey the exchanged prisoners, or to carry messages to the enemy. A ship, when thus employed, must carry no cargo, ammunition, or implement of war, except one gun for signals.

CARTER, a co. in n.e. Kentucky, on Little Sandy river; 500 sq.m.; pop. '70, 7,509—100 colored. It has a rough surface, but near the streams the soil is good. The main business is agriculture. Co. seat, Grayson.

CARTER, a co. in s.e. Missouri, on Current river; 500 sq.m.; pop. '70, 1455. The surface is hilly and well wooded; productions, grain and tobacco. Copper and iron are found. Co. seat, Van Buren.

CARTER, a co. in n.e. Tennessee, on the North Carolina border, in the highest part of the state, watered by the Watauga, Doe, and affluents of Holston rivers; 350 sq.m.; pop. '70, 7,909—573 colored. A branch of the East Tennessee, Virginia, and Georgia railroad traverses the county. There are rich iron mines, but agriculture is the chief business. Co. seat, Elizabethtown.

CARTER, ELIZABETH, an English lady, remarkable for her classical attainments, and also for her knowledge of modern languages, was b. Dec., 1717, at Deal, Kent. Slow at first to learn, she afterwards displayed remarkable aptitude. In her 21st year she published a small volume of poems, and in the succeeding year she translated from the Italian of Algarotti *An Explanation of Newton's Philosophy for the Use of Ladies*. These publications brought her into note, and obtained for her the friendship of such men as bishop Butler, archbishop Secker, sir Joshua Reynolds, Burke, and Dr. Johnson, the latter of whom especially held her in great esteem, and had the highest opinion of her proficiency as a Greek scholar. A translation of Epictetus which she made, was most favorably received by the literary press of her time, both at home and abroad. She died unmarried. Feb., 1806, at the age of 89.

CARTERET, a co. in e. North Carolina, on Pamlico sound and the Atlantic ocean, traversed by the Atlantic and North Carolina railroad; 450 sq.m.; pop. '70, 9,010—2,725 colored. Much of the surface is occupied by swamps and pine forests. Productions mainly agricultural. Co. seat, Beaufort.

CARTERET, JOHN, EARL GRANVILLE, a distinguished orator and statesman of the 18th c., was b. April, 1690, his father being baron Carteret of Hawnes, Bedfordshire. His education, commenced at Westminster school, was completed at Oxford. From the latter

place, according to dean Swift's humorous assertion, he carried away more Greek, Latin, and philosophy than was at all becoming a person of such high rank. Introduced into the house of peers in 1711, he spoke in favor of the Protestant succession, and in consequence received the early notice of George I., and obtained some lucrative appointments. In 1718-19, he was appointed ambassador extraordinary to Sweden, and in the following year succeeded in concluding a peace between Sweden, Prussia, and Hanover. In 1721, he was appointed secretary of state, and in this capacity defended with great zeal the proceedings of government in the Atterbury conspiracy. In 1724, he was made lord lieutenant of Ireland. During his vice-regency, he was in constant intercourse, and held frequent discussion, with dean Swift about public affairs. His lord lieutenantancy, which lasted from 1724 to 1726, and again from 1729 to 1730, was popular, particularly the latter period. From 1730 to 1742, he was one of the most able and determined of the leaders of the opposition in the house of lords against sir Robert Walpole, and on his displacement, was made a secretary of state. On the death of his mother, in 1744, he succeeded to the title of earl Granville, and in the same year had to resign his seals of office, the Broad-bottom administration (q.v.) expressly excluding him; but he continued to receive marks of the royal favor. C. was a most liberal patron of men of letters. He died Jan., 1763.

CARTERET, PHILIP, an English naval officer who commanded the *Swallow* on a voyage of discovery in the South seas in 1766-67. He was gone 2½ years, and made some discoveries, among them an island to which he gave his name.

CARTESIAN PHILOSOPHY. See **DESCARTES**, *ante*.

CARTHAGE, a city in s.w. Missouri, in the lead regions, on the line of the Memphis, Carthage and Northwest railroad, 220 m. s.w. of Jefferson City; pop. about 300. On July 5, 1861, a force of confederates under gen. Jackson and gen. Price, consisting of about 3,500 men, while retreating from the main army of gen. Lyon, were, at a point about 7 m. e. of Carthage, confronted by gen. Sigel with about 1500 union troops. Gen. Sigel, being superior in artillery, gave battle, which continued several hours with much loss to the confederates, when, to prevent the confederate cavalry from outflanking him and to protect his baggage train, gen. Sigel fell back in good order, and continued his retreat to Carthage and Sarcocie, 15 miles to the east. The union loss was 50 in killed and wounded, that of the confederates was reported to be 50 killed and about 150 wounded.

CARTHAGE, called *Carthāgo* by the Romans, *Carchēdon* by the Greeks, both of which are but forms of the native name *Karth-hadtha*, i.e., "New Town" (found on ancient coins), was the greatest city of antiquity on the n. coast of Africa, and was situated in what now constitutes the state of Tunis, on a peninsula extending into a small bay of the Mediterranean sea. It was founded, according to legend, by Dido (q.v.), a Phœnician queen, who had fled from Tyre after the murder of her husband, almost nine centuries before the Christian era, but more probably (like the Anglo-Indian Calcutta) it originated in an emporium or *factory* established by the colonial merchants of Utica, and the capitalists of the mother-city Tyre, on account of the convenience of its situation. Unfortunately, we know very little of its growth. Our information only begins after C. had become one of the greatest commercial cities of the world, and we have but very scanty and one-sided accounts of it even then. The number of the inhabitants before its destruction amounted to about 700,000. The population was partly of Phœnician, partly of Libyan descent. The territory which the Carthaginians acquired by the subjugation of the Libyan tribes, and by the ultimate annexation of other older Phœnician colonies, with which they had at first been simply in alliance, such as Utica, Hadrumetum, Tunis, Hippo, the two Leptes, etc., extended in the middle of the 5th c. b.c. southward to lake Triton, eastward to the Great Syrtis, and westward to Hipporegius (now Bona). The maritime power of the Carthaginians enabled them also to extend their settlements and conquests to the other coasts of the Mediterranean. In the 6th c. b.c., they were masters of Sardinia, and had begun to contend for the possession of Sicily. Hanno (q.v.) founded colonies on the w. coast of Africa beyond the straits of Gibraltar, and Himilco visited the coasts of Spain and Gaul. The relations of C. to foreign states in earlier times are not very clear. The first treaty with the Romans was concluded in 509 b.c.; the second, in 348 b.c.; the third, in 306 b.c. The connected history of C. begins with the 5th c. b.c., a period of wars between the Carthaginians and the Greeks in Sicily. The Carthaginian army under Hamilcar was destroyed by Gelon at Himera in 480 b.c. It was not till 410 b.c. that the war began which ended in the conquest by the Carthaginians of some parts of the island. Dionysius the elder, or rather the pestilence working for him, put a stop to their conquests, but did not succeed in expelling them. War raged almost constantly between Dionysius and the Carthaginians. The more feeble reign of Dionysius the younger afforded them an opportunity of extending their conquests, yet they were frequently repelled and defeated by the Sicilian Greeks; and during 311-301 b.c., Agathocles carried the war into Africa, and attacked C. itself. After his death, the Carthaginians again increased their dominions in Sicily, and although Pyrrhus contended successfully against them at first, he left that island entirely in 275 b.c. The subjugation of the s. of Italy by the Romans, brought the two great and conquering nations into collision, and the first Punic war arose, 264 b.c., and after

a great naval victory of the Romans, terminated in 241, the Carthaginians giving up Sicily, Sardinia, and Corsica, and paying to the Romans a large sum of money. Soon after this, a mutiny of the hired troops of C., combined with an insurrection of the Libyan tribes, the ancient inhabitants of the country, who were kept down by the arbitrary rule of the Carthaginian colonists, threatened the entire ruin of the city. Hamilcar brought that bloody war, however, to a successful termination, and led an army to Spain, where he, and after him Hasdrubal, obtained great successes. Here was founded New C., now Cartagena (q.v.). After Hasdrubal's death, 221 B.C., Hannibal (q.v.), burning to revenge the defeat which his native city had sustained from the Romans, broke the treaty with them, and took Saguntum, 219 B.C. Thus began the second Punic war, in which Hannibal pursued his career of conquest from Spain, through Gaul, and across the Alps into Italy itself, defeated the Romans with terrible slaughter in various battles, and, by that of Cannæ in particular, brought Rome to the very brink of ruin. Yet the war terminated in the total defeat of the Carthaginians by Publius Cornelius Scipio, who overthrew their power in Spain, and was victorious over Hannibal in the final and decisive battle of Zama, in Africa, in Oct., 202. A peace was then concluded, in which the Carthaginians were limited to their African territories; but most of their ships of war and war-elephants were taken from them, besides an immense sum of money, and they were taken bound not to make war without permission of the Romans. Massinissa, king of Numidia, skillfully availed himself of dissensions which arose within C. between the nobles and the people, to advance his own interests at the expense of the Carthaginians; and as they (151 B.C.) opposed him, and drove his adherents out of the city, the Romans seized the opportunity for a new declaration of war, 149 B.C., on the ground that the treaty was broken; and after a siege of two years, C. was taken by Publius Cornelius Scipio Æmilianus, 146 B.C. For six days the combat was maintained in the streets of the city, and for seventeen days the work of its destruction by fire was carried on by the conquerors. The country became a Roman province. C. Gracchus sent out 6,000 colonists to found a new city on the site of Carthage. It was called Junonia, but it did not prosper. Augustus, carrying out the intention of his great uncle, restored the city, and the new C. had become, in the second and third centuries of the Christian era, one of the finest cities of the Roman empire. In 439 A.D., Genseric made it the capital of the Vandal kingdom; Belisarius conquered it in 533, and named it Justiniana; the Arabs under Hassan utterly destroyed it in 647 A.D.; and now only two or three small hamlets and a few ruins mark its site.

We have not very satisfactory accounts of the constitution of the Carthaginian state. It is certain that it was oligarchical, and that the chief power was in the hands of the great families (*gentes*), from whose members the senate, amounting to 300, was chosen. This senate appointed, as it were, a more select council of 30, and sometimes a still smaller one of only 10, at the head of whom were two *suffetes* (probably the same as the Hebrew *shofetim*, "judges"), but it is not certain what relation these bore to one another, or how their power was apportioned between them. We can gather dimly, from various scattered statements, that the Carthaginian oligarchy, while despising the multitude, was itself split up into factions, and torn by family jealousies. Corruption largely prevailed; and it would perhaps have been better for the country if the power had been in the hands of a popular despot than of a band of insolent and tyrannical nobles.

The Carthaginian army was raised from the conscription of the subjugated Libyans, from the hired Numidians, and from slaves. In the time of Agathocles, the city sent forth 40,000 heavy armed infantry, 1,000 cavalry, and 2,000 war-chariots, but the state could easily raise 100,000 troops. The fleet in the first Punic war consisted of 350 ships, carrying 150,000 men. How C. contrived to raise revenues sufficient to cover the enormous expense her military and naval organization involved, is not very clear. It was, in all likelihood, derived from tribute imposed on subject Libyan or Numidian races, in great part from mines in Spain, and from import duties derived from her maritime and inland trade, which was prodigiously great. Her merchantmen visited every coast and island of the Mediterranean, and even ventured as far as the Azores, Britain, the Baltic, etc.; while her caravans penetrated through Sahara to the gold-producing districts of the Niger, and through the Libyan desert to the lands along the Nile.

The religion of the Carthaginians appears to have been substantially the same as that of the Phenicians—a worship of the stars and of fire. Moloch was the chief deity, and to him children and captives were sacrificed. The highest natural manifestation of this deity was the sun. Besides Moloch, the Carthaginians worshiped the Tyrian Hercules; Astarte, the goddess of the elements; Esmun, the god of the celestial vault; and a variety of heros, heroines, and genii or spirits, such as the Genius of Death, Hamilcar (who fell at the battle of Himera), Dido, the brothers Philæni, etc., as well as a few of the lesser Greek divinities, of whom a knowledge had been obtained in Sicily. It does not appear that there was a distinct sacerdotal order in Carthage. Probably religious ceremonies were performed by the dignitaries of the state, but our knowledge on this interesting point is too meager to permit of our arriving at any very definite conclusion.

CARTHAGE, a headland of n. Africa, jutting out into the Mediterranean, in lat. 36° 52' n., lon. 10° 22' east. Traces of the ancient city of Carthage (q.v.) are found on it to the n. of the Tunis lagoon.

CARTHAGENA, capital of the state of Bolivar, one of the United States of Colombia. It stands on the Caribbean sea, a little to the s.w. of the mouth of the Magdalena, in lat. $10^{\circ} 26'$ n., long. $77^{\circ} 54'$ w., having the best harbor on the coast, with a naval arsenal and strong fortifications. Its population is estimated at 10,000, not more than one-tenth being white. The temperature ranges from 80° to 86° F.—the air, however, being dry and healthy. In the history of Spanish America, and more especially in that of the war of independence, the city occupies a prominent place.

CARTHAGENA (*ante*), a fortified seaport of the United States of Colombia, founded by the Spaniards, 1508. The city is noted for its fortifications, convent buildings, and fine harbor. The walls and defenses were completed in 1717, at a cost of \$59,000,000. In 1585, C. was sacked by the English under sir Francis Drake, and in 1741, besieged by the fleet of admiral Vernon. In 1860, gen. Mosquera abolished the convent system, allowing priests and nuns but 48 hours to leave the city. The climate is dry and hot, but salubrious, although C. has been ravaged at intervals by yellow fever. There is a small export of caoutchouc, tobacco, hides, and other interior products. The population, which in 1800 was about 25,000, is now reduced to 3,000.

CARTHAGENA BARK. See CINCHONA.

CARTHA GO, a term of various application in Central America.—1. An almost land-locked bay or lagoon of the Caribbean sea, near the n.w. extremity of the Mosquito shore.—2. A river entering the same from the s.s.w., about lat. 15° n., and long. 84° west.—3. A river of Costa Rica, flowing into the gulf of Nicoya, an inlet of the Pacific, near lat. $9^{\circ} 36'$ n., and long. $84^{\circ} 30'$ w.—4. A city, or rather the ruins of one, on the same, about 60 m. from its mouth. Down to 1841, it was the capital of Costa Rica; but being in that year all but destroyed by an earthquake, it was supplanted by San José, previously its superior in wealth and importance, about 15 m. to the w.n.w. of itself. The volcano of its own name, doubtless connected with its overthrow, is valuable as a landmark to mariners.

CARTHA GO NOVA. See CARTAGENA, *ante*.

CARTHAMINE, or **CARTHAMEINE**. The dye so called is obtained by a chemical process from safflower (q.v.), (*carthamus tinctorius*) in crystals which are insoluble in water, but slightly soluble in alcohol and ether. When newly precipitated, C. immediately and permanently attaches itself to cotton or silk, but not to wool, requiring no mordant, dyeing the fabric a fine red, which is changed to yellow on the addition of alkalies, and may be returned to red again on being treated with acids.

CARTHUSIANS, a monastic order which owes its origin to St. Bruno, who retired in 1086 with six companions to the solitude of La Chartreuse (whence the name), near Grenoble, where they built hermitages, wore rude garments, and lived upon vegetables and coarse bread. In 1134, the fifth prior, Guigo, composed a body of rules, called the *Statuta Guigonis* or *Consuetudines Cartusie*, but they have been often changed. After 1170, when the order received papal approbation, it extended rapidly. It dates from 1180 in England, where the name of Chartreuse-houses was corrupted into charter-houses. The C. were divided into two classes, fathers (*patres*) and brothers (*conversis*). Each occupied a separate cell, with a bed of straw, a pillow, a woolen coverlet, and the means of manual labor or of writing. They left their cell, even for meals, only on festivals and on days of the funeral of a brother of the order. Thrice a week, they fasted on bread, water, and salt, and there were several lengthened fasts in the year. Flesh was forbidden at all times, and wine, unless mixed with water. Unbroken silence, except on rare occasions, was enforced, as well as frequent prayer and night-watching. These austerities were continued, with little modification, by the modern Carthusians. The order at one time counted 16 provinces, and can still boast some of the most magnificent convents in the world—as *La Grande Chartreuse*, near Grenoble, and *Certosa*, near Pavia. They were given to hospitality and works of charity, and were on the whole better educated than the mendicant orders. Their principal seats were in Italy, France, and Switzerland; but they have shared the fate of the other monastic establishments, and their convents are now for the most part solitudes indeed. The Carthusian nuns arose at Salette, on the Rhone, in France, about 1229. They followed the rules of the Carthusian monks, but with some mitigations, of which the most notable is that they have a common refectory.

CARTIER, SIR GEORGE ÉTIENNE, 1814-73; a lawyer of Canada, educated at St. Sulpice, Montreal. He was one of the Papineau "rebels" in the abortive revolution of 1837-38, but was forgiven; and became a member of the provincial legislature, secretary, and attorney-general. In 1858, he became premier. He was instrumental in abolishing feudal tenure in Lower Canada, in making the legislative council elective, in codifying the laws, in decentralizing the judiciary, and in bringing about the confederation of the colonies.

CARTIER, JACQUES, b. 1494, in Brittany. In 1534, he sailed from St. Malo in command of two ships to explore the n.e. coast of America. He touched at cape Buenavista, Newfoundland, passed up the straits of Belle Isle and discovered the mainland of Canada, which he claimed for France. The next year, with another expedition, he sailed up the St. Lawrence as far as Hochelaga, a large fortified native village at the foot of a

hill, which he named Mont Royal (now Montreal). Disgusted with the severe climate, and his men being sick with scurvy, he went back to France in 1536, and nothing was done towards colonization until 1540, when Jean Francis de la Roche, sieur de Roberval, obtained leave to form a settlement. In 1541, Cartier was sent out in command of five ships, and near the present Quebec he built a fort and named it Charlesbourg; but the Indians, whose chief he had carried off in his previous voyage, gave him so much trouble that he returned to France. Cartier appears no more in public life except as seigneur of his native village of Limoilin, where he was living as late as 1552.

CARTILAGE is a firm elastic substance, of a pearly whiteness, presenting to an unaided eye a uniform and homogeneous appearance. Cartilages may be divided into the *temporary*, the *permanent*, and the *accidental*. The *temporary* cartilages are substitutes for bone in the earlier periods of life, and after a certain time become ossified. See **OSTEOLOGY**. At birth the extremities and larger eminences of the long bones, and the margins of the flat bones are still cartilaginous, and this C. does not altogether disappear till the period of puberty. The *permanent* cartilages are either *articular* or *non-articular*. *Articular* cartilages are attached to the extremities of bones, and enter into the formations of joints. *Non-articular* cartilages are usually more flexible than the articular. They are sometimes attached to bones, to lengthen them out, as, for instance, in the nose, the auditory canal, and the Eustachian tube. See **HEARING, ORGANS OF**. In other cases they form the basis of distinct organs, as the larynx, the trachea, and the eyelids. *Accidental* cartilages are cartilaginous concretions, which are occasionally found in situations where they do not normally occur, and are of no general interest. The physical properties of cartilages, especially their elasticity, resisting power, and incapability of extension, are such as to fit them admirably for the functions which they have to perform in the animal economy. A brief notice of the microscopical characters of C. will be found in the article **CELLS**, and a reference to its chemical composition will be found in the articles **GELATINOUS TISSUES** and **GLUTEN**.

CARTILAGINOUS FISHES are those fishes which have a skeleton destitute of bony fibers. In some of these fishes, the skeleton is merely rudimentary, so that they seem to form an intermediate link between vertebrate and invertebrate animals. In the lancelets (q. v.), (*amphioxus*), it consists of nothing more than a slender, transparent, flexible dorsal column; in *myxine* also it is a soft flexible tube, without appearance of vertebræ or of ribs; in the lampreys, the dorsal column is still a mere cylinder of cartilage, without any notable division into segments; whilst even in the sturgeon, the center of the backbone is a continuous gelatinous cord, and in the sharks the vertebræ are formed of hollow cones, meeting at their apexes in the middle, and having their cups filled with the remains of the gelatinous cord, an arrangement from which result great elasticity and flexibility. In many instances, even in the higher C. F., several vertebræ are united in a single piece; in all of them the skull is formed of a single piece without sutures, although the general form agrees with that of the skull of other fishes, and the same parts or regions may be recognized. The calcareous matter present in the skeleton is always deposited in a granular manner, giving a characteristic dotted appearance; but even in the skull of the basking shark, one of the most highly organized, the earthy matter has been found to form little more than 3 per cent of the whole substance; in the skeleton of the lamprey, it is only 1½ per cent. In other parts of their organization, C. F. differ from each other very widely; some of them possessing the organs of the senses in as great perfection as any fishes whatever, whilst in others these organs are very imperfectly developed. Linnæus placed the C. F. along with batrachian reptiles in his class *amphibia*. By the general consent of naturalists, however, they are placed in the class of fishes. Cuvier, referring to the very different degrees of organization which they exhibit, says "they form a series ranging parallel to the bony fishes just as the marsupial mammalia range parallel with the other ordinary mammalia." Owen and others, admitting the justice of this view, have, however, pointed out in the C. F. generally, characters corresponding with those of the osseous fishes in their embryotic state, and with the permanent or mature conditions which prevailed among the fishes of some of the older geological periods. One remarkable characteristic even of the higher groups of C. F.—sturgeons, sharks, rays, etc.—is the *heterocercal* tail, the vertebral column being prolonged into the upper portion of the caudal fin, and the lower one given off on its under side, as in the fossil fishes generally of the old red sandstone and other oldest fish-producing rocks. Cuvier divided C. F., or *chondropterygii* (Gr. cartilage-finned) into 3 orders: *sturiones* (sturgeon, chimera, etc.), having the gills free, and gill-openings with a lid, like the osseous fishes: *selachii* (sharks and rays), having the gills fixed, and consisting of folds of membrane on a plane surface, with numerous gill-openings, the jaws movable as in other fishes generally; and *cyclostomi* (lampreys, etc.), also having fixed gills and numerous gill-openings, the mouth adapted for sucking. Müller and Owen, however, separate the *cyclostomi* of Cuvier from the other C. F., on account of important anatomical differences, particularly in the structure of the heart, which in the *cyclostomi* wants the *bulbus arteriosus*, or thick muscular swelling of the commencement of the arterial system close to the ventricle; whilst this, which may, in fact, be considered as a third chamber of the heart, is present in the *sturiones* and *selachii*, and within it, are 3 or more longitudinal rows of valves; characters derived from the vascular system being

deemed by these great naturalists of the highest value in determining the arrangement of the class of fishes. The lancelets occupy a place by themselves, from their absolutely wanting a heart, and having the circulation carried on by the muscularity of the entire vascular system.

CARTOON (Ital. *cartone*, pasteboard; from Lat. *charta*, paper). In the fine arts, C. is a design on strong paper, of the full size of a work to be afterwards executed either in fresco, oil color, or tapestry. The object of the artist in preparing a C. is, that he may adjust the drawing and composition of his subject in circumstances in which alterations can be effected with facility, before proceeding to the execution of the work itself. Cartoons are generally composed of a number of sheets of stout paper or pasteboard, pasted together at the edges, and stretched on a frame. The surface is sometimes *primed*, or washed with a ground-color; but more frequently this process is dispensed with. The drawing is made either in chalks or in *distemper* (q.v.), in which latter case the C. itself has very much the appearance of a fresco. Frequently only two colors are used, merely for the purpose of producing light and shade, in which case the C. is said to be in *chiaro-oscuro*. The C., when finished, is transferred to the canvas or plaster on which the work is to be executed, either by tracing with a hard point, or by pricking with pins, charcoal in both cases being used. Sometimes lines are simply drawn across it, or, if it is wished to preserve it from injury, threads are stretched across it from pins placed at the required distances along the edges. In *fresco* painting (q.v.), the plaster on which the work is executed must be kept wet, in order that it may absorb the color, and consequently only a small portion can be executed at a time. For this reason, the C. must be traced in small compartments of the size that the artist can finish without stopping. It is here, consequently, above all, that the necessity for the previous execution of a C. is greatest, as it would be impossible to sketch the whole design on the plaster in the first instance. But the great masters used such studies in *chiaro-oscuro* as guides to them in almost all their more extensive works, and many of these monuments of their care, as well as of their genius, have been preserved. We have cartoons of Andrea Mantegna, Domenichino, the Caracci, etc.; but the finest specimens of cartoons in existence are those of Raphael at Hampton court. These marvelous conceptions were sent to Flanders in the reign of Leo X., in order that they might be copied in tapestry in two sets, one of which was designed for the pope, the other for a present by the pope to Henry VIII. of England. The tapestries, which are very inferior to the designs, are still in existence. One set is in Rome, the other was in England till the death of Charles I., when it was purchased by the Spanish ambassador and carried to Spain. At a recent period it was brought to London and offered for sale, but as no English purchaser was found, it was again carried to the continent. For many years the cartoons, originally twenty-five in number, lay neglected at Brussels, and many of them were destroyed. The seven now at Hampton court were at length purchased by Rubens for King Charles I. It is an instance of Cromwell's good sense, in a direction in which it was not often exhibited, that at the dispersion of the royal collections, these cartoons were purchased for the nation by his special command. So low was the artistical taste of the time, however, that whilst the "Triumph of Julius Cæsar," by Andrea Mantegna, still at Hampton court, was valued at £2,000, the cartoons of Raphael were set down at £300! In Charles II.'s time, these remarkable works were again consigned to oblivion. An attempt was made to have them copied in tapestry, by which they were seriously injured. William III., strangely enough, followed in Cromwell's footsteps in appreciating what Charles II. had neglected. He had the cartoons restored, and built a gallery for them at Hampton court, where, with the exception of a visit to Windsor in George III.'s time, they have since sojourned. The following are the subjects represented: 1. Paul Preaching at Athens; 2. The Death of Ananias; 3. Elymas, the Sorcerer, struck with Blindness; 4. Christ Delivering the Keys to Peter; 5. The Sacrifice at Lystra; 6. The Apostles Healing the Sick at the "Beautiful Gate" of the Temple; 7. The Miraculous Draught of Fishes. Our space and our design equally preclude us from attempting any statement of the merits of these exquisite compositions. Several of the lost cartoons are partially transmitted to us by engravings, some of which were executed from the tapestries; others, it is believed, from the originals. The subjects of these are—1. The Adoration of the Kings; 2. Christ appearing to Mary Magdalene; 3. The Disciples at Emmaus; 4. The Murder of the Innocents; 5. The Ascension. These were engraved, along with the others, by Somereau, a French engraver, in 4to. Other cartoons of Raphael exist—one the property of the duke of Buccleuch, and two in the possession of the king of Italy, which are said to have belonged to the set sent to Flanders. There is also a portion of one in the national gallery in London, but it is now painted over with oil color. The best engravings of the cartoons at Hampton court are by Dorigny, Audran, and Holloway; but in future it is probable that they will be more known to the public by means of photographs, of which Messrs. Colnaghi and others have already produced very beautiful specimens.

CARTOUCH is a word much used in the French military service, but less frequently in the English. The name was once given to a wooden case containing 200 to 300 musket-bullets, and 8 or 10 1-lb. balls, fired from a mortar or howitzer in defense of a

ditch or intrenchment; but such missiles have been superseded by others. The cartridge-box carried by the soldiers used to be called a C. in England, and still is in France.

CARTOUCHE, the name by which the French, and we after them, designate the ovals on which the hieroglyphic characters for the names of Egyptian kings are sculptured. See **CAVO-RILIEVO**. C. is also used to signify a tablet, either for ornament or to receive an inscription, so formed as to resemble a sheet of paper or parchment, with the edges and ends rolled up. Cartouches are often seen on tombs. The same term is sometimes applied to modillions, or brackets supporting a cornice.

CARTOUCHE, LOUIS DOMINIQUE, 1693-1721; the leader of a band of robbers and assassins in France, whose crimes created great terror in Paris. For many years he eluded the police, but at last was arrested by chance in a low drinking-house. He had a long trial, which created a great deal of interest, and was finally sentenced to death, and broken on the wheel before an immense assembly of approving spectators.

CARTRIDGE is a cylindrical case made to contain either the whole or a part of the materials for discharging from a fire-arm. Those for ordnance or large guns are chiefly made of serge and flannel, sewn up into the form of a bag, which, supplied with a given weight of powder, is tied round the neck, and strengthened by iron hoops. The weight of powder varies from about 300 lbs. for an 81-ton gun, to a few ounces for a mountain gun.

Cartridges for small-arms which load at the muzzle are usually paper tubes, containing a leaden ball and a few drachms of powder. The tubes are made in such a way that the powder has two or three thicknesses of paper around it, while at the mouth of the tube and over the bullet there is only one. The paper over the bullet is lubricated generally with a composition of beeswax and tallow. In loading, the paper at the mouth of the tube has to be twisted or bitten off; the powder is then poured into the barrel, the tube reversed, and the bullet inserted into the muzzle, and the tube broken away. Cartridges for breech-loading small-arms are generally formed of a thin sheet of brass coiled into a cylinder, and having an iron case, in the center of which is the percussion arrangement. Those used for the Snider and the Martini-Henry rifles are described in the article on **BREECH-LOADING ARMS**. Besides the C. case of coiled brass, there are others made of solid brass or copper (an American invention), and these seem to be gaining favor abroad, the Prussians having adopted such a case for the new Mauser rifle.

For muzzle-loading shot guns, the chief cartridges used contain a charge of shot packed in a paper cylinder of a size suitable for the bore of the gun. Some of these, in addition to the paper covering, are surrounded with a wire net-work, for the purpose of increasing the range and penetration.

The C. for breech-loading shot guns is usually a stout cylinder of paper with a metal case. They are made of various sizes to suit the different calibers of guns, and with pin or central fire ignition. In the pin-fire C., a small brass pin passes through the side of the case into the percussion cap, and protrudes through a small hole in the top of the barrels. The pin is struck by the hammer of the gun, and forced into the percussion cap, which explodes, and ignites the powder. In the central-fire C., the cap is in the center of the case, and is exploded by the hammer of the gun acting on a piston contained in the false breech.

In America, a solid brass C. case is often used for shot guns.

For sporting rifles, the cartridges are quite as numerous and as varied as for shot guns. With large-bore rifles the same C. case is generally used as for shot guns, but loaded with powder and ball (spherical, solid conical, hollow conical, or shell). For small-bore, or what are known as express rifles, either a coiled brass C. case, similar in construction to that for the Snider or Martini-Henry rifle, but made to contain a larger charge, or a solid brass case is used. The coiled case can be reloaded twice or thrice, while the solid case can be reloaded as often as twenty times, and on this account the latter is rapidly gaining favor with sportsmen in India and Africa. The express C. contains a very heavy charge of powder, with a light hollow conical bullet giving very great velocity, low trajectory, and immense killing power. In the Henry express C., the charge of powder is 4 drachms, while the bullet weighs only 270 grains.

Cartridges for breech-loading pistols and revolvers are generally small metal cylinders containing a charge of powder and a bullet, and with rim, pin, or central fire ignition, the diameter varying from .230 of an inch upwards.

CARTRIDGE-PAPER, a light-colored strong paper, originally manufactured for soldiers' cartridges (q.v.), is extensively used in art, its rough surface being useful for certain kinds of drawing.

CARTWRIGHT, EDMUND, celebrated on account of his invention of the power-loom, was b. April 24, 1743, at Marnham, Nottinghamshire. Educated at Oxford, he obtained a living in the English church, and devoted himself exclusively to his ministerial duties and to literature, until a casual conversation, in 1784, directed his attention to machinery, and in 1785 he exhibited his first power-loom (q.v.) in action, an ingenious though very rude machine; upon which, however, he subsequently effected improvements rendering it almost perfect. Its introduction was vehemently opposed, and a mill fitted up with

500 of his looms was ignorantly and maliciously burned down. C., in 1790, took out a patent for combing wool, and secured patents for various other improvements in connection with manufactures. But his patents yielded him little return, and, in 1809, government, in consideration of his inventions, granted him £10,000. C. was the author of a legendary poem, entitled *Arminia and Eleira*, and other poetical pieces. He died Oct., 1823.

CARTWRIGHT, JOHN, 1740-1824; usually called maj. C.; in the English navy in his youth. He was present at the capture of Cherbourg, and subsequently on the Newfoundland station, when he was appointed chief magistrate of the settlement, discharging the duties of the office with great ability for five years. When the dispute with the American colonies began, he espoused their cause, declining to fight against them, and thereby rejecting an almost certain high military or naval promotion. In 1774, he published *American Independence the Glory and Interest of Great Britain*. The next year he was appointed maj. in the Nottingham militia, which position he served for 17 years, being finally superseded because of his political opinions. In 1776, he appeared in print as the advocate of parliamentary reform, and thenceforth devoted his life to the attainment of universal suffrage and annual parliaments. In 1778, he was an unsuccessful candidate for Nottinghamshire, and the same year founded the "society for constitutional information," a body which embraced many of the distinguished men of the day, and from which organization rose the famous "corresponding society." His work in the furtherance of reform was incessant. In 1819, he was indicted for conspiracy, found guilty the following year, and sentenced to pay a fine of £100. He spent his last years in London. He was married, but left no children. In 1831, a monument to him was erected on Burton Crescent.

CARTWRIGHT, PETER, D.D., 1785-1872; a native of Virginia; settled in early life in Kentucky, where, in 1806, he was ordained a deacon in the Methodist Episcopal church. He was subsequently regular preacher and presiding elder, and a member of every quadrennial conference from 1816 to 1860, and once more in 1868. He was a zealous worker, in the course of 33 years preaching about 15,000 sermons, and baptizing 12,000 converts. C. was widely known for his homely but powerful preaching; and interesting stories are told of his daring and romantic adventures among the rough backwoodsmen. Many of these can be found in his *Fifty Years a Presiding Elder*, and in the *Autobiography of Peter Cartwright, the Backwoods Preacher*.

CARTWRIGHT, SAMUEL A., b. Va., 1793; d. about 1863. He studied medicine under Dr. Rush and graduated at Pennsylvania college. During Jackson's campaigns against the Indians and the British he was surgeon-in-chief, and, after 1815, settled in Alabama and afterward in Natchez, Miss., where he labored for a quarter of a century. Dr. C. wrote many valuable papers upon fevers, cholera, and other diseases.

CARTWRIGHT, THOMAS, a distinguished Puritan divine of the 16th c., was b. in Hertfordshire, about 1535. He studied at Cambridge, where, in 1570, he was chosen Margaret divinity professor. His lectures here were too honestly critical of the polity of the church to be acceptable to the chief authorities, who deprived him of his professorship, and subsequently of his fellowship. C. traveled on the continent, and made the friendship of such men as Beza, who, in a letter concerning him, says, "I think the sun doth not see a more learned man." On his return to England, he again became embroiled with the church and the government, and for his non-conformity suffered imprisonment several times. He died Dec., 1603. He wrote *A Confutation of the Rhemish Translation, Glosses, and Annotations on the New Testament*.

CARUS, KARL GUST., a German scholar, physiologist, physician, and artist, was b. at Leipsic, 3d Jan., 1789. He first attracted notice by a series of lectures on comparative anatomy, delivered in his native city about the year 1812. After having superintended, during the war of 1813, the French hospital at Pfaffendorf, he went to Dresden, where he was appointed professor of midwifery in the newly organized medico-chirurgical academy, but resigned his office when elected court physician and counselor of state. His house was the rendezvous of all the most distinguished savants and artists in Dresden. C. wrote a vast variety of works, some of which are marked by original and striking views, as, for instance, *Ueber den Kreislauf des Blutes der Insecten*, in which he demonstrates the circulation of the blood in insects. He died in July, 1869.

CARUS, MARCUS AURELIUS, 222-83; Emperor of Rome; supposed to have been the son of a noble Roman lady and an African father. On the assassination of Probus in 282, C. was proclaimed emperor by the legions. He was victorious over the Sarmatians, and in a winter campaign in Asia, he carried his arms beyond the Tigris. He died very suddenly in camp, and it was given out that he had been struck with lightning.

CARVAHAL', or CARBAJAL, TOMAS JOSÉ GONSALEZ, 1753-1834; poet and statesman of Spain; educated at Seville. He held a number of offices of importance, and in 1812, became director of the university of San Isidore, where, by establishing a chair of international law he offended the government, and was imprisoned for 5 years. He was reinstated by the revolution of 1820, but forced into exile by the counter-revolution 3 years later. He died a member of the supreme council of war. C. obtained celebrity as the author

of metrical translations of the poetical books of the Bible, and for other works in prose and verse.

CARVAL'HO E MELLO. See POMBAL, *ante*.

CARVEL-BUILT. The difference between the *carvel* and the *clincher* methods of arranging the outer planks in ship and boat building is explained under CLINCHER-BUILT.

CARVER, a co. in s.e. Minnesota, on the Minnesota and Crow rivers; 375 sq.m.; pop. '70, 11,586. Surface undulating, and soil fertile; productions chiefly agricultural. One or two railroads are in operation or in progress. Co. seat, Chaska.

CARVER, JOHN, b. England, d. Massachusetts, 1621. He left England on account of religious intolerance, and settled in Leyden, whence he was sent to effect certain arrangements with the Virginia company. In 1619, he got a patent, and sailed in the *Mayflower* with 101 colonists. On the landing at Plymouth, Carver was chosen as governor, and managed affairs prudently for the four months between his election and his death.

CARVER, JONATHAN, 1732-80; a native of Connecticut; began the study of medicine, but became a soldier, and served in the colonial wars previous to the revolution. After the peace of 1763, and the cession of the Canadas to Great Britain, Carver traveled extensively in the northwestern wilderness, for the purpose of finding new openings for trade, going to England to announce his discoveries. In 1778, he published *Travels through the Interior Parts of North America*, and the next year a treatise on the culture of tobacco. He died in extreme destitution.

CARVIN-EPINOY, a t. of France, dep. of Pas-de-Calais, 11 m. s.s.e. of Lille, and about the same distance by railway. There are manufactures of beet-root sugar, starch, earthenware, and leather. Pop. '76, 6,167.

CARVING, a subordinate branch of sculpture, is usually performed on ivory or wood. Ivory was the favorite material for this purpose in the e. from an early period. Among the Babylonians, who likewise practiced gem-engraving to a great extent, carved heads for staves were executed in vast quantities, as every Babylonian carried a staff and a signet ring. During the palmy days of Grecian art, ivory was largely employed; the nude portion of the colossal statues of the gods being composed of some solid material overlaid with plates of ivory, while the remaining portions were of plate gold. At a later period, ivory was chiefly employed in small works, usually of a decorative character. During the earliest period, statues of the gods were generally of wood, painted, gilt, or draped with colored robes, different kinds of wood being appropriated to different divinities. Carvings in ivory form an important branch of early Christian sculpture. Among the most curious of these are the ivory tablets adorned on the outside with low-reliefs, and in the inside coated with wax for the purpose of writing upon. The chair inlaid with ivory that belonged to archbishop Maximilian in the cathedral at Ravenna, is of this period (546-55). In the year 803, Charlemagne received two richly carved doors as a present from Constantinople, but works of the same kind were executed at a much earlier period. Towards the end of the middle ages, the art of C. in wood was brought to a high degree of perfection in Germany. Altars were adorned with carvings of this material, often of large size, and with numerous figures; in general, the nude portions were carefully and tastefully colored after nature, and the draperies gilt. Specimens are to be seen in the churches at Altenberg, Erfurt, Prague, and in some churches in Pomerania. The finest and most perfect specimens are a series of reliefs relating to the doctrine of transubstantiation in the church at Tribsees. Many of the Belgian churches also possess very beautiful examples of wood-carving. Michael Wohlgemuth of Nuremberg, and after him Veit Stoss, were eminent carvers in wood. The wood-carving on the great altar of the cathedral at Schleswig by Hans Bruggemann belongs to the beginning of the 16th century. Many graceful specimens of wood-carving, on a smaller scale, belonging to this period, are to be seen in museums. Nuremberg was celebrated for its wood-carvings; but only a few of the many works ascribed to him can be assigned with certainty to Albert Dürer. Portrait medallions, usually cut in box, were much in vogue during the early part of the 16th century. The first artist in this line was Hans Schwartz of Augsburg. During the 17th and 18th centuries, we find ivory again extensively employed in crucifixes, crosses, and goblets, with relief representations. The most eminent artist is Franz de Quesnoy.

CARY, ALICE, b. near Cincinnati, O., 1820, d. N. Y., 1871. At the age of 18, she began to write for the press, and at the age of 30, with the assistance of her sister Phœbe, she published a volume of verses which were exceptionally popular. In 1851, the sisters removed to New York city, where, under the friendship and patronage of Horace Greeley, they led successful literary and social lives for 20 years. Among the works of Alice, besides many poems, are *Clovernook*; *Hagar, a Story of To-Day*; *Married, not Mated*; *Pictures of Country Life*; *Snow Berries*; *The Bishop's Son*; *The Lover's Diary*, etc.

CARY, ARCHIBALD, 1730-86; a Virginian, conspicuous on the patriot side of the revolution, his services being mainly in the Virginia convention and house of burgesses.

When the state government was organized he was chosen president of the senate. The story is told of him that, on hearing a report that Patrick Henry was spoken of for dictator, he said to Henry's half-brother, "I am told that your brother wishes to be dictator. Tell him from me that the day of his appointment shall be the day of his death, for he shall find my dagger in his heart before the sunset of that day." Patrick Henry was the last man in the world to aspire to a dictatorship.

CARY, Rev. HENRY FRANCIS, known for his admirable translation of Dante, was b. at Birmingham in 1772. At Oxford, where he entered Christ church as a commoner in 1790, he was early distinguished as a classical scholar, and also for his knowledge of Italian, French, and English literature. In 1805, he translated Dante's *Inferno*, and in 1814, the whole of the *Divina Commedia*, a translation remarkable not only for its accuracy but for its expressiveness and force. He afterwards translated Pindar's *Odes* and Aristophanes's *Birds*, and wrote a series of memoirs, in continuation of Dr. Johnson's *Lives of the Poets*. For some years he held the appointment of assistant-librarian in the British museum, and died in 1844. A memoir by his son was published in 1847.

CARY, LOTT, b. a slave in Virginia in 1780, d. in Monrovia, Africa, 1828. Early in life he became a zealous Baptist; redeemed himself and two children from slavery, and in 1821 went to Liberia, where he was concerned in removing the colonists from the unhealthy locality first chosen for their settlement. He did much to advance the welfare of the new republic, and was left in full power when, in 1826, Mr. Ashmun sailed for the United States.

CARY, PHŒBE, 1824-71; sister of Alice, also a poetical and prose writer. Most of her works were issued with those of Alice. She d. at Newport, R. I., three months after the death of her sister, with whom she was a life-long companion. Neither of them were ever married.

CARY, Sir ROBERT, son of Henry Cary, lord Hunsdon, was b. in 1559 or 1560, and rose to eminence in the civil service of queen Elizabeth. For a number of years, he acted as English warden on the marches. As a courtier, he was present at the death of Elizabeth, 1603, and expeditiously rode on horseback to Edinburgh to communicate the intelligence to her successor, James VI. At the coronation of Charles I., he was elevated to the peerage as earl of Monmouth. At his death without male issue the earldom became extinct. Sir Robert Cary wrote his *Memoirs* (Edin. 1808), a work interesting chiefly from notices connected with border history.

CARYA. See HICKORY.

CARYATIDES (pl. of *Caryatis*, literally, a woman of Caryæ), a name given to female figures, in Greek architecture, when applied instead of columns to support a roof. The traditional account of the origin of the name is, that the inhabitants of Caryæ, a city in Arcadia, having joined the Persians after the battle of Thermopylæ, the Greeks, after their victory over the Persians, destroyed the town, slew the men, and carried the women into captivity. As male figures representing Persians were used for this purpose, it occurred to Praxiteles, and other Athenian artists, that female Caryatæ, in their national costume, might be thus employed to commemorate the disgrace of their country. Lessing, and various other writers, have treated this account as fabulous; but it seems to be confirmed by a bass-relief preserved at Naples, in which two female figures are represented in the attitude of C., and which has a Greek inscription mentioning the conquest of Caryæ. Male figures used for the same purpose are called Atlantes (q.v.).

CARYL, JOSEPH, 1602-73; a non-conformist clergyman, a native of London, educated at Oxford. By order of Cromwell, he attended Charles I. in Holmby house, and in 1650, he was sent with Owen to accompany Cromwell to Scotland. He is remembered for a ponderous commentary on the book of Job, in which, after the fashion of his time, he enlarges on every verse, and almost on every word.

CARYOCAR, a genus of large trees of the natural order *rhizobolaceæ*, and almost constituting the whole order. They are all natives of Guiana and Brazil, and are sometimes called *pecca* trees. They yield good timber for ship-building, and produce the delicious nuts, now not uncommon in the London market, called *butter nuts* or *souari nuts*. The fruit is a sort of drupe, containing several combined nuts. The fleshy part of the drupe consists of a butter-like substance, which melts between the fingers, and is used in cookery instead of butter, on which account these trees are sometimes called *butter-trees*. It forms merely a thin covering for the nuts, the bristles on the outer surface of which, in some of the species, sting like the hairs of the nettle, and are very troublesome to those who open them. The kernels are remarkably soft. An oil is extracted from them which is scarcely inferior to olive oil. *C. nuciferum* is now cultivated in the island of St. Vincent; but *C. butyrosum*, *C. glabrum*, *C. tomentosum*, and other species appear equally worthy of attention.

CARYOPHYLLACEÆ, a natural order of exogenous plants, containing upwards of 1000 known species, mostly herbaceous plants, a few half shrubby. The stems are tumid at the articulations; the leaves always opposite and entire, often uniting around the stem. The flowers are regular: the calyx persistent, of 4 to 5 sepals, either free or united into a tube; the corolla of 4 to 5 petals, which are frequently bifid, and generally terminate

in a claw at the base, sometimes wanting; the stamens as many, or twice as many, as the petals; the ovary of 2 to 5 carpels; the stigmas sessile; the fruit is a one-celled capsule, with central placenta, to which the seeds are attached.—The plants of this order are mostly natives of temperate and cold countries; some of them are only found on tropical mountains, near the limits of perpetual snow. Most of them are inconspicuous weeds; some produce beautiful flowers; almost all are insipid and inert; a few contain *saponine*, and afford a substitute for soap. See SOAPWORT. To this order belong the pink, carnation, sweet william, lychnis, chickweed, etc.

CARYOPHYLLUS. See CLOVES, MYRTACEÆ.

CARYOPSIS, in botany, a fruit in which the seed and pericarp are so incorporated as to be inseparable, and even undistinguishable. The grain or fruit of grasses, as wheat, barley, rye, maize, etc., is a caryopsis.

CARYOTA, a genus of palms, natives of the East Indies, one of which, *C. urens*, remarkable for the acidity of its fruit, which produces a burning sensation when its pulp is applied to the skin, is also highly valuable for the great quantity of juice (*toddy*) which flows from its wounded spathes, sometimes, in the hot season, to the amount of 100 pints in 24 hours from a single tree. Sugar (*jaggery*) is made from this juice by boiling it down, and on this account this palm is sometimes called the jaggery palm. The pith of old trees, or farinaceous part of the trunk, is also much used for food, and is said to be equal to the best sago. The outer part of the stem is very hard, and applicable to many purposes. The fibers of the leaf-stalks are made into ropes, which are very strong and durable; the leaf-stalks, merely stripped of the leaflets, are used as fishing-rods, being light, tapering, and elastic; and the woolly substance found at their base is sometimes used for calking ships. This palm is found both in India and Ceylon, and abounds chiefly in mountainous districts. It rises to a height of 60 ft., with a trunk of a foot in diameter, and a magnificent spreading head of great double pinnate leaves, and triangular leaflets, the apex of the triangle being their point of attachment.

CARYSFORT REEF, off the s.e. coast of Florida, in 25° 13' n., and 80° 13' west. There is a light 106 ft. above tide. Navigation is dangerous on account of the proximity of the gulf stream.

CASA, the prefix to many names in Italian and Spanish, signifying "house" or "home."

CASABIANCA, LOUIS, 1755-98; b. at Bastia; an officer in the French navy, and at a later period a member of the national convention; later still one of the council of 500; and finally capt. of *L'Orient*, flag-ship of the fleet that transported Bonaparte and his army to Egypt. In the battle of Aboukir, when the fleet was attacked by the English, Casabianca fought to the last; and, with his son 10 years old, was killed in the blowing up of the vessel.

CASACALEN'DA, a t. of Italy, in the province of Campobasso, 17 m. n.e. of Campobasso, on the site of the ancient Calela. Fruits and wine of good quality are produced in the district, where silk-worms are also reared. Pop. 5,900.

CASALÉ, a city of n. Italy, province of Alessandria, situated on the right bank of the Po, which is here crossed by an iron bridge, 38 m. e.n.e. of Turin. It is a place of considerable antiquity, and occupies the site of a more ancient town. Many Roman remains are found, and coins of the early ages of the republic. It has a cathedral, dating from the 8th c., with valuable archives. The old citadel, founded in 1590, was one of the strongest in Italy, and within recent years the fortifications have been greatly strengthened and extended. During the Italian campaign of 1859, C. was occupied by divisions of the Sardinian army, and for a short time formed the head-quarters of the French emperor. It has manufactures of silk-twist, and a trade in the produce of the district, which is very fertile. Pop. '71, 20,436. C. formerly gave its name to a province which had an area of about 350 sq. m., and a pop. of about 143,000.

CASAL-MAGGIORE, a t. of n. Italy, province of Cremona, on the left bank of the Po, 22 m. e.s.e. of Cremona. Being subject to frequent inundations from the river, strong embankments have been constructed for its protection. It has manufactures of earthenware, leather, glass, etc. Pop. 5,000.

CASAL-PUSTELEN'GO, a t. of n. Italy, province of Milan, 12 m. s.e. of Lodi, on the road to Cremona. It has manufactures of silk fabrics, linen, and earthenware, and an extensive trade in Parmesan cheese, which is here manufactured of the best quality. Pop. 5,600.

CASAMASSIMA, a t. of Italy, in the province of Bari, 14 m. s.e. of the city of that name. It has a convent and two abbeys, and the vicinity produces wine and almonds. Pop. 6,600.

CASANOVA, FRANCIS, a celebrated painter of battles and landscapes, was b. in London, of Venetian parents, 1732. Educated in Italy, he afterwards went to Paris, from which he was driven by the severe criticism of Diderot. C. then took up his abode in Dresden, where he painted chiefly battle-pieces, and by one of his greatest works gained a place in the academy. He afterwards went to Vienna, and painted for the empress

Catharine her victory over the Turks. He died at Briel, near Vienna, 1805. The execution, and especially the coloring of his works, are excellent.

CASANO VA DE SEINGALT, GIOVANNI JACOPO, a notable adventurer of the Cagliostro species, was b., 1725, in Venice, and studied in Padua, afterwards in Venice, intending to enter the church. Having been expelled for sufficient reasons from a seminary of priests, he traveled to Naples, visited Rome, and after many adventures arrived in Constantinople. On his return to Venice in 1745, he supported himself for a time by his skill as a violinist, until he gained some celebrity by curing a senator who had been attacked by apoplexy. His irregularities again drove him from Venice. He now wandered about for some time among the chief cities in the n. of Italy, Milan, Mantua, Verona, Ferrara, Bologna, Parma, etc., but in 1750 he proceeded to Paris, where he was patronized by the nobility, and became acquainted with several eminent authors. It is needless to mention in detail his endless, inexplicable peregrinations. He visited almost every European capital, was somehow introduced to the best company, invariably excited the disgust or ill-will of those who knew him, and had always to "vanish" after a brief period of enjoyment. In 1761, we find him distinctly professing the miraculous after the Cagliostro fashion: he having undertaken to regenerate old Madame D'Urfé into a young man—for a consideration! He died in Bohemia in 1803. His celebrated memoirs, *Mémoires écrits par Lui-même* (12 vols., Leip. 1826-38), contain many interesting notices of the manners of his times, intermixed with details of his personal adventures.

CASAREEP, or **CASSIRIPE**, a sauce or condiment made from the juice of the bitter cassava or manioc root. It is in the highest esteem in Guiana, where it is employed to flavor almost every dish; and it is the basis of the favorite West Indian dish called *pepper-pot*. It is a powerful antiseptic, and meat can by means of it be kept for a long time quite fresh, even in a tropical climate. It is made by evaporating and concentrating the juice, which is also mixed with various aromatics. The poisonous principle of the juice is dissipated in the evaporation, so that although the juice in a fresh state is readily fatal to life, the C. is perfectly safe and wholesome. C. is imported into Holland and Britain, and remains unimpaired in quality for several years.

CASAS GRANDES (the "great houses"), a t. in Chihuahua, Mexico, 150 m. n.w. of the city of Chihuahua, celebrated for the ruins of early Mexican buildings still to be seen. These ruined houses are built of sun-dried bricks of mud and gravel, each brick about 22 in. thick and 3 ft. in length. The walls, which are in some places 5 ft. thick, seem to have been plastered both outside and inside. The main edifice, about 800 by 200 ft. in extent, is rectangular, and appears to have consisted of three separate piles united by galleries or lines of lower buildings, and the ruins indicate a height for the main staircase of six or seven stories. In the same vicinity are artificial mounds from which have been excavated stone axes, corn-grinders, and various other utensils. Similar ruins are found near the Gila, the Salimas, and the Colorado rivers.

CASAUBON, ISAAC DE, a great scholar and critic, was b. Feb. 8, 1559, at Geneva, where, in 1582, he was appointed professor of the Greek language. Subsequently he held professorships at Montpellier, 1596, and at Paris, 1598, but the death of Henry IV. rendered his position (C. being a Protestant) very insecure, and he therefore gladly accepted the offer of Sir Henry Wotton to visit England. King James received him with distinction, and appointed him some time after prebendary of Canterbury and Westminster. He died in London, July 1, 1614. His acute investigation and criticism were applied to several branches of archaeology and theology. Among his chief works may be mentioned the able dissertation, *De Satirica Græcorum Poësi et Romanorum Satira* (1605); the treatise *De Libertate Ecclesiastica* (1607); and the *Exercitationes contra Baronium* (1614), a confutation of cardinal Baronius. His critical and exegetical works include editions of Diogenes Laertius, Aristotle, Theophrastus, Suetonius, Persius, Polybius, Theocritus, Strabo, etc.—See *Isaac Casaubon*, by Mark Pattison (1875).

His son, **MERIC CASAUBON**, was b. at Geneva, 14th Aug., 1599; educated first at Sedan, he accompanied his father to England, and entered Christ Church college, Oxford, where he took his degree of M.A. in 1621. He was appointed rector of Ickham, near Canterbury, 1628, and afterwards professor of theology at Oxford. He died at Oxford, July 14, 1671. His attachment to Charles I. deprived him of all his preferments during the commonwealth, but at the restoration he received them again. Meric was, like his father, distinguished for his erudition; edited the works of Marcus Aurelius Antoninus, Terence, Epictetus, etc.; and wrote a treatise, *De Enthusiasmo* (Lond. 1655).

CAS'BIN, or **KAZVIN**, a t. of Persia, in the province of Irak-Ajemi, 90 m. w.n.w. of Teheran. It is situated on an extensive plain of the same name, and is inclosed by walls. Before the time of Shah Abbas the great, C. was for a brief period the capital of Persia. The plain affords good pasturage, and in the vicinity of the town are extensive vineyards and orchards. The town is very extensive, but a great part of it is now in ruins, owing to its frequent subjection to earthquakes; and the population, which at one time was estimated at 200,000, is now probably not so much as a fifth of that number. Some velvets, brocades, and coarse cotton cloth are manufactured; and C. has also a considerable trade in raw silk, rice, etc.

CASCA, PUBLIUS SERVILIUS, the one among the assassins of Julius Cæsar who, according to Plutarch, struck the first blow. This was done across the back of Cæsar's neck with a short sword, but the wound was not deadly, and the finishing of the work was left to Brutus and the others.

CASCADE RANGE, in Oregon and Washington territory; a mountain chain forming a continuation of the California coast range. The mountains are about 100 m. e. from the Pacific, and the more conspicuous peaks are Mts. Baker, Jefferson, Wood, Pitt, and Ranier, the latter the highest point—14,444 ft. above tide.

CASCARIL LA (i. e., little bark, from Span. *casca*, bark), the name given in South America to many different kinds of bitter medicinal barks which form articles of commerce. Peruvian bark itself bears no other name in the districts which produce it; and the name C. has recently been introduced in botany for a subdivision of the genus *cinchona* (q. v.). By European physicians and apothecaries, the name C. bark. (*cortex cascarille*) is given to the bark of the *croton eleutheria* (see CROTON), a small tree, a native of the West Indies, where it is known as the *sweet-wood* and the *sea-side balsam*. It is imported in considerable quantities into Europe from the Bahama islands, and appears in commerce in small thin fragments and in quills. It is sometimes employed as a substitute for cinchona, although inferior in tonic and febrifuge qualities. It is a favorite medicine in Germany.—The barks of a number of other species of *croton* appear to possess properties similar to those of C. bark.

CASCO BAY, an indentation of the s. w. coast of Maine, about 20 m. wide n. e. of cape Elizabeth, near Portland. The bay contains hundreds of small islands which are much resorted to in the summer by pleasure-seekers.

CASE, in grammar. See DECLENSION.

CASE, in legal phraseology, though often used as synonymous with cause, has, both in the law of England and Scotland, separate though not always very definite meanings. A formal written argument, prepared with a view to obtaining the opinion of a court of law, is called a case. By 15 and 16 Vict. c. 86, s. 61, the practice theretofore prevailing in the court of chancery of directing cases for a court of common law, is abolished. In Scotland, cases were formerly resorted to in almost every suit of intricacy and difficulty; but the abuse which arose from this practice has been remedied by 13 and 14 Vict. c. 36, s. 14. The statements which are laid before the house of lords in appeals from Scotland, are cases in the sense now indicated.—In Scotland and Ireland, as in England, questions in dispute can now be stated for the opinion of courts without the usual formality of pleadings, and decided more quickly.

CASE, in letter-press printing, a receptacle for types, generally made 34 in. long, 15 in. broad, and 1½ in. deep, and divided into compartments or "boxes," each of which contains types of one class or letter. A pair of cases consists of an upper and a lower case: the upper one has 98 "boxes," and contains the capitals, small capitals, and some other letters that are only occasionally required in composition; the lower one has 53 "boxes," and holds the letters of the small character, figures, spaces, and most of the points. The places assigned to the several letters of the alphabet in the boxes of the case are not precisely the same in all printing-offices, but the differences are few. When in use, the cases lie on a frame 4 ft. high, and the compositor stands in front of them. The different sizes of the boxes in the lower case depend upon the comparative frequency in which the several letters occur in composition, and the position in the case allotted to each letter is such as to afford the greatest facility in composing. The letter *e*, which is most run upon in the English language, has a box much larger than any of the other compartments, and is placed directly in front of the compositor. In the upper case, the boxes are of uniform size, and the letters are placed in alphabetical order, the comparatively rare occurrence of capitals rendering it immaterial which letter is nearest the compositor's hand. A case will hold a quantity of "letter" sufficient to "set up" three pages of this work, which is equal to 18,000 types.

CASE, AUGUSTUS LUDLOW, b. 1812; midshipman in the U. S. navy, in 1828, rising to be captain in 1863, and rear-admiral in 1872. He served in the Mexican war and in the war of the rebellion, in the latter participating in the capture of fort Hatteras and Clarke. In 1867, he was light-house inspector, and in 1869 chief of the bureau of ordnance. In June, 1873, he was named for the command of the European squadron.

CASE, WILLIAM, 1784—1855; b. Mass.; a Methodist minister in the New York conference, and for 18 years presiding elder in the western and central part of the state of New York and in Canada. He was superintendent of Indian missions and schools in Canada until his death, and had also the chief direction of the Methodist ministry in that country.

CASEY, a co. in central Kentucky, on Green and Salt rivers; 350 sq. m.; pop. '70, 8,884—544 colored. It has a rough surface and produces grain, tobacco, butter, and wool. Co. seat, Liberty.

CASEY, SILAS, b. R. I., 1807; a West Point graduate in 1826; in the Florida war in 1837—41, and made capt.; served in the Mexican war, and was wounded at Chapultepec;

served in the war of the rebellion at Fair Oaks and in other engagements, and was retired with the rank of brevet brig. gen. He is the author of a *System of Infantry Tactics*, and *Infantry Tactics for Colored Troops*.

CASE-HARDENING is the process of converting the surface of certain kinds of malleable-iron goods into steel, thereby making them harder, less liable to rust, and capable of taking on a better polish. Fire-irons, portions of fine grate-fronts, gun-locks, and other articles of limited size, are very commonly so treated, but the process is sometimes applied to large objects, such as iron railway-bars. The articles are first formed of bar-iron, and being heated to redness, are sprinkled with a little powdered yellow prussiate of potash, and heated again. The result is, that the heat decomposes the prussiate of potash, and the liberated carbon combines with the iron, forming a coating of steel on the surface of the articles. Another mode of case-hardening is to heat the articles along with some animal matter, such as the parings of horns and a little common salt, from one half to several hours; the articles are then cooled in cold water, or in oil, when they are of a delicate nature. Charcoal alone is also employed. The coating of steel is very thin, seldom exceeding $\frac{1}{16}$ th of an inch. Where it is wanted to be thicker, the articles are treated several times. A Swedish iron-master has found that a very excellent case-hardening is obtained by treating iron objects with a mixture of animal matter and arsenious acid dissolved in hydrochloric acid, and heating as usual.

CASÈINE, or **CASEUM**, is an organic compound allied to albumen (q.v.), found in the milk of the mammalia, and in pease, beans, and other leguminous seeds, when it receives the name of **LEGUMIN**. The proportion of C. in milk (q.v.) varies, but averages about 3 per cent, and it may be coagulated and separated therefrom by the addition of a little rennet (q.v.), as in the manufacture of cheese (q.v.), or by the employment of a few drops of a mineral acid, such as dilute sulphuric acid. In either case, the C. separates as *curd*, which still retains attached to it some oil and earthy salts, though the greater portion of these substances, along with the sugar, remains in the watery liquid or *whey*. The elementary bodies which enter into the composition of C., and the proportion in which these are present in 100 parts, are—carbon, 53.83; hydrogen, 7.15; nitrogen, 15.65; oxygen, 22.52; and sulphur, 0.85. The properties of C. are, that it is not coagulated by heat, as is well evidenced in the heating of milk, but is coagulated on the addition of rennet; sulphuric, hydrochloric, or nitric acids; alcohol, creosote, or infusion of galls, but not by acetic acid. It also forms insoluble precipitates with solutions of the poisonous salts, acetate of lead, nitrate of silver, and bichloride of mercury (corrosive sublimate), and hence the efficacy of taking large doses of milk in cases of poisoning by those deadly salts, as the C. in the milk, forming an insoluble compound with the poison, keeps it from exerting its deadly powers.

The form of C. obtained from plants, and termed legumin, is generally procured from leguminous seeds, like pease or beans, though it can also be extracted from the majority of vegetable substances, especially from sweet and bitter almonds, and even from tea and coffee. Dried pease contain a fourth of their weight of legumin, and this can be extracted by bruising the pease to powder, and digesting in warm water for two or three hours. The liquid is then strained through cloth, which retains the insoluble matters, and allows the water with the legumin dissolved therein, and with starch mechanically suspended, to pass through. On settling, the starch falls to the bottom of the vessel, and the clear liquid holding the legumin in solution, on the addition of a small amount of acetic acid, yields a precipitate of legumin or vegetable Casèine. So perfectly does the vegetable C. resemble the C. from milk, that the one can hardly be distinguished from the other by chemical tests or by taste; and at the present time there is regularly prepared in various parts of China, especially near Canton, a form of cheese from pease, which is sold to the populace in the streets of Canton under the name of *tafoo*. C. is a most important article of food. See **NUTRITION**.

CASEMATE, originally a loopholed gallery excavated in a bastion, from which the garrison could do execution upon an enemy who had obtained possession of the ditch without risk of loss to themselves. Hence the designation, from Span. *casa*, house, and *matar*, to kill. As defense from shells became more important, the term was subsequently applied to a bomb-proof vault in a fortress, for the security of the defenders, without direct reference to the annoyance of the enemy. A *casemated* battery consists of such a vault or vaults, with openings for the guns. A C. may also serve for barracks, or for an hospital, or for a store-house. The great want of ventilation in casemates renders them bad places for barracks; and the artillerymen are nearly stifled with smoke when firing from such confined places.

CASEMENT (It. *casamento*, a large house), a frame with hinges to open and shut, closing part of the glazing of a window. Windows of this description are rare in this country, but are almost universal on the continent. Also a name for a deep, hollow, circular molding, similar to the *scotia* of classical and the *caretto* of Italian architecture. The C. is very prevalent in the perpendicular style of Gothic architecture, and is sometimes enriched with running foliage.

CASERNE is a barrack or building for the accommodation of the soldiers forming the garrison of a fortified town or post.

CASERTA, a t. of Italy, in the province of the same name, is situated on a plain about 17 m. n.e. of Naples. It is chiefly remarkable on account of its magnificent palace, one of the finest in Europe, and formerly the frequent residence of the Neapolitan court. During 1860, C. acquired celebrity as the head-quarters of Garibaldi and his army. A royal silk manufactory has been established in the neighborhood. Pop., with adjoining hamlets (1872), 29,142.

CASE-SHOT, or **CANISTER-SHOT**, is an assemblage of bullets or small balls, inclosed in a cylindrical case or canister. The diameter of this canister is a little less than the bore of the gun from which it is to be discharged. According to the size of the canister, the balls vary from 1 lb. to $\frac{1}{2}$ oz. each, from 30 to 280 in number, and from 3 $\frac{1}{2}$ lbs. to 85 lbs. in total weight. The canister bursts immediately on leaving the gun, and the balls spread out into an irregular sort of cone. Within a range of 500 yards they work great execution among troops; they are generally used at 200 or 300 yards.

In a more modern and effective kind, called *spherical case*, the bullets are inclosed, along with a charge of powder, in an iron shell, instead of a tin canister. It is often called *shrapnel shell*, from the name of its inventor. A spherical case-shot for a 68-lb. carronade, or for an 8-inch howitzer, contains 337 balls; for a 24-pounder gun, 128; and for an 18-pounder, 90. It is exploded by a fuse, the length of which depends on the distance of the point where the destructive effect is to be wrought. Its effect is something like that of a prolonged musket-fire. The shrapnel shell is not of much use against the hull of a ship; but is very destructive against masses of men on shore, or on the decks of a ship, with a greater range than that of ordinary canister. Artillerymen prefer just such an amount of charge as will burst the sphere, without scattering the balls very widely.

CASH (Fr. *caisse*, a chest for containing money) is sometimes used as synonymous with money, as distinguished from produce, in which sense it includes all immediately negotiable paper—bills, drafts, and bonds, as well as coin and bank-notes. At other times, it is used, in a limited sense, to denote coin and bank-notes, as distinguished from negotiable instruments which pass by indorsation.

CASH ACCOUNT, or **CASH CREDIT**, a form of account with a bank, by which a person is entitled to draw out sums as required by way of loan to a stipulated amount. The practice began about 1729 in Scotland, with the banks of which country it is still peculiarly identified; but it is not unknown elsewhere, though on a somewhat different plan. In connection with the Scotch banks, the C. A. system is placed on a distinct and secure basis, which we shall briefly describe. The persons procuring a credit of this kind are for the most part retail-dealers, tradesmen, and farmers, who possess a limited capital, and need occasional loans. Instead of borrowing money by bills or mortgages, they apply to a bank for a C. A. to the extent, it may be, of £500. In the origin of the system, the bank may be said to have been influenced by three considerations—first, the necessity for making advantageous use of its capital; second, the desire to extend its issues of small notes; and third, the nature of the security offered. Since sir Robert Peel's act restricting circulation of notes, the second of these reasons no longer operates; for the banks are now much above their authorized issue, and must hold an equal amount of coin against the surplus. What the bank particularly wants, is a customer who will be constantly depositing sums in notes of other banks, and drawing out sums in its own notes. The C. A. system aids this process. It secures a customer who will be frequently operating on his account, according to the exigencies of his business, and whose overdrafts, as well as deposits, tend to benefit the concern. Obviously, for the debtor, the system works more advantageously than when a fixed sum is borrowed, for in that case interest would run on for the whole amount, whereas by a C. A. the trader merely draws what he requires; and by paying in his surplus money in small sums, he is charged with interest only on the sum actually at his debit from day to day. In negotiating a C. A., a bond is prepared by the bank stating the amount and the nature of the security, the cost of which is borne by the borrower. Banks often, in security, accept heritable property and policies of life insurance, but more commonly two persons in good credit become cautioners, or co-obligants along with the principal. Unless the liability of the cautioners respectively be expressly limited in the bond, each is liable for the whole amount. If the bank liberates one cautioner without the consent of the other, it loses its recourse. This recourse is not lost by accepting a dividend from the sequestrated (bankrupt) estate of a principal or cautioner; but it will be lost by accepting a composition from either of these persons without consent of the other. The bank can at any time stop the credit, and call for payment of the balance due. A cautioner can at any time withdraw his name from the credit, on paying up the balance, and the bank is bound to assign the debt to him. While cash accounts may be of great service to traders who act upon them discreetly, it is found that, in too many instances, these accounts are used as a dead-loan to the entire amount stipulated for; and for this, as well as a reason above assigned, banks care now very much less for this kind of business than formerly. Properly, traders are to look on the money procured on cash credits not as an addition to capital, but merely a temporary substitute for current business purposes while the capital is out with customers, and to be replaced accordingly until again required. It may be

added, that the progress of commercial wealth in Scotland, now greatly lessens the necessity for having recourse to the C. A. system. See MARGINAL CREDIT.

CASHEL, a t. of Ireland in Tipperary co., and 105 m. s.w. of Dublin by rail. It is irregularly built on the s. and e. slopes of an isolated height, rising abruptly from a rich and extensive plain. Pop. '71, 4,562. C. is a bishop's see, and returns one member to parliament. The ancient kings of Munster resided here. The top of the height, or "Rock of Cashel," is occupied by an assemblage of the most interesting ruins in Ireland, which have a grand effect from the country around. The ruins consist of a cathedral, the largest and most remarkable in the country, founded 1169, burned 1495, and afterwards repaired; a stone-roofed chapel, built 1127 by Cormac McCarthy, king of Munster, and the most perfect specimen of the kind in the country; Hore abbey, founded 1260; the palace of the Munster kings; and a round tower, 90 ft. high and 56 in circumference. The round tower is built of freestone, but the other ruins of limestone. At C., in 1172, the great synod was held in which the Irish prelates first acknowledged the authority of the English king and church.

CASHEW NUT, *anacardium occidentale*, a tree of the natural order *anacardiaceæ*, a native probably of the tropical parts of both hemispheres, although it has been commonly regarded as of American origin. It is a spreading tree of no great height. It abounds in a clammy, milky juice, which turns black on exposure to the air, and is used in India for varnishing, but is so acrid as to produce painful inflammation when it comes in contact with the skin of some persons, or when they are exposed to its fumes. Others are apparently unsusceptible of its influence. The fruit of this tree is a kidney-shaped nut about an inch long, seated on the thicker end of a pear-shaped fleshy stalk, from which the botanical character of the genus is derived. The shell is double, the outer shell being ash-colored, and very smooth; and between it and the inner is a layer of very caustic black juice. The kernel is oily, and very pleasant and wholesome, and is in common use as an article of food in tropical countries, being made into puddings, roasted, and in various ways prepared for the table. In the West Indies, it is put into wine, particularly old Madeira wine, to which it is thought to communicate a peculiarly agreeable flavor, and for this use it is sometimes imported into Britain. It is also for the same reason sometimes an ingredient in chocolate. Yet the vapor which arises from it in roasting, but which is derived from the coating of the kernel, and not from the kernel itself, is so acrid as to cause erysipelas and other painful affections of the face in those who conduct the process, unless great caution is used.—The fleshy stalk, sometimes called the *cashew apple*, varies in size, being sometimes not much larger than a cherry, and sometimes as large as an orange, and is white, yellow, or red. It is perfectly free of the acridity characteristic of the natural order, is acid and eatable, very pleasant and refreshing, and much used by the inhabitants of the countries in which the tree grows. A very pleasant vinous liquor is obtained from it by fermentation; and this by distillation yields a spirituous liquor, highly esteemed for its flavor. A gum which exudes from the bark of the tree, quite distinct from the milky juice already mentioned, is bland, and very similar to gum-arabic.

CASHGAR, or **KASHGAR**, the political capital of eastern Turkestan, of which khanate—independent of China from 1865 till 1878—Yarkand is the commercial capital. C. stands 140 m. n.w. of Yarkand, in lat. 39° 25' n., long. 73° 57' e. It is surrounded by an earthen rampart, pierced with four gates, and is strongly garrisoned. It has manufactures of cotton, gold and silver cloths, carpets, etc.; and an extensive trade with Central Asia. Pop. estimated at 80,000. C. is said to have been an important commercial town before the Christian era, and was possessed for about a century by the Chinese. See **YARKAND**.—Eastern Turkestan is now frequently called after its capital. See **TURKESTAN**.

CASHIERING is a punishment for officers in the army and navy. It is a severe form of dismissal from the sovereign's service, and implies that the officer, by some disgraceful conduct, has deserved not only dismissal, but disqualification for ever again entering the service. Sometimes there are words added implying still deeper ignominy and degradation. On some rare occasions, when a court-martial has awarded C., the commander-in-chief has mitigated the punishment to simple dismissal. "Scandalous and infamous conduct," and "conduct unbecoming the character of an officer and a gentleman," mark two degrees of offense which may lead, the one to C., the other to dismissal.

CASHMERE, a valley of the Himalaya, between India proper and middle Tibet, stretching between lat. 33° 15' and 34° 35' n., and long. 74° 10' and 75° 40' e. Its bottom, a comparative level of about 2,000 sq. m., is 5,500 ft. above the sea; while the enclosure, as a whole, from ridge to ridge, besides fully doubling the area, attains, at some points, nearly thrice the altitude. The mountain-wall of this secluded region presents but few passes, and most of these too lofty to be practicable in winter. In fact, the Baramula itself does not admit a wheeled vehicle. Through this single opening, situated at the s.w., the Jhelum carries down towards the Punjab the gathered streams and lakes of the entire basin, and is navigable for the last 70 m. of its course. This net-work of waters, without swelling into inundations, affords everywhere a perennial supply for the purpose of irrigation. Besides the copious rains of spring, the snows of winter covering

even the plains to a depth of two feet for four months, accumulate, in every gorge and on every declivity, reservoir above reservoir, against the demands of summer. C. is traditionally believed to have been a vast upland lake, and alluvial deposits beyond the reach of existing influences would seem to confirm the idea.

In regard to climate, moderate but steady frost prevails from Nov. to Mar.; and again, the heat, ranging from 75° F. in June, to 85° in August, is often disproportionately oppressive, through the stagnation of the landlocked atmosphere. The staple production is rice, which, from the singular facilities of irrigation, is an all but sure crop, yielding, even in a tolerable season, 30 or 40 returns; and in the abundance and excellence of its fruits, C. is said to surpass all the rest of the world. The valley is, in general, considered to be remarkably healthy. The inhabitants, almost universally held to be models of strength and beauty, amounted, before 1828, to 800,000, or to 400 in a sq. mile. But by casual famine and pestilence they have since been reduced to 200,000. The people are mostly Mohammedans, divided between the Sunnite and Shiite sects. The manufactures—all superior of their kind—are shawls, leather, fire-arms, and attar of roses. The principal towns are Serinagur, Islamabad, Shupayon, Pampur, and Baramula. The history goes back, through colossal monuments chiefly of marble, beyond the dawn of authentic annals. In 1315, C. first received Mohammedanism; in 1586, it was annexed to the Mogul empire; in 1752, it fell under the power of the Afghans; and in 1819, it was subjugated by the Sikhs. Lastly being ceded, at the close of the first war of the Punjab, to the British, it was by them transferred to Gholab Sing, as the nucleus of a state of its own name, which comprised also Jamu, Bulti, Ladakh, Chamba, etc. Area of principality, 68,944 sq.m.; pop. 1,500,000.—C. or Srinagar, the capital, lies on the Jhelun, about the center of the valley. Pop. 15,000. See Bellew's *Kashmir and Kashmir* (1875).

CASHMERE GOAT, a variety of the common goat, remarkable for its very long, fine, and silky hair, from which the highly valued Cashmere shawls are made. It is not so much in Cashmere that this variety of goat is to be found, as in Thibet, from which the finest goat-hair is imported into Cashmere, to be there manufactured into shawls. The hair is even longer than that of the Angora goat, and not, like it, curled into ringlets, but straight. It is about 18 in. long. A single goat does not yield more than three ounces, and the fleeces of ten goats are requisite for the manufacture of a shawl a yard and a half square. The hair is spun by women, and dyed after it is spun. It is said that 16,000 looms are kept in constant employment in Cashmere, producing annually about 30,000 shawls. The shawls are woven in rudely constructed looms, a pair of shawls sometimes occupying three or four men a whole year in weaving. C. shawls, of the finest quality are sold in London at from £100 to £400 each. Plain shawls are simply woven in the loom, but those with variegated patterns are worked with wooden needles, a separate needle being used for each color. These shawls are in the highest request in India; but the hair of several other breeds of goat inferior to that of Thibet is employed for the manufacture of shawls called by the same name. Imitations of these are manufactured in France rather extensively, some from the Thibet wool entirely, and others of a mixture of this with silk and cotton. It is said that 24 lbs. of the best Thibetan goat-hair sell in Cashmere for 20 rupees, or £10 sterling.

Attempts have been made to introduce the C. G. into Europe. Baron Alströmer attempted, in the end of last century, to naturalize it in Sweden; and a very spirited attempt to introduce it into Britain has recently been made by Mr. Towers. A mixed race, produced by crossing the C. G. and the Angora goat, has been found to possess most valuable qualities, the hair being long, fine, and more abundant than in any of the parent breeds.—The male of the C. G. has very large, flattened, wavy horns.

CASIA, or POET'S CASIA (*oxyris alba*), a shrub of the natural order *santalaceæ*, a native of the s. of Europe, 3 to 4 ft. high, with linear-lanceolate deciduous leaves, long supple branches, numerous small white flowers, and red drupes (stone-fruit) of the size of a pea. The branches are used for making crates. The shrub has been much admired for its modest beauty. Keats speaks of

"The drooping flowers
Of whitest casia, fresh from summer showers."

CASIMIR, properly Kazimierz, was the name of many Polish princes and kings. With the establishment of the power of Casimir I. in 1040, the predominance of Christianity was decided in Poland. But the most distinguished of this name was Casimir III., called Casimir the great, who succeeded his father, Vladislaus Loketek, as king of Poland in 1333. He added little Russia and red Russia to his dominions; repelled the Tartars, who then threatened Poland; and waged successful war in Silesia, which he conquered but did not retain. He showed great anxiety for the advancement of the arts and of learning in his kingdom, and for the improvement of the condition of the most oppressed classes, which won him the title of king of the peasants. A Jewish mistress obtained from him liberties for the Jews, which they have since retained in Poland. He died in consequence of the falling of his horse in 1370.

CASIMIR I. (see CASIMIR), called "the peaceful," son of the Polish king, Miecislav II., and a German princess named Rixa. The mother endeavored to rule during

C.'s minority, but was compelled to fly to Germany, her son following her and leaving Poland in anarchy. In 1040, C. was called upon by his country, and, with the help of the German emperor, established his authority, drove out the plundering Bohemians, and earned the name of "the restorer." He left a moderately well organized government to his successor.

CASIMIR II., surnamed "the just," 1138-94; one of the four sons of Boleslas, king of Poland, and ruler over the reunited kingdom after the expulsion of Miecislav III. in 1177. Under C. II. the first Polish senate was organized, and laws were enacted defending the peasants against the oppression of the nobles.

CASIMIR IV., 1427-92; brother and successor, as king of Poland, of Ladislas III. He reigned 48 years; waged successful wars against the Teutonic knights; kept his country for most of the time in peace and prosperity; and introduced Latin into schools and official business. Of his six sons, three succeeded each other on the throne, one became king of Hungary and Bohemia, one was a cardinal, and one was canonized as a saint.

CASINO, an Italian diminutive of *casa*, a house, signifies a place for social reunions. The Italian nobles have long had casinos detached from the palaces in which they live, whither they can retreat and enjoy themselves, and it is probable that the *public* casinos were the result of an attempt made by the middle classes to imitate their superiors. In Italy, a C. is generally close by a theater, and is a place where musical or dancing soirées are held, containing a conversation-room, billiard-room, and rooms for other kinds of amusement, as well as small apartments where refreshments may be had. Casinos are numerous in Italy and Germany, and have been introduced into England. In general, they are not supposed to exert an edifying influence on the community.

CASINO, or **MONTE-CASINO**, a mountain overhanging the t. of San-Germano (the ancient Casinum), in the Italian province of Caserta, between 50 and 60 m. n.n.w. of Naples, is celebrated on account of the monastery founded here by St. Benedict (q. v.) in 529 A.D. This monastery is remarkable for its noble architecture, its ancient wealth, its library and archives, and in modern times for the learning of its monks, who have a printing-press, from which several important works have issued. The beautiful situation of the abbey, and the reputation of the monks as masters of the healing art, formerly made Monte-Casino a favorite resort of pilgrims. Luigi Tosti, the librarian of the abbey, has given an account of its literary treasures in his *Storia della Badia di Monte-Casino* (1841-43), and a most valuable catalogue (1st vol., 1874; 2d, 1876) is in preparation.

CA SOLI, a t. of Italy, in the province of Chieti, situated on a hill 17 m. s. of the city of Chieti. Pop. between 5,000 and 6,000.

CASORIA, a t. of Italy, 5 m. n.n.e. from Naples. Silk is produced in the district. Pop. 8,000.

CASPÉ, a t. of Spain, in the province of Saragossa, 57 m. s.s.e. of the city of that name. It is situated near the Ebro, has manufactures of oil and soap, and a trade in the agricultural produce of the district. Pop. 7,500.

CASPIAN SEA, an inland sea or great salt lake, the largest in the world, on the boundary between Europe and Asia, extending from lat. 36° 40' to 47° 20' n., and long. 46° 50' to 55° 10' east. Its length from n. to s. is about 700 m., and its average breadth about 200 miles. Its total area is estimated at 180,000 sq. miles. The coast-line is irregular, and on the e. side especially there are several bays and indentations of coast, the principal being those of Mertvoi, Mangushlak, Kenderlinsk, Karabugos, and Balkan. From the w., the naphtha-impregnated peninsula of Apsheron stretches into the C. opposite the Balkan gulf; Mt. Caucasus also rises on its w. side. On the s. rises the lofty range of the Elburz mountains, between which, however, and the coast, on this side almost unbroken, extends a low flat plain of from 15 to 20 m., in breadth. On the n., it is bordered by great steppes, and the country eastward is a vast plain. It is probable that at one time its waters, which are said to be still diminishing, covered great part of the adjacent steppes. Some singular changes appear to take place in the level of the Caspian. Various measurements have made its depth and elevation different. One Russian measurement made it 348 ft. below the level of the Black sea, another only 84 feet. The latter is confirmed by maj. Wood (*The Shores of Lake Aral*, 1876). It has no tides, but its navigation is dangerous because of violent storms, especially from the s.e., by which its waters are sometimes driven for many miles over the adjacent plains. The depth near the southern end, is about 600 ft., and in some places near the center it attains a depth of nearly 3,000 ft.; but near the coast it is very shallow, seldom reaching a depth of more than 3 ft. at 100 yards from the shore, and in many places a depth of 12 ft. is not reached within several miles of the beach. On the n.e. and e. it is especially shallow. It receives the waters of a number of large rivers, of which the greatest is the Volga. The Ural, the Terek, the Kur, and the Atrek also fall into it. The water of the C. S. is salt, but much less so than that of the ocean. Its northern parts are covered with ice during winter. It abounds in fish, and very valuable fisheries are carried on, especially for sturgeon and salmon. By a canal uniting the head-waters of the Volga with the rivers Tvertza and Schlina, the

C. is united with the Baltic sea. The sea is now surrounded on three sides by Russian territory, the southern shore still remaining Persian. The Russians have a fleet stationed upon it, and the most of its commerce is in their hands. Steam packets have been established on it. The chief Russian town upon its shores is Astrakhan; less important are Derbend, Guriev, Baku, and Krosnoi-yar. Balfrush, Reshd, and Astrabad are Persian towns. The practicability of making the Amu-Daria (see Oxus), now running into the sea of Aral, again an affluent of the C. S., has recently been much debated.

The C. S. was known to the Greeks and Romans. According to Strabo, it derived its name from the Caspii, a tribe inhabiting its western shores. The name Caspian was afterwards limited to the western portion of the lake—the eastern being designated the Hyrcanian sea.

CASQUE. See HELMET.

CASS, a co. in n.e. Dakota, organized since the census of 1870, on the Red river of the north. The surface is of river valleys and undulating prairie; and the soil is generally fertile. Co. seat, Fargo.

CASS, a co. in w. Illinois, on the Illinois river, intersected by three railroads; 350 sq. m.; pop. '70, 11,580. The surface is level prairie and woodland; and the soil is very fertile, producing corn, wheat, oats, etc. There are also a number of manufactories of flour, lumber, paper, and carriages. Co. seat, Beardstown.

CASS, a co. in n.w. Indiana, on Wabash and Eel rivers, traversed by the Wabash and Erie canal and two or three railroads; 420 sq. m.; pop. '70, 24,193. With the exception of bluffs near the rivers, the surface is mostly level prairie and forest, producing cereals, butter, wool, etc. Co. seat, Logansport.

CASS, a co. in s.w. Iowa, on the tributaries of Nodaway river, and intersected by the Chicago, Rock Island and Pacific railroad; 576 sq. m.; pop. '70, 5,464. It is in an agricultural region. Co. seat, Lewis.

CASS, a co. in s.w. Michigan, on the Indiana border, traversed by the Lake Shore and Michigan Southern, the Peninsular, and the Michigan Central railroads; 528 sq. m.; pop. '70, 21,094. The surface is level prairie, with oak openings, and dense forests. Iron and limestone are found. Other productions are mainly agricultural, and there is considerable manufacturing business. Co. seat, Cassopolis.

CASS, a large co. in n. central Minnesota, nearly surrounded by the Mississippi river; 4,750 sq. m.; pop. '70, 380. There are numerous streams and a great number of large and small lakes, one of which (Itasca) is the source of the Mississippi. The Northern Pacific railroad will probably pass through the s. part of the county.

CASS, a co. in w. Missouri, on a branch of Osage river, and in part crossed by the Pacific railroad of Missouri; 1000 sq. m.; pop. '70, 19,206—502 colored. Surface mostly prairie; productions agricultural. Co. seat, Harrisonville.

CASS, a co. in s.e. Nebraska, on the Platte and Missouri rivers, intersected by the Burlington and Missouri River railroad; 570 sq. m.; pop. '70, 8,151. The surface is chiefly prairie, well watered and fertile; productions agricultural. Co. seat, Plattsmouth.

CASS, a co. (formerly DAVIS) in n.e. Texas, on the Arkansas and Louisiana border, bounded n. by Sulphur fork, a tributary of Red river; 927 sq. m.; pop. '70, 8,875—3,379 colored. It has a heavily wooded and fertile soil, producing cotton, rice, corn, etc. Co. seat, Linden.

CASS, LEWIS, an American statesman, b. at Exeter, N. H., in 1783. He was educated for the law, but quitting that profession, he entered the army in 1812, and rose rapidly to the rank of gen., though his merit was not very conspicuous. In 1813, he was elected governor of Michigan, in which state he settled. During his governorship, he kept himself apart from party politics, yet all his measures had a decidedly democratic tendency. In 1831, C. was made minister at war under gen. Jackson, and in 1836 he was sent as plenipotentiary to Paris. In this capacity he made himself popular by his replies, in *Galignani's Messenger*, to the attacks of the English press on the claims of the union with regard to its n.e. boundaries, and by his protest against the measures of Guizot; but the treaty concluded by Daniel Webster with lord Ashburton was so much opposed to the views maintained by C., that he resigned his post, and in 1843 returned to America, where he was received with marks of popular favor. He now aimed at the presidency, and in 1844 was put in nomination, but was defeated, as also in 1848, when he made another effort to obtain the supreme power. In 1857 he was appointed secretary of state, resigning office in 1860. Though active and energetic, he had no claim whatever to anything like comprehensive statesmanship. In regard to slavery, his ideas were ludicrously inconsistent, determined solely, as it would seem, by a view to what would be popular with those whose favor he was seeking to secure at the moment. Latterly, he went wholly along with the slave-holding party, advocating an extension of territory with a view to extend the ramifications of slavery. But he was chiefly remarkable on account of his bitter hostility to Britain, against which he was ever ready to inflame the minds of his countrymen on the slightest and silliest pretext. He is author of the *History, Tradition, Languages, etc., of Indians in the United*

States; of France—its King, Court, and Government; and other works. He died in June, 1866.

CASSA'BA, or **CASABA**, a *v.* in Asia Minor, 63 m. e. of Smyrna, with which it is connected by a railroad. C. has a flourishing trade with the surrounding district. Cotton is one of the chief articles of trade, and silk-worms are raised for export. Another valuable industry is the raising of melons for the Constantinople market. In 1865, a large portion of the town was destroyed by fire, and in the same year there were many deaths from cholera. Pop. about 15,000, two thirds of whom are Turks.

CASSAGNAC. See **GRANIER DE CASSAGNAC**, *ante*.

CASSANDER, king of Macedonia, and son of Antipater, was b. about 354 B.C. When young, he is said to have been ill used by Alexander the great, and to have consequently conceived a mortal hatred to that monarch's family. On the death of his father, he expected to succeed to the regency; but Polysperchon received the honor instead, which so dissatisfied him, that he resolved to contest the sovereignty with his opponent. He was completely successful; but while pursuing his career of conquest in the s. of Greece, he learned that Olympias, mother of Alexander, was committing havoc in the north, and consequently hurried back to Macedonia. In less than a year Olympias was taken prisoner, and put to death. Only Roxana, wife of Alexander, and her son Ægus, now stood between him and the throne of Macedon; but he did not find it convenient to "make away" with these two until several years had passed. Meanwhile, he married Thessalonica, half-sister to Alexander, in whose honor he founded, about 316 B.C., the town which bears her name. In the following year he caused Thebes, which Alexander had destroyed, to be rebuilt. He next became involved in a war with Antigonos, king of Asia, which, with an intervening peace of one year, lasted from 315 to 301 B. C., in the last of which years Antigonos was defeated and slain at the battle of Ipsus. Along with his auxiliaries, Seleucus, Ptolemy, and Lysimachus, he seized and shared the dominions of the vanquished. The rest of his life was spent in intrigue and military enterprise. He died 297 or 296 B.C.

CASSANDER, GEORGE, 1515-66; a native of Zealand; professor of classics at Bruges and Ghent; spent most of his life in trying to effect a union between the Roman Catholic and Protestant churches; to which end he published several works, which had the distinction of being both fiercely attacked by Calvin and pointedly denounced by the council of Trent.

CASSANDRA, according to Homeric legend, was the fairest daughter of Priam and Hecuba, and the twin-sister of Helenus. The children playing in the court of the temple of the Thymbrean Apollo, not far from Ilium, till it was too late for them to return home, a bed of laurel twigs was made for them in the temple; and there, in the morning, two snakes were found licking their ears, from which resulted such an acuteness of hearing, that they could hear the voice of the gods. C. afterwards attracted the love of Apollo by her beauty, and he taught her the secrets of prophecy; but displeased by her rejection of his suit, laid upon her the curse that her vaticinations should never be believed. Accordingly, she prophesied in vain of the treachery of the Grecian horse and the destruction of Troy. On the capture of the city, she fled to the temple of Minerva, but was torn from the altar by the Locrian Ajax, and ravished in the temple. She afterwards, in the distribution of the prey, fell to the share of Agamemnon, to whom she bore twin sons, but was murdered by Clytemnestra.

CASSANDRA, a peninsula in the province of Roumelia, European Turkey, situated between the gulfs of Salonica and Cassandra, in lat. 40° n., long 23° 30' e. The ancient name of this headland was *Pallene*. Grain of superior quality is raised here; wool, honey, and wax are produced; and silk-worms are extensively reared. The gulf of Cassandra (ancient *Toronæicus Sinus*) has a length of 33 m. from s.e. to n.w., and a breadth of 10 miles.

CASSANO, a t. of Italy, in the province of Cosenza, 34 m. n. of the town of that name. It is situated in a valley in the midst of the most beautiful scenery, has a cathedral, an old castle built on an imposing mass of rock in the midst of the city, and manufactures of linen, leather, silk, cotton, and macaroni. Pop. 8,000.

CASSANO, a t. of northern Italy, 17 m. e.n.e. of Milan. It is situated on the right bank of the Adda, here crossed by a bridge on the railway to Brescia, and has extensive silk-mills. C. was the scene of two sanguinary battles—one in 1705, between the French under the duke de Vendôme, and the imperialists under prince Eugene, in which the latter were defeated; the other in 1799, when the Russians and Austrians under Suwarow defeated the French under Moreau. Pop. 4,500.

CASSATION, COURT OF. In the law of France, the act of annulling the decision of a court or judicial tribunal is called *cassation*, from the verb *casser*, to break or annul (Lat. *quætere*; Eng. *quash*); and the function of cassation, as regards the judgments of all the other courts, is assigned to a special tribunal called the court of C., which may thus be regarded, in a certain sense, as the last and highest court of appeal for the whole country. But as everything is excluded beyond the question whether or not the view taken of the law, and of the proper method of administering it by the inferior tribunal, has

been the right one, the idea attached to this institution is less that of a court in the ordinary sense, than of a department of government to which the duty of inspecting the administration of justice is assigned. By the 65th article of the constitution of the year VIII., it was enacted that there shall be "for the whole of France a tribunal of cassation, which shall pronounce on demands for cassation against judgments in the last resort pronounced by the tribunals;" and the following article of the same constitution bears that this supreme tribunal shall pronounce no judgment on the foundation or merits of the cause, but that, in case of its breaking the judgment pronounced, it shall remit to the tribunal appealed from to pronounce another. The title of tribunal was afterwards changed for that of court, by a *senatus consultum* of the year XII.; but substantially the institution has retained its original character, notwithstanding all the changes of government which have occurred in France. The demand for cassation can be made only by the parties to the suit, or by the *procureur-général* of the court of C. for the public interest. Criminal as well as civil judgment may be reviewed by the court of C., the only exceptions being the judgments of justices of the peace and of courts-martial, military and naval. The delay allowed for bringing a civil case before the court of C. is three months for persons domiciled in France, six months for those in Corsica, a year for American colonists, and two for all persons resident beyond the cape of Good Hope. In criminal matters, the procedure is greatly more prompt, three full days only being allowed to the person condemned to bring his action of C., and the same space being given to the *procureur-général*. In all criminal and police cases, the court of C. may pronounce judgment immediately after the expiry of these days, and must do so within a month. The court of C. is divided into three sections, one of which is devoted to criminal matters. Its staff consists of a president, who has the title of *first* president, and three vice-presidents, who are called presidents; 45 counselors or ordinary judges; a *procureur-général*, or public prosecutor; 6 substitutes, who have the title of *advocates-general*; and several inferior officers. The presidents and counselors are named by the sovereign for life, the other officers being removable at pleasure. No judgment can be pronounced unless 11 judges are present, the decision being determined by the majority. Where the numbers are equally divided, 5 judges are called in; and cases of peculiar difficulty may be judged of by the three sections united. The whole court, when presided over by the minister of justice, possesses also the right of discipline and censure over all judges for grave offenses, not specially provided for by the law. When thus constituted, the court of C. may suspend the judges of the imperial courts from the exercise of their functions, and call them to its bar. The *procureur-général* of the court of C. likewise possesses a surveillance over the *procureurs-généraux* of the imperial courts.

The members of this august tribunal wear a red gown with a violet *toque*, or cap of velvet; the robes of the presidents and of the *procureur-général* being doubled with white fur.

CASSAVA, a West Indian name of the plant also called Manioc (q. v.), and of the starch produced from it, which is otherwise called Brazilian arrow-root, and is popularly known in Britain as Tapioca (q. v.).

CASSAY, or **MANIPUR**, a mountainous country in farther India, to the s.e. of Upper Assam, stretching from 23° 49' to 25° 41' n. lat., and from 93° 5' to 94° 32' e. long., and having an area of 7,584 sq. miles. It contains a pop. estimated at 126,000. It is important to England merely from its being on the Burmese frontier. Accordingly, before the war of 1825 began, it was occupied by the British; and, being permanently ceded at the close of the contest, it was handed over, free from tribute, to the native rajah. The inhabitants are more generally Brahmanists than Buddhists. The productions are tea, rice, tobacco, indigo, cotton, sugar, opium, and mustard; and the manufactures are muslins, silks, and a few iron wares. The chief town is Manipur, which sometimes gives name to the principality.

CASSEL, the capital of the former electorate of Hesse-Cassel, now a portion of Prussia, pleasantly situated on both sides of the Fulda, here a navigable river, 120 m. by rail, n. n. e. of Frankfort-on-the-Main. It contains (1875) 53,043 inhabitants, including military and servants and laborers connected with them. The oldest part of the town consists of a few very narrow, crooked streets, close on the banks of the Fulda; the more modern parts are on hills, which rise gently from the river. C. is partially walled. In Friedrichs-Platz, the largest square in any German town, stands the elector's palace, a comparatively mean structure: a little below is the first story of a magnificent palace commenced in 1820, and stopped in the following year by the death of the elector who projected it. Amongst the other public buildings and institutions, one of the most important is the *Museum Fredericianum*, which has a library of 90,000 volumes and some valuable MSS. The picture-gallery contains about 1400 paintings, including some excellent specimens of the best masters. In the cabinet of curiosities, there are examples showing the gradual development and improvement of watch-making from the earliest invention at Nuremberg to the present time. C. contains an observatory, and is the seat of a number of learned and scientific associations. From 1807 to 1813 it was the capital of the kingdom of Westphalia. The gardens of Wilhelmshöhe—which was assigned by the present emperor of Germany to the late emperor Napoleon as a resi-

dence after his fall at Sedan, in Sept., 1870—with their splendid fountains and cascades, and the colossal statue of Hercules, within the hollow of whose club eight persons can stand at one time, are only 3 m. from Cassel. There are manufactures of cotton, woolen, and silk fabrics, lace, and carpets. Under the name of *Chassala*, the town appear to have existed as early as the 10th century.

CASSEL, a t. of France, in the department of the Nord, 27 m. n.w. of Lille. It is pleasantly situated on a hill, overlooking a country on all sides so flat, that the view, although the elevation is only 800 ft., is said to be one of the widest in Europe, extending over the broad fertile plains of Flanders, and to the chalk cliffs of England, and taking in 32 towns and 100 villages. During the great trigonometrical survey undertaken in the reign of the first Napoleon, Mont Cassel was one of the chief signal-stations. C. has manufactures of lace, linen, thread, hosiery, etc. Pop. '76, 3,224. It was known to the Romans, who had a station here, as *Castellum*.

CASSEL, PAULUS STEPHANUS SELIG, b. 1827; a German author of Jewish descent; educated both in Roman Catholic and Protestant schools; finished his studies under Ranke in Berlin, and became a journalist. He was in the Prussian chamber of deputies, 1866-67, and declined re-election, preferring to become minister of Christ church, Berlin. He has published articles and books on the Jews, and on religion and politics; and is well known as a lecturer on papal history, the German war, etc.

CASSIA, a name given by the ancients to a kind of medicinal bark, but their descriptions are so imperfect that it is impossible to determine what bark it is. The name is employed in the English translation of the Old Testament in Exodus xxx. 24, and in Psa. xiv. 8, its use in these places being derived from the Septuagint; and it is not improbably supposed that the substance intended is the same now known in our shops as *C. bark*, or *C. lignea*.—2. *C.* is now the botanical name of a genus of plants of the natural order *leguminosæ*, sub-order *cæsalpineæ*, containing many species—more than 200 having been described—trees, shrubs, and herbaceous plants, natives of Africa and of the warm parts of Asia and America. They have abruptly pinnate leaves, and flowers with deciduous calyx of five somewhat unequal sepals, corolla of five petals, of which the lower ones are the larger, ten free stamens, of which three are long, four short, and three abortive, and anthers opening by two holes at the top. The leaves and pods of many species have a peculiar sweetish but nauseous smell, and a nauseous bitter taste accompanied with a loathsome sliminess. They seem all to contain the purgative principle called cathartine (q.v.), and the leaves of some of the Asiatic and African species are highly valued, and much used as a medicine, under the name of SENNA (q.v.). The leaves of *C. Marylandica* possess similar properties, and are now used to some extent in the United States of America.—*C. fistula* (*cathartocarpus*) yields the *C.* of the pharmacopœias, the *C. poas*, *pipe C.*, or *purging C.* of the shops. It is a large tree, a native of Egypt and other parts of Africa, perhaps also of the East Indies, in which, at all events, it is now widely diffused and cultivated, as well as in the West Indies and warm parts of America. Its leaves have 4 to 6 pair of ovate smooth leaflets, its flowers are yellow and in loose racemes; its pods, which have obtained for it the name of *pudding-pipe tree*, are sometimes 2 ft. in length, cylindrical, black, consisting of thin brittle woody valves, within which is a cavity divided by numerous thin transverse partitions, each cell containing a single seed imbedded in a soft black pulp. It is this pulp that is the part used in medicine; it has a sweetish mucilaginous taste, and in small doses is a mild laxative. It is sometimes removed from the pods when fresh; or an extract is obtained, after they are dried, by boiling and evaporating. It is said to contain 61 to 69 per cent of sugar. The *C.* pods of the West Indies contain much more pulp, and are therefore more valuable than those imported from the East.—3. *C. bark*, or *C. lignea*, sometimes called *China cinnamon*, is a bark very similar to cinnamon both in appearance and properties; but in thicker pieces, and less closely quilled, of a less sweet and delicate flavor, but more pungent. It is the produce of the *cinnamomum C.*, or *aromaticum*, a tree of the same genus with the cinnamon-tree, a native of China, and extensively cultivated there. It is highly esteemed by the Chinese, and is now largely imported into Europe. As it contains a greater proportion of essential oil, and is also much cheaper than true cinnamon, it is much more generally used. The oil which it contains is called *oil of C.*, and is very similar to oil of cinnamon. Coarse cinnamon is sometimes sold as cassia. *C. buds* are believed to be the dried flower-buds of the same tree which yields *C. bark*. They are now imported into Britain in large quantities, and are much used in confectionery. In flavor and other qualities they resemble *C. bark*; in appearance they are very similar to cloves.

CASSIANUS, JOANNES, or JOANNES MASSILIENSIS, or JOANNES EREMITA, a Christian teacher of the ancient church, who flourished in the early part of the 5th c., and distinguished himself as the promoter of monachism in Southern Gaul, and as the opponent of the extreme dogmas of St. Augustine respecting grace and free-will. Shortly before 415 A.D., he went to Massilia (Marseille), where he founded two monasteries according to the rules laid down in his *De Institutis Cœnobiorum*. One of these monasteries was for nuns, the other was the famous abbey of St. Victor, which under *C.* is said to have possessed not less than 5,000 inmates, and which served as a model to a multitude of monastic institutions in Gaul and Spain. His *Collationes Patrum Secti-*

corum, is a work in 24 chapters, each of which gives a "spiritual colloquy between monks in the desert of Sketis," regarding the monastic life, and the vexed questions of theology. C.'s Grecian erudition, his dislike of dogmatic subtleties, and his zeal for monastic habits, led him to oppose the doctrine of St. Augustine on works and grace, and to set up a doctrine which was known by the schoolmen as "semi-pelagianism." See PELAGIANISM. As C.'s doctrine gained support from the Massilian monks, St. Augustine, having been informed of it by his friend Prosper of Aquitaine, wrote strongly against it, especially in his treatise *De Gratia et Libero Arbitrio, contra Collatorem*. It is not known when C. died; but it must have been subsequent to 433 A.D. The first collected edition of the various works attributed to him was published at Basel in 1559; the best at Frankfurt, in 1722. The best account of his life and writings is by Wiggers, *De Johanni C.* (Rostock, 1824-25).

CASSICAN, *Cassicus*, a genus of birds allied to starlings, having an exactly conical bill, thick at the base, and extremely sharp pointed, the commissure forming an angulated line, the bill ascending on the forehead, and encroaching circularly on the plumage. They are all American birds of gregarious habits, feeding both on fruits and insects, and "exhibiting such surprising skill and ingenuity in the structure of their nests, that an old lady once gravely asked an American ornithologist whether he did not think they might be taught to darn stockings!" The crested C., or crested oriole (*C. cristatus*), is a native of Brazil, Guiana, and Paraguay. It is about 20 in. long, is sometimes seen in flocks of 50 or 100, and constructs its nest by knitting together shreds of a thin bark, *tillandsias*, etc. The nest is about 36 in. long, and resembles a purse or pouch, the lower end hemispherical, and 10 in. wide, and is suspended from the extremity of a branch of a tall smooth-stemmed tree on the outskirts of a forest, apparently to insure safety from monkeys and serpents. Several of these nests are often to be seen hanging from the branches of the same tree.

CASSIDA RIA, a genus of mollusks—class *gasteropoda* (q.v.), order *pectinibranchiata*—with univalve shells, generally regarded as belonging to the family *buccinidæ* or whelks (q.v.), but is forming a connecting link with the family *muricidæ* (see MUREX). The shell is ventricose, with a moderately elevated spire, the aperture elongated, and the canal recurved, but not very abruptly—much less so than in the nearly allied genus *cassia* (see HELMET SHELL).—the columellar lip covered with a plate, and the outer lip similarly margined within. The recent species, which are not numerous, belong to tropical and subtropical seas. Fifty fossil species have been described. The genus first appears in the upper cretaceous measures, where a single species occurs. In the eocene 11 have been found, and about 40 in the pliocene. It has its fullest development as a recent shell, no less than 70 species being known.

The name *cassidarie* is sometimes given to a family of coleopterous insects, of which the type is the genus *cassida*. See TORTOISE BEETLE.

CASSIN, JOHN, 1813-69; b. Penn.; except a few years in business, he devoted most of his life to ornithology, and published many works thereon, among which are *Birds of California*; *American Ornithology*; *Mammalogy and Ornithology of the U. S. Exploring Expedition*; *Ornithology of the Japan Exploring Expedition*; *Ornithology of Gulliss's Astronomical Expedition to Chili*; a portion of the *Ornithology of the Pacific Railroad Explorations and Surveys*; and the ornithology of the *Iconographic Encyclopædia*. He was grand-nephew of commodore John Cassin, and nephew of commodore Stephen Cassin, both of the U. S. navy.

CASSINI, the name of a family distinguished by their services in astronomy and geography.

CASSINI, GIOVANNI DOMENICO, was b. at Perinaldo, near Nice, on the 8th of June, 1625, and studied at the college of Jesuits, Genoa. In 1650 he was appointed to the astronomical chair in the university of Bologna. His first work related to the comet of 1652. He subsequently devoted himself to the determination of astronomical refraction, and of the sun's parallax, etc. In 1664-65 he determined the period of Jupiter's rotation. Subsequently, he determined the periods of the planets Mars and Venus, as also of the *apparent* rotation of the sun. He it was who discovered the third and fifth satellites of Saturn, and afterwards the first and second, as well as the dual character of that planet's ring. He was also the first who carefully observed the zodiacal light; he demonstrated that the axis of the moon was not (as had been believed) at a right angle to the ecliptic, and explained the cause of the phenomenon known under the name of lunar libration. One of his finest observations was the coincidence of the nodes of the moon's equator and orbit. C. died Sept. 14, 1712, at Paris, whither he had gone in 1669, at the invitation of Colbert, to take charge of the observatory erected by that minister.

CASSINI, JACQUES, son of the preceding was b. at Paris, Feb. 18, 1677. In 1694 he was elected a member of the academy of sciences. He traveled in Italy, Holland, and England, where he formed the acquaintance of Newton, Halley, Flamsteed, etc., and was elected a member of the royal society of London. On the death of his father, he succeeded to the charge of the observatory at Paris, and died April 16, 1756. C. wrote several treatises on electricity, the barometer, etc. In his treatise, *De la Grandeur et de la Figure de la Terre* (Par. 1720), he attempted to show that the earth must be a spheroid

elongated at the poles. The Newtonians denied this, inasmuch as it was opposed to the ascertained facts of gravitation and rotation, which necessitated the earth's being a spheroid flattened at the poles. As an observer, C. was eminently successful. He determined the periods of rotation of all the satellites of Saturn then known, the inclination of the planetary orbits, the obliquity of the ecliptic very nearly, and the length of the year, etc.—His son, CÆSAR CASSINI, was also engaged in scientific pursuits.

CASSINI, JEAN DOMINIQUE, Comte de, the son of Cæsar Cassini, was b. at Paris, June 30, 1748. He succeeded to the charge of the observatory, and completed in 1789 the great topographical map of France, begun by his father. But it having been decreed in 1793 that the observatory should no longer be in the hands of one person, three others were in consequence elected to the superintendence of it along with C., whose conduct on learning this fact showed that he had a greater regard for his own dignity than for the whole stellar universe. He refused to have anything more to do with astronomical science, and obstinately kept his purpose through a life that lasted nearly a century, and which was apparently so prolonged to test the durability of a Frenchman's disdain. In his 95th year he published a small volume of poems! He died Oct. 18, 1845.

CASSINO, a game at cards played by two or more persons. Four cards are dealt, one at a time, to each player, and four are turned face up on the table. After the hands are played the greatest number of cards counts the holder three, the greatest number of spades one, big C. (the ten of diamonds) two, little C. (the deuce of spades) one, and each ace one, so that nine can be possibly counted by one person; the whole game is 21. The play is to take from the table as many cards as possible, preferring spades, or aces, or big or little Cassino. The cards are taken by the number of their spots; thus a ten will take a ten, or a nine and an ace, or four aces and a six, or any combination of spots that make just ten. Another part of the game is "building;" for example, a player puts a four on a six to make up ten, meaning to take both when it again comes his turn; but any one having a ten may take them before him; or if he builds a six, the next player may make it a nine, and the next still may put on an ace and call it ten; but in building, the one who makes any particular number must hold the card that will take it. Some persons make a progressive build; that is, if one has a nine and cannot at the time make a nine, he puts a four on a two and calls it six, having of course a three to make nine when it is next his turn to play. But this kind of building is generally ruled out as irregular. A modern variation of the game is now common, in which the knave counts eleven, the queen twelve, the king thirteen, the ace one or fourteen as the players may choose, and the "joker" fifteen. This plan greatly enlarges the number of combinations, and makes the game more intricate; as, for instance, an ace may possibly take three other aces, four deuces, and a tray, making fourteen spots; or the ace may take the big and little C. and two aces, which would make six points in the game.

CASSIODORUS, or (according to several MSS.) CASSIODORUS, MAGNUS AURELIUS, a Latin writer, who distinguished himself by his erudition in an age of barbarism, was b. at Scylaceum (now Squillace), in Calabria, about 468 A.D. He was a member of a noble Roman family, and soon attracted the attention of Odoacer by his superior abilities and accomplishments. Under this monarch he held various offices, but after the defeat and murder of Odoacer by Theodoric the Ostrogoth, he passed into the service of the latter. The highest honors now fell upon him; and for years he administered the Ostrogothic power with remarkable prudence and success. In his 70th year, however, he withdrew to Calabria, where he founded the monastery of Viviers, and employed himself and the other monks in the invaluable work of copying classical MSS.; his great desire being to improve the education of the clergy. C. was about 100 years old when he died. Besides his grammatical and rhetorical manuals, which were used as text-books during the middle ages, he wrote a very important work, entitled *Variarum Epistolarum Libri XII*. This is a collection of state-papers, and is, in fact the most extensive as well as the most reliable source of information which we possess in regard to everything connected with the Ostrogothic rule in Italy. The style, however, is very peculiar, and shows the influence which the political career of C. had exercised on his language and modes of thought. The editio princeps of the *Variarum* was printed at Augsburg in 1533.

CASSIOPEIA, the lady in her chair, a constellation in the northern hemisphere, near Cepheus, and not far from the n. pole. It is marked by five stars of the third magnitude, forming a figure like an M. A line from Capella to the bright star in Cygnus passes nearly through the middle of this M. C., according to Flamsteed, contains 55 stars, all of small magnitude. The figure is that of a woman sitting in a chair with a branch in her hand. In the year 1572, there all at once appeared in C. a new star. It was first noticed by Tycho Brahé on the 11th Nov., when its luster exceeded that of all the fixed stars, and nearly equaled that of Venus. The star gradually diminished in luster, from the time of its being observed until, in Mar., 1574, it disappeared. It is said to have alarmed all the astronomers of the age. Tycho Brahé wrote a treatise on it, and supposed—without good reasons—that it had previously appeared in 945 and

1264. Sir John Herschel suggested the possibility of its reappearance in 1872, but his suggestion was not verified.

CASSIQUIA RĒ, or **CASSIQUIARI**, a river of Venezuela, South America, forming the s. bifurcation of the Orinoco, which it leaves in lat. $3^{\circ} 10' n.$, long. $66^{\circ} 20' w.$, and after a rapid s.w. course of about 130 m., joins the Rio Negro in lat. $2^{\circ} 5' n.$, long. $67^{\circ} 40' west$. About 100 yards in breadth when it issues from the Orinoco, it gradually increases until at its union with the Rio Negro it attains a width of 600 yards. By means of this singular river, water-communication is established, through the Amazon, Orinoco, and their affluents, between the interior of Brazil and the Caraccas in Venezuela.

CASSIS (Fr., the black currant-tree), a French liqueur prepared from black currants; the manufacture has recently become of great importance. See **CURRENT**.

CASSIS. See **HELMET SHELL**, *ante*.

CASSITE RIDES. See **SCILLY ISLES**.

CASSITERITE, the common ore of tin, the only source of the metal; found in Banca (an island in the Malay archipelago), in Cornwall (England), Spain, Sweden, France, California, and Chili. It consists of 78.38 tin, and 21.62 oxygen; it is found in mass, in fibres, in rolled flakes, and in grains.

CASSIUS, **LONGINUS CAIUS**, one of Cæsar's assassins. At the breaking out of the civil war, though a tribune of the plebs, he sided with Pompey and the aristocratic faction against Cæsar. He was taken prisoner by the latter, who pardoned him, and even made him one of his legates. In 44 B.C., through the influence of Cæsar, he was made *prætor peregrinus*, and was promised the governorship of Syria in the following year. But his mean and jealous spirit could not endure the burden of gratitude imposed upon him by the generosity of the dictator, and he resolved to be released by the murder of his benefactor. Having attached to himself the mutinous spirits among the subjugated aristocracy, and also won over M. Brutus, the pseudo-patriotic conspiracy was soon matured, and on the 15th of Mar., 44 B.C., Cæsar fell by the daggers of assassins. The result of this bloody deed was not what C. had expected. The popular feeling—as witnessed by the riots that broke out at Cæsar's funeral—was strongly against the murderers; and the military power fell into the hands of Mark Antony. C. therefore fled to the east, and made himself master of Syria. Afterwards he united his forces with those of Brutus, and having greedily plundered Asia Minor, they crossed the Hellespont in the beginning of 42 B.C., marched through Thrace, and took up a superior position near Philippi, in Macedonia. Here they were attacked by Antony and Octavian. The division commanded by C. was totally routed, although, on the other hand, Brutus succeeded in repulsing the troops of Octavian. C., supposing that all was lost, compelled his freedman, Pindarus, to put him to death. C.'s wife, a half-sister of Brutus, survived him upwards of 60 years. She died in the reign of Tiberius, 22 A.D.

CASSIUS, **PURPLE OF**, is a coloring substance of very ancient use, which is prepared by adding a mixed solution of protochloride and bichloride of tin gradually to a solution of chloride of gold, when a more or less abundant precipitate of the double stannate of gold and tin ($AuO, SnO_2 + SnO, SnO_2$) is thrown down. The purple of C. is soluble in ammonia, yielding a very pretty purple solution, from which it can again be obtained, with solid form unchanged, by evaporating the ammonia. Mixed with borax, or some fusible glass, purple of C. is employed by the potter to communicate a rich purple or rose tint to the better kinds of china, and it also imparts the red color to the kind of glass known as *Bohemian glass*.

CASSIUS PARMENSIS, or **CAIUS CASSIUS SEVERUS**, one of the conspirators against the life of Julius Cæsar. He was an adherent of his namesake Cassius, and fought on his side until their defeat at Philippi. Afterwards he adhered to Pompey, and finally supported Anthony until the defeat at Actium. He went to Athens, but was arrested and executed by order of Augustus. He made some pretensions to poetry, but he was not the Cassius alluded to by Horace as noted for the abundance and the poverty of his compositions.

CASSIVELAU'NUS, a British chief, who fought against Cæsar during his second invasion of the island, 54 B.C. He ruled the country n. of the Thames, and had a great reputation as a warrior, but his capital was taken by the Romans, and he himself compelled to flee. He afterwards sued for peace, which he obtained, on condition of paying tribute and giving hostages.

CASSOCK, a long loose coat, formerly in common wear, but now usually worn only by the clergy. As worn by the clergy of the church of England it is a long coat with a single upright collar. Black is the common color for all orders of the clergy, but on state occasions bishops frequently wear purple cassocks. In the Roman Catholic church cassocks vary in color according to the dignity of the wearer—priests wearing black, bishops purple, cardinals scarlet, and the pope white.

CASSOWARY, *Casuaris*, a genus of birds nearly allied to the ostrich (see **BREVI-PENNES** and **OSTRICH**), but distinctively characterized by still greater shortness of wing, by a laterally compressed bill, by a bony crest, by pendent wattles on the naked neck, and by three toes on each foot, all furnished with claws, the inner toe short, and armed

with a very long and sharp claw. There are also very important anatomical differences in its digestive organs, which are not adapted to the same coarse diet, for the C. "has short intestines and small coeca, wants the intermediate stomach between the crop and gizzard, and its cloaca does not proportionally exceed that of other birds." Only one species is known, *casuarius galeatus*, sometimes called emu by the older naturalists, before that name was appropriated to the Australian bird which now alone receives it. The C. is a native of the Moluccas, New Guinea, and other Asiatic islands, chiefly inhabiting deep forests. In general appearance, it is not unlike the ostrich, but has a much shorter neck. It is the largest known bird except the ostrich, and its height, when erect, is about 5 feet. It feeds on fruit, eggs, and succulent herbage. When attacked, it defends itself by kicking obliquely backwards with its feet, and by striking with its short wings, the rigid barbless shafts of which, although useless even to aid it in running, are not without value as weapons. There are only about five of them in each wing, somewhat resembling the quills of a porcupine; and at the end of the last joint of the wing there is a spur. The color of the C. is brownish black; the feathers are loosely webbed, and hang down, so that, at a little distance, the bird seems clothed with hair. Those of the rump are 14 in. long, hanging down in place of a tail. The head and upper part of the neck are naked and of a bluish color, and there are two pendent wattles, partly red and partly blue, on the front of the neck. On the breast is a callous bare part, on which the bird rests its body on the ground. The bony crest or helmet reaches from the base of the bill to the middle of the crown, and is about 3 in. high, exhibiting the most intense blue, purple, and scarlet blended together. The C. lays a few eggs, which it leaves to be hatched by the heat of the sun; and which are greenish, and have a much thinner shell than those of the ostrich. Its flesh is black, tough, and juiceless. The C. is not unfrequently to be seen in menageries in Europe, but is becoming more rare in its native regions, in which it is sometimes kept tame.

CAST, an impression produced by pouring a ductile substance, such as plaster of Paris, into a mold. This method was employed by the ancients in multiplying not only objects of art, such as the small household statues of the gods, but articles of direct utility. These so-called *Celts*, or chisels of bronze, which, with the molds for casting them, are found in England, Ireland, and France, testify to the fact that the art of casting from a mold is one of the earliest acquired by semi-civilized nations. Casts are of incalculable value in familiarizing the eyes of those who can never look on the originals with the grand and beautiful forms of antique art. The best to be had in this country are those executed, and sold on application, at the British Museum. Casting, when applied to metals, is called *founding* (q.v.).

CASTAGNO, ANDREA DEL, 1390-1457; a painter of the Florentine school, who imitated the naturalists of the time in boldness of attitude, but was deficient in grace and coloring. For several centuries, C. rested under the imputation of having murdered his colleague, Domenico Veneziano, in order to monopolize the then recent secret of oil painting as practiced in Flanders by the Van Eycks; but the charge has been proved untrue, as Domenico outlived C. by four years. One of C.'s extant works is an equestrian figure in the Florentine cathedral.

CASTALIA, a fountain on the slope of Parnassus, a little above Delphi, in Phocis, sacred to Apollo and the Muses. It was the "holy-water" of the Delphian temple; and all who came to consult the oracle, or visited the place with any religious purpose whatever, were wont to bathe their hair *rore puro Castalie* (in the pure dew of C.), but those who wished to be purified from murder bathed their whole body. The Roman poets feigned that its waters filled the mind of those who drank of it with poetic inspiration. It was imagined to have some connection with the river Cephissus, and to flow from the subterranean Styx. The fountain, whose waters are still pure and delightful as in the days of classical antiquity, now bears the name of St. John, from a small chapel of that name close by.

CAS TANETS, a musical instrument of percussion in the form of two hollow nut-shells, which are bound together by a band fastened on the thumb, and struck by the fingers to produce a trilling sound in keeping with the rhythm of the music. The *krotalon* of the ancients was somewhat similar. The C. were introduced into Spain by the Moors, where they retain the name of *castanulas*, from their resemblance to the form of the chestnut. The C. are now much used in the ballet and in the opera.

CASTA'NEA. See CHESTNUT, *ante*.

CASTAÑOS, DON FRANCISCO XAVIER DE, Duke of Baylen, a celebrated Spanish general, was b. at Madrid in 1756, and studied in Germany the military tactics of Frederick the great. For some time after his return to Spain, he had no opportunity of acquiring distinction; but when Napoleon I. invaded that country, C. received the command of a division of the Spanish army, and on the 22d of July, 1808, compelled 20,000 French, under gen. Dupont, to surrender at Baylen. It is asserted, however, that the merit of this prodigious success belonged more to Aloys Reding, a Swiss by birth, and the second in command. In Nov. of the same year, C. was in turn defeated by the French at Tudela. The arrival of Wellington necessarily reduced him to a subordinate position, but he took part in the important battles of Albuera, Salamanca, and Vittoria. In 1811,

he was appointed general of the 4th Spanish *corps d'armée*, and commandant of several provinces. In 1815, he was placed at the head of 80,000 troops, destined to invade France, some of which had already crossed the frontier when the news came of the battle of Waterloo. Although no great favorite with the court politicians, his talents could not be overlooked. In 1825, he was called to the state council, where he became a decided opponent of the Carlist party. He died 24th Sept., 1852, at the advanced age of 96.

CAST—CASTING-LINE. The casting-line, in angling, is a gut-line on which the artificial flies are fastened. It is made up of several lengths of gut, knotted together, and, usually from 2 to 4 yards long. The flies are attached at intervals of about 2 ft., and the line with its flies is called a *cast*. The term *cast* is also applied to a part of a stream where certain fish may be taken, as a trout-cast, a salmon-cast.

CASTE, a term applied chiefly to distinct classes or sections of society in India, and, in a modified sense, to social distinctions of an exclusive nature among the nations of the west. When, at the end of the 15th c., the Portuguese began to penetrate to India by the cape of Good Hope, and to trade with the Deccan or southern portion of the Indian peninsula, they found arbitrary social laws, full of intricate regulations which constantly interfered with their intercourse with the natives, especially in matters involving the *subdivision of labor*. They found certain pursuits invariably followed by a certain class, and any attempt to induce a man to perform offices not appointed for the class of which he was a member, met with violent opposition, though such offices might, according to European notions, be more honorable than many he was content to fulfill. They observed, also, that these different classes often varied in appearance, the result, in some cases, of their addiction for many generations to the same pursuits; in others, of their having actually arisen from a different stock. Hence they applied to these various divisions of society the term *casta*—a Portuguese and Spanish word, meaning a breed. As applied to these classes of Hindu society, the word has passed into most European languages. From its frequent use in India, it has sometimes been erroneously considered of Hindu origin.* Of late, it has been spelled *caste*, but by old authors *cast*; and it is even a question whether the word may not be as genuine English, as *casta* is Spanish.

In the s. of India, the Portuguese became acquainted with what is considered the most exaggerated evil of caste. There are found there large numbers of a class called *pariahs*, or, in other districts of India, *chandalas*. They are probably the relics of some early conquered race, who have been degraded by uninterrupted ages of oppression, as is represented to have been the case with the Helots of Sparta, and people in a similar condition. These pariahs were always identified with outcasts—i.e., persons who had forfeited the privileges of their original order. No one of any C. would have any communication with them. If one of them even touched a Nayar, or warrior of high C., he might with impunity kill him. Some sorts of food were defiled by even their shadow passing over them; and the name of Pariah or Chandala conveyed to the Hindu the idea of the utmost vileness and disgust. All who violated the institutions of their class were held to sink into this class—a condition which involved the loss of all human respectability and comfort. These regulations were, moreover, referred to religion.

As India was at this time the land of the marvelous, and its inhabitants, though as various as the different nations of Europe, viewed as one homogeneous people, what was only true of one portion of the peninsula, was considered as prevailing everywhere, and as identical with the divisions of the Indians into *seven* tribes or castes, mentioned in olden times by Strabo, by Diodorus Siculus, and by Arrian. Nor was it forgotten that the Egyptians, whose early civilization was as undoubted as that of India, were also divided, according to Herodotus, into seven classes of priests, warriors, herdsmen, swineherds, tradesmen, interpreters, and pilots, to each of which were assigned particular districts.

About the middle of the 16th c., however, Abraham Roger, chaplain of the Dutch factory at Pulicat, gained the confidence of a Brahman, acquainted with the Sanscrit language, and by this means learned pretty exactly the account of the origin of C. given in the *Laws of Menu*, a work inferred to have been written not later than 900 B.C., which was long known only by name in Europe, until about the end of the last century, when a copy was obtained, and translated by sir William Jones. The whole of the Hindus are represented by Menu as divided into four classes:

1. The *Brahmans*, or *sacerdotal class*, who are said, at the moment of creation, to have issued from the *mouth* of Brahma. Their business is reading and teaching the Vedas, and the performance of sacrifice for themselves and others. They are to be the chief of all created beings; the rest of mortals enjoy life through them. By their imprecations, they can destroy kings, with all their troops, and elephants, and pomps. Indra, when cursed by one of them, was hurled from his own heaven, and compelled to animate a cat. Hence, the Brahman is to be treated with the most profound respect, even by kings. His life and person are protected by the severest laws in this world, and the most tremendous denunciations for the next. His own offenses are treated with singular lenity; all offenses against him, with terrible severity. He is forbidden

* In Sanscrit, castes are called *varnas*, i.e., "colors;" color being, no doubt, the chief distinction at first.

to live by service, but on alms; and it is incumbent upon virtuous men and kings to support him with liberality; and all ceremonies of religion involve feasts and presents to him. The first part of his life is to be devoted to an unremitting study of the Vedas—books, be it observed, older than the code of Menu, and yet, except, perhaps, one of the later hymns, containing no mention of C. as a religious ordinance. He is to perform servile offices for his preceptor, and beg from door to door. In the second quarter, he lives with his wife, reads and teaches the Vedas, assists at sacrifices, and, "clean and decent, his hair and beard clipped, his passions subdued, his mantle white, his body pure, with a staff and a copy of the Vedas in his hand, and bright golden rings in his ears," he leads a studious and decorous life. The third quarter of his life he must spend in the woods, as an anchorite, clad in bark, without fire, wholly silent, and feeding on roots and fruits. The last period he is released from external forms and mortifications, and is to spend his time meditating on the divinity, until at length he quits the body, "as a bird leaves the branch of a tree, at pleasure."

2. The *Kshatrya*, or *Chuttree*, or *military class*, sprang from the arm of Brahma, and bear something of a sacred character. It is stated that the sacerdotal order cannot prosper without the military, or the military without the sacerdotal; and the prosperity of both, as well in this world as in the next, is made to depend on their cordial union. The *Kshatrya* are to give alms, to sacrifice, to read the Vedas, and defend the people. Though Brahmans are to draw up and interpret laws, they are carefully excluded from administering them. The *executive* government is vested in the *Kshatryas* alone.

3. The *Vaisya*, or *Bais*, or *mercantile class*, sprang from the thigh of Brahma. Their grand duties are to keep cattle, carry on trade, lend on interest, cultivate the soil, and turn their attention to every description of practical knowledge. They are to be perfect men of business.

The *Sudras*, or *Sooders*, or *servile class*, came from the foot of Brahma. They are to serve the three superior classes, more especially the Brahmans. Their condition is never to be improved; they are not to accumulate property, and are unable by any means to approach the dignity of the higher classes. Utter and entire submissiveness to the Brahmans is the spirit of all the *Sudra's* duties, and this is to be enforced by penalties as severe as they are ridiculous. Yet, withal, the *Sudras* were not to be slaves, either public or private, and to occupy a position much higher than the *Chandalas*.

Mixture of castes, though not absolutely forbidden, entails disadvantages on the children, and the offspring of a Brahmanical woman and a *Sudra* becomes a *Chandala*, or outcast.

Such—omitting the minute and childish laws and penalties, many hundreds in number, by which it is proposed to carry the principle of C. into the pettiest affairs of life—is a brief outline of it, as gathered from the code of Menu. There is no historical evidence that it ever existed in this form, and, from the nature of the case, we may conclude that it never did. In the *Toy-cart*, the oldest Hindu drama, no extravagant veneration for Brahmans anywhere appears. In fact, one of them is condemned to death; and the arrangements of society appear to have been the same as at present. The laws of C. form, it is true, a part of what is reputed to be Hindu law, but they have remained in all the states of India, Hindu as well as Mohammedan, to a great extent a dead-letter. There is nothing to show that the code of Menu was drawn up for the regulation of any particular state. Some have even conjectured that it may have been the work of some learned man, designed to set forth his idea of a perfect commonwealth under Hindu institutions, just as Plato in *The Republic* gives us his idea of a model government under Greek institutions.

Be this as it may, the C. which at present exists throughout the greater part of India is very different from that described in the code of Menu, though to this it owes, no doubt, much of its stability and its importance in the eyes of Europeans. With the exception of the Brahmans, the pure castes have disappeared, and out of the intermixture of the others have sprung innumerable classes, many of them unauthorized except by the people themselves. So ingrained in the whole community is this tendency to class distinctions, that Mussulmans, Jews, Parsees, and Christians fall, in some degree, into it; and even excommunicated or outcast Pariahs form castes among themselves. Most of the existing castes partake of the nature of associations for mutual support or familiar intercourse, and are dependent upon a man's trade, occupation, or profession. Many of them have been described by Mr. Colebrook in the *Asiatic Transactions*, vol. v. Many have had their origin in guilds, in schism from other castes, in the possession of a particular sort of property (as, for instance, landlords are spoken of as the C. of *zemindars*), and similar accidental circumstances. Their names are often due to the district in which the C. took its rise, to their founder, to their peculiar creed, or any random circumstance. In the Bengal presidency, there are many hundreds of such castes, almost every district containing some unknown in those adjacent. Among the lowest classes, and especially among the servants of the English at Calcutta, it has degenerated into a fastidious tenacity of the rights and privileges of station. For example, the man who sweeps your room will not take an empty cup from your hand; your groom will not mow a little grass; a coolie will carry any load, however offensive, upon his head, but even in a matter of life and death, would refuse to carry a man, for that is the business of another caste. Such and many other regulations are described in

every work on C., but are as unworthy of serious regard as are the assertions of self-importance found among little people all the world over. When an English servant pleads that such a thing "is not his place," his excuse is analogous to that of the Hindu servant when he pleads his caste. When an Englishman of birth or profession, which is held to confer gentility, refuses to associate with a tradesman or mechanic—or when members of a secret order exclude all others from their meetings—or when any other similar social distinction arises, it would present itself to the mind of the Hindu as a regulation of caste.

Nor does C., at the present day, *te a man down to follow his father's business, except*, perhaps, in the case of the more sacred functions of the Brahmans. For the rest, Brahmans serve as soldiers, and even as cooks. Men of all castes have risen to power, just as in England our statesmen have sprung from every class of society. Nor, again, is loss of C. anything so terrible as has been represented; in most cases, it may be recovered by a frugal repast given to the members of the C.; or the outcast joins another C., among whom he will commonly be received with the heartiness due to a new convert. The question of the restoration of a Christian convert wishing to rejoin the Brahmanical C., has been differently decided by his fellow caste-men in different places.

As in the west, so in the east, C. enters into all the most ordinary relations of life, producing laws often most tyrannical and too anomalous to admit of generalization. In the west, however, whilst good sense and Christianity have ever tended to ameliorate social differences, the feeble mind of the Hindu and the records of his religion have had a contrary effect.

These modified views of C., which have begun to prevail in recent years, will be found more fully developed in Shore's *On Indian Affairs*, Irving's *Theory and Practice of Caste*. Full accounts of the petty regulations of C., as laid down in the code of Menu, may be seen in sir William Jones's *Translation of the Code of Menu*, Robertson's *Disquisition on India*, Richard's *India*, Elphinstone's *History of India*, Dubois's *India*, Colebrooke's *Asiatic Transactions*, vol. v., and in various articles in the *Calcutta Review*. The most authoritative account of the subject of caste is to be found in the first volume of Dr. John Muir's *Original Sanscrit Texts on the Origin and Progress of the Religion and Institutions on India; collected, translated into English, and illustrated by Notes* (5 vols., Lond. 1867-71; vols. 1 to 4, new ed.), a work of the utmost value.

The question how C. is to be dealt with in converts to Christianity, has now been determined by common consent of missionaries in India; and it receives no recognition within the Christian church. An opposite policy, in former times, founded on the opinion that C. might be regarded as merely a civil or social institution, and not as a part of the religion of the Hindus, is now believed to have been among the principal causes of the comparative decay of the churches or congregations founded during the 18th c. in the s. of India.

CASTEGGIO, or **MONTEBELLO**, a t. of Piedmont, northern Italy, 5 m. e.n.e. of Voghera. In the campaign of 1859, C. was occupied by Austrians prior to the battle of Montebello, in which they were defeated by the French and Sardinians. C. was also valorously but unsuccessfully defended by the Austrians in the great battle of Montebello between them and the army of Napoleon I. in 1800. As *Castidium*, C. was an important military position as early as the times of the Gallic and Punic wars. Some Roman antiquities still remain, and numerous curious inscriptions and coins have been found. Pop. 3,206.

CASTEL' (from the Latin *Castellum*) is a name prefixed to various places in Italy, France, Spain, Portugal, etc., of which the most important are:

1. **CASTEL-ARQUATO**, a t. of Parma, n. Italy, 19 m. s.e. of Piacenza, picturesquely situated amid forests and vineyards, with a fine Gothic church and a noble old castle, from which the town derives its name. It has manufactures of silk, and a pop. of 4,400.

2. **CASTEL-BOLOGNESE**, a t. of n. Italy, about 22 m. w.s.w. from Ravenna. It derives its name from a strong fortress built here by the Bolognese in the 14th c.; and is historically famous as the scene of a decisive battle between the Milanese and Florentines in 1434, in which the latter were completely vanquished.

3. **CASTEL-BUONO**, a t. of Sicily, in the province of Palermo, 8 m. s.e. of Cefalu. It is noted for its mineral springs, and has a trade in manna. Pop. 5,288.

4. **CASTEL-FRANCO**, a t. of central Italy, 8 m. e. of Modena, with the old walls and ramparts of a castle built by Urban VIII., and near the site of the battle between the consuls Hirtius and Pansa and Mark Antony.—Also the name of a town of Italy, in the government of Venice, about 25 m. n.w. from the city of that name, with linen and woolen manufactures, and a pop. of 4,220.

5. **CASTEL-GANDOLFO**, a village of the former Papal states, 11 m. s.e. of Rome, near the w. shore of lake Albano. Its situation is extremely picturesque, and it commands extensive views of some of the most beautiful scenery in Italy. The pope has his summer residence here. In early times, the noble family of the Savelli had a stronghold at C., by means of which, for a period of nearly 400 years, they bade defiance to popes, barons, and *bourgeoisie*. Pop. 1144.

6. **CASTEL-SARDO** (formerly *C. Aragonese*), a fortified t. and seaport, the strongest

on the island of Sardinia, is situated on a steep rock on the n. coast, 16 m. n.e. of Sassari. The environs produce wine. Pop. 1946.

7. **CASTEL-SARRASIN**, a t. of France, in the department of Tarn et Garonne, on the Songuine, 12 m. w. from Montauban. It has the remains of an old castle said to be of Saracenic origin, a pop. in 1876 of 3,547, manufactures of serge and worsted stockings, and a trade in the agricultural produce of the district.

8. **CASTEL-TERMINI** (ancient *Cumiciane Aquæ*), a t. of Sicily, in the province of Girgenti, and 16 m. n. from the city of that name. It has extensive mines of rock-salt and sulphur, and a pop. of 8,200.

9. **CASTEL-VETRANO**, a t. of Sicily, in the province of Trapani, 20 m. s.e. of the town of that name. It is an interesting place, with an old castle, several convents, manufactures of articles of coral and alabaster, and a pop. in 1872 of 20,420. Some of the most esteemed white wine of Sicily is produced in the vicinity.

CASTELLAR, **EMILIO**, b. 1832; an author, statesman, and president of the Spanish republic. He was the son of a broker, and at the death of his father was left in poverty, but managed to secure a good education. He came before the public as a writer of novels, more prominently as an advanced liberal in politics. In 1856, he obtained the professorship of history in the university of Madrid, but lost the place in 1864, in consequence of joining Carrasen in the establishment of *La Democracia*, a radical journal. The paper was suppressed in 1866, and C. was sentenced to death for participation in the disturbance of June in that year; but he escaped to Switzerland, and subsequently went to France. At the beginning of the revolution in 1868 he went back to Spain and resumed his professorship, and in 1869 was one of the few republicans returned to the cortes. In that body he advocated republicanism and vigorously opposed the prospect of a regency. In the government chosen by the cortes after the abdication of Amadeo, C. was made minister of foreign affairs. In Aug., 1873, he was elected president of the cortes, but vacated the post when, Sept. 6, he was nominated for president of the executive power. His first act was to prorogue the cortes and assume complete authority. He made energetic but ineffectual efforts to suppress the Carlists, and sent the minister of war to Cuba, in person to protect Spanish interests in that island. When the cortes re-assembled, Jan. 2, 1874, a vote of confidence in president C. was defeated, and he at once resigned. Thereupon, Pavia, as capt. gen. of Madrid, forcibly dissolved the cortes and appointed a provisional government with marshal Serrano at its head. Soon after the pronunciamiento in favor of Alphonso XII., Dec. 13, 1874, C. went to Switzerland, whence in Mar., 1875, he sent back his resignation of the chair of history in the university of Madrid. Among his writings are novels, poems, works on politics, slavery, the war in Africa, *Old Rome and New Italy* (translated into English), parliamentary discourses, etc. His oratory is vigorous and elegant.

CAS'TELL, **EDMUND**, 1606-85; an English orientalist who spent 18 years in compiling a lexicon of Hebrew, Chaldee, Syriac, Samaritan, Ethiopic, Arabic, and Persian. He spent from 16 to 18 hours a day on the work, and had 14 assistants. The outlay was \$60,000, which reduced him to poverty, but his losses were in part compensated by a number of preferments, among them that of prebend of Canterbury. C. assisted Dr. Walter in the preparation of the polyglot Bible.

CASTELLAMARÉ, a fortified city and seaport of s. Italy, about 17 m. s.e. of the city of Naples. It is built on the lower slopes of Monte d'Auro, and along a sheltered beach on the s.e. side of the gulf of Naples, over which it commands a magnificent view. It is on or near the site of the ancient *Stabie*, which was desolated by Sylla during the social war, and where the elder Pliny afterwards lost his wife when the city was overwhelmed with lava from Vesuvius. Some ancient remains have been found here. The town was sacked in the 15th c. by pope Pius II., and again in the 17th c. by the duc de Guise. It has a royal palace, a cathedral, several convents, among which that founded by Gonsalvo de Cordova, in the 16th c., is famous for the possession of an image of the Madonna found in a well in the 11th c., which is greatly venerated by the peasantry, who make an annual pilgrimage to the church. The old castle, which gave name to the town, was built in the 12th century. C. has a royal dockyard, affording employment to many of the inhabitants, and manufactures of linen, silk, cotton, leather, and sail-cloth. Pop. 20,488.—**CASTELLAMARE** is also the name of a town in Sicily, situated at the head of a gulf of the same name, and 20 m. e. from Trapani. It has a population of 11,280, and exports of cotton, wine, fruit, and manna.—**C. GULF** OF, is an extensive bay on the n. coast of Sicily. Its width from e. to w., between point Uomo Morto and cape St. Vito, is about 15 m.; and its depth about 14 miles. It has deep water and good anchorage, but is much exposed to n. winds.

CASTELLAMON'TÉ, a t. of n. Italy, in the province of Turin, 10 m. s.w. of Ivrea. It has an old castle, manufactures of earthenware, and a trade in the agricultural produce of the district. Pop. 5,641.

CASTELLAN, or **CHÂTELAIN**, the keeper of a castle or *burg* in the middle ages. The office and the rank of the C. were various in various countries. In France and Flanders, the title C. belonged to the holders of certain demesnes, and was next in order of rank to that of a bailiff. In Germany, the C. had the jurisdiction of a burg-graf during the

ages of chivalry. In Poland, the title of C., with its appendages, remained in later times, and, after the 16th c., the castellans, with the waiwodes and bishops, formed the senate or superior legislative chamber.

CASTELLANA, a t. of s. Italy, in the province of Bari, and 26 m. s.e. of the city of that name. Its trade is confined to the produce of the district. Pop. 9,691.

CASTELLANETA, a t. of s. Italy, in the province of Lecce, 20 m. n.w. of Taranto. It has a cathedral and several convents. Cotton is grown in the district. Pop. 8,358.

CASTELLAZZO, a t. of n. Italy, about 5 m. s.w. of Alessandria. Pop. 5,749.

CASTELLEONE, a t. of Lombardy, n. Italy, situated near the Oglio, about 12 m. n.n.w. of Cremona. It is surrounded by old walls, has a fine church, and a population of 5,700.

CASTELLIO, or **CASTALIO**, SEBASTIANUS, a theologian, b. in Dauphiné in 1515. His proper name was *Châteillon*, which he Latinized, according to the usage of his time. About 1540, he was invited to Geneva, by Calvin, and appointed humanity professor; but having the misfortune, afterwards, to differ from the reformer in religious opinion, he was banished from the city, and went to Basel, where he spent the rest of his life in great poverty. He died in 1563. See CALVIN.

Among his various writings may be mentioned *De Hereticis*, etc.—a treatise which argues against the right of the magistrate to punish heretical opinions, and which produced a rebly from Beza; a Latin version of the Old and New Testaments, published in 1551, and dedicated to Edward VI. of England; and a posthumous work, in dialogue, on predestination, election, free-will, and faith, first published by Faustus Socinus in 1578.

CASTELLO, GIOVANNI BATTISTA, 1500–69; an Italian historical painter of the Genoese school. His best known works are the "Martyrdom of St. Sebastian," and "Our Savior as Judge of the World." He was also an architect and sculptor.

CASTELLO, VALERIO, 1625–59; a son of Giovanni Battista, who excelled his father in painting, especially in cattle scenes. He decorated the cupola of the church of the Annunciation, in Genoa, and painted the "Rape of the Sabines," in the Brignole palace in that city.

CASTELLON, a province in e. Spain, on the Mediterranean, 2,447 sq. m.; pop. '70, 296,222. It is a rough and mountainous region, containing many mines, and mineral springs. A railroad runs through the province parallel with, and not far from, the sea. The chief town is Castellon de la Plana, near the Mediterranean, 40 m. n.n.e. of Valencia, with which there is railroad connection; pop. 20,123.

CASTELLON DE LA PLANA, a t. of Spain, capital of the province of the same name, is situated in the midst of a fruitful plain, about 4 m. from the Mediterranean, and 40 m. n.n.e. of Valencia. A magnificent aqueduct supplies the means of irrigation. C. is surrounded by walls, and is for the most part well built. It has some handsome old churches, and a singular bell-tower, 260 ft. high. Ribalta, the celebrated Spanish painter, was a native of Castellon de la Plana. It has manufactures of linen, woolen, sail-cloth, paper, earthenware, and fire-arms; also brandy distilleries, and an active trade. Pop. 20,000.

CASTELNAU, MICHEL DE, SIEUR DE LA MAUVISSIÈRE, 1520–92; a French soldier and ambassador to the court of queen Elizabeth. He was thoroughly educated, traveled much, and served in the French army in active service in Italy, where his courage and ability secured for him the friendship of the cardinal of Lorraine, who took him into his service. In 1557, he was given a command in the navy, but soon rejoined the French army in Picardy. He executed several delicate diplomatic commissions so satisfactorily to the constable de Montmorency that he was sent by the king to Henry II. of Scotland with dispatches for Mary Stuart, who was then betrothed to the dauphin (afterwards Francis II). He went also to England and treated with Elizabeth respecting her claims in Calais, a settlement of which was made at the congress of Cambray. Afterwards he was sent to Margaret of Parma, governess of the Netherlands, and later still to Rome to ascertain the views of the pope with regard to France. Returning to France he again entered the navy and had the fortune to discover the earliest symptoms of the conspiracy of Amboise. After the death of Francis II. he accompanied the queen (Mary Stuart) to Scotland, remaining a year, during which time he made several journeys to England and attempted to bring about a reconciliation between Mary and Elizabeth, but his wise and temperate counsels were disregarded. In 1562, he retired to France in consequence of the civil war, and was employed against the Protestants of Brittany, by whom he was taken prisoner, but was soon afterwards exchanged. He served at the siege of Rouen and at the battle of Dreux, took possession of Tankerville, and contributed in 1563 to the recapture of Havre from the English. Within the next ten years he was employed in a number of important missions; first to queen Elizabeth to negotiate a peace; next to the duke of Alva, the new governor of the Netherlands, on which occasion he discovered the project formed by Condé and Coligny to seize and carry off the royal family (1567). After the battle of St. Denis he was again sent to Germany to solicit aid against the Protestants, and on his return was made governor of St. Dizier. In 1572, he was sent to England by Charles IX. to allay the excite-

ment caused by the massacre of St. Bartholomew, and in the same year was sent to Germany and Switzerland. Two years later he was sent by Henry III. as ambassador to queen Elizabeth's court, where he remained ten years. While on this duty, with a view of strengthening and maintaining the alliance between the two countries he used his influence to procure the marriage of Elizabeth with the duke of Alençon; but Elizabeth made so many promises, only to break them, that C. at last refused to transmit them to his government. On returning to France he was out of favor with the league, lost his governorship of St. Dizier, and was reduced to extreme destitution; but on the accession of Henry IV. he was, though a Roman Catholic, intrusted with many important missions. The memoirs of C. are valuable for their accuracy and impartiality.

CASTELNAUDARY, a t. in the department of Aude, France, situated on a declivity, skirted at the base by the canal du Midi, 22 m. from Carcassone. Pop. '76, 7,628. It has manufactures of woolen and silk fabrics, and earthenware, and carries on a lively trade in agricultural produce. The canal at this point expands into a large basin, which serves as a haven. It suffered dreadfully in the crusade against the Albigenses, and was, in 1212, the scene of a battle between Simon de Montfort and Raymond, count of Toulouse. In 1855, it was captured by the black prince. In 1632, marshal Schomberg here gained a victory over the party of the duke of Orleans, when the brave duke of Montmorency was taken prisoner, and afterwards executed at Toulouse.

CASTELNUOVO, a seaport t. of Dalmatia, Austria, situated near the w. entrance of the gulf of Cattaro. It is surrounded by walls, and defended by two forts and a citadel. It has manufactures of brass, and a trade in the produce of the district, which is fertile. It was captured by the British in 1814. Pop., including commune ('69), 6,105.

CAS'TI, GIOVANNI BATTISTA, 1721-1803; an Italian poet of humble origin, who rose to the dignity of a canon in the church, but preferred, to further preferment, a life of travel to the gay cities of Europe. In 1782, on the death of Metastasio, he was appointed poet-laureate of Austria, in which position he devoted himself to comic operas. His best known work is *Gli Annunziati Parlanti*, freely used in W. S. Rose's *Court and Parliament of Beasts*. On the whole, his poems are harmonious and pure in style, lively and sarcastic, but without originality of plot, and often grossly licentious.

CASTIGLIONE, a t. of Sicily, province of Catania, on the n. slope of Mt. Etna, on the right bank of the Cantara, 35 m. s. w. of Messina. The town stands on a square rock rising abruptly from the valley, and having a double crest, on which stand a domed church and the ruins of a feudal castle. Here, in 1297, in the war of the Vespers, admiral Roger Toria raised the standard of rebellion against his sovereign, Frederick of Aragon. In the district are several large nut-plantations, which produce the best Sicilian hazel-nuts. Pop. 8,000.

CASTIGLIONE, a village on the site of the old city of Gabii, in Italy, 10 m. e. of Rome. The place is noted for ruins of a temple to Juno, a theater, the ancient walls, and other relics of the past.

CASTIGLIONE, LAKE OF, a lagoon of central Italy, in the province of Siena. It lies n. of Grosseto, and has a length of about 10 m., with a breadth of from 1 to 3 miles. Receiving the waters of the Bruna and other rivers, it discharges its waters, by a short canal, into the Mediterranean.

CASTIGLIONE, BALDASAR'RE, Count, one of the most elegant of the old Italian writers, was b., 1478, at Casatico, in the duchy of Mantua, and studied at Milan. His shining talents, knowledge, and pleasing manners made him a favorite of Guidobaldo di Montefeltro, duke of Urbino, a great patron of literature, at whose court he was honorably entertained, along with other men of eminence in letters. He was employed by the duke as envoy to Henry VIII. of England, who made him a knight; and was afterwards sent in the same capacity to Louis XII. of France, under Guidobaldo's successor, in several important ambassadorial missions. He died at Toledo in 1529. His chief work is the book *Del Cortegiano*, a manual for courtiers, remarkable for its elegant style. His Italian and Latin poems are also models of elegance, and his *Letters* (2 vols., Padua, 1769-71) contain interesting contributions to the political and literary history of his time. Tasso devoted a sonnet to the death of C., and Giulio Romano raised to his memory a monument in Padua.

CASTIGLIONE, CARLO OTTAVIO, Count, an eminent Italian philologist, was b. at Milan in 1795. At an early period, he displayed a predilection for antiquarian studies, more particularly numismatics. When only 24 years of age, he published a description of the Kufic coins in the cabinet of Brera, at Milan, under the title, *Monete Cufiche del Museo di Milano* (Milan, 1819), which showed a great knowledge of oriental languages and history. C.'s principal work in the sphere of oriental literature is his *Mémoire géographique et numismatique sur la Partie orientale de la Barbarie appelée Afrikiah par les Arabes, suivi de Recherches sur les Berbères Atlantiques* (Milan, 1826), in which he seeks to ascertain the origin and the history of the towns in Barbary whose names are found on Arabic coins. Out of Italy, C. is perhaps best known by his edition of some fragments of the Mæso-Gothic translation of the Bible by Ulphilas (q. v.), which had been discovered, in 1817, by cardinal Mai among the palimpsests of the Ambrosian library. At

first, he published some specimens in conjunction with Mai, but in 1829, 1834, 1835, and 1839, appeared a variety of fragments of the Pauline epistles, edited by himself, and enriched with valuable disquisitions, commentaries, and glossaries. He died at Genoa, April 10, 1849.

CASTIGLIO'NE, GIOVANNI BENEDETTO, 1616-70; a Genoese painter who studied for some time under Vandyke. He excelled in depicting fairs, markets, and rural scenes, and painted portraits and historical pieces. He also made many etchings which were remarkable for light and shade. Among the most famous of his paintings was "The Nativity of Jesus," in the church of San Luca at Genoa. His brother Salvatore, and his son Francesco, excelled in similar subjects.

CASTIGLIO'NE, GIUSEPPE, 1698-1768; an Italian Jesuit missionary who labored many years in Peking and other parts of China. He was also an artist of ability, and it is said that the emperor Kien-Long erected several palaces from his designs.

CASTIGLIONE DEL LÉ STIVIERÉ, a t. of n. Italy. 22 m. n.w. of Mantua. It is walled and defended by an ancient castle; but is chiefly celebrated on account of the victory obtained here by the French over the Austrians in 1796, and which gave the title of duc de Castiglione to marshal Augereau. Pop. 3,716.

CASTILE' (Spanish, **CASTIL'LA**) forms, in a geographical and political point of view, the central district of the Spanish peninsula, being the middle and most strongly marked plateau of Spain, as well as the central seat of the monarchy. Both geographically and politically it is divided into Old and New Castile—*Castilla la Vieja* and *Castilla la Nueva*. The former district, situated in 40° 5' to 43° 32' n. lat., and 1° 40' to 5° 35' w. long., rises, in the form of an elevated plateau, to the height of 2,500 to 3,000 feet. It is walled in on all sides; on the n., by the highest masses of the Cantabrian mountains, which separate it from the Basque provinces and Asturias; on the s., by the high ridge forming the water-shed between the Douro and the Tagus; while the Sierras de Oca, de Urbion, and Moncayo, and the heights of Leon and Tras-os-Montes bound it on the e. and west. The high plateau of Old C. is but scantily watered, and its natural characteristics far from inviting. In many parts, nothing is presented to the eye but a wide, unwooded, almost treeless waste of land, unrefreshed by streams, in some parts monotonously covered with stunted grasses, and in others almost destitute of vegetation. The traveler may walk many miles without finding a village, or even a solitary farm-house. All Old C., however, is not a dusty desert. There are rich tracts in it producing some of the finest wheat in the world. Madder and grasses are also produced abundantly in some parts; and even the olive flourishes where it is protected from the frost and snow of winter, and from the cold winds prevailing in Oct. and the following months. Iron and other minerals exist in plenty, but are not worked to any great extent. Sheep, cattle, pigs, and mules form the chief wealth of the inhabitants. Manufactures consist of coarse woollens, cotton, linen, leather, and glass.

The plateau of **NEW CASTILE**—which is situated between lat. 38° 23' and 41° 15' n., and long. 1° and 5° 25' w.—like Old C., is also inclosed by mountains. Though lying 1800 ft. lower than Old C., New C. presents many similar characteristics of soil and scenery. It is mostly sterile, and scantily irrigated; little rain falls, and the nightly dews are insufficient to refresh the plains, which are entirely destitute of trees, and, in summer, appear quite burned up. Olives, corn, pulse, and saffron are cultivated in some neighborhoods; but flocks of sheep constitute the chief wealth of extensive tracts of land. The commerce, carried on by means of long trains of mules, reminds the tourist of the caravan traffic over eastern deserts. Industry is almost entirely restricted to manufactures of coarse woollen goods. The yield of the salt-mines in the s. is considerable; and quicksilver, especially at Almaden (q.v.), and iron (manufactured at Toledo) are plentiful. The Castilians have even more than the general haughtiness of the Spanish character. Their language prevails throughout the educated classes, as in the literature of Spain, and their rulers have extended their sway over the whole nation.

In the present administrative division of Spain into forty-nine provinces, the division of Old and New C., though it will long be remembered by the people, is one belonging to past history. Old C. is now divided into the eight provinces of Burgos, Logroño, Santander, Soria, Segovia, Avila, Palencia, and Valladolid. The population, distributed over an area of 22,797 sq. m., amounted, in 1870, to 1,689,864. New C. includes the five provinces—Madrid, Guadalajara, Guençá, Toledo, and Ciudad Real, and on an area of 30,882 sq. m. has 1,541,772 inhabitants. Besides these provinces, the kingdom of Leon, Galicia, the principality of Asturias, and the districts of Estremadura, Andalusia, Granada, and Murcia, belonged to the crown of Castile.

C. first became an independent country in 762, and remained so until 1028, when it passed to Sancho III., king of Navarre. His son, Ferdinand I. (great), founded the kingdom of C., and among other acquisitions annexed to it the kingdom of Leon. This union, however, was not permanent, Leon being made a separate kingdom for Ferdinand II. The two kingdoms, however, were afterwards reunited in the 13th c. in the person of Ferdinand III., and remained ever after under one scepter. Among the successors of Ferdinand III., the most distinguished was Alfonso X., by whose direction the Alfonsine (astronomical) tables were drawn up. By the marriage of Isabella, sister and successor of Henry IV., with Ferdinand, king of Aragon (1469), the two crowns of C.

and Aragon became united (1479), and from these sprang the kingdom of Spain, which, however, was not fully established before the death of Ferdinand, in 1516, when Charles I. of Spain (Charles V. of Germany) inherited both crowns.

CASTIL/ LA, DON RAMON, 1797-1867; a Peruvian who entered the Spanish army in 1816, but soon after 1820 joined the revolt against Spanish rule. In 1830, Gamarra made him chief of staff of the whole army, and the provisional president appointed him brig. gen. After the treaty with the president of Bolivia, Castilla went to Chili, and in 1837 joined the Peruvians who marched against Santa Cruz, the president of Bolivia. When the revolutionists proclaimed Gamarra president, Castilla was made minister of war. In 1841, he was one of the leaders of the Peruvian force that invaded Bolivia, and in 1845 he was elected president of Peru. His successor, Echenique, became unpopular, and Castilla started a revolution, overcame Echenique, and became sole ruler of the country. One of his important reforms was the abolition of slavery. In 1858, he was re-elected president, and in 1860, he proclaimed a new constitution which granted universal suffrage and prohibited the exercise of any religion except the Roman Catholic. His last political movement was in 1867, when he led an insurrection against Prado, then president; and he was on his way to Arica when he died.

CASTILLEJO, CHRISTOVAL DE, 1494-1556; a Spanish verse-writer of great fertility, whose poems were about the last of the old Spanish school before the changes led by Garcilaso de la Vega. Being strongly anti-clerical, Castillejo's writings were usually noted on the Index Expurgatorius, and were smuggled into Spain from foreign printing-houses, while in a later period the agents of the church altered the verses to suit themselves. The works of Castillejo are in three books, one entitled *Love*, one *Conversation and Pastime*, and the third comprising moral and religious verses. He died in a monastery.

CASTILLON, a t. of France, in the department of Gironde, situated on the right bank of the Dordogne, 26 m. e. of Bordeaux. It has manufactures of cotton and woolen yarns, nails, and cordage. It is celebrated as the scene of the battle between the forces of Henry VI. of England and Charles VII. of France, July, 1453, in which the English met with a signal defeat, their leader, the earl of Shrewsbury, and his son, being slain. Of all their possessions in France, Calais alone remained to the English after this battle, the incidents of which were seized on by Shakespeare for the sixth scene in his play of *King Henry VI.*, part i. Pop. '76, 2,766.

CASTINE, a t. in Hancock co., Maine, on the Penobscot, 34 m. below Bangor; pop. '70, 1303. It was here that the baron de Castine settled in 1667 a French colony, which was soon abandoned in consequence of Indian and English wars. In 1760, it was re-occupied by the English, who made a harbor that was always accessible for the largest ships. Castine is now a port of entry, and ship-building and fishing are the employments of the greater portion of the people.

CASTING, in angling, is the term applied to the act of throwing a fly or a fish-bait. In casting a fly with a single-handed rod, the beginner should let out about as much line as the length of the rod; grasp the rod just above the reel; then wave it back over the right or left shoulder, with a slightly circular sweep, so as to extend the line behind; and then bring it forward with a steady cutting kind of action, urging the point of the rod towards the spot where the fly is to fall, taking care not to carry the point of the rod too far forward, or too low, or the line will not fall straight and evenly on the water. The object of the circular sweep behind is to prevent the fly from cracking off. By slightly raising the point of the rod just as the fly is delivered, the line is straightened; and the fly, checked in mid career, falls like thistle-down upon the water. Always allow time for the line to go straight out behind, for if returned too quickly, the fly cracks off. In casting with the double-handed rod, the one hand grasps the rod above the reel, and the other below it, the lower hand acting as a pivot upon which the rod turns.

In casting a bait, either for spinning, trolling, or live-baiting, the bait is suffered to hang from the point of the rod about a yard. Taking the rod in both hands, the line clasped to the rod in his right, the angler waves the bait gently back; and having first drawn as much line as he requires off the reel, and laid it loosely at his feet, he sends the bait forward with a swing towards the point he desires to reach.

CASTING. See **FOUNDING, ante.**

CASTING-NET, a species of net very widely distributed, having been found in use amongst various savage tribes in different parts of the world, some of whom, from long and constant practice, use it with a dexterity and address unknown in England. The nets used in England are usually from 13 to 20 ft. in circumference when spread out. They are netted in the shape of a kind of long loose bag or cone; and so much is the number of meshes increased as the net progresses, that it is capable of being spread out in a perfectly flat and circular form, the apex of the cone forming the center of the circle. To this apex is attached a rope of some yards in length; when casting, this rope is fastened round the left wrist of the caster. The bottom of the net, which forms, when it is held up by the apex, the base of the cone, or, when spread, the circumference of the circle, is hung around with perforated leads or bullets. These have not only the effect of carrying the net to the bottom of the water, but also, when it is cast, of causing

the net to spread open. The bottom of the net is turned up some 6 in. or more in depth, and hung up on the inside about every 10 in. or so, to an upper portion of the net, by stout strings, so as to form a kind of purse; this is called the "tuck." When the net is required to be cast, the caster, having fastened the rope to his wrist, and coiled it loosely in his left hand, hangs a portion of the net over his left shoulder; and then gathering as much of the outer edge of the net as he can collect in his right hand, and holding it up so as to open the net as much as possible, makes a semicircular sweep of the body and the right hand—rather difficult to accomplish without practice—and whirls the net away off the shoulder. The centrifugal motion thus communicated to the leads, etc., on the bottom of the net, causes it to open like a circle on the surface of the water, the leads carry it to the bottom, and the net thus covers all that comes within its circle. The rope is then pulled gradually, and worked from side to side, in order to narrow the circle, to bring it once more into a cone; and, in their efforts to escape, the fish that may have been covered are gradually driven into the tuck or purse of the net. When the leads are all close together, the net is lifted from the water, and the fish in the tuck are taken out. The cost of a cast-net is regulated by the circumference and the size of the mesh. They may be had from 12s. to 30s. or more.

CASTING-VOTE, the vote by which the chairman or president of a meeting is generally empowered to *cast* the balance on the one side or the other, where the other votes are equally divided. In the house of commons, the speaker does not vote at all unless this occurrence takes place. As his position in this respect is felt to be a delicate one for a person whose duty it is to withdraw himself from the contentions of party, it is usual for the speaker to vote in such a way as to give the house an opportunity of reconsidering its decision. The same rule prevails in select committees. Following a similar rule, the chairman at corporation and general meetings usually gives his casting-vote either in a way that will lead to a reconsideration of the subject, or for what seems the popular view of the case, although that may be at variance with his convictions.

CAST-IRON, or **PIG-IRON**. This is the crudest form of iron, and the method of its production is described under the head **IRON**. There are two leading kinds of it, namely, white pig-iron and gray pig-iron; the former is also called forge-iron, from the fact of its being chiefly used for conversion into malleable iron and steel; and the latter is often called foundry-iron, on account of its suitability for castings. Of each of these, again, there are many varieties; and much light has of late years been thrown on what constitutes their different qualities, by experiments in the manufacture of steel. White cast-iron, when smelted from the argillaceous ores of the coal-measures, is of inferior value to the gray; much of it, indeed, being produced against the will of the iron-master, when the blast-furnace is working badly. But when obtained from pure ores and fuel it is the most valuable kind, because it contains fewer impurities, and has its carbon nearly all in the combined state, in which case it is best suited for the manufacture of wrought-iron and steel. Gray pig-iron contains carbon both in the combined and the uncombined (graphitic) state. In the grayest kind, uncombined carbon greatly prevails, and the fracture of the iron is more distinctly granular or scaly-crystalline than is the case with other varieties. Such cast-iron is usually called No. 1. It is much softer, but fuses at a higher temperature than white pig-iron. It also becomes thinly liquid when melted, and expands slightly just before cooling—properties which render it extremely valuable for castings. As the grayness and graphite-like brightness diminish, the iron is known as No. 2, No. 3, and so on for several numbers, till we come to the close texture and light color of white pig-iron; No. 2 being but slightly different from No. 1, and No. 5 from white-iron, in quality. No. 3 is intermediate between the extremes. When cast-iron is partly gray and partly white, it is called mottled iron. Cast-iron contains from 2 to 5 per cent of carbon, the maximum amount in steel being 2; but steel is practically free from silicon, sulphur, and phosphorus, while cast-iron is not.

CASTLE (Sax. *castel*; Lat. *castellum*, dimin. from *castrum*), a building constructed for the purpose of repelling attack. The root of the word is the same as that of *casa*, a little house or hut, and probably means a driving off or repelling; and it is worthy of notice, in confirmation of this view, that in Welsh the radical syllable *cas* signifies a C., separated, and also hatred, malice, etc. The *castella*, left by the Romans in Britain and elsewhere, were constructed on the general model of their stationary encampments (*astra stativa*), (see **CAMP** and **ENCAMPMENT**); and though they may have suggested the castles of the middle ages, they differed from them in being designed for military purposes only, and not also as places of permanent residence. Even Burgh castle, in Suffolk, the ancient Garamonium, and Richborough castle, in Kent, the ancient Rutupiaë, were encampments or fortresses, rather than castles.

Besides these monuments of the military occupation of the island by the Romans, traces are found in various parts of the country of encampments or castles, which are ascribed to its aboriginal or early inhabitants. These are generally situated on the tops of hills; as, for example, the Herefordshire beacon, on the Malvern hills; Moel Arthur, in Flintshire; Chem castle, in Cornwall; the Maiden castle, in Dorsetshire; the Caterthuns, near Brechin, in Forfarshire; the Barmkin of Echt, in Aberdeenshire. It is probable that the Saxons adapted the Roman castles to a certain extent to their modes of defense, and traces of Saxon and even Norman workmanship are found in struc-

tures which are believed to have been originally Roman. One very frequent change consisted in raising a mound of earth on one side of the walls on which the keep or citadel was erected. The Decuman and Prætorian gates were also, as at Portchester, converted into the fortified entrances peculiar to the castellated structures of the middle ages. But of castles designed for residence as well as defense, there are few or none which are of higher antiquity than the conquest. They were part of the organization of the feudal system—castle-guard being one of the duties which the tenants were taken bound to pay in return for their lands; and till that system was developed by the Normans, the residences of persons of importance were probably guarded only by their domestic retainers, or, in extraordinary circumstances, perhaps by the national militia. The absence of strongholds is said to have been a reason why William the conqueror so easily became master of the kingdom; and it was as a protection against the resentment which the conquest occasioned, that most of the great Norman castles of England were built. As these castles grew in strength by the additions and improvements of each generation, they afforded their possessors the means not only of security from their fellow-subjects, but of independence as regarded the central government. The lord of every C. became a petty tyrant; and no small portion of the history of England, and, indeed, of Europe altogether, during the feudal period, consists of an account of the attempts which were made by the monarch to extirpate what Matthew Paris has emphatically designated as "these nests of devils and dens of thieves." Of castles of this description, it is said that in England, in the reign of Stephen (1135-54), no fewer than 1115 were built.

The Norman C., which was the most complete structure of the kind, was generally surrounded by a moat or ditch; and in order that the ditch might be readily filled with water, the site chosen was usually either on the banks of a river, or on a peninsula running into a lake. In the latter case, the ditch was of course merely a deep cut made through the neck of land, by means of which the C. and its surroundings were converted into an island. On the inner side of the ditch, mounds were constructed, which were surmounted with walls and towers, both of which, but particularly the latter, were supplied with battlements and bastions. The entrance-gates were also protected by towers, which were usually of great strength. The communication was by a bridge, sometimes of stone, but usually of wood, which was made to draw up and down; and the entrance, in addition to thick folding-doors, was protected by a portcullis (q. v.), which was dropped down through grooves in the masonry at the sides. The gateway, in castles of the larger sort, was further defended by a barbican (q. v.). On passing the external wall, you entered the bailey (q. v.), which sometimes consisted of several courts, and contained the barracks, magazines, well, a chapel, and sometimes even a monastery. The only portion of the C. which was always spoken of as distinguished from the bailey, was the keep (q. v.) or citadel, which corresponded to the prætorium of the Roman fortification. The keep was a species of internal C., more strongly defended than any other portion of the fortress, and placed in the most advantageous position, so as to afford a last chance to the garrison when driven from the external works. As the keep had the same design as the C. itself, it contained most of its appliances, even to a chapel, when large and complete. The keep was also called the dungeon or donjon (q. v.). An excellent example of a keep is seen at Rochester castle. The best known is probably that at Windsor, which forms so prominent an object in the surrounding landscape. The protection which the walls of his C. afforded to the retainers of a baron in a state of society in which life and property were extremely insecure, naturally led to the construction of houses around the moat, and to this custom a very large number of the towns, both in England and on the continent of Europe, owe their origin. Along the banks of the Rhine, this process of town-formation may be seen in all its earlier stages; from the few peasants' houses and the village church nestling under the ivy-covered ruin on the cliff, to the large and prosperous city of Coblenz. Strange as it may seem, the existence of these castles may be regarded not only as a cause, but as an effect of a certain feeling of security on the part of the surrounding population; for where a country was thoroughly insecure, the risk of the castles falling into the hands of the enemy, and thus proving a source not of protection but of oppression, was so great as to prevent their erection. It is on this ground that sir Walter Scott explains the slight character of the fortresses on the Scottish border, notwithstanding centuries of warfare. "It was early discovered that the English surpassed their neighbors in the arts of assaulting and defending fortified places. The policy of the Scotch, therefore, deterred them from erecting upon the borders buildings of such extent and strength, as being once taken by the foe, would have been capable of receiving a permanent garrison. To themselves, the woods and hills of their country were pointed out by the great Bruce as their safest bulwarks; and the maxim of the Douglases, that 'it was better to hear the lark sing than the mouse cheep,' was adopted by every border chief." For these reasons, "we do not find, on the Scottish borders, the splendid and extensive castles which graced and defended the opposite frontier. The Gothic grandeur of Alwick, of Raby, and of Naworth, marks the wealthier and more secure state of the English nobles." The residence of the Scottish chieftain, "was commonly a large square battlemented tower, called a *keep* or *peel*, placed on a precipice, or on the banks of a torrent, and, if the ground would permit, surrounded by a moat. In short, the sit-

nation of a border-house, encompassed by woods, and rendered almost inaccessible by torrents, by rocks and morasses, sufficiently indicated the pursuits and apprehensions of its inhabitants."—*Minstrelsy of the Scottish Border*, Introduction.

CASTLEBAR, the capital of the co. of Mayo, Ireland, 159 m. w.n.w. of Dublin. It is situated on the Castlebar river, near the head of a valley at the n.w. end of the great limestone plain which includes the greater part of the counties of Roscommon, Sligo, Galway, and Mayo. The two main streets cross each other, and the chief buildings are in a square near the w. end. The suburbs, as in most of the w. Irish towns, consist of the wretched hovels of agricultural laborers. Pop. '71, 3,571. C. has some coarse linen manufactures. Here the Irish, in the rebellion of 1641, massacred the English parliamentary army, and in 1786 was executed the famous "fighting Fitzgerald." In 1798, the French gen. Humbert, held the town for a fortnight. In 1846 and 1847, C. suffered extremely from the famine.

CASTLEMAINE, a t. in the province of Victoria, Australia, 65 m. n.w. of Melbourne; pop. '71, 7,308. It was a place of much importance when gold mining began, the diggings near by being among the earliest opened. The Victoria railroad passes through the town.

CASTLE PEAK, a peak of the Sierra Nevada in California, about 38° 10' n.; height estimated at 13,000 feet.

CASTLEREAGH, LORD. See LONDONDERRY, MARQUIS OF.

CASTLES, in heraldry, are often given as charges in the shields of persons who have reduced them, or been the first to mount their walls in an assault. The practice of heralds, in this as in other respects, has not been very consistent, as we learn that in 1602, a castle was granted by William Cambden, Clarencieux king of arms, to William Frear, doctor of physic!

CASTLETON, a t. in Richmond co., New York, forming the n. portion of Staten island, and occupied in part by the summer residences of business men of the city, pop. '75, 10,957; in '80, 12,723. New Brighton is the only considerable village. There are ferries from several points in the township to New York, and one to New Jersey; and a railroad connects with the southern part of the island. Among the institutions is "Sailor's Snug Harbor," a home for old and indigent seamen, established about the beginning of the century by capt. Randall. The surface of the township is hilly, and there are many charming sites occupied by handsome modern villas, from some of which wide views may be had over the city of New York, and large portions of New Jersey, Long Island, and the ocean.

CASTLETON, a village in Rutland co., Vt., 12 m. s. of Rutland, reached by the Rensselaer and Saratoga, and the Rutland and Washington railroads; pop. '70, 3,243. The slate quarries in the neighborhood are valuable. In the village is the state normal school.

CASTLETOWN, the capital town and seat of government of the Isle of Man, called in Manx *Bulley Cusstal*, or the Town of the Castle. C. is situated on the margin of Castletown bay, near the southern extremity of the island, and surrounds Castle Rushen, a Danish fortress of prodigious strength, having walls from 12 to 18 ft. in thickness, built of the limestone found on the spot, which is of so imperishable a nature that the sharp angles of the keep retain the marks of the builder's chisel, though completed in the 10th century. The castle was founded by Guthred II. of the Orrys kings of Man, and having been added to from time to time, it now consists of a pile of building of a most imposing appearance. It underwent a six months' siege by Robert Bruce in 1313. The keep is used as the public jail of the island, and the other portion of the castle consists of public offices, officer's apartments, and accommodation for the chancery and other superior courts.

Being in the neighborhood of the bold coast-scenery of the Calf of Man, Spanish head, etc., C. is a desirable resort for the numerous tourists who frequent the Isle of Man. Ship-building has of late made considerable progress in Castletown. Pop. '71, 2,320.

CASTOR, ANTONIUS, an eminent botanist of Rome in the first century after Christ: several times quoted and mentioned by Pliny. He had a botanical garden, probably the earliest on record. He lived more than 100 years in perfect health, it is reported, both of body and mind.

CASTOREUM, a substance secreted in two glandular sacs, closely connected with, but quite distinct from, the organs of reproduction in the beaver (q.v.), and at one time held in the highest repute in medicine, although now regarded as almost inert, and chiefly used by perfumers. The C. sacs are pear-shaped, and it appears in commerce in these sacs themselves, connected in pairs as they are taken from the animal. C. is produced both by the male and by the female beaver. In Hudson's bay commerce, ten pair of them are equal in value to one beaver skin. Russian C. is of much higher value than American. C. was well known to the ancients. From the time of Hippocrates, it was regarded as having a specific influence over the uterus, and is still in use in the

n. of Europe. It was at one time also esteemed a most valuable medicine in hysteria, catalepsy, and other spasmodic diseases.

CASTORIDÆ, a family of *mammalia*, of the order *rodentia*, of which the beaver (*castor*) is the type, and in which, besides the beaver, the coypu (*myopotamus*), and the *musquash*, some naturalists include other genera more commonly regarded as belonging to the mouse and rat family (*muridæ*), as the lemmings and voles.

CASTOR OIL, a fixed oil obtained from the seeds of the C. O. plant. In extracting the oil, the seeds are first bruised between heavy rollers, and then pressed in hempen bags under a hydraulic or screw press. The best variety of oil is thus obtained by pressure in the cold, and is known as *cold-drawn* C. O.; but if the bruised and pressed seeds be afterwards steamed or heated, and again pressed, a second quality of oil is obtained, which is apt to become partially solid or frozen in cold weather. In either case the crude oil is heated with water to 212°, which coagulates, and separates the albumen and other impurities. Exposure to the sun's light bleaches the oil, and this process is resorted to on the large scale. When pure and cold-drawn, C. O. is of a light yellow color; but when of an inferior quality, it has a greenish, and occasionally a brownish tinge. It is somewhat thick and viscid. Its specific gravity is high for an oil, being about 960 (water being taken as 1000). It is miscible with alcohol or spirits of wine and ether. Reduced to a temperature of 0° F., it does not become solid; but exposed to the air, it very slowly becomes rancid, then dry and hard, and serves as a connecting link between the drying and non-drying oils. It has a nauseous smell, and an acrid, disagreeable, and sickening taste, which may be overcome by the addition of a little magnesia. The principal acid present in it is *ricinolic* acid (HO, C₃₆H₇₂O₆), which is allied to oleic acid.

C. O. is one of the most convenient and mildest of purgative medicines. Given in doses of one or two tea-spoonfuls, with a little peppermint-water, it forms a gentle laxative for habits easily acted on by medicine; while a dose of a table-spoonful, or a little more, will almost always succeed if it remains on the stomach. The only serious objections to the use of C. O., are its disagreeable flavor, and the sickness often produced by it; some persons get over this difficulty by floating the oil in hot coffee, which is said to remove its nauseous quality.

The adulteration of C. O. may be various. Several of the fixed oils, including lard, may be employed. The best test of its purity is its complete solubility in its own volume of absolute alcohol, which other fixed oils are not. Croton oil is occasionally added to increase the purgative powers of the oil.

The **CASTOR OIL PLANT** (*ricinus communis*) is a native of the s. of Asia, but now naturalized in the s. of Europe, and in other warm regions of the globe. The genus *ricinus* belongs to the natural order *euphorbiaceæ*. It has panicled flowers, with 3 to 5-partite perianth; the fruit a tricoccos capsule, with one seed in each cell, the outside of the capsule generally covered with soft spines. The C. O. plant is often cultivated in gardens in the middle and even in the northern parts of Europe, where it is only an annual, attaining a height of 3 to 10 feet, but highly ornamented by its stately growth, its large, broad, palmato-peltate, 7 to 9-fid leaves, $\frac{3}{4}$ to 2 ft. in diameter, and its generally purplish hue. Its flowers are produced in long glaucous racemes. In warmer climates, it is perennial, and its stem becomes arborescent, attaining even 30 ft. in height, with a corresponding thickness, so that ladders are used for climbing it. Different species which have been described, are probably mere varieties. It was known to the ancients, and appears to have been valued by them. Its seeds have been found in Egyptian sarcophagi. From the resemblance of its seeds to an insect called *ricinus*, it received that name from the Romans. The seeds are oval, and about four lines long. They are chiefly valued for the oil which they yield, on account of which the plant is cultivated in the Levant, Spain, Provence, the West Indies, Brazil, the United States of America, as far n. as New Jersey, and in other tropical and warm temperate countries.—Although C. O. is chiefly used in medicine, it is not unfit for lamps and for oiling the wheels of machinery. The streets of Lima are lighted and the machines used in the works of the sugar plantations of Peru are oiled with it. The appearance of the C. O. plant obtained for it the name of *palma christi*, by which it is still sometimes called. Its seeds were formerly known as *semina calaputivæ majoris*.

CASTOR AND POLLUX, twin gods of Greece and Rome; known under the name of Dioscuri (from Dios or Jupiter, and Kouroi, children); children of Jupiter by Leda, who met the divinity in his form of a swan. The Dioscuri were specially revered among people of the Dorian race, and were said to have reigned at Sparta. They presided over public games, Castor being the god of equestrian exercises, and Pollux the god of boxing; but both were usually represented on fiery steeds, with spears, and egg-shaped helmets crowned with stars. They were the patrons of hospitality, and their aid was especially sought by travelers, to whom they were always gracious. Among their exploits were the invasion of Attica to rescue their sister Helen from Theseus; their part in the Calydonian hunt; their participation in the Argonautic expedition, during which they married the daughters of Leucippus; and lastly their battle with the sons of Aphareus, in which Castor (the mortal brother) was slain by Idas. On finding him dead, Pollux, who was immortal, implored Jupiter to permit him also to die; but

Homer says the dead one was permitted to live again on condition that both should, on alternate days, descend to Hades, or that they should live only on alternate days. Another story is that they were placed among the stars, and now, as the Twins, form one of the 12 zodiacal signs. They were greatly venerated at Rome, where it was believed that at the battle of lake Regillus they fought at the head of the legions of the commonwealth, and afterwards with incredible speed carried to the city the news of the victory. Where they alighted near a well in the forum, a temple was built, and a great festival was held in their honor during the ides of Quintilis, the supposed anniversary of the battle, where sacrifices were offered at the public charge. A part of the ceremonies was a grand muster of the equestrian body, when all the knights, clad in purple and crowned with olive, assembled at the temple of Mars, out of the city, and rode in state to the forum where stood the temple of the twins. For centuries this pageant was one of the most splendid sights in Rome. In the days of Dionysius the cavalcade consisted of 5,000 horsemen, all persons of wealth and honorable repute.

CASTOR AND POLLUX, the two principal stars in the constellation Gemini (q. v.), were so called from Castor and Pollux, sons of Leda and Tyndareus, king of Lacedæmon. Their sister was the famous Helen of Troy. On account of their mutual attachment, Zeus placed them among the stars.

CASTOR AND POLLUX, the name given to a meteor, seen at sea, and which, under the form of twin balls of fire, attaches itself to the masts of ships. Sailors predict fair weather from its appearance. Sometimes, however, only one ball of fire is seen; the meteor is then called Helena, and it is regarded as foreboding a storm. Shakespeare makes mention of this superstition in the *Tempest* (act i. scene 2).

CASTRAMETATION is the art of encamping; and a *camp* is the result of that art. See **CAMP, ENCAMPMENT**.

CASTRATION, taking away, or destroying the natural powers, or the essential organs of generation in animals; in males the removal of the testicles, and in females a mutilation or removal of the ovaries, commonly called "spaying." The general purpose is to make domestic animals more docile and useful, and more valuable for meat, as well as to restrict unlimited reproduction.

CASTREN, MATTHIAS ALEXANDER, the greatest authority in regard to the Finnish people and language, was b. in 1813, not far from the Lappish boundaries of Finland. He received his earliest instruction in the town of Tornea, and afterwards studied at Helsingfors. About the year 1838, he undertook a pedestrian excursion through Finnish Lapland, in order to extend his knowledge of the language and literature; and, in 1840, another through Carelia, to collect ballads, legends, etc., illustrative of Finnish mythology. On his return, he published in Swedish a translation of the famous Finnish poem, *Kalevala*, the meter and style of which have been imitated by Longfellow in his poem of *Hiawatha*. Aided by the government of his native province, he commenced his researches among the Finnish, Norwegian, and Russian Laplanders, as also among the European and Siberian Samoyeds. Appointed linguist and ethnographer to the St. Petersburg academy, C., between the years 1845 and 1849, prosecuted his laborious investigations as far e. as China, and as far n. as the Arctic ocean. On his return, he was appointed first professor of the Finnish language and literature at the university of Helsingfors. He employed himself in preparing for publication the vast materials which he had collected, but died 7th May, 1852, from exhaustion—a martyr to science. Before his death, appeared *Versuch einer ostjåkischen Sprachlehre nebst kurzen Wörterverzeichniss* (Petersburg, 1849), as the first installment of his *Northern Travels and Researches*. He also wrote *Elementa Grammaticæ Syrjacnæ* (Helsingfors, 1844), and *Elementa Grammaticæ Tscheremissæ* (1845); *On the Influence of the Accent in the Lappish Language* (Petersburg, 1845); *De Affixis Personalibus Linguarum Altaicarum* (Helsingfors, 1850), etc.

CASTRÉN, MATTHIAS ALEXANDER, 1813–52; a native of Finland, and the first eminent philologist and antiquarian of that country. He traveled extensively in all parts of the country to become familiar with the language (having been educated in Swedish), and with the antiquities and folk-lore of the people. He also traveled among the Samoyeds of Europe and Siberia to the provinces of China and the Arctic ocean. He was the first professor of the Finnish language and literature at the university of Helsingfors. All his works were published after his death, and a monument has been dedicated to his memory at Helsingfors.

CASTRES, a t. of France, in the department of Tarn, is situated on both sides of the river Agout, 46 m. e. of Toulouse. The two parts of the town are united by two stone bridges. In the middle ages, C. was celebrated for its Benedictine abbey, the heads of which exercised a temporal sway over the place. Later, it was one of the strongholds of the reformed party, but it was forced to submit, and had its fortifications demolished in the reign of Louis XIII. C. has beautiful promenades, shaded by fine alleys of trees, and in the neighborhood is a remarkable rocking-stone, 11 ft. high, and weighing some 30 tons. It is of egg-shape, and rests upon its smaller end; a strong push is sufficient to cause its vibration. C. is a busy manufacturing place. Its fine wool-dyed goods are

especially famous, and it has also manufactures of linen, leather, paper, soap, etc. Pop. '76, 20,520.

CASTRI, or **KASTRI**, a village of modern Greece, in the government of Phocis, situated on the s. declivity of Mt. Parnassus, and worthy of notice, as occupying a portion of the site of the ancient Delphi (q.v.). The famous Castalian spring, now called the fountain of St. John, is situated between 200 and 300 yards to the e. of the village. Beside it grows a plane-tree, the only one in C., which is fabled to be that planted by Agamemnon.

CASTRO (ancient *Mitylene*), a seaport t. of Asiatic Turkey, capital of the island of Mitylene, situated on the e. coast, about 55 m. n.w. of Smyrna. It is surrounded with walls, and defended by a castle, and its streets are narrow and dirty. Remains of the ancient town are found to the west. Pop. 6,500.

CASTRO, GUILLEN DE, 1569-1631; a Spanish dramatist who enjoyed the friendship of Lope de Vega, whom he assisted in the famous festival of the canonization of San Isidoro, where he won a prize in the literary tournament. Castro wrote about 40 plays, the most celebrated of which was *Las Mercedes del Cid*, to which Corneille was greatly indebted for the materials of his renowned tragedy. It is said that Castro died in poverty and was buried by charitable friends.

CASTRO, HENRY, 1786-1861; a native of France, an officer of the national guard of Paris, who, after the downfall of Napoleon, emigrated to the United States, and in 1827, was consul for Naples at Providence, R. I. He returned to Paris 11 years later, became a partner in the counting-house of Lafitte, and was made consul-general for the new republic of Texas. He engaged in the business of sending out emigrants, and within a few years established at Castroville and other places settlements which, after the annexation, were organized into Medina county.

CASTRO, INEZ DE, whose mournful fate is the subject of several tragedies and poems, was the daughter of Pedro Fernandez de Castro, and sprang from a branch of the royal family of Castile. She was appointed lady-in-waiting to the wife of Dom Pedro, son of Alfonso IV. of Portugal. Her beauty captivated Dom Pedro, and, after the death of his wife, in 1345, he secretly married Inez. Their stolen interviews took place in the convent of St. Clara, at Coimbra, until the secret was discovered and revealed to the king, who was made to believe that this union might prove injurious to the young Ferdinand, son of Dom Pedro by his deceased wife. Questioned by his father, Dom Pedro had not the courage to reveal the whole truth, while he refused to marry another. In the king's council, it was determined that Inez must die. To see this sentence executed, the king hastened to Coimbra, while his son, Dom Pedro, was engaged in hunting (1355); but the sight of the beautiful Inez, who, with her children, cast herself at the feet of the king, and prayed for mercy, diverted him for a few moments from his purpose. His advisers, however, soon obtained from the king permission to execute the sentence, and, in the course of an hour after the interview, Inez fell pierced by the daggers of assassins. Dom Pedro attempted a revolt against his father, but was pacified by the queen and the archbishop of Braga, and promised not to seek revenge for the death of Inez. Two years afterwards, the king died, having shortly before his death recommended the murderers of Inez to leave Portugal, and seek shelter in Castile, where Peter the cruel was then ruling. As several of Peter's nobles had escaped into Portugal, to avoid his oppression, he now proposed to Dom Pedro an exchange of fugitives, to which the latter (now king of Portugal) consented. Two of the assassins accordingly were delivered up, and were tortured and burned. Two years afterwards, the king, in an assembly of the nobility, declared that he had been lawfully married, by papal sanction, and in the presence of the archbishop of Guarda, to Inez de Castro. When this statement had been confirmed by several testimonies, the king gave orders that the corpse of Inez should be removed from its grave, clothed in royal attire, with a crown on the head, and seated on a throne, should receive homage as queen. This strange ceremony was performed, the nobles of Portugal bowing before the enthroned dead, and kissing the hem of the royal robe. The body was then removed to Alcobaca followed by the king, with the bishops and the nobility, all on foot. A splendid marble monument was erected over the grave of Inez, surmounted by her statue, wearing a crown.

CASTRO, JOÃO DE, 1500-48; viceroy of the Portuguese Indies, son of the civil governor of Lisbon. He served in a military capacity in Tangier, Tunis, and elsewhere, and went to the Indies with his uncle, Garcia de Noronha. On arriving at Goa he enlisted among the "bravest of the brave" who were told off for the relief of Diu (a Portuguese settlement on an island of the same name, in the present province of Guzerat). Returning to Portugal he was made commander of a fleet to clear the European seas of pirates; and in 1545 he was sent out as viceroy of the Indies to supplant Martin de Souza. The next three years were full of struggle, suffering, and triumph. Valiantly seconded by his two sons, one of whom was killed before Diu, he overthrew Mahmoud, king of Cambodia, relieved the beleaguered town of Diu, and defeated the great army of Adhel Khan. He subsequently completed the subjugation of Malacca, soon after which he was fully commissioned as viceroy, but did not live long to fill the place, dying the next year in the arms of his friend, St. Francis Xavier. He was buried at Goa, but the body was after-

wards removed to Portugal, to be interred under a splendid monument in the convent at Bemfica.

CASTRO DEL RIO, a t. of Andalusia, Spain, situated on a slope on the right bank of the Guadajocillo, 16 m. s.e. of Cordova. A portion of the old town is surrounded by ruinous walls: the new town lying outside of these has some good streets. It has manufactures of woolen and linen fabrics, earthenware, etc., and considerable trade in agricultural produce. Pop. 9,100.

CASTRO-GIOVANNI, a t. of Sicily, in the province of Caltanissetta, is situated 13 m. n.e. of the chief town of the province, on a remarkably fertile plateau, which rises precipitously to a height of 4,000 ft. above the sea-level. Castro-Giovanni occupies the site of the ancient *Enna*, of which Ceres was the presiding goddess, and her most famous temple was here. The neighborhood was the scene of Proserpine's abduction by Pluto. In connection with the Punic and Servile wars, Enna has a conspicuous part in early history. There are no remains of the old town. A castle and other buildings of Saracenic origin are still standing. The district yields large quantities of sulphur. Pop. 14,633.

CASTRONUOVO, a t. of Sicily, in the province of Palermo, 25 m. n. of Girgenti. It is situated on a hill, is fortified, and in its vicinity are quarries of fine marble. Pop. 4,029.

CASTROVILLA RI, a t. of s. Italy, in the presence of Cosenza, 34 m. n. of Cosenza. It is situated on an eminence surrounded by mountains, is partially fortified, and has an old massive castle, and a trade in wine, manna, silk, etc. Pop. 7,931.

CASTRUCCIO CASTRACANI, 1283-1328; a Ghibelline exiled at an early age with his parents and others of that faction; orphaned at the age of 19; served as a soldier in England, France, and Lombardy, until in 1313 he returned to Italy and was chosen chief of the Ghibellines, who had obtained mastery over the Guelphs. Thenceforth he passed a stormy life, chiefly in the support of the emperor Louis V., whom he accompanied to Rome, and who made him duke of Lucca, count of the Lateran palace, and senator of the empire. Castruccio was excommunicated by a Guelphic legate, and died soon afterwards, leaving several children, whose fortunes were wrecked in the Guelphic triumph that followed his death.

CAST-STEEL. This term, until lately, was confined to steel made by melting blister-steel (q.v.), obtained by the old cementation process. Through this simple operation of melting it in crucibles, which was invented by an Englishman named Huntsman about the middle of last century, steel was first readily made perfectly homogeneous, and fitted for the production of the finer kinds of tools and cutting instruments. The crucibles are made of fire-clay, mixed with a small proportion of the material of old ones and coke. They are very carefully prepared and annealed, but notwithstanding this, the heat of the furnace is so high that they can only be three times used. Each crucible contains from 30 to 40 lbs. of steel, which is poured, when melted, into cast-iron ingot-molds previously smoked. The name "cast-steel," however, can no longer be confined to steel so made, because Bessemer steel, although produced by a quite different process, is truly a cast-steel. In Sheffield, the finer kinds of cast-steel are now sometimes called "crucible steel;" but since puddled steel, which, like the Bessemer, cannot be used for fine cutlery, is also cast in crucibles, such a term is not sufficiently distinctive.

CASTUE RA, a t. of Estremadura, Spain, 68 m. e.s.e. of Badajos. It is situated near the right bank of the Guadalefra, has several good streets, manufactures of brick, earthenware, etc., and a trade in agricultural produce; there is also some weaving carried on. Pop. 5,600.

CASUAL POOR are persons temporarily relieved without being admitted to the roll of permanent paupers. See **POOR-LAWS**.

CASUALTIES OF SUPERIORITY, in the feudal law of Scotland, are such emoluments arising as to the superior as depend on uncertain events. See **WARD-HOLDING**.

CASUARINA, a genus of trees of the natural order *amentaceæ*, and of the sub-order *casuarinæ*, which is regarded by some as a distinct natural order. The trees of this genus are almost exclusively Australian; one only, *C. equisetifolia*, being found in the South Sea islands, the Indian archipelago, the Malayan peninsula, and on the e. side of the bay of Bengal, as far n. as Arracan. Some of them are large trees, producing timber of excellent quality, hard and heavy, the *beef-wood* of the Australian colonists, so called from the resemblance in color to raw beef. *C. equisetifolia* is called in Australia the **SWAMP OAK**. It is a lofty tree, the *toa* or *aitoa* of the Society islands, where it grows chiefly on the sides of hills, and where its wood was formerly used for clubs and other implements of war. It has been introduced into India, and is there much valued, as its wood bears a great strain, and is not readily injured by submersion in water. The hardness and durability of this wood led the earlier voyagers to the South Sea islands to designate it *iron wood*. *C. quadrivalvis* is the **SHE OAK** of New South Wales. **CASSOWARY TREE** is a popular generic name of the *casuarinæ*. Some of the species are scrubby bushes. All of them have a very peculiar appearance, their branches being long, slender, wiry, drooping, green, jointed, with very small scale-like sheaths instead

of leaves. They resemble arborescent *equisetaceæ*. The fruit consists of hardened bracts, collected in a *strobilus*, or cone, and inclosing small winged nuts. The flowers have neither calyx nor corolla; the stamens and pistils are in separate flowers, the male flowers with only one stamen, the female flowers with a one-celled ovary, the male flowers in spikes, the female flowers in dense heads. More than 20 species are known.

CASUISTRY, called by Kant the *dialectics of conscience*, is that branch of theology and morals which professes to deal with very delicate moral questions—*casus conscientie*—and which supplies rules and principles of reasoning for resolving the same: drawn partly from natural reason and equity, and partly from the authority of Scripture, the canon law, councils, fathers, etc. C. has been, and still is, studied chiefly by Roman Catholic theologians; but at one period Protestant divines also paid some attention to the perilous science. The rudiments of it, however, are to be sought for in antiquity. Traces of it are found in the Stoic philosophers of ancient Greece. This is not to be wondered at, for C. is not, in its essence, a device of the schoolmen, although the latter elaborated it into a science, but a natural expression of the intellect and moral nature of man, when he is placed in circumstances of great perplexity. The sound and healthy reason of antiquity, however, could not enter into the morbid refinement, or rather the insidious corruption of morals found in certain Jewish and Christian writers. The *Talmud* (q. v.) contains an enormous accumulation of casuistical questions, while the sphere of Christian ethics in the middle ages often became a mere arena for unprofitable and pernicious disputations of this nature, as is seen in such works as the *Summa Raymundiana*, *Summa Astesana*, *Summa Bartholina*, which obtained their names from their respective compilers. At a later period, the Jesuits Molina, Escobar, Sanchez, Busenbaum, etc., became notorious for their abuse of ingenuity in the construction of moral puzzles, and for the flagrant immorality of their solutions. Some of them still "suffer the vengeance" of Pascal's immortal satire. It is nevertheless indubitable, that in the life of every man—now as formerly—*casus conscientie* will at times arise, when the higher laws of morality come into collision with subordinate conventional ones. The dubiety as to what the path of duty is, what *ought* to be done, resulting from this collision, naturally and legitimately leads to many nice considerations. If these are carried on under the guidance of a pure conscience, no harm can ensue, but, on the contrary, much good. Such, however, is not the *perverted* C. of the Jesuits, "the art of quibbling with God," as M. Le Feore, preceptor to Louis XIII., called it, in which a man seeks to justify, by subtle quirks, his immoral actions. Mayer has published an account of all the writers on cases of conscience, ranging them under three heads—Lutheran, Calvinistic, and Romish.

CASUS BELLI, or a case of war, is the reason alleged by one power for going to war with another. It is found impossible to reduce these causes or reasons to any definite code, because an ambitious or aggressive power has no difficulty in *making* a reason to declare to others, without acknowledging the real reason.

CASWALL, HENRY, D.D., 1810-70; b. in England, and emigrated to the United States at the age of 18, graduating at Kenyon college, Ohio. After some years of service as minister and professor of theology, in 1842 he returned to England, and procured a private act of parliament recognizing the validity of his ordination in the United States. He was appointed vicar, became proctor, and prebendary of Salisbury cathedral. About 1868, he returned to the United States, and he died in Pennsylvania. He wrote *America and the American Church*; *Scotland and the Scottish Church*; *The Western World Revisited*; *The Martyr of the Pongas*; and two works on Mormonism.

CASWELL, a co. in n. North Carolina, on the Virginia border, watered by the tributaries of the river Dan, and intersected by the Richmond, Danville and Piedmont railroad; 400 sq. m.; pop. '70, 16,081—9,494 colored. The chief productions are tobacco, corn, oats, and wheat. Co. seat, Yanceyville.

CASWELL, ALEXIS, D.D., LL.D., 1799-1877: one of the corporators of the national academy of sciences. He was professor of mathematics in Brown university from 1828 to 1850, and of mathematics and astronomy from 1850 to 1864, and president from 1868 to 1872. Author of a *Memorial of John Barstow*.

CASWELL, RICHARD, 1729-89; a revolutionary officer, native of Maryland, but an early settler in North Carolina, where he was for many years a member of the colonial assembly, speaker of the house, treasurer of the state, first governor, and thrice re-elected. He was a delegate to the convention that framed the federal constitution, and in 1787, was speaker of the state senate, and was presiding in that body when he was stricken with fatal paralysis. He was a brig.gen. in the patriot armies, and shared in the battle of Camden, and other conflicts.

CAT (Lat. *catus*), a name sometimes extended to the whole family of quadrupeds designated by zoologists *felidæ* (q. v.), the genus *felis* of Linnæus; and sometimes more restrictedly applied to a section of that family, containing a number of its smallest species, the domestic C. and species most nearly allied to it. These form the subject of the present article. They all pursue their prey on the branches of trees more than on

the ground, and are most expert climbers, in which, however, they are rivaled by some of the other *felidae*.

The origin of the domestic C. is by no means well ascertained; and by some naturalists it is described as a distinct species, under the name *felis domestica*, which perhaps may be regarded as at least a convenient provisional designation, until satisfactory reasons can be adduced for referring it to some species existing in a wild state. By many, indeed, the domestic C. has been confidently pronounced to be a mere domesticated variety of the common wild C. (*felis catus*) of Europe and the n. of Asia; but to this there are many objections; the most important being that it is always of smaller size, contrary to what is usually observed of the effects of domestication in animals; and that in cats of the domesticated race which have run wild, and in their known progeny, there is no appearance whatever of a tendency to return to the type of the true wild cat.—Another opinion as to the origin of the domestic C. has obtained the assent of a considerable number of naturalists; that it is derived from the *felis maniculata*, or gloved C. of n. Africa, a species discovered by the celebrated traveler Rüppell. But Mr. Owen has stated a perfectly conclusive reason against identifying the domestic C. with the *felis maniculata*, that the first deciduous molar tooth in the latter has a relatively thicker crown, and is supported by three roots, whilst the corresponding tooth both of the domestic C. and of the wild C. of Europe has a thinner crown, and only two roots.

The certainty, however that the C. existed as a domestic animal in ancient Egypt, makes it not improbable that we ought to look for its origin on the banks of the Nile, or in some of the countries from which the ancient Egyptians might most readily have obtained it. Of its rarity in Britain in former times, when the wild C. was common in all the woods which covered so much of the island, a curious evidence is afforded by a Welsh law quoted by Pennant—a law of the reign of Howel the good, who died in 938 A.D.—fixing the prices of cats according to their age and qualities, beginning with a price for a kitten before it could see, and enacting that if any one stole or killed the C. that guarded the prince's granary, he was to forfeit a milk ewe, its fleece and lamb; or as much wheat as when poured on the C. suspended by its tail, the head touching the floor, would form a heap high enough to cover the tip of the tail.

It is needless to describe an animal so well known as the domestic C., or to do more than allude to its purring, its mewling, and the other sounds which it makes, its aversion to wet its feet or fur, its love of heat and comfort, its stealthy manners when in quest of prey, its patient watchfulness, so often fatal to mice, and other points of its natural history with which everybody is familiar.

The delight which a C. takes in tormenting a mouse before killing it, has sometimes been mentioned as an apparent exception to the general character of goodness manifest in the instincts of animals. It is an interesting circumstance, however, that when the prey is a bird instead of a mouse, a C. immediately inflicts a mortal wound, as if aware of its greater power of effecting its escape.

The eye of the C. is capable of much contraction and dilatation of its pupil, so that the animal can see in a very feeble light, and is thus adapted for those nocturnal habits to which, even in domestication, it shows so strong a natural tendency.

The fur of the C. is very free from any oily substance, so as to be readily injured by water, and is capable of being rendered highly electric by friction, particularly in very dry or frosty weather. An electric spark is readily obtained from the tip of the ear.

The strong statements of Buffon gave for a time great currency to the opinion, that the C. is incapable of affection, and retains, even in a domesticated state, its savage ferocity, merely restrained by selfishness, and disguised by cunning. The belief is very prevalent that the C. forms an attachment to places only, and not to persons. There are, however, well-authenticated stories which prove the C. to be capable of strong attachment to its master or mistress, although this quality is less frequently and remarkably displayed than by the dog. The instances which have, on the other hand, been recorded to show the attachment of the C. to places, are well worthy of attention in connection with the subject of instinct in animals. Some of these instances of cats finding their way back from great distances to their former home, are very wonderful, and indeed cannot be explained on any grounds or principles known. The same instinct and power, however, are displayed by other animals.

The varieties of the domestic C. are neither numerous nor very different. The *tortoise-shell* C. differs from the most common variety chiefly in color, although it is also particularly elegant and delicate in form. It is much more common in the s. of Europe than in Britain.—The *Angora* C. is a beautiful variety, remarkable for its long silky hair.—The *Chinese* C. has a fine glossy fur, and is remarkable for its pendulous ears.—The *Chartreuse* is of a bluish color.—It is supposed that the *tabby* may have undergone less change by domestication than any other variety.

The wild C. is still to be found in a few of the woods of the n. of England, in the mountains of Wales, the Highlands of Scotland, and some parts of Ireland. It has entirely disappeared from districts where it was once common. It is the only beast of prey remaining in Britain the strength and fierceness of which make it at all dangerous to man; but an encounter with a wild C. is safe only to a man well armed. Fortunately, the instances of its attacking when unmolested are rare, but such instances have occurred. The wild C. is an inhabitant of deep thickets and recesses of woods, and of the rocky and

bushy ravines of mountainous districts. Its fur is held in considerable estimation. The fur is soft, long, and thick. The color of the face is yellowish-gray, with a band of black spots towards the muzzle; the forehead is brown; the head is gray, with two black stripes passing from the eyes, over and behind the ears; the back, sides, and limbs are gray, darker on the back, paler on the sides, with a blackish longitudinal stripe along the middle of the back, and numerous paler curved ones on the sides; the tail is ringed with light-gray and black, the tip being black. The length of a medium-sized male wild C. is almost 2 ft., exclusive of the tail, but this length is sometimes very considerably exceeded.—We know no record of any attempt to domesticate the wild cat.

The animal often called wild C. in America is the bay lynx. See LYNX.

Superstitions regarding Cats.—Cats have been objects of superstition from the earliest ages. In Egypt, they were held in the highest reverence; temples were erected in their honor; sacrifices and devotions were offered up to them; and it was customary for the family in whose house a C. died to shave their eyebrows. In the middle ages, they were regarded as the familiars of witches. The favorite shape of Satan was said to be that of a black C.; and the animal was an object of dread instead of veneration. There is or was a belief among sailors, that the frolics of a C. at sea portended a storm. Many people still prophesy rainy weather from a C. washing its face; and a cat-call on the house-top was formerly held to signify death. Their superstitious connection with witches, and the foolish belief that a C. has nine lives, have led to the perpetration of great cruelties upon this harmless and very useful domestic animal. See Brand's *Popular Antiquities*, Ellis's revised edition.

CAT, on shipboard, is a name for many of the ropes or lines employed. A *cat-fall* is a rope for heaving up the anchor from the water's level to the bow; it works through *cat-blocks*, and is connected with the *cat-head*. *Cat-harpings* are small ropes for tightening the shrouds. The *cat-heads*, just named, are two strong short timbers projecting from the bow, on each side of the bowsprit. A *cat-hook* fastens the ring of the anchor to the *cat-block*.

CAT, or **CAT-CASTLE**, in the military engineering of the middle ages, was a kind of movable tower to cover the sappers as they advanced to a besieged place. The garrison sometimes poured down burning pitch and boiling oil from the walls upon the C.; but occasionally this stratagem was disastrous, for the besiegers availed themselves of the blazing tower to burn the wooden gates of the town or fortress.

CATABRO'SA (Gr. *catabrōsis*, a gnawing), a genus of grasses formerly included in *aira* (see **HAIR-GRASS**), but distinguished by the leathery *puleæ*, which are ribbed, truncated, erose (as if gnawed at the points), awnless, and nearly equal. The glumes are much shorter than the spikelets, membranaceous, and very obtuse. The general appearance is different from that of the genus *aira*.—*C. Aquatica* is a pretty common British grass. It is of very wide geographic and climatic range, being found throughout Europe, from Lapland to the Mediterranean, and also in the torrid regions of South America. It grows only in very moist situations, as the muddy margins of lakes and rivers, ditches, etc., and is only cultivated in irrigated meadows, or on the banks of rivers subject to be overflowed by high tides, where the ground is always wet and muddy. It is one of the most valuable grasses for such situations, its foliage being peculiarly sweet, and much relished by cattle. Both its foliage and its seeds, also, afford much food to water-fowl, and to some kinds of fish, particularly carp. Its leaves often float, and its stalks seldom rise more than a foot or 15 in. above the surface of the water. It has a stiff branching panicle, with whorled spreading branches, and its seeds are small. When its artificial propagation is attempted, it is more frequently by dropping freshly gathered stems into still waters, or scattering them on the mud, than by sowing the seeds. It is sometimes called **WHORL GRASS**, and sometimes **SWEET WATER GRASS**.

CATACOMBS (Gr. *kata*, and *kumbos*, a hollow), subterraneous chambers and passages formed generally in a rock, which is soft and easily excavated, such as *tufa*. C. are to be found in almost every country in which such rocks exist, and, in most cases, probably originated in mere quarries, which afterwards came to be used either as places of sepulture for the dead or as hiding-places for the living. The most celebrated catacombs in existence, and those which are generally understood when C. are spoken of, are those on the Via Appia, at a short distance from Rome. To these dreary crypts it is believed that the early Christians were in the habit of retiring, in order to celebrate their new worship, in times of persecution, and in them were buried many of the saints and martyrs of the primitive church. They consist of long narrow galleries, usually about 8 ft. high and 5 wide, which twist and turn in all directions very much resembling mines; and at irregular intervals, expand into wide and lofty vaulted chambers. The graves were constructed by hollowing out a portion of the rock, at the side of the gallery, large enough to contain the body. The entrance was then built up with stones, on which usually the letters D. M. (Deo Maximo), or $\chi\rho$., the first two letters of the Greek name of Christ, were inscribed. Other inscriptions and marks, such as the cross, are also found. The original extent of the C. is uncertain, the guides maintaining that they have a length of 20 m., whereas about 6 only can now be ascertained to exist, and of these, many portions have either fallen in or become dangerous. When Rome was besieged by the Lombards in the 8th c., many of the C. were destroyed, and the

popes afterwards caused the remains of many of the saints and martyrs to be removed and buried in the churches. Art found its way into the C. at an early period, and many remains of frescoes are still found in them. After being neglected for centuries they were again brought to notice by father Bosio, who spent thirty years in their exploration. His investigations were published in 1632, two years after his death; but the most exhaustive treatise on the subject in all its aspects is the *Roma Sotterranea* of De' Rossi (1864-67), of which an abridgment is published in English by Dr. Northcote. The C. at Naples, cut into the Capo di Monte, resemble those at Rome, and evidently were used for the same purposes, being in many parts literally covered with Christian symbols. In one of the large vaulted chambers there are paintings, which have retained a freshness which is wonderful, considering the time and the dampness of the situation. The palm-tree, as a memorial of Judea, is a prominent object in these pictures. At Palermo and Syracuse there are similar C., the latter being of considerable extent. They are also found in Greece, in Asia Minor, in Syria, Persia, and Egypt. See NECROPOLIS. At Milo, one of the Cyclades, there is a hill which is honey-combed with a labyrinth of tombs running in every direction. In these bassi-rilievi and figures in *terra-cotta* have been found, which prove them to be long anterior to the Christian era. In Peru and other parts of South America, C. have been discovered. The C. in Paris are a species of charnel-houses, into which the contents of such burying-places as were found to be pestilential, and the bodies of some of the victims of 1792, were cast.

CATAFALCO (Ital. a scaffold), or **CATAFALQUE**, a temporary structure of carpentry, intended to represent a tomb or cenotaph, and adorned with sculpture and painting. It was employed in funeral ceremonies. The most magnificent C. ever made, perhaps, was that used at the interment of Michael Angelo, at Florence.

CATAHOULA, a parish in Louisiana, on the Tensas, Black, and Saline rivers; 1770 sq. m.; pop. '70, 8,475—4,082 colored. The soil is fertile, producing corn, cotton, etc. Seat of justice, Harrisonburg.

CATALANI, ANGELICA, a highly celebrated Italian singer, b. at Sinigaglia, in central Italy, some say in 1780, others in 1784, educated in the convent of St. Lucien, near Rome, where, in her seventh year, she displayed such wonderful vocal powers that strangers flocked from all quarters to hear her. She made her first public appearance at Venice in her 16th year, and experienced a succession of triumphs in every country in Europe for more than 30 years, amassing immense sums of money. The Italian opera in Paris was twice under her direction; but her husband's interference and extravagance brought her into much trouble. Her large queenly person and fine countenance, the immense volume, range, and flexibility of her voice, her power of sustaining her notes, in contrast with the lightness and facility of her unerring execution, everywhere took her audience by storm. Her expression, although fine, and her whole style, surprised rather than touched the heart. In concert singing, her great triumphs were in *Rhode's* air with variations, and *God Save the King*—which she would call *shave*; and in oratorios, Luther's hymn, her delivery of which, especially when her marvelous voice alternated with the trumpet's sound, was so sublimely awful, that the audience were hushed and pale, and some were borne away fainting. The throat from which these wondrous sounds proceeded was physically of such dimensions, that a physician, when called to look into it, declared he could have passed down a penny-loaf! In 1830, Madame C. purchased a villa near Florence, formerly belonging to the Medici family, where she gave free instructions to girls who had a talent for singing, on condition of their taking the name of Catalani. In the spring of 1849, when political disturbances broke out in Tuscany, she repaired with her daughters to Paris, where she died of cholera on the 13th of June.

CATALAUNIAN PLAIN (*Campi Catalaunici*), the ancient name of the wide plain surrounding Chalons-sur-Marne, in the old province of Champagne, France, celebrated as the field of battle where the west Goths, and the forces under the Roman gen. Aetius, gained a great victory over Attila in 451 A.D. A wild tradition (made the subject of a striking picture by Kaulback, "Die Hunnenschlacht," or "The Battle of the Huns") tells that three days after the great fight, the ghosts of the fallen myriads appeared on the plain, and renewed the conflict.

CATALDO, SAN, a t. of Sicily, in the province of Caltanissetta, and 5 m. w. of the town of that name. There are productive sulphur-mines in its vicinity. Pop. 12,800.

CATALEPSY (*katalepsis*, a taking possession of), a state of more or less complete insensibility, with absence of the power of voluntary motion, and statue-like fixedness of the body and limbs in the attitude immediately preceding the attack, a like position being also retained, unless altered by force, until the return of consciousness. Such is the abridged description of C., as commonly given in works of authority. The patient is usually in good health at the time of seizure, or subject only to nervous affections, such as hysteria (q. v.); sometimes the attack is preceded by disappointment, fear, violent exciting or depressing passions, or even religious emotions, being in such cases only an extreme form of what is otherwise called trance, reverie, or ecstasy (q. v.); on other occasions, the apparent cause is more purely physical, as in some of the hysterical cases, depending on suppressed menstruation. In all cases of cataleptic rigidity and insensi-

bility, it may be presumed that the brain, as the organ of consciousness, is disturbed; but it does not appear that in any considerable proportion there is structural disease. Patients rarely die during the attack, which may, however, be protracted for an indefinite period, and may even endanger life indirectly by the debility consequent on imperfect nourishment. The circulation and respiration are, in most instances, little affected; cases, however, have been recorded in which, in consequence of their failure, the patient has been supposed to be dead. See DEATH. Many of the recorded cases of C. are little worthy of credit, and it has even been doubted whether this curious disease can ever be said to exist exempt from some degree of deception, or at least voluntary and conscious regulation of the muscles on the part of the person affected. The combination of C. with hysteria, and its frequent association with what are called the higher phenomena of mesmerism (see ANIMAL MAGNETISM), are undoubtedly circumstances of great suspicion; but it would certainly be wrong to suppose that all the cases described were fictitious, and not less so to classify them all under the head of pure imposture. Epidemic C. has been described, and in such cases it would appear plain that the principle of imitation, so powerful in producing nervous disease, must have been at work. The remedies of C. are the same as those of the states to which it is so nearly allied, and of which it may be said to form a part. Moral means form a large part of the treatment, as in hysteria. In some cases, it may become necessary to administer food by means of the stomach-pump, and this even for weeks or months. We have seen such a case end in complete recovery.

CATALOGUE (Gr. a list). See BIBLIOGRAPHY, BRITISH MUSEUM, LIBRARY, STARS.

CATALONIA (Spanish, *Cataluña*), an old province and principality of Spain, now divided into the provinces of Barcelona, Tarragona, Lerida, and Gerona, the total area being 12,180 m., and the pop. '70, 1,768,408. C. occupies the north-eastern corner of Spain, having France on the n., and the Mediterranean on the e. and s.e. It is watered by the Llobregat and the Ter, and by some of the affluents of the Ebro, the last-mentioned river having its embouchure in Catalonia. The coast is rugged, its boldest promontories being capes Creus and San Sebastian, and its deepest indentations the bays of Rosas and Tarragona. With the exception of a few low plains of limited extent, the soil of C. is that of a wild mountainous region formed by numerous offsets or terraces of the Pyrenees, one great ridge or series of ridges extending through the center of the province.

The terraces, sloping abruptly down to the coast, or to the narrow coast plains, are divided by the valley of Llobregat into the lower and the upper Catalonian mountains.

The climate of C., though fog and rain are frequent, and extreme and rapid changes of temperature prevail, is on the whole healthy and favorable to vegetation. Near Barcelona, oranges flourish in the open air; the fields in some parts are bounded by alce-hedges, and olives grow on Montserrat. Cork-trees grow on the mountains, and thickets of thorn-apple, laurel, myrtle, pomegranate, box, rosemary, etc., extend where the cork has its limits. Northern upper C. has a more severe winter than the s.; but everywhere vineyards and olive-gardens cover the slopes, and cornfields extend in the valleys. Among the other products are hemp, flax, madder, barilla, and saffron. Hazel-nuts, a variety called Barcelona nuts, are extensively grown. Meadow-lands and pastures are comparatively rare, and horned cattle are, therefore, mostly confined to the districts bordering on the Pyrenees; while few horses and mules are kept; but sheep, goats, and swine are bred in considerable numbers. Silk-worms and bees are also reared. The coasts abound with fish, and game is plentiful. The minerals are coal, copper, manganese, zinc, lead, cobalt, salt, sulphur, and many varieties of marble.

C. is the principal manufacturing province of the kingdom—is, in fact, “the Lancashire of Spain.” The inhabitants are neither French nor Spaniards, their language, costume, and habits being quite distinct from those of either; they have also local coins, weights, and measures. In energy, industry, and intelligence, they greatly surpass the rest of the Spaniards.

C., under the name of *Hispania Tarraconensis*, was one of the earliest, and remained among the last of the Roman provinces. It was invaded and captured by the Alans, who were followed by the Goths, hence its name *Gothalania*, changed into Gothallunia or Catalonia. In the 8th c., the Arabs gained possession of the southern part. When Charlemagne, in 788, subjugated Spain as far as the Ebro, C. formed the central portion of the Spanish mark, governed by French counts, having Barcelona as their residence. They soon made themselves independent of France. In 1137, earl Raymond Berengar, by his marriage, united C. with Aragon; and the marriage of Ferdinand and Isabella (1469) united both with Castile, and so C. became a portion of the Spanish monarchy, but never a very peaceable one. In modern times it has repeatedly taken a prominent share in Carlist or other insurrections.

CATALPA, a genus of trees of the order *bignoniaceæ*. The *catalpa syringifolia* is a native of the s. portion of the United States, and is cultivated there and in the cities of the northern states as an ornamental shade-tree. It may be known by silver-gray bark, wide-spreading but few branches, and the fine pale green of its large heart-shaped leaves. The flowers are white, tinged with violet or purple, and dotted with the same colors. The flowers are succeeded by long bean-like pods, that sometimes hang on the

otherwise bare limbs all winter. The wood is light and of fine texture, and useful in cabinet work. There is a catalpa in London said to have been planted by lord Bacon.

CATALYSIS (Gr. dissolution) is a term applied in chemical physics to a force supposed to be exerted by one substance upon a second, whereby the latter is subjected to change or decomposition, whilst the former, or acting substance, remains comparatively unaltered, and does not combine with it. The force, indeed, has been ascribed to the mere "action of contact." Fermentation is an example of this force (see BEER), when one part of yeast acting upon the sugar of the sweet worts, without entering into combination with it, compels 100 parts of sugar to pass into alcohol and carbonic acid. Germination, or the sprouting of grain when placed in the ground, is another example where one part of *diastase* changes 1000 parts of starch into sugar. No plausible theory has been brought forward to account for these changes, or to define what the force of C. is. Liebig has suggested, as an explanation, "that a body in the act of combination or decomposition enables another body with which it is in contact to enter into the same state;" but this view does not explain C., as that force does not act in the majority of cases where changes are proceeding, and, moreover, the acting substance, while changing itself, never throws the body acted upon into the *same state of change*, but causes it to assume a new series of changes different from those pursued by itself.

CATALYSOTYPE, a name given by its inventor, Dr. Wood, to a modification of the calotype process, upon the assumption that light set up a catalytic action (see CATALYSIS) among the ingredients employed. The paper is first washed with very dilute hydrochloric acid, to prevent the formation of yellow patches of insensitiveness, and then treated with sirup of iodide of iron containing a trace of free iodine; it is then partially dried between folds of blotting-paper, and sensitized by brushing over it a solution of nitrate of silver of ten grains to the ounce. Immediate exposure in the camera follows; after which, though no picture be visible at first, if it be allowed to remain in the dark for a period which varies with the length of time it was exposed, and the amount of light, a negative picture of great perfection is gradually developed. It is not necessary, however, for the explanation of this phenomenon, to assume, that a catalytic action is set up, inasmuch as the ordinary chemical reactions are quite sufficient to account for it. As soon as *nitrate of silver* comes in contact with the moist *iodide of iron* with which the paper is first imbued, an interchange of elements takes place, *iodide of silver* is precipitated in the pores of the paper, and *protonitrate of iron* is diffused over the surface; and this latter salt is even a more energetic developing agent than the ordinary gallic acid, hence the seemingly spontaneous appearance of the picture. This process is so uncertain in its results, that it is seldom practiced.

CATAMARAN is a raft formed of three planks lashed together, the middle one serving as a keel, and the other two for the sides. The rower stands or kneels on the middle plank, and works a paddle. These simple vessels are used by the natives of Madras, to maintain communication between ships and the shore, ordinary boats being rendered unsafe by the surf. By the adoption of a similar construction on a larger scale, some of the catamarans are made large and strong enough to carry goods, and even artillery. Catamarans used in Brazil consist simply of three logs of wood tapered at the end and lashed together; they carry a sail.

CATAMARCA, a province in the Argentine republic, between 25° and 29° s., and 66° and 69° w., lying at the foot of the Andes; 35,500 sq.m.; pop. '89, 79,962; the greater portion being of pure Indian blood. The province is intersected by several mountain-chains; and by many small streams, most of them dry in the summer, but in winter subject to destructive floods. Some of the plains are sandy deserts, while others are periodically inundated; and when the water dries away, it leaves a coating of salt, which is gathered for home use and for trade. Gold, silver, and copper are found, the latter in abundance; and nearly all the fruits and grains of tropical and temperate regions are grown. The cotton of C. is especially esteemed. Among the animals are large herds of alpaca, llama, and vicuna, and also horned cattle, asses, and mules. The main exports are wines, brandy, raisins, hides, leather, tobacco, cochineal, and copper. The people are occupied in agriculture, and in manufactures of earthenware, and fabrics made from the wool of the alpaca and kindred animals. The chief town and capital is the city of the same name.

CATAMARCA, the capital of the province of Catamarca, in the Argentine republic. 28° 20' s., 66° 25' west. It is a regular and moderately well-built town of about 6000 inhabitants. Of public buildings, there are a town-house, a Franciscan monastery, and a convent. There is considerable import-trade of European goods, and the place is a center of distribution for a flourishing district. Dried figs, wines, brandy, and cotton are the principal articles of export.

CATAMENIA. See MENSTRUATION, *ante*.

CATAMOUNT. See PUMA, *ante*.

CATANIA, or CATANEA, a city and seaport of Sicily, situated on the e. coast, near the foot of Mt. Etna, 31 m. n.n.w. of Syracuse. The fertile and well-cultivated neighborhood of C., extending along the s.e. base of Mt. Etna, is styled "the granary of Sicily," and has given to C. the title, "La Bella Catania." By eruptions of the great

volcano and attendant earthquakes, the city has been several times almost entirely destroyed, especially in the year 1693; but out of its ruins it has always risen with increased beauty, and it is now the finest city in Sicily, being built throughout on a beautiful and consistent plan, from which no deviation is allowed. The harbor of C., formerly good, was choked by a stream of lava in 1693, and the mole was partly destroyed, so that now it has only a roadstead, which is guarded by a fort, and serves as a landing-place. It has several squares, the finest of which, in front of the cathedral, has a statue of an elephant sculptured in lava. Among its chief public buildings are the Benedictine convent and church of San Nicolo, with one exception the grandest structure of the kind in Europe; the town-hall; the cathedral, with its noble granite columns; and the university, founded in 1445. It has besides many handsome churches and convents, and several educational and charitable institutions, and is the seat of one of the three high courts in the island. The inhabitants, formerly much more numerous, amounted in 1872 to 84,397, and are distinguished by their commercial spirit and industry. C. has manufactures of silk and linen goods, and of articles in amber, lava, wood, etc. Among the remains of ancient times, that earthquakes have spared, are those of a theater, an odeium, a temple of Ceres, Roman baths, and an aqueduct. C., anciently known by the name of *Catana*, was founded by a Greek colony of Chalcidic origin, in the latter part of the 8th c. B.C.; and as early as the beginning of the 5th c. B.C., it was esteemed one of the most flourishing towns in Sicily. It was taken by the Athenians under Nicias, and was desolated by Dionysius I.; but again rose under the Roman sway into its former importance. Augustus here founded a Roman colony. It suffered at the hands of the Goths, but once more, under the Byzantine empire, became one of the principal cities in the island. C. gives name to the province of which it is the capital, and which is one of the richest in Sicily, with an area of 1743 sq. miles, and a pop., in 1872, of 479,850.

CATA'NIA, GULF OF, an inlet of the Mediterranean, on the e. coast of Sicily, extends in the form of a semicircle from La Trezza bay to cape Santa Croce, a distance of 18 miles. It is about 10 m. deep, and receives the river Giaretta.

CATANZA'RO, a city of s. Italy, in the province of the same name, is beautifully situated on the declivity of a rocky hill, near the gulf of Squillace, and in the midst of a very fertile district. On account of its agreeable climate, many wealthy families have made it their residence. It has a cathedral, an old castle of the Norman period, a college, one of the largest, as it is one of the best conducted in the country, and is the seat of one of the four great civil courts of the kingdom. C. suffered very severely by an earthquake in 1783. It has manufactures of silk-velvet and woolen fabrics, and an active trade in agricultural produce. Pop. '71, 18,781.

CATAPLASM (a Greek term for a poultice), an application to diseased or painful parts, for the purpose of promoting suppuration, relieving pain, and stimulating or soothing the skin, according to circumstances. A C. may be composed of any moist pulpy substance of sufficient consistence to retain the water without dripping or soaking through the thin muslin covering in which it is generally wrapped. The making of a poultice well is a matter of some nicety, and unless the proper consistence is given to the mass, the application is apt to do more harm than good. The linseed-meal poultice is the most easily made, and most satisfactory of all soothing applications. The meal is stirred gradually into a sufficient quantity of boiling water, placed in the bottom of a small basin or teacup, until a perfectly smooth pulp is formed of the proper consistence, and in quantity sufficient to cover completely, to the thickness of three quarters of an inch, the whole pained part. The pulp is then folded up in muslin or thin calico, and applied as soon as the heat will permit it to be borne. The bread and milk, or even bread and water poultice, is also very good; as is also the oatmeal-porridge poultice, to which a little butter may be added with advantage. A spoonful or two of yeast may be added, if there are foul discharges, or peat charcoal may be sprinkled on the surface of the poultice before it is applied. Carrot poultices are in great favor with the people in some parts of the country. Hemlock poultices, made of the fresh leaves, or of the dried leaves, with the aid of some powder of the leaves, form a valuable sedative application in painful diseases; and poppy-heads, or even opium, are sometimes infused in the water of which a poultice is made, for the same purpose. A stimulating C. or poultice may be made by sprinkling oil of turpentine, or chloroform, or mustard in moderate quantity on the surface of any ordinary poultice. When considerable irritation of the skin in a short time is desirable, a mustard C. or sinapism (*sinapi*, mustard) is used.

CATAPULTA, an engine of war used by the ancients, somewhat resembling the crossbow. In the C., a string or rope, suddenly freed from great tension, gave a powerful impulse to an arrow placed in a groove. There were great catapults fixed upon a scaffold with wheels, which were used in sieges, and small ones, carried in the hand, which were employed in the field. For a description of similar engines of ancient warfare, see articles BALISTA and ARBALEST.

CATARACT, an opaque condition of the lens of the eye. It is readily distinguished from opacities of the cornea, or clear front part of the eye, by its position just behind the pupil—that round and varying aperture in the iris through which light is admitted

into the back of the eye. C. may affect the lens alone (lenticular C.), or the front or back of the capsule of the lens (capsular C.), or both lens and capsule (capsulo-lenticular cataract). Its whiteness varies from that of half-boiled white of egg to that of snow. Heat will produce a like change on the lens out of the body, just as it changes white of egg from transparent to opaque. The rounded lens of the fish is seen at table in this opaque condition.

C. is painless, and unaccompanied by inflammation. It occasions blindness simply by obstructing the passage of the light; but C. alone does not produce so complete blindness but that the patient can tell light from darkness. It may occur at any age, but is most common in elderly persons, and is not unfrequent in children, who may be even born with it. The catoptric test, as it is called, is an ingenious method of distinguishing incipient C. from certain other deep affections of the eye. When a lighted candle is held before the eye of a person whose back is to the window, three candles are seen in the healthy eye. Two are erect—the large front one caused by the convex cornea, the smaller and fainter one behind by the convex front of the lens. The third, occasioned by the concave back of the lens, is in the middle; is small, bright, and turned upside down; and, when the candle is moved, goes in the opposite direction, while the two erect images move with the candle. When the back of the lens becomes opaque, the inverted image is obscured or disappears; and when the front of the lens is affected, only the great front image, caused by the cornea, remains. This curious experiment may be tried on a large scale, by holding a common bi-convex lens a little way behind a watch-glass. Then, on greasing the back of the lens, to imitate C., the inverted image disappears, and on turning the lens round, all but the image in the watch-glass disappears.

No medical or other treatment has any influence in arresting the progress of C., nor can it be cured but by a surgical operation. A clever imposture used to be practiced by quacks. By applying belladonna to the eye—as the surgeon does when he wishes to dilate the pupil for an examination or operation—some little light was temporarily admitted through the less opaque edge of the lens. The patient beginning to see somewhat better, after long and increasing dimness of vision, began to congratulate himself on a cure; the quack, of course, hastened to get his money without waiting for the further result, which was sure to be blank disappointment. So long as there is fair vision with one eye, the operation on the other may be delayed. It is a mistake to delay the operation in children on account of their tender age. The sooner it is done the better, both for the eye and the education of the child.

Three methods of operation are practiced. 1. For *absorption* or solution. This is suitable for children, in whom the C., like the natural lens, is soft, and in all other cases in which there is reason to suppose that the C. is soft. An appropriate needle is passed through the cornea; made to open and lacerate the front of the capsule, the rags of which curl out of the way behind the iris, so that their subsequent opacity does not obstruct the light; then the soft cataractous lens is punctured and picked so as more effectually to admit the aqueous humor, which naturally fills the space between the lens and the cornea, and which has the remarkable property of absorbing or dissolving the lens or cataract when admitted within the capsule. This operation may require to be repeated several times, at intervals of a few weeks, before the whole C. is dissolved. 2. *Displacement*. A needle is passed through the fore part of the white of the eye, until it is seen through the upper part of the pupil, lying across the front of the upper part of the lens. This is now pressed back, so as to make the lens sink down and back into the vitreous humor, when it is either slowly absorbed, or may in part permanently remain. The older method of displacement, termed *couching*, in which the lens was pushed more directly downwards, is now abandoned, as more likely to press on the retina, and cause subsequent evil to the eye. 3. *Extraction*. Half the cornea, through nearly its whole breadth, is divided with Beer's knife, an operation requiring great skill; the front of the capsule is opened, and disposed of with a needle; and the lens is gently assisted out of its place, through the pupil, and out of the opening in the cornea, great care being taken not to allow the vitreous humor to follow. Displacement and extraction are both applicable to hard cataracts, the form it generally takes in old age, as the lens itself becomes naturally harder with age, as well as more flat and amber-tinted. Displacement is more likely to be followed by bad consequences, some time after, from the presence of the displaced lens, while the risk of extraction is greater at the operation. The surgeon must decide which is best for each case. Though not so simple and successful as the operation for absorption through the cornea for soft C., displacement and extraction are generally very successful in restoring vision. The place of the lens is supplied by fluid humor, the refracting power of which is nearly equal to that of the lens, and the restoration of vision may be perfect. All of these operations require minute anatomical knowledge (see EYE), and great nicety and skill in the use of the instruments.

CATARACTS and RAPIDS. See WATERFALLS, *ante*.

CATABRH (Gr. *katarreo*, I flow down), a disease of great frequency in temperate latitudes, especially in changeable moist climates in the winter season. From its well-known connection with sudden falls of temperature, and other epidemic or atmospheric causes (see INFLUENZA), as also from the chill often experienced at the commencement

of the disease, it is popularly called a *cold*—a term, however, perhaps somewhat less definite in its meaning than *C.*, which word is usually restricted to the case of a cold affecting the chest, and attended with discharge of mucus by coughing. A "cold in the head" is termed, in strict scientific language, *coryza*; we shall, however, keep both forms in view in the present article. *C.*, or cold, commonly begins with a feeling of chilliness, which may or may not be attributable to external causes. Sometimes this is absent, there being only a sense of languor and indisposition; not unfrequently there is no sensation of an unusual kind, until a stuffing is experienced in the nostrils, or severe headache, or hoarseness with cough, or oppression of the breathing. The regular form of a cold is to attack the nostrils first, and afterwards the air-passages leading to the chest. When it habitually attacks the chest, without running through its ordinary course as indicated above, there is often some special cause of delicacy in the lungs, or some constitutional tendency towards consumption (q.v.). The discharge is in the beginning watery, becoming afterwards more abundant, glairy, and of yellowish color; the early stages of the disease are attended by considerable irritation of the surfaces affected, and probably no one of the little miseries of life is more prostrating and discouraging for the time than a bad cold in the head. The tendency of *C.* to attack the chest, and thus to pass into bronchitis or pneumonia (q.v.), or to lay the foundation of tubercular disease, constitutes almost its only danger. See CHEST.

The treatment of a cold is commonly a simple matter, so far as the particular attack is concerned. Confinement to the house, and, in severe cases, to bed, or to the sofa, for a day or two; a warm hip or foot bath, to remove the chill; light farinaceous diet, and, if the stomach and bowels are at all loaded, a dose or two of some gentle laxative, are commonly sufficient to subdue the disease. Some persons cure their colds by entire abstinence from food, and as much as possible from drink; others by a large opiate, or by a succession of doses of Dover's powder; others by spirit of mildererus and paregoric; some even profess to carry out the popular maxim, "stuff a cold, and starve a fever," and maintain that a good dinner, and a tumbler of whisky or brandy toddy, are the best specifics. That colds get well under all these methods, needs not be denied; but that any violently perturbative or specific practice assists the cure, or shortens the disease, has yet to be proved; and multiplied experience has shown, that "stuffing a cold" is by no means to be commended. In the later stages, however, a more liberal diet than at first, and in some cases even a moderate allowance of stimulants, affords considerable relief from the feeling of depression that remains for a time on the subsidence of a catarrh. The tendency to this disease, when habitual, and when not dependent on any form of constitutional disorder requiring special means for its cure, is best met by the daily use of the cold bath, with frequent exercise in the open air, and proper ventilation of the sleeping-apartment; also by friction of the skin, and by clothing, which, without being oppressive, is comfortably warm. Exposure to draughts or sudden chills, when the surface is perspiring, is to be avoided; but a close confined air habitually breathed in a workshop or bedroom, is a fruitful predisposing cause of the disease.

CATASAU'QUA, a t. in Lehigh co., Penn., on Lehigh river, 3 m. above Allentown; pop. '70, 2,853. The Lehigh Valley and the Lehigh and Susquehanna railroads unite here.

CATAWBA, a light sparkling wine, of rich muscadine flavor, produced in the neighborhood of Cincinnati, Ohio, U. S. It is made from a grape called the Catawba grape, "first found growing on the banks of the Catawba river, in Carolina." This wine, which is scarcely known in England, is now in extensive use in North America, where it is gradually superseding the importation of the Rhenish and French sparkling wines, to which, in general character, it bears a resemblance. The vineyards where the *C.* is produced are situated on the steep and beautiful slopes with a southern exposure on the banks of the Ohio river, under the shelter of high hills on the north. The first great grower of the *C.* was Mr. Longworth, an esteemed and wealthy proprietor in this quarter, who, embarking in the pursuit less on business considerations than as an enthusiast, succeeded, after much patient care and expense, in producing a wine that throughout the states finds more favor, and commands a higher price, than the choicest wines imported. Some of the finer kinds of *C.* rival the best champagne in delicacy and purity, and are not to be confounded with inferior American imitations.

CATAWBA, a co. in w. North Carolina, on the Catawba river, crossed by the Western North Carolina railroad; 250 sq. m.; pop. '70, 10,984—1703 colored. It has a varied surface and fertile soil, producing wheat, corn, oats, etc. Iron ore is found in abundance. Co. seat, Newton.

CATAWBA, or **GREAT CATAWBA**, a river rising in the Blue Ridge in n.w. North Carolina, and flowing e. and s. through the gold region of that state into South Carolina, where it takes the name of the Wateree and joins the Congaree, the two forming the Santee. The *C.* is about 250 m. long.

CATAW'BAS, Indians of North Carolina, once a large tribe in the region of Catawba river, but now a mere remnant. At the time of the early white settlements, they could muster many thousands of warriors, and as late as the revolution were able to furnish a valuable contingent to the Carolina troops. They occupied several towns

along the river that still bears their name; but at last leased the lands to the whites, and removed into the territory of the Cherokees, with whom they had been at war. After a short residence they returned to a reservation in their original district. Their language is closely allied to that of the Waccos and the Caroline tribe. Peter Harris, a revolutionary soldier, was said to be the last full-blooded survivor of the Catawba tribe.

CATBALO'GAN, or **CADVALONGA**, a t. of the Philippines, capital of the island of Samar, on a small bay on the w. coast. The houses are mostly constructed of nipa palm, but there are some of stone. Pop. about 7,000.

CAT-BIRD, *Turdus felix*, an American thrush, of the same group with the mocking-bird, which it resembles in its vocal powers. It is a bird of passage, making its way northward in spring through Georgia and Carolina as far as Massachusetts. It feeds on fruit and berries of all kinds, worms, and insects; builds a large nest of dry twigs, weeds, etc., without any attempt at concealment, in a bush or tree, often in the immediate vicinity of human habitations, and shows extraordinary boldness in the defense of its young. It has its name from a mewing cry which it utters when annoyed by an intruder approaching too near its nest.

CATCH, a species of musical composition peculiar to England, and in the canon style. The words of the C. are generally humorous, and intended to be sung in social parties over a glass. The music is generally for three voices, of which there exist hundreds of specimens from the time of Purcell to the present day. As in the canon, each voice takes up the subject at a certain distance after the first has begun. One of the best specimens of a C. is by Calcott, on Hawkins' and Burney's histories of music, where the humor lies in one of the parts repeating "Burney's history"—sounding like "burn his history"—while the others are advocating Hawkins.

CATCH-DRAINS, open drains, and sometimes covered drains, along a declivity to intercept and carry off surface water.

CATCHFLY, the common English name of several plants of the natural order *caryophyllaceæ*—as *silene armeria*, *S. Anglica*, *lychnis viscaria*, etc.—which being clammy, in consequence of a peculiar exudation, on the calyx, on the joints of the stem, etc., often prove fatal to insects settling upon them. See **LYCHNIS** and **SILENE**.—The name is sometimes employed by botanists as a sort of popular equivalent to *silene*.—*Dionæa muscipula* is also sometimes called the Carolina catechism. See **DIONÆA**.

CATCHPOLL, a sheriff's officer, or bailiff, is so called in England, probably because he was in use to catch his victim by the *poll*, or head.

CATEAU, **LE**, or **CATEAU-CAMBRESIS**, a t. of France, in the department of Nord, situated on the Selle, 14 m. e.s.e. of Cambrai. C. has manufactures of shawls, merinoes, calicoes, and leather; it has also breweries and distilleries. Pop. 76,944. It is celebrated as the place where, in 1559, the treaty known as that of Cateau-Cambresis was concluded between Henri II. of France and Philip II. of Spain, by which the former monarch ceded to the latter, Savoy, Corsica, and nearly 200 forts in Italy and the low countries.

CATECHETICAL SCHOOLS, the name given to the ancient Christian schools of theology, of which the chief were those of Antioch and Alexandria. Clement and Origen were the most famous of the teachers.

CATECHISM, from a Greek word, *katêcheō*, which means to resound, or sound into one's ears; hence to instruct by word of mouth. Persons undergoing instruction in the principles of Christianity were hence called *catechūmens* (*katêchoumenoi*), and the teacher appointed for this purpose was called a *catechist*. Hence any system of teaching by question and answer is called a catechism.

Catechisms have long formed one of the principal means employed for popular instruction in the truths and duties of the Christian religion. The composition of the first catechisms was, in all probability, suggested by the ordinary oral instruction of catechumens, and was intended for the help both of teachers and pupils. It appears to have been in the 8th and 9th centuries that the first regular catechisms were compiled, of which that by Kero, a monk of St. Gall, and that ascribed to Otfried of Weissenburg, are among the most noted. At later periods, the use of catechisms prevailed chiefly among the opponents of the hierarchy, as among the Waldenses, the Albigenses, the Wickliffites, and, above all, among the Bohemian brethren. The term C. appears to have been first employed in its present sense among the latter. At an early period in the history of the reformation, the reformers began to avail themselves of this method of popular instruction, and their catechisms became important instruments in that great religious movement. In 1520, Luther published his first short catechism. In 1525, Justus Jonas and John Agricola were intrusted with the preparation of a catechism. In 1529, Luther published his larger and smaller catechisms, which found a place among the symbolical books or standards of the Lutheran churches. A number of catechisms were published also by the Swiss reformers, and by those of England and other countries. The Geneva catechisms, larger and smaller, were the work of Calvin. They were published in 1536, were speedily translated into various languages, and became acknowledged standards of the reformed churches, not only in Switzerland but in the low countries, in France, and

in Hungary. The church of Geneva has set aside the authority of these catechisms.—The Zurich C. is received as a standard in the church of Zurich.—The Heidelberg or palatinate C. is of greater importance, however, than any other as a standard of the Swiss reformed churches. It was compiled by the Heidelberg theologians, Caspar Olevian and Zacharias Ursinus, at the request of the elector Frederic III. of the palatinate; it was published in 1563, was approved by several synods, and was subjected to a revision by the synod of Dort.—In the church of Rome, the Romish or Tridentine C. is of high authority. It was prepared in accordance with the decrees of the council of Trent, by archbishop Leon. Marino, bishop Ægidius Foscorari, and the Portuguese dominican, Francis Fureiro; revised by cardinals Borromeo, Sirlet, and Antonian, and sanctioned by pope Pius V. It was published at Rome in 1566.—The C. of the Orthodox Greek church was prepared by Peter Mogilas, metropolitan in Kiew, and published in 1642. It received authority as a standard or symbolical book from a synod at Jerusalem in 1672. It is often called the larger Russian C., to distinguish it from the smaller C., prepared by order of Peter the great.—Besides these catechisms, which have a historic interest, or are of importance from their symbolical character, there have appeared at all periods, since the reformation, many others, both Protestant and Roman Catholic, some doctrinal, some controversial, some devoted to particular subjects, as the sacraments, or to particular purposes, as the preparation of candidates for admission to the Lord's supper, some adapted to the mental capacity of very young children, etc. The opinion, however, has become prevalent, that doctrinal abstracts are not the best form in which religion can be presented to the young, and the use of catechisms has accordingly been in some measure relinquished in favor of other methods of instruction.

The C. of the church of England, with which we are most familiar, is the smaller one published in the book of Common Prayer. It is in two parts: the first contains and explains the baptismal covenant, the creed, the ten commandments, and the Lord's prayer; the second explains the two sacraments, baptism, and the Lord's supper. It is not known with absolute certainty who was the author of the first part; probably Cranmer and Ridley had the principal hand in framing the questions and answers. It was originally put forth with the 42 articles in the reign of Edward VI., and condemned as heretical in the reign of Mary. It must not be confounded with Cranmer's C., which was a larger work, differently arranged, and translated chiefly from the German C. used in Nuremberg. This first part of the church C. is spoken of as the *shorter* catechism.

There was a *larger* church C. compiled also in the reign of Edward VI., by Ponet, as is supposed, and it corresponds in some degree with the smaller work above described. It was afterwards revised and enlarged by Noel, dean of St. Paul's, and published in 1570; and though never officially promulgated by the church, it has some authority from having been approved by the lower house of convocation. At the Hampton court conference, in the reign of James I., the *shorter* C. was considered too short, and the larger one of Noel's too long; and accordingly, at the king's suggestion, an addition was made to the former of that explanation of the two sacraments which now forms the second part of the church catechism. This was drawn up by Dr. Overall. The whole is a work much esteemed by all sections of the church, as remarkable for its simplicity, truth, and catholicity. It, however, states the baptismal theory in a way that is not very acceptable to the extreme low church party. The rubrics in the Common Prayer book enjoin the teaching of the C. in the church on Sundays and holidays after the 2d lesson at evening prayer; and the 59th canon contains a like injunction, imposing penalties on the clergy who neglect this. The custom of catechizing in the church had fallen into almost universal disuse, but in many parishes it has been revived with excellent results.

The larger and shorter catechisms, which, with the Westminster confession of faith, constitute the standards or symbolical books of the Presbyterian churches throughout the British empire and the United States of America, were compiled by the assembly of divines at Westminster (q. v.); the shorter C. "to be a directory for catechizing such as are of weaker capacity;" the larger, "for catechizing such as have made some proficiency in the knowledge of the Christian religion." The shorter C. was presented to the English house of commons on 5th Nov., 1647; the larger on the 14th April, 1648; and in July, 1648, both received the sanction of the general assembly of the church of Scotland—the general assembly, in the act approving of the larger C., declaring it to be "a rich treasure for increasing knowledge among the people of God," and that "they bless the Lord that so excellent a catechism has been prepared." The shorter C. has, however, been far more generally used for the purpose of instruction than the larger, which has been generally felt to be too minute in its statements, and too burdensome to the memory to be employed as a catechism. Even the shorter C. is regarded by many, who substantially adhere to its doctrine, as carrying the statement of dogmatic theology beyond what is proper for elementary instruction, whilst it has been long felt to be unsuitable for the very young and the very ignorant, and its use is now almost always preceded by that of catechisms more adapted to their capacity. Its influence, however, has been very great in forming the religious opinions, and in exercising and training the intellectual faculties, wherever Presbyterianism has prevailed; for it has been, and still

is, in almost universal use among Presbyterians speaking the English language, and to a considerable extent among Independents or Congregationalists both in Britain and America. In Holland also, a translation of it has been much used. It is very generally regarded, by those whose doctrinal views are in accordance with it, as an admirable compend of Christian doctrine and duty.—The authorship of the Westminster assembly's catechisms has been the subject of much debate, or at least the authorship of the first drafts of them; it being admitted that they were prepared with great care by committees of the assembly. But the probability appears to be, that their authorship is to be ascribed entirely to these committees; and that, like the Westminster confession of faith, they are thus the result of the joint labors of many. From discoveries made by the late Dr. M'Crie, it seems probable that at least the plan or scheme of the shorter C. is to be ascribed to Mr. Palmer.

CATECHU, a substance employed both as a coloring matter and medicinally as an astringent. The C. of commerce is obtained chiefly from East Indian trees, such as the C. tree (*acacia catechu*), betel-nut, etc.; but the greater part of that which is exported from India is made from the C. tree. It is known in India by the name *kutt*; and C. is said to be a name compounded of two words signifying *the juice of a tree* (*cate*, a tree, and *chu*, juice). Cutch is another form of one or other of these names, and is a common commercial name. The heart-wood alone of the tree yields C., which is obtained by cutting it into small chips, and boiling it in water, straining the liquid from time to time, and adding fresh supplies of chips, till the extract is of sufficient consistence to be poured into clay molds, which are usually of a square shape: or when of the thickness of tar, it is allowed to harden for two days, so that it will not run, and is formed into balls about the size of oranges, which are placed on husks of rice or on leaves, and appear in commerce enveloped in them. The C. manufacturers in Northern India move to different parts of the country at different seasons, and erect temporary huts in the jungles, where they carry on their operations. The C. tree abounds chiefly in the Bombay and Bengal presidencies; it is a small, erect, thorny tree, with a roundish head of (generally) prickly branches. Its sapwood is yellow, the heart-wood dark red. C. is brittle, and can readily be broken into fragments; is soluble in water, and possesses an astringent taste, but no odor. It is a very permanent color, and is employed in the dyeing of blacks, browns, fawns, drabs, and greens. It contains much tannin, and an acid called catechuic acid, which can be isolated in white silky crystals. It is often adulterated with earthy substances, but its ready solubility in water and alcohol, should at once show the presence of such, by leaving them behind in an insoluble state.—The C. of the betel-nut is obtained by boiling first the nuts, and then the extract to a proper consistency. A first boiling of the nuts for some hours is said to yield a black kind of C., called *kassu*; and a second boiling, after the nuts are dried, a yellowish-brown kind, called *coury*, which is considered the best, and is sold for the highest price. The former appears in commerce under the name of colombo C. or Ceylon C. (or *cutter*) in the form of circular flat cakes, covered on one side with husks of rice. The latter does not seem to reach Europe.—Gambir (q. v.) may be regarded as a kind of catechu. Kino (q. v.) is sometimes confounded with catechu. *Terra Japonica*, or Japan earth, is an old name for C., not quite disused, which was given to it on the supposition of its being an earthy substance brought from Japan.

CATECHU MENS (Gr. persons undergoing a course of instruction; see CATECHISM), the appellation given, in the early Christian church, to those converted Jews and heathens who had not yet received baptism, but were undergoing a course of training and instruction preparatory to it. They had a place assigned them in the congregation, but were not permitted to be present at the dispensation of the Lord's supper. In the apostolic age, converts appear to have been at once admitted to the sacraments; but afterwards this ceased to be the case, and a period of probation was required. The C. were divided into different classes or grades, according to their proficiency—those of the lowest grade were not permitted to be present during the prayers of the congregation; and those only of the highest, and who had been declared fit to be baptized at the next administration of the ordinance, were permitted to witness the dispensation of the Lord's supper.—The term C. was afterwards employed to designate young members of the Christian church who were receiving instruction to prepare them for confirmation or for the Lord's supper, and it is still often used in this sense.

CATEGORIES. This designation has come down to us from Aristotle. One of the books of his *Organon* or Logical System is so named. The C., or predicaments, as the schoolmen called them, are to be understood as an attempt at a comprehensive classification of all that exists, for the purposes of logical affirmation, proof, or disproof. The entire universe may be classified in various ways—as into things celestial and terrestrial; into matter and spirit; into organized and unorganized; into minerals, plants, animals, etc. But the classification contemplated under the C. proceeds on the very general properties or attributes that most extensively pervade all existing things, although in unequal degrees. A good example is quantity, which pertains to every thing that we know or can think of. We give the Aristotelian enumeration—the first column is the

original Greek; the second, the Latin rendering of the schoolmen; the third, the nearest corresponding English words:

Οὐσία,	Substantia,	Substance
Ποσόν,	Quantitas,	Quantity.
Ποῖόν,	Qualitas,	Quality.
Πρὸς τι,	Relatio,	Relation.
Ποιεῖν,	Actio,	Action.
Πάσχειν,	Passio,	Passivity.
Ποῦ,	Ubi,	Position in space
Ποτε,	Quando,	Position in time.
Κεῖσθαι,	Situs,	Situation.
Ἐχειν,	Habitus,	Possession.

Mr. J. S. Mill has the following remarks on the above scheme: "The imperfections of this classification are too obvious to require, and its merits are not sufficient to reward, a minute examination. It is a mere catalogue of the distinctions rudely marked out by the language of familiar life, with little or no attempt to penetrate, by philosophical analysis, to the *rationale* even of these common distinctions. Such an analysis, however superficially conducted, would have shown the enumeration to be both redundant and defective. Some objects are admitted, and others repeated several times under different heads. It is like a division of animals into men, quadrupeds, horses, asses, and ponies. That, for instance, could not be a very comprehensive view of the nature of Relation, which could exclude action, passivity, and local situation from that category. The same observation applies to position in time and position in space; while the distinction between the latter and situation is merely verbal."—*Logic*, book i., chap. iii. § 1. Some writers have endeavored to save the C. from these objections, by declaring that the fourth, Relation, is to be looked upon as a general head, comprehending the remaining six under it. But there is no evidence that Aristotle had this view in his mind; on the contrary, it appears almost certain that his idea of Relation was too narrow and limited to admit of his giving it so great a comprehension.

Mr. Mill gives us the result of his own analysis, the following enumeration and classification of existences or describable things:

1. Feelings, or states of consciousness; which are the most comprehensive experience that the human mind can attain to, since even the external world is only known as conceived by our minds.

2. The minds which experience those feelings.

3. The bodies, or external objects, which are supposed to excite all that class of feelings that we denominate sensations.

4. The successions, and coexistences, the likenesses and unlikenesses, between feelings or states of consciousness. Although the relations are considered by us to subsist between the bodies, or things, external to our minds, we are driven in the last resort to consider them as really subsisting between the states of each one's own individual mind.

Mr. Mill shows that all possible propositions—and it is with the truth or falsehood of propositions that the science of logic has chiefly to do—affirm or deny one or other of the following properties or facts: Existence—the most general attribute of all—Co-existence, sequence or succession, causation—a peculiar case of succession—and resemblance. It is to arrive at this classification of propositions, for the purposes of logic, that the foregoing analysis, corresponding to the Aristotelian C., was made. The properties affirmed of any thing or things, or the things of which any properties are affirmed, come under some one or other of the four heads above given.

The C. of Kant, which are sometimes brought into comparison with those of Aristotle, are conceived under a totally different point of view. See sir W. Hamilton's *Dissertations on Philosophy*, 2d edit., p. 26. They refer to certain forms supposed to be inherent in the understanding itself, under which the mind embraces the objects of actual experience. The Kantian philosophy supposes that human knowledge is partly made up of the sensations of outward things—color, sound, touch, etc.—and partly of intuitions existing in the mind prior to all experience of the actual world. This is the point of difference between the school of Locke—who rejected all innate ideas, conceptions, or forms—and the school of Kant. No such question was raised under the Aristotelian categories. Kant's enumeration of his innate forms is as follows: 1. Quantity, including unity, multitude, totality; 2. Quality, including reality, negation, limitation; 3. Relation, including substance and accident, cause and effect, action and reaction; 4. Modality, which includes possibility, existence, necessity. These indicate the elements of our knowledge *a priori*; it being the opinion of the author, that such notions, as causation, necessity, etc., cannot be obtained from the exercise of our senses and intelligence upon the world of realities, but must have been somehow or other imprinted upon the mind originally.

CA' TEL, FRANZ, 1778-1856; a German artist who first gained reputation by his illustrations of Goethe's *Hermann and Dorothea*. He labored in Paris and Rome, and his works found their way all over the continent. He left all his fortune for the benefit of poor artists.

CATENARY. The C. is the curve formed by a flexible homogeneous cord hanging freely between two points of support, and acted on by no other force than gravity. If the cord is not homogeneous, and the density varies in any regular way, the cord hangs in a curve slightly different in shape from that of the ordinary catenary. The C. possesses several remarkable properties, one of which is, that its center of gravity (q.v.) is lower than that of any curve of equal perimeter, and with the same fixed points for its extremities. Where the cord is such that the weight of any part of it is proportioned to its horizontal projection, the curve is a parabola (q.v.). The latter curve and the ordinary C. are of importance chiefly in the theory of suspension bridges (q.v.). The properties of the C. will be found fully analyzed in all the leading works on mechanics.

CATENIPORA, a genus of fossil lamelliferous corals peculiar to paleozoic strata, confined in Britain to the Silurian measures. The genus is easily recognized. The cells are terminal and oval, arranged like a loose net-work of chains, hence called "chain coral." Vertical anastomosing lamellæ united the cells together, and formed a hemispherical polypidom, sometimes of great size.

CATERINA, SANTA, a t. of Sicily, in the province of Caltanissetta, and 7. m. n.n.w. of the town of that name. It is situated on a hill near the river Salso, is fortified, has manufactures of fine earthenware; and in the neighborhood are found jaspers and agates of good quality. Pop. 5,800.

CATERPILLAR, the name given to the larvæ of lepidopterous insects—butterflies, moths, and hawk-moths. Caterpillars exhibit as great differences as subsist among the perfect insects into which they change, and the family, genus, and species may be determined by the characters of the C., as well as of the perfect insect. Their body is generally long, nearly cylindrical, soft, and consisting of 12 rings or segments besides the head, with nine spiracles or small openings for respiration on each side. The head is much harder than the rest of the body, of a sort of almost horny substance, and has 6 small shining points on each side, which are regarded as simple or *stemmatic* eyes, and is also furnished with two very short rudimentary antennæ. The mouth is adapted for tearing, cutting, and masticating the substances on which the C. is destined to feed, which are very various in the different species, although in all extremely different from the food of the perfect insect; it is provided with two strong *mandibles*, or upper jaws; two *maxilla*, or lower jaws; a *labium*, or lower lip; and four *pulpi*, or feelers. In the mouth also is situated the *spineret* of those species which, when they change into the chrysalis or pupa state, envelop themselves in silken cocoons. See SILK-WORM. The first three segments of the body are each furnished with a pair of feet, which are hard and scaly, and represent the 6 feet of the perfect insect; some of the remaining segments are also furnished with feet, varying in all from 4 to 10 in number, the last pair situated at the posterior extremity of the body; but these feet are soft and membranous or fleshy, and armed at their extremity with a sort of circlet of minute hooks. All the feet or legs are very short. Those caterpillars in which the *pro-legs*, as they are sometimes called, or supplementary soft feet, are pretty equally distributed along the body, move by a sort of regular crawling motion; but those which have only four such feet situated near the posterior extremity, move by alternately taking hold by what may be called their fore-feet and their hind-feet, now stretching the body out to its full length, and now bending it into an arch, whilst the hinder part is brought forward almost into contact with the forepart. Caterpillars which move in this way are called *geometers* or *loopers*. Some caterpillars have the power of fixing themselves by the two hind feet to a twig, and stretching themselves out as straight as a rod, so that being in color very like a twig of the tree on the leaves of which they feed, they are not readily observed. The muscular power required for this position of rest is very great, and Lyonnet found the number of muscles in a C. to be more than 4,000. The skin of some caterpillars is naked, that of others is covered with hairs, spines, or tubercles. Some make for themselves nests or tents of silk, under which they dwell in societies, protected from the inclemency of the weather. Many construct cases or sheaths by agglutinating various substances together, as the C. of the common clothes-moth. Some roll together leaves, and fix them by threads, so forming a dwelling for themselves; and a few burrow and excavate galleries in the substance of leaves. Many feed on leaves; many being limited to a particular kind of plant, or to a few nearly allied plants. Some feed on flowers, some on seeds, some on roots, and some even on the woody portions of stems; some on wool, hides, furs, and other animal substances; a few on lard, and other kinds of fat. Among the admirable arrangements which make all nature harmonious, is the adjustment of the time of each kind of C.'s appearance to that of the leaf or flower on which it is to feed.

CATERPILLAR FUNGUS, or FUNGOID PARASITES, a species of fungus that attacks insects, particularly the larvæ of moths and beetles, filling their bodies and sending shoots beyond the skin so that the creature takes the appearance of a vegetable growth. These growths vary in length from a slight projection to nearly a foot, and in diameter from a hair to a quarter of an inch. The fungi attacking insects also infest all organic and decaying matter.

CATESBY, MARK, 1680–1749; an English naturalist who was seven years in the American colonies, returning to England in 1719 with a fine collection of plants. He

made another journey in 1722, exploring South Carolina, Georgia, Florida, and the Bahamas. He published *Natural History of Carolina, Florida, and the Bahama Islands*, in which the figures were etched by himself from his own paintings. He also wrote *Hortus Europæ Americanus* and a paper on *Birds of Passage*.

CAT-FISH, a name given to several species of the family *Siluridæ*, dwelling in American rivers and lakes. The common cat-fish, or horned pout, of the Atlantic slope, is preferred above most river fish for food. They are from 7 to 9 in. long, dusky brown in color on the back and sides, and white underneath. The upper jaw is the longest; the tail is rounded; skin without scales and commonly covered with a slimy secretion. It has two fleshy barbels (long beard-like spines) on the top of the nose, and others at the angles of the jaws. Its mouth is very large. Immense cat-fish are found in the great lakes and western rivers, more than 4 ft. long and weighing 60 to 150 lbs.

CATGUT is employed in the fabrication of the strings of violins, harps, guitars, and other musical instruments; as also in the cords used by clockmakers, in the bows of archers, and in whip-cord. It is generally prepared from the intestines of the sheep, rarely from those of the horse, ass, or mule, and *not* those of the cat. The first stage in the operation is the thorough cleansing of the intestines from adherent feculent and fatty matters; after which they are steeped in water for several days, so as to loosen the external membrane, which can then be removed by scraping with a blunt knife. The material which is thus scraped off is employed for the cords of battle-doors and rackets, and also as thread in sewing the ends of intestines together. The scraped intestines are then steeped in water, and scraped again, when the large intestines are cut and placed in tubs with salt, to preserve them for the sausage-maker; and the smaller intestines are steeped in water, thereafter treated with a dilute solution of alkali (4 oz. potash, 4 oz. carbonate of potash, and 3 to 4 gallons of water, with occasionally a little alum), and are lastly drawn through a perforated brass thimble, and assorted into their respective sizes. In order to destroy any adherent animal matter, which would lead to putrefaction and the consequent development of offensive odors, it is customary to subject the C. to the fumes of burning sulphur—sulphurous acid, which acts as an antiseptic (q.v.), and arrests decomposition. The best strings are used for musical instruments; and those which come from Italy, and are known as *Roman strings*, are the strongest. They are remarkable for their clearness and transparency. Cord for clockmakers is made from the smallest of the intestines, and occasionally from larger ones, which have been split longitudinally into several lengths. Whip-cord is fabricated from C. which has been twisted in a manner somewhat similar to single-corded ropes. The C. obtained from the intestines of horses, asses, and mules is principally made in France, and is employed instead of leather-belts for driving machinery.

CATHA, a genus of the natural order *celastraceæ*. The fruit is a three-cornered capsule.—*C. edulis*, sometimes called **ARABIAN TEA**, the **KHÂT** of the Arabians, is a shrub with erect smooth branches, elliptical obtusely serrated leaves, and small flowers in axillary cymes. It is a native of Arabia, and the Arabs ascribe to its leaves, even carried about the person, extraordinary virtues as a preventive of plague, with probably about as much reason as our forefathers had for esteeming the rowan tree formidable to witches. When fresh, they are stimulant, narcotic, and intoxicating, and are eaten with greediness by the Arabs. They are very antisoporific, so that a man, after using them, may keep watch for a whole night without drowsiness.

CATHARI, or **CATHARISTS** (Gr. pure), a name very generally given to various sects which appeared in the church during the middle ages. It appears to have been sometimes assumed in profession of a purity of doctrine and morals superior to that which generally prevailed in the church, sometimes bestowed ironically in ridicule of such a profession, and perhaps was first used as a designation of the Paulicians (q.v.). It became a common appellation of sects which appeared in Lombardy in the beginning of the 11th c., and afterwards in France and the w. of Germany. Having some connection with the Bulgarian Paulicians, they were sometimes called *Bulgarians*; sometimes also *Patarenes* or *Patarines*, sometimes *Publicans* or *Popelitanis*, and in the Low Countries, *Piphles*. The names *Albigenses* and C. are often used as equivalent to one another; but we are under the disadvantage of having to depend entirely on the writings of very bigoted adversaries for our knowledge of their doctrines and practices, and considerable obscurity rests on all this interesting part of ecclesiastical history. Manicheism, Gnosticism, and Montanism are ascribed to the C.; but there is much reason to think that the errors of a few were often indiscriminately charged upon all, and that such charges indeed sometimes rested on ignorant or willful misconstruction. It appears quite certain, that the C. differed considerably in their doctrines and in the degree of their opposition to the dominant church. Some of them advocated and practiced a rigid asceticism. There is no good evidence that any of them nearly approached to the doctrines of the reformation; although in their rejection of tradition, of the authority of Rome, of the worship of saints and images, etc., there are notable points of agreement with the views of the reformers.

CATHARINE is the name of several saints of the Roman Catholic church. The simple designation of *Saint C.*, however, is given to a virgin, said to have been of royal descent

in Alexandria, who, publicly confessing the gospel at a sacrificial feast appointed by the emperor Maximinus, was put to death in 307 A.D., after being tortured on a wheel. Hence the name of "St. Catharine's wheel." Very extraordinary legends exist as to her converting 50 philosophers sent by the emperor to convert her in prison, besides a multitude of other persons; the conveyance of her head by the angels to Mt. Sinai, etc. She is regarded as the patroness of girls' schools.—*Saint C. of Siena*, one of the most famous saints of Italy, was the daughter of a dyer in Siena, and was born there in 1347 A.D.; practiced extraordinary mortifications; and was said to be favored with extraordinary tokens of favor by Christ, whose wounds were impressed upon her body, etc. She became a Dominican, and therefore afterwards a patron saint of the Dominicans. She wrote devotional pieces, letters, and poems, which have been more than once printed; the best edition appeared at Siena and Lucca, in 1707-13, in 4 vols. 4to, under the title of *Opere della serafica Santa Catarina*.—*St. C. of Bologna* and *St. C. of Sweden* are of less note.

CATHARINE I., Empress of Russia, was originally by name Martha Rabe, and was the posthumous daughter of John Rabe, a Swedish quarter-master in Livonia. Her mother died in 1685, when she was but three years old. Left hopeless and destitute, a parish-clerk took compassion on her, and supported her, and a Lutheran clergyman in Marienburg, afterwards received her into his house as an attendant on his children. In 1701, she married a Swedish dragoon, who next year was called to active service; and Marienburg being taken by the Russians, she became for some time the mistress of gen. Bauer; and afterwards entering the service of the princess Menschikoff, she attracted the notice of Peter the great. In 1703, she went over to the Greek church, and took the name of Catharina Alexiewna. After being for some years the emperor's mistress, she was privately married to him in 1711; the marriage was publicly avowed in 1712; she was proclaimed empress in 1718, and was crowned at Moscow in 1724. She bore eight children to the emperor, all of whom died in childhood, except two daughters, Anne and Elizabeth, the latter of whom was afterwards empress of Russia, and the former married the duke of Holstein, and was the mother of the emperor Peter III. When Peter the great and his army seemed entirely in the power of the Turkish army on the Pruth in 1717, C., who was with him, sought an interview with the grand vizier, and, by employing her jewels to bribe his attendants, succeeded in procuring the deliverance of the Russians. Her conduct on this occasion excited so much admiration and gratitude in the emperor, that he resolved to appoint her his successor. Yet in the end of the year 1724, she became the object of his displeasure and suspicion, on account of an alleged intimacy with a chamberlain, whom he caused to be beheaded. Menschikoff, who had always been attached to her interests, was at this time in disgrace. But she had contrived in a great measure to recover her position, when, on 28th Jan., 1725, Peter the great died. His death was kept secret as long as possible, that everything might be arranged for her taking possession of the throne; and the archbishop of Pleskow came forward and declared before the troops and people, that the emperor, on his death-bed, had declared her alone worthy to be his successor. The hostility and hesitation of the nobles were at once overcome, and C. was acknowledged as empress and sole ruler of all the Russias. Under Menschikoff's directions, the affairs of government went on well enough for a time; but the empress ere long began to yield to the influence of a number of favorites, addicted herself to drunkenness, and lived such a life as could not fail to hurry her to the grave. She died, however, unexpectedly, 17th May, 1727.

CATHARINE II., empress of Russia, was b. at Stettin on 25th April, 1729. Her father, the prince of Anhalt-Zerbst, was a Prussian field-marshal, and governor of Stettin. She received the name of Sophia Augusta; but the empress Elizabeth of Russia having selected her for the wife of her nephew and intended successor, Peter, she passed from the Lutheran to the Greek church, and took the name of Catharina Alexiewna. In 1745, her marriage took place. She soon quarreled with her husband, and each of them lived a life of unrestrained vice. Among his attendants was a count Soltikow, with whom her intimacy soon became scandalous; and Soltikow was sent on an embassy abroad. But the young Polish count, Stanislaus Poniatowski, almost immediately supplied his place. After the death of the empress Elizabeth in 1761, Peter III. ascended the Russian throne; but the conjugal difference became continually wider. C. was banished to a separate abode; and the emperor seemed to entertain the design of divorcing her, declaring her only son, Paul, illegitimate, and marrying his mistress, Elizabeth Woronzow. The popular dislike to Peter, however, rapidly increased; and at length, he being dethroned by a conspiracy, C. was made empress. A few days afterwards Peter was murdered (July, 1762). What participation his wife had in his murder, has never been well ascertained.

C. now exerted herself to please the people, and among other things, made a great show of regard for the outward forms of the Greek church, although her principles were, in reality, those of the infidelity then prevalent among the French philosophers. The government of the country was carried on with great energy; and her reign was remarkable for the rapid increase of the extent and power of Russia. Not long after her accession to the throne, her influence secured the election of her former favorite, Stanislaus Poniatowski, to the throne of Poland. In her own empire, however, discontentment

was seriously manifested, the hopes of the disaffected being centered in the young prince Ivan, who was forthwith murdered in the castle of Schlüsselburg. From that time, the internal politics of Russia long consisted in great part of intrigues for the humiliation of one favorite and the exaltation of another. The first partition of Poland in 1772, and the Turkish war, which terminated in the peace of Kainardji in 1774, vastly increased the empire. The Turkish war which terminated in the peace of Jassy in 1792, had similar results, and also the war with Sweden, which terminated in 1790. The second and third partitions of Poland, and the incorporation of Courland with Russia, completed the triumphs of C.'s reign. She began a war with Persia, however, and cherished a scheme for the overthrow of the British power in India; but a stroke of apoplexy cut her off on Nov. 9, 1796. She was a woman of great ability; but, utterly devoid of principle, she shrunk from no crime; and sensuality and ambition governed all her actions. She was shameless in vice; and always had a paramour, who dwelt in her palace, and might be regarded as filling an acknowledged office of state, with large revenues and determinate privileges. Yet distinguished authors flattered her; and she invited to her court some of the literati and philosophers of France. She was ever ready to commence great undertakings, but most of them were left unfinished; and little was really accomplished in her reign for the improvement of the country, or the progress of civilization. On a visit to the southern provinces of the empire in 1787, she was gratified by a perpetual display of fictitious wealth and prosperity along the whole route. This imperial progress was also a triumphal procession of her vile favorite Potemkin (q.v.).

CATHARINE OF ARAGON, Queen of England, the first wife of Henry VIII., and fourth daughter of Ferdinand and Isabella, king and queen of Castile and Aragon, was b. Dec., 1485. She occupies a prominent place in English history, not for what she herself was, but for what she was the occasion of—the reformation. Married when scarcely 16, to Arthur, prince of Wales, son of Henry VII., she was left a widow within a year; and in the course of a few months more a second marriage was projected for her by her father-in-law, with his second son Henry, as yet a boy of only 12 years old. The pope's dispensation enabling such near relatives to marry was obtained in 1503, and the marriage took place in June, 1509, immediately after Henry's accession to the crown as Henry VIII. Although Henry was very far from being a model husband, he appears to have treated queen C., who had borne him several children, with all due respect, until about 1527, when he conceived a passion for Anne Boleyn (q.v.). He now expressed doubts as to the legality of his marriage, and set about obtaining a divorce. Pope Clement VII. would readily have annulled the marriage permitted by his predecessor, had he not feared queen C.'s powerful nephew, the emperor Charles V. He, however, granted a commission to Campeggio and Wolsey, to inquire into the validity of the marriage; but before these prelates queen C. refused to plead, and appealed to the pope. The king craved judgment. The legates cited the queen, and declaring her contumacious when she appeared not, went on with the cause; but the wily Campeggio, anxious only for time for his master when the king expected an answer, prorogued the court until a future day. The king consulted the universities of Europe, many of which declared the marriage invalid. The pope now summoned the king to Rome, but Henry haughtily refused to appear either himself, or by deputy, which he maintained would be to sacrifice the prerogatives of his crown; and setting the pope at defiance, married Anne Boleyn. Cranmer, shortly afterwards (1533), declared the first marriage void, and pope Clement annulled Cranmer's sentence, making the separation from Rome complete. Queen C. did not quit the kingdom, but took up her residence first at Ampthill, in Bedfordshire, and afterwards at Kimbolton castle, Huntingdonshire, where she led an austere religious life until her decease in Jan., 1536. Queen C.'s personal character was unimpeachable, and her disposition sweet and gentle.

CATHARINE DE' MEDICI, the queen of Henri II. of France, was the daughter of Lorenzo de' Medici, duke of Urbino, and was b. at Florence in 1519. In her 14th year she was brought to France, and married to Henri, the second son of Francis I. The marriage was a part of the political schemes of her uncle, pope Clement VII., but as he died soon after, she found herself friendless and neglected at the French court. In these circumstances, she conducted herself with a submission which seemed even to indicate a want of proper spirit, but which gained her the favor of the old king, and in some measure also of her husband. It was not till the accession of her eldest son, Francis II., in 1559, that her love of power began to display itself. The Guises at this time possessed a power which seemed dangerous to that of the throne, and C. entered into a secret alliance with the Huguenots to oppose them. On the death of Francis II. in 1560, and accession of Charles IX., the government fell entirely into her hands. Caring little for religion in itself, although she was very prone to superstition, she disliked the Protestants, chiefly because their principles were opposed to the absolute despotism which she desired to maintain. Yet she sought to rally the Protestant leaders around the throne, in order to remove the Guises. This attempt having failed, and the civil war which ensued having ended in the peace of Amboise, highly favorable to the Protestants, she became alarmed at the increase of their power, and entered into a secret treaty with Spain for the extirpation of heretics; and subsequently into a plot

with the Guises, in which at first only the murder of the Protestant leaders was contemplated, but which resulted in the fearful massacre of St. Bartholomew's day. This event brought the whole power of the state into the hands of the queen-mother, who boasted of the deed to Roman Catholic governments, and excused it to Protestant ones, for she now managed all the correspondence of the court. About this time she succeeded, by gold and intrigues, in getting her third son, afterwards Henri III., elected to the Polish throne. But her arbitrary and tyrannical administration roused the opposition of a Roman Catholic party, at the head of whom was her own fourth son, the duke of Alençon, who allied themselves with the Protestants. It was very generally believed that she was privy to the machinations that led to his death. When, after the death of Charles IX., Henri III. returned from Poland to be king of France, his mother still ruled the court, and had the principal share in all the intrigues, treacheries, and political transactions of that woful period. Having betrayed all who trusted them, she and her son found themselves at last forsaken and abhorred by all. The league and the Guises had no more confidence in them, than had the Protestants and Henri of Navarre. Vexation on this account prayed on the proud heart of the queen-mother in her last days; and, amidst the confusion and strife of parties, she died at Blois, on 5th Jan., 1589, unheeded and unlamented. Her ruling passion was ambition, and to this she was ready to sacrifice everything. Her unprincipled policy had almost subverted the French monarchy; her extravagance and luxury exhausted the finances of the country. Her influence was powerful in increasing the demoralization of the court and of society. She unscrupulously employed beauties of her train to corrupt men from whose power she apprehended danger.

CATHARINE PARR, the sixth wife of Henry VIII., was the daughter of sir Thomas Parr, and was b. in 1513. Married first to lord Burgh, and afterwards to lord Latimer, she, in July 12, 1543, became queen of England by marriage with Henry VIII. She was distinguished for her learning and her knowledge of religious subjects, her discussion of which with the king had well-nigh brought her to the block, like so many of her predecessors. Her tact, however, saved her, and brought rebuke on her enemies; for she made it appear to the king's vanity, that she had only engaged him in discourse about the reformation, in order to derive profit from his majesty's speech. She persuaded Henry to restore the right of succession to his daughters, and interested herself on behalf of the universities. After Henry's death, she married, 1547, sir Thomas Seymour, and died the following year, not without suspicion of poison.

CATHARINE'S, ST., COLLEGE, or HALL, Cambridge, was founded by Robert Wode-larke, provost of King's college, 1473, for a master and three or more fellows. The visitors sent down to the university by Edward VI. ordered that there should be then six fellows, and in future a greater or less number as the revenues permitted. The statutes confirmed in May, 1860, provide that there shall be a master and nine fellows. There are twenty-five scholars. Edwyn Sandys, archbishop of York, bishop Overall, and bishop Sherlock, were of this college.

CATHARTES AURA, a vulture known as the turkey-buzzard, from its resemblance to the domestic turkey. Its home is in the southern Atlantic and gulf states, though it is sometimes found in the West Indies. The full-grown bird is 30 in. long, with a spread of wings of 6 ft., and the color black and brown. This greedy bird acts as the scavenger for southern cities, devouring refuse matter that might otherwise be injurious to the public health. For this purpose they are deemed so valuable that in some places their destruction is forbidden. There is a small species known locally as the carrion-crow.

CATHARTICS (Gr. *kathairō*, I purify), a name originally for all medicines supposed to purify the system from the matter of disease (*materies morbi*), which was generally presumed by the ancients to exist in all cases of fever and acute disease (see **CRISIS**), and to require to be separated or thrown off by the different excretions of the body. Ultimately, the term C. became limited in its signification to remedies acting on the bowels, which are popularly called *purgatives*—a mere translation of the Greek word. The principal C. are aloes, gamboge, colocynth, rhubarb, scammony, jalap, senna, Epsom, and other salts, and castor oil. Sulphur and cream of tartar forms a well-known mild laxative; magnesia is also useful in many cases of indigestion with acidity. Croton oil and elaterium belong to a more dangerous class of C., as also does the favorite remedy of the ancients—the black hellebore. The doses and use of the more ordinary remedies of this class are explained in all works on medicine. See **CONSTIPATION**.

CATHARTINE, or BITTER OF SENNA, is the essential principle in senna which possesses laxative or purgative properties. It can be isolated as a yellowish-red uncrystallizable solid, which is deliquescent, soluble in water and alcohol, insoluble in ether, has a very bitter nauseous taste, a characteristic odor, and possesses great purging powers, accompanied by nausea and griping. Three grains of C. are a full dose.

CATHAY. See **CHINA**, *ante*.

CATHCART, Sir GEORGE, son of William, Earl Cathcart, was b. in London, 1794. Educated at Eton and Edinburgh, he, in 1810, joined the 2d life guards, and fought with the grand army in the campaigns of 1812 and 1813; and as aid-de-camp to the duke of Wellington, was present at Quatre Bras and Waterloo. In 1828, he was made lieut.

col., and served in British America and the West Indies for about 8 years; and in 1837 he proved himself an energetic and efficient officer in quelling the outbreak in Canada, where he remained for more than 6 years. In 1852, having held the appointment of deputy lieut. of the tower for some years, he was made governor of the cape of Good Hope, with command of the forces, and in this capacity succeeded in bringing to a successful end the harassing Kaffer war. He returned to England in time to be sent out to the Crimea as general of division. His bravery here was conspicuous, especially in the battle of Inkermann, where the odds were so terribly against the British forces, and where he was slain. He was buried on the spot where he fell, and which, in his honor, was named Cathcart's hill. C. was the author of a very valuable work, entitled *Commentaries on the War in Russia and Germany in 1812 and 1813* (Lond. 1850).

CATHCART, WILLIAM SHAW, Earl, a British gen. and diplomatist, son of baron Cathcart of Cathcart, co. of Renfrew, was b. Sept. 17, 1755. Having studied at Glasgow, he entered the army, took a prominent part in the American war, and fought with distinction in Flanders and n. Germany. In 1801, he was made lieut. gen., and in 1803, commander-in-chief for Ireland. In 1805, he was engaged on a diplomatic mission to the czar Alexander. In July, 1807, he received the command of the land forces employed to co-operate with the fleet in the attack on Copenhagen, and, for his services in this capacity, was made a British peer, with the title of viscount, and received a vote of thanks from both houses of parliament, Jan. 28, 1808. In 1812, he was sent as ambassador to St. Petersburg, accompanied the czar Alexander in the campaigns of 1813 and 1814, and was present at the congresses of Chatillon and Vienna. He was raised to the rank of earl, June 18, 1814. The latter years of his life were chiefly spent at his country residence, Cartside, near Glasgow, where he died June 17, 1843.—His eldest son, **CHARLES MURRAY, EARL CATHCART** (formerly known as lord Greenock), was born 1783; served in Spain and at Waterloo under Wellington; afterwards acted in Canada; and was made a general and colonel of the 1st dragoon guards. He died July, 1859.

CATHEDRAL, from a Greek word *cathedra*, signifying a *seat*. Thus, "to speak *ex cathedra*," is to speak as from a *seat* of authority. The C. city is the seat of the bishop of the diocese, and his throne is placed in the C. church, which is the parish church of the whole diocese. The diocese was, in fact, anciently called *parochia*, until the application of this name to the smaller portions into which it was derived. A C. town has generally been understood to be entitled to the honors of a city, even although the town be not a borough incorporate; but in the case of Manchester, the claim was disallowed by a court of law. The distinction between C. and collegiate churches consists principally in the see of the bishop being at the former. The governing body of a C. is called the dean and chapter—i. e., the dean and canons who meet for corporate purposes in the chapter-house of the cathedral. The property of the C. vests in this body. They elect the bishop of the diocese on the issue of a *cougé d'élire* from the crown, but as the person to be elected is always named, and they may be compelled by a mandamus to elect that person and no other, the election is merely a form.

The bishop is "visitor" of the dean and chapter. In England, by the act of 1840, all members of cathedrals, except the dean, are styled canons. Their *seat* in the C. is called their *stall*. They are no longer called prebends. Canons must reside 3 months in each year. The act allows to the canons of Durlham, Manchester, St. Paul's, and Westminster, an income of £1000 per annum; to those of every other C. in England, £500. The bishop was always considered of common right to have the patronage of canopies, but formerly there were exceptions. Now, the appointment to all canopies is vested either in the bishop, or in the crown. Where the bishop is patron, he "collates," and the dean and chapter "induct," by placing the new canon in a stall in the church. The crown appoints by letters-patent, and the canon is installed without collation. Honorary canons have no emoluments, but rank after the canons. Minor canons, of whom there are from 2 to 6 in each C., perform the daily choral services. The C. service is the usual church of England service intoned, with an anthem and the Psalms chanted. For the general plan of C. buildings, see CHURCH. The more remarkable cathedrals will be noticed under the names of the towns in which they are situated. In England, the number of cathedrals is 29.

CATHEDRAL (*ante*). As Christianity was at first established chiefly in cities, the churches that grew up adjacent to them were, either originally or eventually, included in the diocese of the city bishop. Throughout the Roman empire the ecclesiastical divisions were the same as the civil, and the bishop's seat was placed in the same city with the governor's chair of state. From this point the transition was easy to the formal decree requiring that a C. as the seat of a bishop should be established in cities only. In Britain, however, where in the early days of Christianity cities were few and small, this rule could not be enforced. The bishop was over a district or tribe rather than a city, and naturally placed his seat where he found it most convenient and safe. Often he was compelled to remove it from one place to another. As the country became more settled this necessity ceased to exist, and at the close of the 11th century a law was passed requiring that the sees of bishops should be removed from villages to walled cities. In the early missionary work, especially of Britain, instead of beginning with a bishop,

companies of priests were organized, with the church as their center of work and the monastery as their home. After sufficient progress had been made, a bishop was appointed over them, and the church became a cathedral. The revival of missionary work by the church of England, at the beginning of the present century, led to a renewal of this system. The bishop followed the missionaries, and placed his seat in a church not originally designed for the honor. In colonial and foreign missionary work, within the last 25 years, there has been a return to the earlier plan. In the dioceses of Africa, New Zealand, and elsewhere, the bishop takes the lead in the date of his appointment as well as in rank, and his cathedral church is at once erected and manned. In this way the original design of such an establishment as described by bishop Stillingfleet is accomplished. "Every C., in its first institution, was as a temple to the whole diocese, where the worship was to be performed in the most decent and constant manner; for which end it was necessary to have such a number of ecclesiastical persons there attending as might still be ready to do all the offices which did belong to the Christian church—such as constant offering of prayer, singing, preaching, and administering sacraments—which were to be kept up in such a church as the daily sacrifice was in the temple." The bishop in his church was surrounded by his college of presbyters, of which he was the head, and the design of which was: 1. To strengthen him by wise counsel. 2. To maintain public worship with reverence and dignity. 3. To go forth at his command, as evangelists, whithersoever he might send them. In this way the chapter of the C. was established, originally in closest connection with the bishop, and having no corporate existence separate from him. It sometimes consisted of "secular clergy," who were not bound by monastic vows, and had separate homes of their own; and sometimes of "regulars," who were under monastic rule and lived in buildings common to all. Of both kinds of chapters the bishop was the head: of the latter, as the abbot of the monastery to which his cathedral church belonged; and of the former, as having sole authority over it. In early times, there was an arch-presbyter, who had chief authority among the cathedral clergy, always in strict subordination to the bishop. He was gradually supplanted by the archdeacon, who was followed in the 8th and 9th centuries by the "prepositus" or provost. The "dean," the present head of all English cathedral chapters, first appears in the 10th or 11th century. Gradually, as the bishop's diocesan duties increased and important political functions also were assigned him, he was obliged to leave the affairs of his C. to the head of the chapter, who consequently, in time, became the actual chief; and when the chapter was organized as an independent corporation, the bishop, seldom present, sank into a mere "visitor," called in occasionally to correct abuses or settle disputes. This is the explanation of the strange anomaly, witnessed in modern times, that in his own cathedral church, of which he is the titular head, and which is dignified by the presence of his seat, the bishop has less authority than in any other church of his diocese. Under the bishop as its *nominal* head, the chapter of a fully organized C., formed of secular priests, consisted of four chief dignitaries and a body of canons. I. The four high officers were: 1, the "dean," as the general head of the chapter charged with its internal discipline; 2, the precentor, presiding over the choir and musical arrangements; 3, the chancellor, who superintended the religious and literary instruction of the younger members, took care of the library, and wrote the letters; 4, the treasurer, to whom were intrusted, not the money of the church (as might appear from the modern use of the word), but its sacred vessels, altar-furniture, reliquaries, and similar treasures. II. In addition to these dignitaries, a cathedral chapter consisted of a board of officers called canons, because they were inrolled on the *list* and perhaps because they were subjected to the *rules*; some of them who enjoyed a separate estate (*præbenda*) in addition to their share of the corporate funds, were called prebendaries. A prebendary was always a canon, but a canon was not always a prebendary. Each canon had his own house and personal establishment. In the middle ages an attempt was made to impose on them, in part, monastic rules with dining-hall and lodging-rooms in common; but the restriction was never acceptable, and was gradually given up. Monastic cathedrals closely resembled other monasteries, except that in the almost constant absence of the bishop—their nominal abbot—they were governed by a prior. At the reformation the distinction between secular and monastic cathedrals was maintained under the titles of cathedrals of the old and new foundations. And when the monasteries were suppressed, the cathedrals connected with them were furnished with new chapters of secular canons, presided over by a dean. In the early part of queen Victoria's reign all the cathedrals in England and Wales were reduced to a uniform constitution.

In the Protestant Episcopal church in the United States, there is in recent years an evident movement in some dioceses toward the establishment of the cathedral system of England, with such modifications as the circumstances may require. For the diocese of Long island, noble structures are now in process of erection at Garden City, including schools of various grades, and institutions of beneficence, grouped around a magnificent cathedral church. The funds for this great work are from the estate of the late Alexander T. Stewart, of New York.

CATHELINEAU, JACQUES, general of the army in La Vendée, in the w. of France, was b. Jan. 5, 1759, in very humble life, at Pin-en-Mauges, in lower Anjou. Horrified at the atrocities and despotic acts of the convention, he placed himself in opposition to

It, and soon collected around him a body of loyal peasantry, whom he led against and defeated the republicans in several conflicts. After the victory of Saumur (q.v.), the council of generals appointed him, as having the greatest influence over his countrymen, commander-in-chief. He immediately determined to make an attack upon Nantes, and managed to penetrate into the town, where he was wounded by a musket-ball, and his troops immediately dispersed. He was carried to St. Florent, where he died July 11, 1793. He was a man of great simplicity and honesty of character, and his piety was such, that he was called the saint of Anjou.

CATHERINE OF BRAGANZA, 1638-1705; queen of Charles II. of England, daughter of John, duke of Braganza, the rightful heir to the throne of Portugal, then under Spanish rule. John headed the revolt of 1640, and after years of fighting succeeded in reaching his throne. The mother of Catherine was a woman of ability, and governed Portugal for several years after the death of her husband. She foresaw the coming restoration in England, and proposed the marriage of Catherine with Charles mainly to gain a powerful ally against Spain. The latter power vainly tried to prevent the marriage, and when it was agreed upon, Portugal promised a dowry of £500,000, and the towns of Tangier and Bombay (the latter being the first of the now enormous English possessions in the east), besides many privileges of trade. On the marriage at Plymouth, May 13, 1663, Charles appeared to be well pleased with his bride; but the union proved unhappy. Catherine had been brought up in a convent, and had none of the manners required by the most fashionable and profligate court of Europe. The chief trouble, however, was the heartless and shameless profligacy of her husband, who brought his mistresses into the court, and, when the queen expressed her indignation at the insult, lectured her upon the duty of submission. After repeated humiliations of this kind, the queen's spirit was broken, and alienation naturally followed. As she was a Roman Catholic, she was an object of suspicion outside of the court, and her name was subjected to calumny. The only satisfaction she could experience in her unfortunate connection was the great aid rendered by England against Spain in the struggle of her native power with that kingdom. After a life of entire seclusion during the reign of James II. and the first years of William III., she returned to Portugal in 1692, where, for a time before her death, she acted in capacity of regent to her brother, Don Pedro. She had no children.

CATHERINE FIESCHI ADORNO, SAINT, 1477-1510; a daughter of the viceroy of Naples, who, at the age of 13, devoted herself to a religious life, but three years later, in obedience to parental desire, married Julian Adorno, a gay young nobleman of Genoa—a reckless fellow, who spent her fortune and gave her a life of misery for many years. After his death she became mother-superior in the hospital, and extended her care to the sick throughout the city. She wrote several works, two of which, *Purgatory*, and *Dialogue Between the Soul and the Body*, are evidently records of her own experience. She was canonized in 1737. In her, a piety contemplative, mystical, and almost ecstatic, had an accompaniment not always found of active beneficence.

CATHERINE OF VALOIS, OR OF FRANCE, 1401-36; Queen of Henry V. of England. She was unfortunate in her childhood, her father, Charles VI. of France, being subject to prolonged fits of insanity, while her mother—who was one of the most abandoned women of the time—neglected her children to such an extent that they were often without suitable food or clothing. She was at last taken away from her mother and educated in a convent. When she was only 12 years old, Henry asked her hand in marriage, coupling the proposal with a demand for a large dowry in money, and the restitution to England of the French provinces once held by the English crown. The proposition was indignantly rejected, and Henry soon afterwards invaded France and asserted his claims in a manner that was not to be resisted. All his claims were admitted, and when he married Catherine at Troyes in 1420 he received immediate possession of the provinces claimed, the regency of France during the life of the father-in-law, and the reversion of the sovereignty after the death of Charles. In 1421, Catherine was crowned at London, and in Dec. of that year she became the mother of Henry VI. The next year she was in France, where her husband died, and she returned to London with the funeral cortège; but after the funeral little is heard of her history, the only notable event being her secret marriage to Owen Tudor, the heir of a princely house in Wales, who had distinguished himself for bravery at Agincourt. His position in England, however, was low, and the marriage was long kept secret—a necessity that caused Catherine much vexation and probably hastened her death. Her son by Tudor was made earl of Richmond, and married Margaret Beaufort, heiress of the house of Somerset, and junior representative of the branch of John of Gaunt, and she became the mother of Henry VII., and consequently the ancestress of the Tudor line of English kings.

CATHERINE-WHEEL (see **CATHARINE, ST.**) is frequently used as a charge in coats of arms, when it is represented with teeth.

CATHETER (Gr. *kathēmi*, to thrust into), was a name applied indifferently to all instruments used for passing along mucous canals. In modern times, however, it has generally been reserved for tubular rods through which fluids or air may pass, and which may give free exit to the accumulated contents of such organs as the urinary bladder. The

C. for the latter purpose is a very old surgical instrument. The ancients made theirs of copper, which accumulated verdigris. In the 9th c. silver was substituted by the Arabian surgeons as a cleaner metal, and is still used by all who are not obliged, for economical reasons, to have their catheters made of German silver or pewter. The urinary C. for the male varies in length from 10 to 11 in.; the female C. need not be more than 4 or 5 inches. The form is a matter of indifference, but most surgeons prefer an instrument straight to within the last few inches of its length; the latter should be curved into the segment of a small circle. Others, however, use a double curve, and, indeed, nearly every surgeon has a peculiar fancy in this respect.

Flexible catheters are made of gum elastic, which may be used either alone or supported on a wire. Many other materials have been proposed. Of late years, gutta-percha has been used, but owing to some awkward accidents—such as portions often breaking off in the bladder—it has not been generally adopted by surgeons.

CATHODE. See ANODE.

CATHOLIC APOSTOLIC CHURCH. See IRVINGITES, *ante*.

CATHOLIC CHURCH. The term catholic literally signifies *universal*. The phrase C. C. is therefore equivalent to "universal church," and cannot properly be applied to any particular sect or body, such as the Roman, Anglican, Genevan, Reformed Lutheran, or Presbyterian, all of which form merely portions more or less pure of the "church universal." It was first employed to distinguish the Christian church from the Jewish; the latter being restricted to a single nation, whereas the former was intended for the world in general. Afterwards, it served to mark the difference between the orthodox Christian church and the various sects which sprang from it, such as the Cerinthians, Basilidians, Arians, Macedonians, etc. The name has been retained by the church of Rome, which was the visible successor of the primitive one; and although Protestant divines have been careful to deny its applicability to a church which they consider buried under the corrupt accretions of centuries, yet the term catholic is still used by the populace of almost every Protestant country as synonymous with Roman Catholic, so that from their minds all conception of the literal meaning of the word has vanished. For an account of the church of Rome, see art. ROMAN CATHOLIC CHURCH.

CATHOLIC, or UNITED, COPTS, a body of about 10,000 native Egyptians who acknowledge the authority of the pope of Rome. In 1855, one of their priests was appointed vicar apostolic and bishop *in partibus*.

CATHOLIC CREDITOR, in the law of Scotland, is one whose debt is secured over several or the whole subjects belonging to the debtor—e.g., over two or more heritable estates for the same debt. The C. C. is bound so to exercise his right as not unnecessarily to injure the securities of the other creditors. Thus, if he draw his whole debt from one of the subjects, he must assign his security over the others to the postponed creditors.

CATHOLIC (ROMAN) EMANCIPATION ACT (10 Geo. IV. c. 7). To render this famous measure intelligible, and still more to convey a conception of its importance to younger readers, it is necessary that we should preface our account of it by a slight sketch of the position of our Roman Catholic fellow-subjects before it was passed. From first to last, the sufferings of the Roman Catholics were the fruit of political tyranny quite as much as of religious rancour or fanaticism, and their release was effected by a change in the political rather than in the religious views or feelings of the dominant party. The first occasion on which even a promise of a different line of policy from that which had been originally adopted was held out to the Roman Catholics of Ireland, was on the termination of the revolutionary war in 1691; and had king William been able to carry out the views which his personal enlightenment and liberality dictated, it is probable that Catholic emancipation would have been hastened by more than a century. But the English parliament, which was intensely anti-Roman Catholic, enacted, on the 22d of Oct. 1691, that Irish members of both houses should take the oaths of supremacy; and three years later, a set of acts were passed, which placed the Roman Catholics in a worse position than at any previous period of their history. The whole population was disarmed, and the priests banished from the country. But what must have been still more intolerable, was the interference with the private arrangements of their families. All Roman Catholics were prohibited from acting as guardians not only to Protestant but to Catholic children. At a somewhat later date (1704), it was enacted that if a son chose to turn Protestant, he should be entitled to dispossess his father, and at once to take possession of the family estate. Though Catholics were not directly declared incapable of holding land, they were deprived of the right of acquiring it by purchase, or even by long lease; and if a Catholic chanced to occupy a place in a line of entail, he was passed over in favor of the next Protestant heir. No office of trust, civil or military, was now open to a Catholic; he was forbidden to vote at elections, to intermarry with a Protestant, or even to dwell in Limerick or Galway, except under certain conditions. But perhaps the most demoralizing provision of all, was that which empowered the son of a Catholic to bring his father into chancery, to force him to declare on oath the value of his property, and to settle such an allowance on him as the court should determine, not only for the father's life, but the son's.

Amongst the other burdens of this heavy time, may be mentioned the exclusion of Catholics from the profession of the law, and the regulation that if a Protestant lawyer married a Catholic, he should be held to have gone over to her faith: the prohibition against Catholics acting as schoolmasters, under the penalty of being prosecuted as convicts, by which the whole body was virtually excluded from the benefits of education: and the still more summary enactment, that if a priest celebrated marriage between a Protestant and a Catholic, he should be hanged. But as years passed away, the memory of the foul deeds of the inquisition and the confessional, and of the other enormities of which Roman Catholics had been guilty in their days of power, waxed fainter; milder feelings began to prevail; and when Grattan appeared as the champion of their rights, the field was already in some degree prepared for his labors. Favored by such influences, of which no one knew better how to avail himself, he succeeded, in 1780, in carrying, in the Irish parliament, the famous resolution, "that the king's most excellent majesty, and the lords and commons of Ireland, are the only competent power to make laws to bind Ireland." Many of the disqualifying statutes were now repealed, and the claim for complete equality with Englishmen and Protestants, or complete separation from the sister-country, was now formally urged. From this period to the final liberation was achieved, there was no rest. The Irish rebellion of 1798 brought home to the English nation the dangers to which it would constantly be exposed till the question was finally adjusted. The act of union of 1800 was the immediate consequence of that outbreak; and to this act the Irish were induced to consent by a virtual pledge entered into by Mr. Pitt, to the effect that the Catholic disabilities should be at once removed. But, like William of Orange, Pitt had pledged himself to more than he was able to accomplish. The king was seized with scruples regarding the obligations imposed upon him by his coronation oath, and made a vigorous stand against the proposals of his minister.

At a subsequent period, efforts were made in the direction of emancipation by Mr. Canning and lord Castlereagh. About 1824, the press began to take up the question warmly; a Catholic association was formed, to prepare petitions to parliament; the Irish priests stimulated their flocks to subscribe for the purposes of agitation; O'Connell rapidly became a power; and as early as March, 1825, the importance of the question was so deeply felt, that sir F. Burdett ventured to introduce a relief bill, which passed the commons by a majority of 268 to 241, but was rejected by the lords. A slight temporary reaction now took place, the superstitious fears of ignorant Protestants being excited by a "no-popery" cry, and in consequence, a new relief bill, introduced in 1827, though supported by the last effort of Canning's eloquence, was lost in the commons by a majority of 4. But the liberal view of the Roman Catholic claims was essentially the popular one—at least among the enlightened classes; and as a proof of this, under the hostile administration of the duke of Wellington, the very same resolution which had lost in 1827 by a minority of 4, was carried in 1828 by a majority of 6. The duke himself now began to waver in opinion, so that the beginning of the end was manifestly near. During O'Connell's famous canvass for the county of Clare, the duke declared in the house of lords, "if the public mind were now suffered to be tranquil, if the agitators of Ireland would only leave the public mind at rest, the people would become more satisfied, and I certainly think it would then be possible to do something." O'Connell's return for Clare, notwithstanding the existence of the oaths which precluded him from taking his seat in the house, and the events which now followed in quick succession, made it clear that the "something" of which the duke had spoken must be the passing of the emancipation bill in the ensuing session. The king's speech, which was read on the 5th Feb. of the following year, accordingly contained a recommendation to parliament, to consider whether the civil disabilities of the Catholics could not be removed, "consistently with the full and permanent security of our establishments in church and state."

On the 5th Mar., Mr. Peel brought forward the great measure. The majority on the motion in the commons for going into committee was 188, in a house of 508 members; the debate on the second reading issued in a majority of 180; and the final majority, after the bill had passed through committee, in which not one of the many amendments proposed was carried, was 178 in a house of 462. In the lords, the debate lasted three nights, the majority being 106 in favor of the second reading of a bill which, nine months before, the same house had refused, by a majority of 45, even to entertain—so rapid and threatening had been the progress of the agitation. On the 13th April, 1829, this famous measure became the law of the land. It now only remains that, by mentioning the provisions of the act, we sum up the results of one of the most important controversies that ever agitated the inhabitants of this country. For the oath of supremacy, another oath was substituted, by which all Catholic members of parliament bound themselves to support the existing institutions of the state, and not to injure those of the church (see ABJURATION). Catholics were admitted to all corporate offices, and to an equal enjoyment of all municipal rights. The army and navy had already been opened to them. On the other hand, they were excluded from the offices of regent, of chancellor of England or Ireland, and of viceroy of Ireland; from all offices connected with the church, its universities and schools, and from all disposal of church patronage. The most important security related to the franchise, in which a £10 was substituted for a 40s. qualification in Ireland. The clergy of the R. C. church were left

in the position of other dissenters, the government having declined either to endow them, or to introduce any machinery for prying into their relations to the pope. But the public use of their insignia of office, and of episcopal titles and names, was denied them; the extension of monachism was prohibited; and it was enacted that the number of Jesuits should not be increased, and that they should henceforth be subject to registration. For further information, see Miss Martineau's *History of England during the Peace from 1815 to 1846*. W. & R. Chambers, 1858.

CATHOLIC EPISTLES, the name given, according to Clemens Alexandrinus and Origen, to certain epistles, addressed not to particular churches or individuals, but either to the church universal or to a large and indefinite circle of readers. Originally, the C. E. comprised only the first epistle of John and the first of Peter, but, at least as early as the 4th c. (as evinced by the testimony of Eusebius), the term was applied to all the apostolic writings used as "lessons" in the orthodox Christian churches. But this included the epistle of James, of Jude, the 2d of Peter, and the 2d and 3d of John. These seven thus constituted the C. E., although the genuineness and authenticity of the last-mentioned five were not universally acknowledged; but this very incorporation with epistles whose canonicity was not questioned, naturally had the effect of confirming their authority, so that in a short time the entire seven came to be considered a portion of the canon.

CATHOLICOS, the title of the patriarchs or chief ecclesiastics in the hierarchy of the Armenian church, and of the Christians of Georgia and Mingrelia.

CATILINA, LUCIUS SERGIUS, descended from a patrician but impoverished family, was b. about the year 108 B.C. During his youth, he attached himself to the party of Sulla. His bodily constitution, which was capable of enduring any amount of labor, fatigue, and hardship, allied to a mind which could stoop to every baseness and feared no crime, fitted him to take the lead in the conspiracy which has made his name infamous to all ages. In the year 68 B.C., he was elected prætor; in 67 B.C., governor of Africa; and in 66 B.C., he desired to stand for the consulship, but was disqualified on account of the accusations brought against him of maladministration in his province. Disappointed thus in his ambition, and burdened with many and heavy debts, he saw no hope for himself but in the chances of a political revolution, and therefore entered into a conspiracy, including many other young Roman nobles, in morals and circumstances greatly like himself. The plot, however, was revealed to Cicero by Fulvia, mistress of one of the conspirators. Operations were to commence with the assassination of Cicero in the Campus Martius, but the latter was kept aware of every step of the conspiracy, and contrived to frustrate the whole design. In the night of Nov. 6 (63 B.C.), Catiline assembled his confederates, and explained to them a new plan for assassinating Cicero; for bringing up the Tuscan army (which he had seduced from its allegiance), under Manlius, from the encampment at Fæsulæ; for setting fire to Rome, and putting to death the hostile senators and citizens. In the course of a few hours, everything was made known to Cicero. Accordingly, when the chosen assassins came to the house of the consul, on pretense of a visit, they were immediately repulsed. On the 8th of Nov., Catiline audaciously appeared in the senate, when Cicero—who had received intelligence that the insurrection had already broken out in Etruria—commenced the celebrated invective beginning: *Quousque tandem abutere, Catilina, patientia nostra?* etc. ("How long now, Catiline, will you abuse our patience?") The scoundrel was abashed, not by the keenness of Cicero's attack, but by the minute knowledge he displayed of the conspiracy. His attempt at a reply was miserable, and was drowned in cries of execration. With curses on his lips, he abruptly left the senate, and escaped from Rome during the night. Catiline and Manlius were now denounced as traitors, and an army under the consul, Antonius, was sent against them. The conspirators who remained in Rome, the chief of whom was Lentulus, were arrested, tried, condemned, and executed, Dec. 5. The insurrections in several parts of Italy were meanwhile suppressed; many who had resorted to Catiline's camp in Etruria, deserted when they heard what had taken place in Rome, and his intention to proceed into Gaul was frustrated. In the beginning of Jan. (62), he returned by Pistoria (now Pistoja) into Etruria, where he encountered the forces under Antonius, and, after a desperate battle, in which he displayed almost superhuman courage and enthusiasm, was defeated and slain. The appearance of Catiline was in harmony with his character. He had a daring and reckless look; his face was haggard with a sense of crime; his eyes were wild and bloodshot, and his step unsteady, from nightly debauchery. The history of the Catiline conspiracy is given by Sallust in a remarkably concise and nervous style.

CATINEAU-LAROCHE, PIERRE MARIE SÉBASTIEN, 1772-1828; a French philologist who emigrated to San Domingo, where his antislavery sentiments were so obnoxious that he was prosecuted and saved from death only by the interference of the home government. He went to Cape Haytien, where in the great massacre he alone of 17 Frenchmen was saved. He returned to Paris by way of the United States, set up a printing-office, and produced several dictionaries. In 1819, he was sent by the government to study the climate of French Guiana, and three years later his notes were published.

CATION. See **ANODE.**

CATKIN, *Amentum*, in botany, a spike of numerous, small, unisexual flowers, destitute of calyx and corolla, and furnished with scale-like bractæ instead, the whole inflorescence finally falling off by an articulation in a single piece. Examples are found in the willow, hazel, oak, birch, alder, and other trees and shrubs, forming the natural order amentaceæ (q.v.). In some, as in the oak and hazel, the male flowers only are in catkins.

CATLIN, **GEORGE**, 1796–1872; b. Penn.; an artist celebrated for his travels, writings, and portraits of American Indians. He was bred to the law and practiced for a year or two in Philadelphia, but having a taste for art he established himself in New York as a portrait-painter. About 1832, he became impressed with the fact, that the most remarkable American Indians were fast disappearing, and resolved to rescue at least the portraits of some of them from oblivion. In pursuit of this object he traveled and dwelt among the aboriginal tribes in North and South America, acquiring their languages, and thoroughly studying their manners and customs, traditions, history, and modes of life. After collecting many portraits, and many sketches of life and scenery, he published in London, in 1841, a large work on the *Manners, Customs, and Condition of the North American Indians*, with 300 illustrations. In 1844, followed the *North American Portfolio of Hunting Scenes*; in 1848, *Eight Years' Travels and Residence in Europe*, in which he gives the stories of several Indians whom he had introduced to various European courts. In 1861, he published a little monograph which created much interest among medical men, entitled *The Breath of Life*, in which he argued the importance of keeping one's mouth closed when sleeping—an idea doubtless suggested by the fact that the Indians use special care in this respect. His last work was *Last Rambles among the Indians of the Rocky Mountains and the Andes*.

CATMANDOO. See **KHATMANDU**, *ante*.

CATMINT, *Nepeta cataria*, a plant of the natural order *labiata*, pretty common in England, in chalky and gravelly soils, but rare in Scotland and Ireland, widely diffused throughout Europe and the middle latitudes of Asia, and of North America; remarkable for the fondness which cats display for it. It appears to act upon them in a similar way to valerian root; and when its leaves are bruised so as to be highly odoriferous, they are at once attracted to it, rub themselves on it, tear at it, and chew it. Its odor has been described as intermediate between that of mint and that of pennyroyal. It has erect stems, 2 to 3 ft. high, dense whorls of many whitish flowers, tinged and spotted with rose-color, and stalked heart-shaped leaves of a velvety softness, whitish and downy beneath.—Other species are numerous in the s. of Europe, and middle latitudes of Asia.

CATNIP. See **CATMINT**, *ante*.

CATO, **DIONYSIUS**, is the name prefixed to a little volume of moral precepts in verse, which was a great favorite during the middle ages. Whether or not such a person ever existed, is a point of the greatest uncertainty. The title which the book itself commonly bears, is *Dionysii Catonis Disticha de Moribus ad Filium*. Its contents have been differently estimated: some scholars have considered the precepts admirable; others, weak and vapid: some have found indications of a superior scriptural knowledge; others, of a deep-rooted paganism. The style has been pronounced the purest Latin and the most corrupt jargon. The truth would seem to be, that on a ground-work of excellent Latin of the silver age, the illiterate monks of a later period have, as it were, inwoven a multitude of their own barbaric errors, which preclude us from determining precisely the period when the volume was composed. It begins with a preface addressed by the supposed author to his son, after which come 56 injunctions of rather a simple character, such as *parentem ama*. This is followed by the substance and main portion of the book—viz., 144 moral precepts, each of which is expressed in two dactylic hexameters. During the middle ages, the *Disticha* was used as a text-book for young scholars. In the 15th c., more than 30 editions were printed. The best edition, however, is that published at Amsterdam in 1754 by Otto Arntzenius. Caxton translated it into English.

CATO, **MARCUS PORCIUS**, surnamed *Censorius* and *Sapiens* ("the wise"), afterwards known as **CATO PRISCUS** or **CATO MAJOR**—to distinguish him from Cato of Utica—was b. at Tusculum in 234 B.C. He inherited from his plebeian father a small farm in the country of the Sabines, where he busied himself in agricultural operations, and learned to love the simple and severe manners of his Roman forefathers, which still lingered round his rural home. Induced by Lucius Valerius Flaccus to remove to Rome when that city was in a transition epoch, from the old-fashioned strictness and severe frugality of social habits, to the luxury and licentiousness of Grecian manners, C. appeared to protest against this, to denounce the degeneracy of the Philo-hellenic party, and to set a pattern of sterner and purer character. He soon distinguished himself as a pleader at the bar of justice, and after passing through minor offices, was elected consul. In his province of Nearer Spain, where an insurrection had broken out after the departure of the elder Scipio (206 B.C.), C. was so successful in quelling disturbances and restoring order, that in the following year he was honored by a triumph. C. exhibited extraordinary military genius in Spain; his stratagems were brilliant, his plans of battle were

marked by great skill, and his general movements were rapid, bold, and unexpected. In 187 B.C., a fine opportunity occurred for the display of "antique Roman" notions. M. Fulvius Nobilior had just returned from Ætolia victorious, and sought the honor of a triumph. C. objected. Fulvius was indulgent to his soldiers, a man of literary taste, etc., and C. charges him, among other enormities, with "keeping poets in his camp." These rude prejudices of C. were not acceptable to the senate, and C.'s opposition was fruitless. In 184 B.C., C. was elected censor, and discharged so rigorously the duties of his office, that the epithet *Censorius*, formerly applied to all persons in the same station, was made his permanent surname. Many of his acts were highly commendable. He repaired the water-courses, paved the reservoirs, cleansed the drains, raised the rents paid by the publicans for the farming of the taxes, and diminished the contract prices paid by the state to the undertakers of public works. More questionable reforms were those in regard to the price of slaves, dress, furniture, equipage, etc. His despotism in enforcing his *own* idea of decency may be illustrated from the fact, that he degraded Mautilus, a man of prætorian rank, for having kissed his wife in his daughter's presence in open day. C. was a thoroughly dogmatic moralist, intolerant, stoical, but *great*, because he manfully contended with rapidly swelling evils; yet not *wise*, because he opposed the bad and the good in the innovations of his age with equal animosity.

In the year 175 B.C., C. was sent to Carthage to negotiate on the differences between the Carthaginians and the Numidian king Masinissa; but having been offended by the Carthaginians, he returned to Rome, where, ever afterwards, he described Carthage as the most formidable rival of the empire, and concluded all his addresses in the senate-house—whatever the immediate subject might be—with the well-known words: "*Ceterum censeo, Carthaginem esse delendam*" ("For the rest, I vote that Carthage must be destroyed").

Though C. was acquainted with the Greek language and its literature, his severe principles led him to denounce the latter as injurious to national morals. He died 149 B.C., at the age of 85. C. was twice married. In his eightieth year, his second wife, Salonia, bore him a son, the grandfather of Cato of Utica. C. treated his slaves with shocking harshness and cruelty. In his old age, he became greedy of gain, yet never once allowed his avarice to interfere with his honesty as a state-functionary. He also composed various literary works, such as *De Re Rustica* (a treatise on agriculture)—much corrupted, however. The best editions are by Gesner and Schneider in their *Scriptores Rei Rusticæ*. His greatest historical work, *Origines*, has, unfortunately, perished; but some few fragments are given in Krause's *Historicorum, Romanorum Fragmenta* (Berlin, 1833). Fragments of C.'s orations—of which as many as 150 were read by Cicero—are given in Meyer's *Oratorum Romanorum Fragmenta* (Zurich, 1842).

CATO, MARCUS PORCIUS, named CATO THE YOUNGER, or CATO UTICENSIS (from the place of his death), was born 95 B.C. Having lost, during childhood, both parents, he was educated in the house of his uncle, M. Livius Drusus, and, even in his boyhood, gave proofs of his decision and strength of character. In the year 72 B.C., he served with distinction in the campaign against Spartacus, but without finding satisfaction in military life, though he proved himself a good soldier. From Macedonia, where he was military tribune in 67, he went to Pergamus in search of the Stoic philosopher, Athenodorus, whom he brought back to his camp, and whom he induced to proceed with him to Rome, where he spent the time partly in philosophical studies, and partly in forensic discussions. Desirous of honestly qualifying himself for the questorship, he commenced to study all the financial questions connected with it. Immediately after his election, he introduced, in spite of violent opposition from those interested, a rigorous reform into the treasury offices. He quitted the questorship at the appointed time amid general applause. In 63 B.C., he was elected tribune, and also delivered his famous speech on the Catiline conspiracy, in which he denounced Cæsar as an accomplice of that political desperado, and determined the sentence of the senate. Strongly dreading the influence of unbridled greatness, and not discerning that an imperial genius—like that of Cæsar—was the only thing that could remedy the evils of that overgrown monster, the Roman republic, he commenced a career of what seems to us blind pragmatical opposition to the three most powerful men in Rome—Crassus, Pompey, and Cæsar. C. was a noble but strait-laced *theorist*, who lacked the intuition into circumstances which belongs to men like Cæsar and Cromwell. His first opposition to Pompey was successful; but his opposition to Cæsar's consulate for the year 59 not only failed, but even served to hasten the formation of the first triumvirate between Cæsar, Pompey, and Crassus. He was afterwards forced to side with Pompey, who had resiled from his connection with Cæsar, and become reconciled to the aristocracy. After the battle of Pharsalia (48 B.C.), C. intended to join Pompey, but hearing the news of his death, escaped into Africa, where he was elected commander by the partisans for Pompey, but resigned the post in favor of Metellus Scipio, and undertook the defense of Utica. Here, when he had tidings of Cæsar's decisive victory over Scipio at Thapsus (April 6, 46 B.C.), C., finding that his troops were wholly intimidated, advised the Roman senators and knights to escape from Utica, and make terms with the victor, but prohibited all intercessions in his own favor. He resolved to die rather than surrender, and, after spending the night in reading Plato's *Phædo*, committed suicide by stabbing himself in the breast.

CAT'ODON and **CATODON'TIDÆ.** See **CACHOLOT.**

CAT-O'-NINE-TAILS. See **FLOGGING.**

CATOO'SA, a co. in n.w. Georgia, watered by affluents of the Tennessee river, and crossed by the Western and Atlantic railroad; 175 sq.m.; pop. '70, 4,409—616 colored. The region is hilly, with much woodland. The productions are chiefly agricultural. Co. seat, Ringgold.

CATOP TRICS. The divisions of the science of optics are laid out and explained in the article **OPTICS** (q.v.). C. is that subdivision of geometrical optics which treats of the phenomena of light incident upon the surfaces of bodies, and reflected therefrom. All bodies reflect more or less light, even those through which it is most readily transmissible; light falling on such media, for instance, at a certain angle, is totally reflected. Rough surfaces scatter or disperse (see **DISPERSION OF LIGHT**) a large portion of what falls on them, through which it is that their peculiarities of figure, color, etc., are seen by eyes in a variety of positions; they are not said to *reflect* light, but there is no doubt they do, though in such a way, owing to their inequalities, as never to present the phenomena of reflection. The surfaces with which C., accordingly, deals, are the smooth and polished. It tracks the course of *rays* and *pencils* of light after reflection from such surfaces, and determines the positions, and traces the forms, of images of objects as seen in mirrors of different kinds.

A ray of light is the smallest conceivable portion of a stream of light, and is represented by the line of its path, which is always a straight line. A pencil of light is an assemblage of rays constituting either a cylindrical or conical stream. A stream of light is called a converging pencil when the rays converge to the vertex of the cone, called a focus; and a diverging pencil, when they diverge from the vertex. The axis of the cone in each case is called the axis of the pencil. When the stream consists of parallel rays, the pencil is called cylindrical, and the axis of the cylinder is the axis of the pencil. In nature, all pencils of light are primarily diverging—every point of a luminous body throwing off light in a conical stream; converging rays, however, are continually produced in optical instruments, and when light diverges from a very distant body, such as a fixed star, the rays from it falling on any small body, such as a reflector in a telescope, may, without error, be regarded as forming a cylindrical pencil. When a ray falls upon any surface, the angle which it makes with the normal to the surface at the point of incidence is called *the angle of incidence*; and that which the reflected ray makes with the normal, is called *the angle of reflection*.

Two facts of observation form the ground-work of catoptrics. They are expressed in what are called the laws of reflection of light: 1. In the reflection of light, the incident ray, the normal to the surface at the point of incidence, and the reflected ray, lie all in one plane. 2. The angle of reflection is equal to the angle of incidence. These laws are simple facts of observation and experiment, and they are easily verified experimentally. Rays of all colors and qualities follow these laws, so that white light, after reflection, remains undecomposed. The laws, too, hold, whatever be the nature, geometrically, of the surface. If the surface be a plane, the normal is the perpendicular to the plane at the point of incidence; if it be curved, then the normal is the perpendicular to the tangent plane at that point. From these laws and geometrical considerations may be deduced all the propositions of catoptrics. In the present work, only those can be noticed whose truth can in a manner be exhibited to the eye without any rigid mathematical proof. They are arranged under the heads *plane surfaces* and *curve surfaces*.

Plane Surfaces.—1. When a pencil of parallel rays falls upon a plane mirror, the reflected pencil consists of parallel rays. A glance at the annexed figure (fig. 1),

Fig. 1.

Fig. 2.

Fig. 3.

where PA and QB are two of the incident rays, and are reflected in the directions AR and BS respectively, will make the truth of this pretty clear to the eye. The proposition, however, may be rigidly demonstrated by aid of Euclid, book xi., with which, however, we shall not presume the reader to be acquainted. The reader may satisfy himself of its truth practically by taking a number of rods parallel to one another and inclined to the floor, and then turning them over till they shall again be equally inclined to the floor, when he will again find them all parallel.—2. If a diverging or converging pencil is incident on a plane mirror, the focus of the reflected pencil is situated on the opposite side of the mirror to that of the incident pencil, and at an equal distance from it. Suppose the pencil to be diverging from the focus Q (fig. 2), on the

mirror of the surface of which CB is a section. Draw QNq perpendicular to CB and make $qN=QN$, the ng is the focus of the reflected rays. For let QA, QB, QC be any of the incident rays in the plane of the figure; draw the line AM perpendicular to CB , and draw AR , making the angle MAR equal to the angle of incidence, MAQ . Then AR is the reflected ray. Join qA . Now it can be proved geometrically, and indeed is apparent at a glance, that qA and AR are in the same straight line; in other words, the reflected ray AR proceeds as if from q . In the same way, it may be shown that the direction of any other reflected ray, as BS , is as if it proceeded from q ; in other words, q is the focus of reflected rays; it is, however, only their *virtual* focus. See art. **FOCUS**. If a pencil of rays converged to q , it is evident that they would be reflected to Q as their real focus, so that a separate proof for the case of a converging pencil is unnecessary. The reader who has followed the above will have no difficulty in understanding how the position and form of the image of an object placed before a plane mirror—as in fig. 3, where the object is the arrow AB , in the plane of the paper, to which the plane of the mirror is perpendicular—should be of the same form and magnitude as the object (as ab in the fig.), and at an equal distance from the mirror, on the opposite side of it, but with its different parts inverted with regard to a given direction. The highest a , for instance, in the image, corresponds with the lowest point, A , in the object. He will also understand how, in the ordinary use of a looking-glass, the right hand of the image corresponds to the left hand of the object.

When two plane mirrors are placed with their reflecting surfaces towards each other, and parallel, they form the experiment called the endless gallery. Let (in fig. 4) the arrow, Q , be placed vertically between the parallel mirrors, CD, BA , with their silvered faces turned to one another, Q will produce in the mirror CD the image q^1 . This image will act as a new object to produce with the mirror BA the image q^2 , which, again, will produce with the mirror CD another image, and so on. Another series of images, such as $q', q'',$ etc., will similarly be produced at the same time, the

Fig. 4.

Fig. 5.

first of the series being q' , the image of Q in the mirror BA . By an eye placed between the mirrors, the succession of images will be seen as described; and if the mirrors were perfectly plane and parallel, and reflected all the light incident on them, the number of the images of both series would be infinite. If, instead of being parallel, the mirrors are inclined at an angle, the form and position of the image of an object may be found in precisely the same way as in the former case, the image formed with the first mirror being regarded as a new (virtual) object, whose image, with regard to the second, has to be determined. For a curious application of two plane mirrors meeting and inclined at an angle an aliquot part of 180° , see art. **KALEIDOSCOPE**.—3. The two propositions already established are of extensive application, as has partly been shown. They include the explanation of all phenomena of light related to plane mirrors. The third proposition is one also of considerable utility, though not fundamental. It is: When a ray of light has been reflected at each of two mirrors inclined at a given angle to each other, in a plane perpendicular to their intersection, the reflected ray will deviate from its original course by an angle double the angle of inclination of the mirrors. Let A and B (fig. 5) be sections of the mirrors in a plane perpendicular to their intersection, and let their directions be produced till they meet in C . Let SA , in the plane of A and B , be the ray incident on the first mirror at A , and let AB be the line in which it is thence reflected to B . After reflection at B , it will pass in the line BD , meeting SA , its original path, produced in D . The angle ADB evidently measures its deviation from its original course, and this angle is readily shown to be double of the angle at C , which is that of the inclination of the mirrors. It is on this proposition that the important mathematical instruments called the quadrant and sextant (*q. v.*) depend.

Curved Surfaces.—As when a pencil of light is reflected by a curved mirror, each ray follows the ordinary law of reflection, in every case in which we can draw the normals for the different points of the surface, we can determine the direction in which the various rays of the pencil are reflected, as in the case of plane mirrors. It so happens that normals can be easily drawn only in the case of the sphere, and of a few

“surfaces of revolution,” as they are called. These are the paraboloid, the ellipsoid, and the hyperboloid of revolution. The paraboloid of revolution is of importance in optics, as it is used in some specula for telescopes. See arts. *SPECULUM* and *TELESCOPE*. The three surfaces last named are, however, all of them interesting, as being for pencils of light incident in certain ways what are called surfaces of accurate reflection—i.e., they reflect all the rays of the incident pencil to a single point or focus. We shall explain to what this property is owing in the case of the parabolic reflector, and state generally the facts regarding the other two.

1. The concave parabolic reflector is a surface of accurate reflection for pencils of rays parallel to the axis or central line of figure of the paraboloid. This results from the property of the surface, that the normal at any point of it passes through the axis, and bisects the angle between a line through that point, parallel to the axis, and a line joining the point to the focus of the generating parabola. Referring to fig. 6, suppose a ray incident on the surface at P, in the line SP, parallel to the axis AFG. Then if F be the focus of the generating parabola, join PF. PF is the direction of the reflected ray. For PG, the normal at P, by the property of the surface, bisects the angle FPS, and therefore \angle (angle) FPG = \angle GPS. But SPG is the angle of incidence, and SP, PG, and FP are in one plane, and, therefore, by the laws of reflection, FP is the reflected ray. In the same way, all rays whatever, parallel to the axis, must pass through F after reflection. If F were a luminous point, the rays from it, after reflection on the mirror, would all proceed in a cylindrical pencil parallel to the axis. This reflector, with a bright light in its focus, is accordingly of common use in lighthouses.

2. In the concave ellipsoid mirror there are two points—viz., the foci of the generating ellipse, such that rays diverging from either will be accurately reflected to the other. This results from the property of the figure, that the normal at any point bisects the angle included between lines drawn to that point from the foci.

3. Owing to a property of the surface similar to that of the ellipsoid, a pencil of rays converging to the exterior focus of a hyperbolic reflector, will be accurately reflected to the focus of the generating hyperbola.

The converse of the above three propositions holds in the case of the mirrors being convex.

Though the sphere is not a surface of accurate reflection, except for rays diverging from the center, and which on reflection are returned thereto, the spherical reflector is of great practical importance, because it can be made with greater facility and at less expense than the parabolic reflector. See art. *TELESCOPE*. It is necessary, then, to investigate the phenomena of light reflected from it.

4. *Spherical Mirrors*.—It is usual to treat of two cases, the one the more frequent in practice, the other the more general and comprehensive in theory. First, then, to find the focus of reflected rays when a small pencil of parallel rays is incident directly on a concave spherical mirror. Let BAB' (fig. 7) be a section of the mirror, O its center of curvature, and A the center of its aperture. AO is the axis of the mirror, and therefore of the incident pencil, because it is incident directly on the mirror; a pencil being

Fig. 6.

Fig. 7.

Fig. 8.

called oblique when its axis is at an angle to the axis of the mirror. As the ray incident in the line OA will be reflected back in the same line—OA being the normal at A—the focus of reflected rays must be in OA. Let SP be one of the rays; it will be reflected so that \angle qPO = \angle SPO. But \angle POq = \angle OPS by parallel lines. Therefore, \angle qPO = \angle qOP, and Pq and Oq are equal. If, now, the incident pencil be very small—i.e., if P be very near A—then the line Pq will very nearly coincide with the line OA, and Pq and Oq will each of them become very nearly the half of OA. Let F be the middle point of OA—the point, namely, to which q tends as the pencil diminishes. The F is called the principal focus of the mirror, and AF the principal focal length, which is thus = $\frac{1}{2}$ radius of the mirror. It will be observed that when AP is not small, q lies between A and F. Fq is called the aberration of the ray. When AP is large, the reflected rays will continually intersect, and form a luminous curve with a cusp at F. This curve is called the caustic (q.v.). We shall now proceed to the more general case of a small pencil of diverging rays, incident directly on a concave spherical mirror. Let PAP' (fig. 8) be a section of the mirror, A the center of its aperture, O of its curvature, and let F be its principal focus. Then, if Q be the focus of incident rays (as if proceeding from

a candle there situated), q , the focus of the reflected rays, lies on QOA , since the pencil is incident directly, and the ray QOA , being incident in the line of the normal OA , is reflected back in the same line. Let PQ be any other ray of the pencil. It will be reflected in Pq , so that $\angle qPO = \angle OPQ$; and on the supposition that PA is very small, so that QP becomes nearly equal to QA , and qP to qA , it can be shown, by Euclid, vi. 3,

that $\frac{QO}{QA} = \frac{qO}{qA}$ very nearly. From this equation is deduced the formula $qA = \frac{QA \times AF}{QA - AF}$, which enables us to find qA , when QA and AF are known. Thus, let the radius of curvature be 12 in., and the distance of the source of the rays, or QA , 30 in., the focal length $qA = \frac{30 \times 6}{30 - 6} = 7\frac{1}{2}$ inches. If the rays had diverged upon q , it is clear they

Fig. 9.

would have been reflected to Q . The points Q and q , accordingly, are called conjugate foci.

If the mirror be convex, as in fig. 9, instead of concave, and a pencil of diverging rays be incident directly on it from Q , we should find, proceeding in exactly the same way as in

the former case, the equation $Aq = \frac{QA \times AF}{QA + AF}$; or taking the

same numbers as before; $qA = \frac{30 \times 6}{30 + 6} = 5$ inches.

For information regarding the formation of images by spherical mirrors, the reader may consult Potter's *Elements of Optics*. See also the arts. MIRRORS and IMAGES.

By considering fig. 8, it is easy to see how the relative positions of the two conjugate foci, as they are called, Q and q , vary as the distance, AQ , of the origin of the rays is changed. As Q is advanced towards O , q also approaches O , since the angles QPO and qPO always remain equal; and when the source of the light is in the center, O , of the sphere, the reflected rays are all returned upon the source. As Q , again, recedes from O , q moves towards F , which it does not quite reach until the distance of Q is infinite, so that the incident rays may be considered as parallel, as in fig. 7. If Q is placed between O and F , then q will be to the right of O ; and when Q coincides with F , the reflected rays will have no focus, but will be parallel. If Q is between F and A , the reflected rays will diverge, and will have their virtual focus to the left of A . The correctness of these deductions may easily be verified. The positions of the conjugates are traced in precisely the same way for the convex mirror, and the reader who is interested will find no difficulty in tracing them for himself.

CATOP TROMANCY, divination by the mirror or looking-glass. At Patras, in Greece, the sick foretold their death or recovery by means of a mirror let down with a thread until its base touched the water in a fountain before the temple of Ceres. The face of the sick person appearing healthy in the mirror, betokened recovery; if it looked ghastly, then death was sure to ensue. More modern superstitions attach ill-luck to the breaking of a looking-glass, and to seeing one's face in a glass by candle-light.

CATS, JACOB, a Dutch statesman and poet, was b. at Brouwershaven, in Zeeland, in 1577, and after studying law, finally settled at Middelburg. He rose to high offices in the state, and was twice sent as ambassador to England, first in 1627, and again in 1652, while Cromwell was at the head of affairs. He died 1660. As a poet, he enjoyed the highest popularity. His poems are characterized by simplicity, rich fancy, clearness, and purity of style, and excellent moral tendency. The most highly prized of his productions were the *Huvelyk, Trouweringh* (a series of romantic stories relating to remarkable marriages), and the *Spiegel van den Ouden in Nieuwen Tyd*. The best edition of his works appeared at Amsterdam, in 19 vols., 1790-1800.

CAT'S-EYE, a beautiful mineral, a variety of quartz receiving its name from the resemblance which the reflection of light from it, especially when cut *en cabochon*, or in a convex form, is supposed to exhibit to the light which seems to emanate from the interior of the eye of a cat. It has a sort of pearly appearance, and is *chatoyant* or characterized by a fine play of light, which results from the parallel arrangement of the minute fibers of the stone itself, or from an intimate mixture of some foreign substance, such as amianthus. It has been supposed that cat's-eye is silicified wood. It is of various colors, and is obtained chiefly from Malabar and Ceylon. The Singhalese are especially proud of it, believing it, although erroneously, to be only found in their island. It is often brought from that island, cut to resemble a monkey's face, from the idolatrous regard entertained for the monkey. A chatoyant variety of feldspar has been sometimes confounded with cat's-eye, and is also found in Ceylon.

CATSKILL, a village on the Hudson river, in e. New York, the capital of Greene co., 34 m. s. of Albany; pop. '75, 6,679. C. is one of the landing places for the thousands of visitors who go annually to the Catskill mountains, a few miles westward. A ferry across the river connects with the Hudson River railroad. There are several important manufactories in the village.

CATSKILL GROUP, in geology, the name of rocks of the Devonian system seen in the northern counties of Pennsylvania. They are chiefly red sandstone and shale, and

contain fossil scales of the earliest fishes. The Catskill mountains were formerly supposed to belong in this group, whence the name, now known to be inappropriate.

CATSKILL MOUNTAINS, a group of the Allegheny chain, in its largest sense, situated near the right bank at once of the Hudson and of the Mohawk, in the state of New York. The loftiest points, Round Top and High Peak, are respectively 3,800 ft. and 3,720 above tide-water; and, on a third eminence, a terrace of 2,500 ft. above the same level presents Catskill Mountain house, a favorite retreat in summer. The group is drained chiefly by Catskill creek, which, at a village of its own name, enters the Hudson 111 m. above its mouth, and 34 below the confluence of the Mohawk.

CATSKILL MOUNTAINS (*ante*), a part of the Appalachian system w. of the Hudson, river in Greene co., N. Y. The group, about 12 m. long, nearly parallel with the river about, 8 m. distant, turns westward in spurs extending many miles. Besides the Ulster and Delaware railroad, beginning at Kingston and leading w. into the mountains, there is a good wagon road from Catskill village to the "Mountain House," 12 m. w., which is a favorite summering place. The house stands on a terrace 2,231 ft. above the river, and almost at the edge of a perpendicular cliff several hundred ft. high. There is another public house on Overlook mountain, a few miles to the s., which is estimated to be 3,800 ft. above tide. The views from these houses and from the neighboring peaks are wonderfully varied and beautiful, reaching from the Green mountains in Vermont to the highlands at West Point, and taking in nearly 100 m. of the Hudson river and valley, with numerous cities and villages, and a vast expanse of highly cultivated farming country. An immense number of summer boarders are accommodated through all this region, not only in hotels, but also in countless farm-houses and village homes. One of the highest points is the top of Overlook, 3,800 feet. The other prominent elevations are Hunter mountain, High peak, and Round Top. One of the sights of the region is "The Clove," or ravine, and the falls therein. The ravine is about 5 m. long. At its head two rivulets unite and flow rapidly to a point where the mountain divides and forms a deep hollow into which the brook rushes over a cascade of 180 ft.; and further down are other falls, one of 80 and another of 40 feet. The ice formation in winter around the highest fall is particularly grand and beautiful. There are other ravines and water-falls in the region, but none equally important. The mountains are for the most part covered with thick forests of oak, hickory, ash, maple, beech, pine, etc.

CAT'S-TAIL. See *TYPHA*.

CAT'S-TAIL GRASS. See *TIMOTHY GRASS*.

CATTACK. See *CUTTACK, ante*.

CATTARAUGUS, a co. in w. New York, on the Pennsylvania border, watered by the Allegheny and other rivers, and intersected by the New York and Erie and the Atlantic and Great Western railroads, and the Genesee Valley canal; 1250 sq. m.; pop. 75, 47, 130. The surface is undulating and the soil fruitful. The chief products are wheat, corn, oats, potatoes, hay, cheese, butter, wool, hops, and maple sugar. Iron, manganese, marl, peat, and sulphur are found. Co. seat, Little Valley.

CATTARO, a t. of Austria, in the crown-land of Dalmatia, is situated at the head of the gulf of Cattaro, about 36 m. s. e. of Ragusa. It is strongly fortified, and surrounded on all sides by mountains. The castle, a massive and almost inaccessible building, stands on a precipitous rock immediately behind the town. C. has a cathedral several churches and hospitals, and a population of 3,000. C., which was at one time the capital of a small republic, was in 1807 annexed to the kingdom of Italy, but was handed over to Austria in 1814 by the treaty of Vienna.—**CATTARO, GULF OF**, or **BOCCA DI CATTARO**, an inlet of the Adriatic, near the s. extremity of the Dalmatian coast. It consists of three basins or lakes, connected by straits of about half a mile in breadth. The outer entrance is only a mile and a half wide, and the total length of the gulf is about 30 miles. Mountains protect it from all winds, and it has a depth of from 15 to 20 fathoms.

CATTEGAT, or **KATTEGAT** (*Sinus Codanus*), the bay or arm of the sea situated between the e. coast of Jütland and the w. coast of Sweden, to the n. of the Danish islands. It is connected with the Baltic sea by the Great and Little Belt (q. v.), and by the sound. The Skager Rack (q. v.) connects it with the North sea. The length of the C. is about 150 m., and its greatest breadth 85 miles. It is of unequal depth, and has dangerous sand-banks. The principal islands are Lasøe, Samsøe, and Anhalt. The Danish shores of the C. are low, but the Swedish shore is very steep and rocky.

CATTERMOLE, GEORGE, one of the most distinguished of English painters in water-colors, was born at Dickleburgh, Norfolk, in 1800. His pictures, which embrace a wide range of subjects, are remarkable for their striking originality of conception, vigorous execution, and fine color and tone. One of his best known and greatest pictures is "Luther at the Diet of Spires," containing 33 portraits of the principal characters, copied from the authentic originals by the old masters. He also designed the engravings for his brother's *History of the Civil Wars*, and illustrated many scenes in Scott's novels and in Shakespeare. His later works are chiefly oil-paintings. He d. July 24, 1868.

CATTI, or **CHATTI**, a German people, included by Cæsar under the name Suevi (q. v.), who inhabited a country pretty nearly corresponding to the present Hesse. The south-western part of their territory, around *Mattiacum*, was conquered by the Romans under Drusus. The C. took part in the general rising of the Germans under Hermann. Tacitus praises them as excellent foot-soldiers. During the reign of Marcus Aurelius, in the end of the 2d c., they made incursions into Roman Germany and Rætia. Caracalla failed in an expedition against them and the Alemanni in the 3d century. About the middle of that century, their name began to give place to that of the Franks (q. v.), and is last mentioned by Claudian in the latter part of the 4th century.

CATTLE. See Ox.

CATTLE, in English law. See CHATTEL.

CATTLE-PLAGUE, **RINDERPEST** (Ger.), or **STEPPE MURRAIN**, is a contagious eruptive fever, or exanthema, of the bovine species; sheep, goats, deer, and other allied species occasionally, however, catch it from cattle. It occurs indigenously on the plains of western Russia, whence it has at various times overspread most parts of the old world. The specific virus from diseased or infected animals is the only source of cattle-plague; no filth, overcrowding, or other health-depressing cause has hitherto produced it. As in small-pox, scarlatina, and other eruptive fevers, an incubative stage, varying between two and twenty days, intervenes between the introduction of the virus into the system, either by inoculation or contagion, and the development of the characteristic symptoms. These consist essentially of congestion of the mucous and cutaneous surfaces, with a sort of aphthous eruption, and thickening, softening, and desquamation of the superficial investing membrane. The disease runs a tolerably fixed and definite course, which is not materially altered by any known remedial measures. It seldom attacks the same individual a second time.

History.—The cattle-plague has been recognized for upwards of a thousand years. It appears to have destroyed the herds of the warlike tribes who overran the Roman empire during the 4th and 5th centuries. About 810, it traveled with the armies of Charlemagne into France, and about the same period is also supposed to have visited England. Several times throughout the course of every century it spread from the plains of Russia over the western countries of Europe, and is stated to have again visited England about 1225. Although occasioning, every few years, great losses on the continent of Europe, the plague does not appear to have again shown itself in England until 1714, when it appeared at Islington about the middle of July, was very destructive for about three months, but was again got rid of towards Christmas. In 1744, it was in Holland, destroying there, in two years, 200,000 cattle; in Denmark, from 1745–49, it killed 280,000; in some provinces of Sweden it spared only 2 per cent of the horned cattle. It made terrible havoc throughout Italy, destroying 400,000 beasts in Piedmont alone. In April, 1745, the plague was again imported into England, probably by some white calves from Holland, where, as already stated, it had for some time prevailed. It continued its devastations for twelve years, but it is now impossible accurately to discover the losses it occasioned. In the third and fourth years of its ravages, 80,000 cattle were slaughtered, and double that number are supposed to have died. In 1747, 40,000 cattle died in Nottingham and Lancashire alone; whilst, so late as 1757, 30,000 perished in Cheshire in six months. In March, 1770, the disease was brought with some hay from Holland to Portsoy, in the Moray firth; several cattle died, and others, to the value of £799, 13s. 2d., being destroyed, the further spread of the pest was prevented. By the wars which wasted Europe towards the close of the last and first eighteen years of the present century, cattle-plague was spread widely over the continent, and occasioned, wherever it occurred, terrible losses. Since then, at short intervals, it has spread—always being traceable to its source on the Russian plains—over Poland, Hungary, Austria, Prussia, portions of Germany and Italy, and has extended to Egypt. It has also reached China and Japan.

The British outbreak of 1865–67, like its predecessors, undoubtedly came from Russia. The steamer *Tonning*, from Revel, brought 331 cattle and 330 sheep into Hull on 29th May, 1865. A portion of the cattle had come from the interior of Russia, where the plague then was, or recently had been; the cargo was rapidly landed, and very hurriedly inspected. Nearly half of the cattle were distributed in various lots to butchers in Leeds, Derby, and Manchester, but, curiously, these do not appear to have left any contagion in their trail. One hundred and seventy-five came to London, remained from the Monday evening until Thursday's market in lairs at York road, adjoining the cattle-market. It was stated, in a leader in the *Times* of 15th Aug., that rinderpest was seen in the metropolitan market as early as 12th June. Certain it is that more than one lot purchased on 19th June carried the disease to several dairies in and about London. The first cases were mistaken for cases of poisoning, the cows they had stood beside were sent into market, and thus the subtle disorder in a few weeks spread into many dairies both in town and country. Twenty-three Dutch cattle, having stood over for several markets, were sent back to Holland on 2d July, carried with them the contagion, were placed in a field near Schiedam, but soon sickened and died, thus spreading the disease in Holland. During the next six months, plague was repeatedly reimported thence into England. Until 11th Aug., 1865, no restrictions whatever were

put upon the removal of cattle; diseased and infected animals were freely taken to fairs and markets, were openly traveled by road and rail; whilst the metropolitan market continued every week to send forth infected cases, not only to the neighboring counties, but to Southampton, Birmingham, Hereford, Liverpool, Edinburgh, and even to Aberdeenshire. As early as 18th July, the pest was brought from London to Huntly by four calves; subsequent outbreaks occurred in the same way. The stamping-out system was, however, early and rigidly enforced in Aberdeenshire, and eight distinct outbreaks were promptly got rid of.

In Edinburgh, it appeared probably about 9th Aug., was brought from London by some low-priced foreign cows; in six weeks, about 800, or one half the dairy cows in Edinburgh, had died—200 having been buried in one trench. By the end of Jan., four fifths of the dairy cows had perished, but Edinburgh was reported clear. In Glasgow, the first case occurred on 19th Aug., in a cow sent from Edinburgh. By 30th Sept., 432 cases were reported, and it continued to spread. By the middle of Oct., it was in Mr. Harvey's valuable stock of 800, of which 25 died in one night, and to save further loss, 50 healthy animals were in one day disposed of to the butcher. From Falkirk Trysts, as from Barnet, Norwich Hill, and other large English fairs, the disease was transmitted into fresh localities. From the autumn trysts, it was carried into Perthshire, Forfarshire, and Fifeshire. Diseased cattle passing along in railway trucks, appear to have spread the contagion over the fields adjoining the line at Thornton, Fifeshire. Into West Lothian it was conveyed in early Sept. by lambs from the Edinburgh market.

The rapid spread of the insidious disorder may be gathered from the fact that, whilst, during the week ending 24th June, 1865, there was only one outbreak at Mrs. Nicholl's dairy at Islington, and 30 animals affected, by 30th Sept. there were 1702 farms, sheds, or other places in which the pest had appeared, and 13,263 animals had been attacked. Three months later, 8252 separate places had been visited, and 62,743 animals attacked. During six months, the aggregate of cattle attacked was 76,002. During the three months to 30th Mar., 13,443 farms and other premises had been infected, and 147,275 cattle attacked. In Dec., 1865, the fresh cases each week reached 9000; but in spite of remedial and preventive measures, of orders in council, and restrictions on the movement of stock, the number of weekly cases steadily increased to 15,706 in the third week of Feb. "The cattle diseases prevention act" passed 20th Feb., 1866, and the advantages flowing from the restrictions thus tardily imposed on the trade in cattle, and the slaughter of diseased and infected animals, were speedily apparent. In four weeks, the number of cases was reduced by one half. During the three months ending 30th June, 28,276 cases were reported; during the next three months to 30th Sept., the numbers fell to 2108; whilst, to 29th Dec., the three months' cases were but 149; to 30th Mar., 1867, 89 new cases were noted. Throughout April and May the number of cases continued steadily to decline; but during the week ending 25th May a fresh outbreak occurred in the Finsbury district of the metropolis, and 81 animals died, or were slaughtered to prevent the further spread of the pest. With the exception of an isolated outbreak in Essex, which was promptly stayed by slaughter of the ailing and suspected animals, the country was free of plague during August. The following are the records of its destructive career during 1865-67:

	Attacked.	Killed.	Died.	Recovered.
England.....	223,672	102,740	90,450	21,589
Wales.....	8,388	1,180	5,794	1,117
Scotland.....	46,863	6,263	28,088	10,707
Total... ..	278,923	110,183	124,332	33,413

To this sad total must be added 11,000 cases known to have been attacked and unaccounted for, and upwards of 60,000 healthy cattle slaughtered to prevent the spread of the disease. Plague was again imported into Hull in Aug., 1872; it was brought with cattle from Cronstadt; it spread into several districts of the East Riding, attacked 72 animals, 51 of which were killed, and 21 died. In 1877, an outbreak took place in Germany, but by energetic measures was speedily suppressed without extensive losses.

Causes.—The development of cattle-plague by filth, overcrowding, miasmata, hot weather, or other such causes, is untenable. Faulty hygiene, by lowering vitality, probably renders the animal more prone to the attack, and less able to bear up against it, but it cannot originate plague. Like hydrophobia, small-pox, or syphilis, it is developed only by the special virus, which appears to have its habitat on the Russian steppes. This virus occurs abundantly in the blood of every plague-stricken beast, in the discharges from its nostrils, mouth, or eyes, in the off-scourings from the bowels, probably even in the breath. It may be transferred to healthy beasts by inoculation. A little of the blood or nasal or other mucous discharges of a plague case, if introduced underneath the skin of a healthy cow, develops the disease within a few days. The transference of the virus or contagion from the sick to the sound animal, is not always so direct and evident. As with other catching diseases, the virus may be carried considerable distances in the air; its particles are minute, but they have powerful vitality; it may adhere to the food that has lain before infected beasts; to the litter from the stalls, or even after it has been heaped for weeks; to the clothes of attendants; to the floors, walls, or stalling of build-

ings; to imperfectly cleansed cattle-trucks. So subtle and potent is the plague poison, and so endowed with the power of self-multiplication and growth, that a very minute portion of it finding access to the blood of a healthy animal of the bovine race increases so rapidly, that to use the words of the commissioners' report, No. III. p. 4, "the whole mass of the blood, weighing many pounds, is infected; and every small particle of that blood contains enough poison to give the disease to another animal." It may gain access to the blood probably through the air-passages, perhaps also by absorption through the mucous surface of the bowels, or even through the skin.

Symptoms.—In from three to six days after an animal has been exposed to the virus of cattle-plague, or about 36 to 48 hours after being purposely inoculated, the temperature of the body is raised by several degrees. A delicate thermometer introduced into the vagina or rectum, instead of marking about 102° F., indicates 104° to 106°. As yet the appetite, secretion of milk, breathing, and pulse are scarcely if at all affected, and but for the elevation of temperature, accompanied sometimes by dullness, the animal might be supposed to be in the best of health. Two or three days later, or usually within six or eight days after the beast has taken in the subtle virus, the mucous membrane of the mouth is generally observed to be slightly reddened, and soon a granular yellowish-white eruption, consisting of thickened epithelium cells and granules, appears on the gums round the incisor teeth, and by and by on the lips and dental pad. Some hours later, the same eruption extends to the cheeks, tongue, and hard palate. Within 48 hours, or about the sixth day of attack, a crust of epithelium covers the gums, lips, and mouth, and when wiped away, or accidentally rubbed off, leaves the abraded membrane red and vascular, and exhibiting patches of erosion. The membrane lining the vagina indicates very similar appearances; it is reddened and vascular, dotted with grayish translucent elevations about the size of rape-seeds, covered with a whitish-yellow, usually sticky discharge, and occasionally marked with patches of excoriation. The skin, like the mucous surfaces, is congested; there is hence a perverted development of scarf skin, and of the oleaginous secretion of the irritated sebaceous glands. The skin is thus invested with a furfuraceous desquamation; whilst on its thinner portions about the lips, between the thighs, and on the udder, there are papular eruptions or elevations. About two, or even three days after the temperature has been increased, and usually one, or even two days after the appearance of the characteristic eruption on the gums, the constitutional symptoms present themselves. The animal is dull, hangs its head, arches its back, the eyes are leaden and watery, and from both eyes and nose there latterly comes a dirty slimy discharge. Appetite and rumination are irregular, and in dairy cows, the secretion of milk rapidly abates. The breathing, especially towards the sixth day, is oppressed, expiration is prolonged, and accompanied by a peculiar grunt. The pulse is small and thready, and quickened as death approaches. The bowels, usually at first confined, become, towards the sixth or seventh day, much relaxed; the discharges passed, often with pain and straining, are profuse and liquid, offensive, acrid, pale colored, and occasionally mixed with blood. The patient loses weight and strength, totters if it attempt to walk, and prefers to lie rather than to stand. Death usually occurs about the seventh day, and is preceded by muscular twitchings, a peculiar sickly, often offensive smell, a cold clammy state of body, moaning, grinding of the teeth, and rapidly increasing prostration.

Prognosis.—Cases usually terminate unfavorably when about the fifth or sixth day the animal temperature falls rapidly; the pulse becomes small, quick, and weak; the breathing more difficult, distressed, and moaning; the diarrhea increased; and the depression more notable. A more favorable termination may be anticipated when, after the fifth day, the heightened temperature, so notable even from the earliest stages, abates gradually; the breathing becomes easier; the pulse firmer; the visible mucous membranes appear healthier; and patches of extravasation or erosion speedily disappear.

Sheep do not take rinderpest spontaneously, and even when kept with diseased cattle, or inoculated with cattle-plague virus, they do not catch the disease so certainly as cattle do. When diseased, they exhibit, however, very similar symptoms, but professor Röhl, and other observers, record that upwards of 40 per cent recover. Goats, deer, antelopes, gazelles, yaks, and indeed all animals taking rinderpest, exhibit with tolerable uniformity the same characteristic symptoms.

Post-mortem Appearances.—The mucous membranes are generally deeper colored than natural, are congested, softened, marked in places with the same granular patches discoverable during life within the mouth and the vagina, and in bad cases exhibit œdema, hæmorrhage, and sloughing. The first three stomachs sometimes contain a good deal of food, but show less declension from health than the fourth stomach, of which the mucous membrane is dotted with spots of congestion and extravasation. The coats of the bowels are thinned and easily torn. The mucous coat, especially towards the middle of the small intestines, the opening into the cæcum, and posterior half of rectum, is much congested, bared of epithelium, and sometimes ecchymosed, but never ulcerated. Peyer's glands, so generally inflamed in the somewhat analogous typhoid fever of man, are perfectly healthy. The liver, spleen, and pancreas seldom present any special appearances. The respiratory mucous membrane, like the digestive, is vascular, and marked with submucous hæmorrhage; the lungs are generally emphysematous, the heart often marked with petechial spots. The urino-genital, like the other

mucous membranes, is congested in females, especially towards the lower part of the vagina and vulva; the kidneys are sometimes rather softened, the serous membranes and nervous centers are perfectly unchanged. Dr. Beale, by his microscopical observations, discovers in the capillaries a great increase of nuclear or germinal matter, and white blood-corpuscles, which he believes may account for the local congestion. The blood itself is dark in color; in the later stages it contains less water, probably owing to the draining diarrhoea, and about double its usual proportion of fibrine. The muscular tissues are softened, easily broken down, and contain an abnormal amount of soluble albumen. The urine is little altered in quantity, but from the first rise in the animal temperature, it contains an increase of urea varying from 5 to 15 per cent. The chief change in the milk is its rapid diminution in quantity, and the increase of its fatty matters. The bile is watery, offensive, and prone to decomposition.

Treatment.—Cattle-plague is proved to be an eruptive fever. When the specific poison, on which such disorders depend, has entered the body of a susceptible subject, no remedy has yet been discovered which can destroy it, or even materially shorten or mitigate its effects. Until such an antidote is found, there can be no hope of certain cure. The cattle-plague commissioners have collected information regarding the four following methods of treatment—namely, the antiphlogistic, the tonic and stimulant, the antiseptic, and the special. Diverse as are these systems, the percentages of recoveries, varying from 25.83 to 27.45, were so nearly alike, that it is fair to conclude that no one of the systems tried exercised any notable influence in checking the mortality. Partly, perhaps, from the varying virulence of the plague, partly from differences in the nursing and care bestowed on the animals, the proportion of recoveries has varied greatly in different localities. Up to the end of 1865, in Huntingdon they were only 4.668 per cent; in Norfolk they were 12.102; in Flint, 15.909; in Scotland, 19.889; whilst in Fife-shire they reached 24.552; and in Yorkshire, 29.731 per cent.

Like small-pox, measles, and other eruptive fevers in man, rinderpest runs a definite course which cannot safely be interfered with. Rational treatment is therefore limited to warding off untoward symptoms, to careful nursing, and husbanding the failing strength. It must, however, be remembered that throughout the progress of the disease there is constantly given off from the sick body minute particles, which are capable of developing the disorder in healthy cattle. Hence plague-subjects, by the orders in council, are very properly desired to be immediately destroyed. Except, therefore, for purely scientific purposes, and with careful precautions to prevent the spread of the poison, it is unwise to attempt remedial treatment. Where, however, a beast is to have a chance of recovery, so soon as the elevated temperature indicates the accession of the disease, solid indigestible food should be withheld, and the patient restricted to mashes, gruel, boiled linseed, malt, and other food, which can be digested without the necessity for rumination. The paramount importance of such a dietary is clearly demonstrated in the returns of the Edinburgh cattle-plague committee to the government commissioners. The recoveries amongst 310 cattle "fed with dry food, and treated medicinally with drugs," were 13.6. Amongst 303 cattle treated with mixed food and hay, 22.2 recovered. Where mashes were given during sickness, but dry food supplied during convalescence, the recoveries reached 51.5; whilst in 95 cottagers' cows, whose chief ordinary dietary consisted of mashed food, and which were fed in the same manner throughout both sickness and convalescence, and were besides carefully nursed but not doctored, the recoveries reached 73.7. Where the bowels at the outset are costive, a dose of oil, or a very small quantity of some saline purgative, may be required. Cold water, gruel, mashes, or stale bread soaked either in water or beer, should be offered at short intervals throughout the attack. The animal, kept in an atmosphere of about 60°, should be comfortably clothed, and have its legs bandaged. The hot-air bath and wet-packing has been repeatedly tried, but although probably useful in the earlier stages, appear, when the disease is fully established, to harass and weaken the patient. Small and repeated doses of sulphite of soda have in some cases proved useful, and may be conjoined with carefully regulated moderate doses of such stimulants as ale, whisky and water, sweet spirit of niter, spirit of ammonia, or strong coffee. It is most important, however, that these and other such medicines should be drunk by the animal of its own accord in its gruel, water, or mashes, as the forcible horning over of drenches always disturbs the patient. The inhalation of chloroform, although temporarily relieving the distressed breathing, does not appear to exert any permanent benefit.

Prevention.—From what has been stated regarding the nature of cattle-plague, it must be evident that its prevention can only be effected by the destruction of the specific virus, or by removing beyond its influence all animals on which it might fasten. Sparks fall harmless where no inflammable materials lie within reach, and there are many such materials. Neither should sheep, fresh hides, hay; nor any other fodder and litter from countries where this ruinous plague exists, or has recently visited, be allowed to enter British ports. This very obvious precaution took strong hold of the public mind, and the practical result is, that importations of cattle-plague are guarded against by the provisions of the contagious diseases (animals) acts, 1869 and 1878. Neither cattle, sheep, nor pigs, fodder, litter, or hides, can be landed from countries where the plague exists, or from places in direct communication with such infected countries. All foreign stock is

inspected at the ports of debarkation, and inspectors have orders for the immediate slaughter and disinfection of cattle-plague subjects, and of any animals with which they have been in contact. But even with such precautions, foreign cattle frequently bring with them catching disorders, notably foot-and-mouth disease. Since they constitute, however, less than 5 per cent of the total cattle stock of the country, such risks should be removed by converting the foreign cattle traffic into a dead-meat trade.

Rinderpest being found to resemble smallpox in men and sheep, it was thought that its propagation and virulence might be abated by vaccination with cowpox lymph; but cattle, even when effectually vaccinated, which is often a difficult task, readily take rinderpest, often in its most mortal forms. Inoculation with the discharges from mild cases and from young calves has been tried as a palliative; but the disease, thus artificially developed, loses nothing either of its severity or of its dangerous contagious character. Cattle in Oxfordshire receiving for several weeks daily doses of sulphite of soda are stated to have had the plague in a mild form.

Where an outbreak occurs, the diseased animals must be promptly destroyed, and all cattle in immediate contact with them should likewise be slaughtered. This "stamping-out system" prevents the multiplication and diffusion of the virus, and hence saves still further losses. It is rigidly and successfully carried out in many continental countries. By stamping out and strict isolation, eight or ten outbreaks in Aberdeenshire were got rid of without serious loss. A French outbreak on the Belgian frontier in Sept., 1865, was stamped out with the sacrifice of forty-three animals. The disease was imported to Paris in Nov. by two gazelles purchased in London by the French Acclimatization society. Before it was stayed by slaughter and segregation, thirty-four animals, including yaks, antelopes, deer, gazelles, goats, and peccari, died or were destroyed. The determined slaughter of diseased and infected animals, and the restrictions on the movement of all stock, were the only means that reduced the number of attacks during the British outbreak of 1865-66. As is officially recorded in the commissioners' report, No. IV., p. 6, "where the percentage of killed is high, the ratio of increase of the disease is low, and *vice versa*. This has generally been noticed under each county and district."

When plague is in the neighborhood, it is desirable daily to sprinkle the walls, wood-work, and floor of the sheds and hovellings with carbolic acid solution, and to keep up throughout the premises a continual odor of this useful antiseptic, and with a diluted solution of the acid, or with M'Dougall's disinfecting soap, to wash over the cattle daily. The animals should be carefully fed on digestible soft food; receive daily about an ounce of sulphite of soda in a mash; and, in order to note the first access of the disease, should have their temperature examined by the thermometer every night and morning.

The recommendations of the cattle-plague commissioners for the purifying of infected sheds, litter, and manure must receive careful attention. In whatever premises infected beasts have stood, the walls should be lime-washed, a pint of carbolic acid being added to each pailful of the whitewash. The floors and wood-work, after being washed and scrubbed with boiling water, should be sprinkled with a strong solution of carbolic acid. The sheds being emptied of their living inhabitants, and the doors and windows closed, sulphur should be burned, and the vapors allowed to float about for a couple of hours before the sheds are again thrown open to the purifying influences of abundance of fresh air. A pound of sulphur placed on a shovel of burning coals suffices for a twelve-stalled shed or byre. Where cattle plague has raged, this cleaning and fumigation should be repeated, and, if possible, several weeks allowed to elapse before the premises are again occupied by sound animals. All shovels, forks, buckets, or brooms, that have either directly or indirectly come in contact with diseased or infected animals, should be washed with carbolic acid solution. The clothes and boots of attendants, inspectors, and others coming in contact with plague-stricken animals must be similarly cleansed. The manure should be sprinkled with carbolic acid at intervals of a few days, and then covered over with a foot of earth, freely mixed with soil, or carted away and plowed in. It is safer thus to put the manure on the arable land than to use it as a top-dressing for the pastures.

Authorities.—Official reports of commissioners, Nos. I., II., III., and IV.; *The Cattle Plague*, by prof. Gamgee; *Die Rinderpest*, by Roloff (2d ed., 1877); and numerous monographs by German authorities.

CATTO LICA, a t. of Sicily, in the province of Girgenti, and 14 m. n.w. of the city of that name. It has extensive sulphur-works, and a pop. of 7,200.

CATTY (Malayan, *kati*; Japanese, *kin*), the unit of weight used throughout Chinese and Malayan Asia, and by the Chinese all over the world. American scales exported to Asia are graduated into catties. A catty is $1\frac{1}{4}$ pounds avoirdupois.

CATTYWAR. See **KATTYWAR**, *ante*.

CATUL LUS, VALE'RIVS, a celebrated Roman lyricist, was b. at Verona, 87 B.C. His father was an intimate friend of Julius Cæsar, and the young poet must have frequently met the great warrior at the paternal residence, when the latter was on his way to Gaul. In early life, he went to Rome, where his career was that of an Epicurean, and the expense of this kind of living soon involved him in pecuniary difficulties. To release

himself from these, he followed the prætor Memmius to Bithynia, with the intention, like his superior, of wringing a fortune out of the provincials. This fashionable but felonious method of acquiring money did not succeed in C.'s case, mainly, however, through the more dexterous cupidity of Memmius. After his return, C. appears to have lived mostly in Rome, and in very straitened circumstances. When he died is unknown. His poems, 116 in number, chiefly consisting of lyrics and epigrams—first brought to light by Benvenuto Campesani of Verona in the beginning of the 14th c.—have always been justly admired for their exquisite grace and beauty of style; but are, in many places, grossly indecent. In higher styles of writing, C. was equally successful, especially in his odes, of which, unfortunately, only four have been preserved. His heroic or narrative poem on the marriage of Peleus and Thetis—consisting of more than 400 hexameter lines—and the wild enthusiastic poem entitled *Atys*, are especially worthy of notice. Most of the earlier editions of C. include the works of Tibullus and Propertius. The best modern editions are by Sillig (1823), Lachmann (1829), and Ellis (1867 and 1878). There are English translations by Lamb (1821), Martin (1861), Cranstoun (1867), etc. See Munro's *Criticisms* (1878).

CAT'ULUS, QUINTUS LUTATIUS, d. 87 B.C.; consul of Rome with Caius Marius. Catulus was beaten by the invading Cimbri and driven across the Po, but Marius came to his aid, and the barbarians were defeated at Vercellæ in July, 101 B.C. In the civil war Catulus supported Sulla and was proscribed. Preferring death to capture, he suffocated himself over burning charcoal.

CAT'ULUS, QUINTUS LUTATIUS, son of the consul; made consul in 78, and censor in 65, B.C. He put down a rebellion incited by Lepidus after the death of Sulla, and assisted Cicero in the suppression of Catiline's conspiracy.

CAUB, a t. of Nassau, n. Germany, on the right bank of the Rhine, 21 m. w.n.w. of Wiesbaden. It is noteworthy as the place where Blücher crossed the Rhine with his army, Jan. 1, 1814; and also as the place where, till 1866, toll was levied by the duke of Nassau—the only ruler who kept up this feudal privilege—from vessels navigating the Rhine. C. has underground slate-quarries; and opposite, on an island in the river, where Louis le Débounaire died, 840, is a castle called the Pfalz, built in 1326, and which is said to have been resorted to for safety by the countesses Palatine during their confinement. C. is threatened with destruction by the disintegration of the mountains behind, and in Mar., 1876, a destructive landslip took place. Pop. '71, 2,098.

CAUCA, a river of the United States of Colombia, in South America, which, after flowing 500 m. to the n.e., joins the Magdalena on the w., 150 m. from the Caribbean sea. It gives name to a department of 260,000 sq.m., and (1870) 445,000 inhabitants.

CAUCA, one of the United States of Colombia, occupying the whole w. coast of the Caribbean sea to Ecuador, including the chain of the Andes and the valley of the Rio Cauca; 257,462 sq.m. (more than half of the republic); pop. '71, 435,078. The region is well cultivated, producing cereals, sugar, tobacco, coffee, cocoa, cotton, etc., and vast herds of horned cattle and mules. The capital is Popayan.

CAUCASIAN VARIETY OF MANKIND, an ethnological division adopted by Blumenbach, which included all the inhabitants, ancient and modern, of Europe (except the Finns); in Asia, the Hindus (of high class at least), Persians, Assyrians, Arabians, Jews, Phœnicians, inhabitants of Asia Minor and of the Caucasus, etc.; and in Africa, the Egyptians, Abyssinians, and Moors. What Blumenbach had called Caucasians, Dr. Prichard, who may be said to have laid the real foundation of ethnology, makes to consist of two independent groups or varieties, grounding on a radical difference of language. One of these is the Syro-Arabian or Semitic (q.v.) race, and the other the Indo-European or Aryan (q.v.) race. The inhabitants of the Caucasus, so long held to be types of the European variety, are now by some excluded from it altogether, and classed with the sallow flat-faced Mongols, to which it is considered the nature of their language and other facts ally them more closely than the symmetry of their shape and complexion do to the European variety. The narrow basis upon which the theory of the Caucasian type was first formed is thus stated by Dr. Latham: "Blumenbach had a solitary Georgian skull; and that skull was the finest in his collection—that of a Greek being the next. Hence it was taken as the type of the skull of the more organized divisions of our species. More than this, it gave its name to the type, and introduced the term *Caucasian*. Never has a single head done more harm to science than was done in the way of posthumous mischief by the head of this well-shaped female from Georgia." See **ETHNOLOGY**.

CAUCASUS, a mountain range of great geographical and ethnographical importance, occupying the isthmus between the Black sea and the Caspian, its general direction being from w.n.w. to e.s.e.—from the peninsula of Taman on the Black sea, in lat. 45° 10' n., long. 36° 45' e., to the peninsula of Apsheron on the Caspian, in lat. 40° 20' n., long. 50° 20' e.—a length of about 750 miles. The breadth, including the secondary ranges and spurs, may be stated at about 150 m., but the breadth of the higher C. is much less, not much exceeding 60 or 70 miles. This range, formerly belonging entirely to Asia, now forms part of the boundary-line between Europe and Asia. The higher and central part of the range is formed of parallel chains, not separated by deep and wide valleys, but

remarkably connected by elevated plateaus, which are traversed by narrow fissures of extreme depth. The highest peaks are in the most central ridge or chain—Mt. Elburz attaining an elevation of 18,000 ft. above the sea, while Mt. Kasbeck reaches a height of more than 16,000 ft., and several others rise above the line of perpetual snow, here between 10,000 and 11,000 ft. high; but the whole amount of perpetual snow is not great, nor are the glaciers very large or numerous. This central chain is formed of trachyte. The secondary parallel chains are, on the inner side, mostly formed of argillaceous slate and plutonic rocks; on the outer side of limestone. The spurs and outlying mountains or hills are of less extent and importance than those of almost any other mountain-range of similar magnitude, subsiding as they do until they are only about 200 ft. high along the shores of the Black sea. Some parts are entirely destitute of wood, but other parts are very densely wooded, and the secondary ranges, near the Black sea, exhibit most magnificent forests of oak, beech, ash, maple, and walnut; grain is cultivated in some parts to a height of 8,000 ft., while, in the lower valleys, rice, tobacco, cotton, indigo, etc., are produced. As might be expected from the geographical situation of the C., the climate, though it is generally healthy, is very different on the northern and southern sides, the vine growing wild in great abundance on the s., which is not the case on the north. The s. declivity of the mountains, towards Georgia, presents much exceedingly beautiful and romantic scenery.

There are no active volcanoes in Mt. C., but every evidence of volcanic action. There are mud-volcanoes at each end of the range, and there are also famous naphtha springs in the peninsula of Apsheron. See BAKU. Mineral springs also occur in many places. The bison, or aurochs, is found in the mountains; in the forests are many fur-bearing animals; and game abounds. Bears, wolves, and jackals are among the carnivorous animals. Lead, iron, sulphur, coal, and copper are found.

The waters of the C. flow into four principal rivers—the Kuban, and the Rion or Fz (the *Phasis* of the ancients), which flow into the Black sea; and the Kur and the Terek, which flow into the Caspian. The Russians have carried a military road, with great labor and danger, through a valley somewhat wider than most of the Caucasian valleys, between the sources of the Kuban and the Terek. This road passes over a height of about 8,000 ft., and is protected by many forts, but is exposed to other dangers besides those which arise from the hostility of the mountain tribes. The only other road is by the pass of Derbend, near the Caspian sea.

The resistance which the Caucasian tribes, for more than half a century, offered to the arms of Russia, attracted to them the attention of the world. But with the capture (1859) of the prophet-chief of the Lesghians—Schamyl, the most active and determined of the foes of Russia, who for a quarter of a century withstood and harassed the armies sent against him—the power of the Caucasians was greatly shattered; and after his death in 1871 the Russians regarded the territory as virtually subjugated. A large number of the Circassians elected to migrate to Turkish territory, where they were welcomed. The general name Circassians (q.v.) is often, but not very correctly, applied to the tribes which inhabit the Caucasus, and whose whole number is not above 1,300,000 or 1,500,000. From the situation of Mount C., there have gathered together in it tribes belonging to a greater number of distinct races than can perhaps be found within the same space anywhere upon the earth. There are more than 100 different languages or dialects spoken; the Turkish-Tartar language, however, serving for a general medium of communication. The different tribes inhabiting the C., long believed to be the purest type of the Indo-European family, are now considered not to belong to it at all, but to have more affinity with the Mongolian races. See CAUCASIAN VARIETY OF MANKIND. The principal tribes are the Tsherkesses or Circassians, Ossetes, Lesghians, Abchasians, Georgians, Suans, and Tchetches. The Georgians and Ossetes are at least nominally Christians; the Lesghians are fanatical Mohammedans. The Byzantine emperors and kings of Georgia planted Christian churches throughout this region, and many ruins of them remain, some of which are very beautiful. But the present Christianity of the nominally Christian tribes is more akin to heathenism than to true Christianity. In character, they are distinguished by their valor and love of freedom, but also by cruelty and treachery. They carry on a little agriculture, but live more by the care of their flocks, and by hunting.—The Russian lieutenantancy of the C., lying on both sides of the mountain range, has an area of 172,170 sq. m., and a pop. (1871) of 4,893,332.

CAUCASUS, INDIAN. See HINDU-KUSH, *ante*.

CAUCHON, JOSEPH, b. 1820; a Canadian journalist and legislator, who has been in the colonial or Dominion parliament since 1844. From 1867 to 1872 he was speaker of the senate. He established the *Quebec Journal* in 1842, and has conducted it ever since.

CAUCHY, AUGUSTIN LOUIS, 1789-1857; a French mathematician; a member of the academy in 1816, and professor of mathematics in the polytechnic school. His reputation rests chiefly upon his residuary and imaginary calculus. In politics he was a firm legitimist, steadily refusing to take the oaths of allegiance from time to time proffered, and on that account resigning his chair of mathematics in the new university of Paris in 1852. He published several valuable works on the calculus, on analysis, and other mathematical themes.

CAUCUS, a meeting, private or public, of citizens to select candidates for office; or of members of a legislative body for a similar purpose. Recently the meaning of the term has been extended to almost any conference previous to final action. Thus the people may hold a C. to ask or instruct their representative to support one or another measure; or the members of a party in congress, legislature, common council, or town-meeting may hold a C. to determine their course upon any subject. Legitimately, therefore, the term C. means a preliminary or preparatory meeting to arrange methods for some designated end. Much effort and ingenuity have been spent in trying to settle the origin of the term, but the most probable theory is that it came from Boston about the middle of the last century, and originally meant "the calkers' meeting," that is, the private gathering of the ship-calkers. The term was applied almost indiscriminately to meetings in the period preceding the revolution, and when the federal government was instituted it was accepted as the official term for what are now called "nominating conventions." Candidates for president of the United States were uniformly selected by a C. of the members of congress of the several parties, from 1789 to 1823. In the election of 1824, the regular democratic C. candidate, William H. Crawford, ran behind both Jackson and Adams, and but for some jugglery in New York would have run even behind Clay and come out the lowest of the four. This result ended the congressional C. system of presidential elections, and since that time candidates have been nominated by national conventions or political parties. Soon afterwards state conventions supplanted the legislative C. for the nomination of state officers, and now the C. is practically confined to the meetings of partisans in legislative bodies to decide upon a policy, or to select candidates for presiding and other officers of the particular body, or (by joint C. of senators and members of assembly) to settle upon nominees for U. S. senators. Outside of these special functions partisan work is now usually managed by conventions of the party at large, or by smaller conventions of delegates chosen by the voters of the party, or by committees appointed by such conventions.

CAUCUS. See **AMERICANISMS**

CAUDEBEC-LÈS-ELBEUF, a t. of France, in the department of Seine-Inférieure, 12 m. s. of Rouen. It has manufactures of cloth, and a pop. of (1876) 11,338.—**CAUDEBEC** is also the name of a t. in the same department, situated on the right bank of the Seine, 26 m. e. of Havre. It is one of the prettiest and most picturesque little towns on the Seine, with its old wooden houses and elm-shaded quays. It has a fine Gothic church of the 15th c., and manufactures of cotton, sail-cloth, leather, and soap. Formerly the capital of the Pays de Caux, C. was strongly fortified; and in 1419, so obstinate was its resistance, that it took the great English gen., Talbot, 6 months to capture it. Pop. '76, 1951.

CAUDE TÈ, a t. of Murcia, Spain, 50 m. e.s.e. of Albacete. The inhabitants, 5,500 in number, are chiefly engaged in agricultural pursuits. C. is also the name of a small place in New Castile, a few miles from Teruel, where there are some of the largest bone-deposits, fossilized and unfossilized, in Europe.

CAUDINE FORKS (*Furcula Caudina*), two high, narrow, and wooded mountain gorges near the town of Caudium, in ancient Samnium, on the boundary towards Campania. These gorges are celebrated on account of the defeat here suffered by the Romans in the second Samnite war (321 B.C.). Four Roman legions commanded by the two consuls Titus Veturius and Spurius Postumius, after marching through a narrow pass, found themselves locked in a spacious valley, surrounded on all sides by lofty mountains, with no way out save that by which they entered, and another pass on the opposite side. Attempting to defile through the latter, they found it blocked up with trees and stones, and commanded by the Samnites, who had also in the mean time made themselves masters of the other pass. Consequently, the four legions were compelled to encamp in the valley. After some days, famine compelled them to surrender unconditionally. The Samnite gen., Caius Pontius, according to old custom, compelled the Romans to pass under the yoke, and then permitted them to march back. This submission was regarded as too ignominious for Rome, and consequently the two consuls and the other commanders were delivered again into the hands of the Samnites, who, however, refused to have them.

CAUGHNAWAGA a village in Canada, 9 m. w. of Montreal, on the s. bank of the St. Lawrence, at the head of the Lachine rapids. It is inhabited exclusively by Indians, remnants of the once powerful Iroquois. They are about 500 in number.

CAUL is a thin membrane encompassing the heads of some children when born, and is mentioned here on account of the extraordinary superstitions connected with it from very early ages down to the present day. It was the popular belief that children so born would turn out very fortunate, and that the C. brought fortune to those purchasing it. This superstition was so common in the primitive church, that St. Chrysostom felt it his duty to inveigh against it in many of his homilies. In later times, midwives sold the C. to advocates at enormous prices, "as an especial means of making them eloquent," and to seamen, as an infallible preservative against drowning. It was also supposed that the health of the person born with it could be told by the C., which, if firm and

crisp, betokened health, but if relaxed and flaccid, sickness or death. During last century, it was common to find advertisements in the newspapers of caul to be sold—from £10 to £30 being the prices asked for them. So recently as 8th May, 1848, there was an advertisement in the *Times* of a C. to be sold, which "was afloat with its late owner thirty years in all the perils of a seaman's life, and the owner died at last at the place of his birth." The price asked was six guineas. Sir John Oflley, of Madeley manor, Staffordshire, by his will, proved at Doctors' Commons 1658, devised a C. set in jewels, which had covered him when he was born, to his daughter, thereafter to her son, and then to his own heirs-male. The C. was not to be concealed or sold out of the family. See Brand's *Popular Antiquities*, vol. iii.; *Notes and Queries*, 1st series, vol. vii.

CAULAINCOURT, ARMAND AUGUSTIN LOUIS DE, duke of Vicenza, a statesman of the French empire, was b. at Caulaincourt, a village in the department of Somme, Dec. 9, 1772. He entered the army at the age of fifteen, rapidly attained promotion, and, as col. of a regiment of carbineers, distinguished himself in the campaign of 1800. He was made a gen. of division in 1805, and shortly after created duke of Vicenza. In 1807, he was appointed ambassador at St. Petersburg, where he soon gained the confidence of the czar, who often made use of his advice. Disputes having arisen between Alexander and Napoleon, C. endeavored to restore amity and prevent war; but his proposals being rejected, he, in 1811, asked permission to resign his post, and received an appointment in the army of Spain. During the events of 1813, he was frequently employed as plenipotentiary in diplomatic affairs. In Nov. of 1813, he was made minister for foreign affairs, and in this capacity attended the congress at Chatillon, Jan., 1814. When Napoleon abdicated, C. endeavored to make use of his influence with Alexander to obtain the most favorable conditions for the fallen emperor, and, chiefly through his intervention, the island of Elba was ceded to Napoleon. During the hundred days, C. resumed office as minister of foreign affairs, and was made a peer. On the second restoration, he retired into private life. He died in Paris, Feb. 19, 1827.—His brother, AUGUST JEAN GABRIEL, count of Caulaincourt, b. 1777, served with distinction in all the campaigns from 1792 to 1812, when he fell in battle.

CAULIER, MADELEINE, a peasant girl of France who aspired to the military fame of the maid of Orleans. At the siege of Lille, in Sept., 1708, she conveyed into the city an important order to the officer in command, for which the duke of Burgundy offered her a large reward. This she declined, but received permission to raise a company of dragoons. She was killed in the battle of Denain, July 24, 1712, when marshal Villiers defeated the imperialists.

CAULIFLOWER, a variety of the common kale or cabbage, affording one of the most esteemed delicacies of the table. It was cultivated as a culinary vegetable by the Greeks and Romans. Its culture was, however, little attended to in England till the end of the 17th c.; but after that time it rapidly increased, and prior to the French revolution, C. formed an article of export from England to Holland, whilst English C. seed is still preferred on the continent. The C. is entirely the product of cultivation. The leaves are not in this, as in other varieties of the same species generally, the part used, nor are they so delicate and fit for use as those of most of the others, but the flower-buds and their stalks, or, properly speaking, the inflorescence of the plant deformed by cultivation, and forming a head or compact mass generally of a white color. There are many subvarieties, but all of them are rather more tender than the ordinary forms of the species, and in Britain generally require more or less protection during winter, whilst the seed is sown on hotbeds, that the plants may be ready for planting out in spring. Later sowings are made in the open ground. The C. requires a moist rich loamy soil, with abundance of manure, and above all, very careful cultivation, which is directed to the object of having the heads not merely large, but as compact of possible. Great care is bestowed on the selection of proper plants for seed. In Scotland, C. plants almost always require the protection of the frame during winter. C. may be preserved for some time fit for use by pulling the plant up by the roots, and hanging it in a cold and dry place.—**BROCCOLI** (q. v.) may be regarded as another kind of cauliflower.

CAULKING is the operation of driving oakum or untwisted rope into the seams of a ship, to render them water-tight. The quantity thus driven in depends on the thickness of the planking; it varies from 1 to 13 double threads of oakum, with 1 or 2 single threads of spun-yarn. The caulker first *raims* or *reems* the seam—that is, drives a caulking iron into it, to widen the seam as much as possible, and close any rents or fissures in the wood; he then drives in a little spun-yarn or white oakum with a mallet and a kind of chisel, and afterwards a much larger quantity of black or coarse oakum. The fibers are driven in until they form a densely hard mass, which not only keeps out water, but strengthens the planking. The seam is finally coated with hot pitch or resin.

CAULONIA, an ancient Greek city in Italy near the gulf of Syllacium. It was a town of importance five centuries before Christ. In 389 B. C. it was captured by Dionysius the elder who removed its people to Syracuse. Porphyry asserts that Pythagoras sought refuge in Caulonia after his expulsion from Crotona.

CAULOP'TERIS, a generic name for the stems of fossil tree-ferns found in the carboniferous and triassic measures. They are hollow, and covered with the markings similar to the leaf-scars on recent tree-ferns. Twelve species have been described.

CAUS, or **CAULX**, **SALOMON DE**, 1576-1630: a French engineer and physicist who resided in England and in Heidelberg, and later in Paris. Little was known of him until Arago exhumed his works, from which he considered him to have been the real inventor of the steam engine, for in one of these works he gave the plan of an apparatus for raising water by the power of steam. Some critics believe that it was from Caus that the marquis of Worcester got the idea, printed in his *Century of Inventions* in 1633, of the "exact and true deposition of the most stupendous water-commanding engine, invented by the right honorable Edward Somerset, lord marquis of Worcester."

CAUSE. The words "Cause," "Causality," and "Causation," although familiar and intelligible in ordinary speech, have given rise to some of the most subtle questions in philosophy and theology. We shall here advert briefly to the chief meanings of these terms, and in so doing, we shall indicate the disputes that have arisen in connection with them.

In common language, we are accustomed to describe as the C. of an event, the one event immediately preceding it, and but for which it would not have happened. A man slips his foot on a ladder, falls, and is killed: we give the slipping of the foot as the C. of the fatality. A legislative assembly decides a question of great moment by the casting vote of the president, who is then not unfrequently spoken of as the C. of all the good or evil that followed on the decision. Now, a slight examination shows that this mode of speaking is defective, as not expressing the whole fact, or, in other words, presumes a great deal that is not stated. In the supposed death from a fall, there are many conditions necessary to the result besides the slipping of the foot: the weight of the body, the height of the position, the hardness of the ground, the fragility of the human frame, all enter into the C. strictly represented; but for practical purposes, we leave out of account all those elements that are not at the moment under our control, and allude to the one that is so. And when we speak of the decision of an assembly being the effect of the president's vote, we mean that his share in the responsibility is peculiarly great, or that, in order to turn the vote in one way, all that is necessary is to secure his individual opinion. If we do not enumerate all the conditions of the event, it is because some of them will, in most cases, be understood without being expressed, or because, for the purpose in view, they may without detriment be overlooked.

When, however, we aim at strict accuracy, as in the investigations of science, we must not be content with singling out the one turning event, but must enumerate everything that is necessary to the result. A *scientific C.* is the full assemblage of *conditions*, failing any one of which, the effect would not happen. In a full explanation of the phenomenon of the tides, we must enumerate all the circumstances connected with their production—the attraction of the sun and moon, the motions of the earth and the moon in their orbits, the globular form and rotation of the earth, the liquidity of the sea, the mode of distribution of the sea over the earth—every one of which facts is an essential in the full causation. The effect cannot be adequately accounted for without adverting to every one of those conditions, and it is therefore the sum-total of them that is rightly described as the C. of the tides. Taking this complete view of causation, it is found that every event that happens is the sequel to some previous event, in whose absence it would not have been, but which being present it is sure to occur. Between the phenomena existing at any instant, and the phenomena existing at the succeeding instant, there is an invariable order of succession; to certain facts, certain facts always do, and, as we believe, will continue to succeed. The invariable antecedent is termed the C.; the invariable consequent, the effect. What is termed the *law of universal causation*, consists in this, "that every consequent is connected in the manner now described with some particular antecedent, or set of antecedents."—Mill's *Logic*, book iii. chap. 5.

The physical philosopher—the chemist or physiologist—trusts to the uniformity with which the same C. yields the same effect; and if he can find out the true succession in one instance, he is satisfied that the same succession will always hold. In the physical sciences, therefore, there is no dispute as to the law of causation itself; the controversies on that head occur only in *metaphysics*. It is made a serious problem by mental philosophers, and also by theologians, to determine how we come by the irresistible belief that we are said to possess, that every event has and must have a cause. There are many answers to this question: eight are enumerated by sir William Hamilton (*Discussions on Philosophy*, p. 611, 2d edit.). It is only necessary, however, to advert to the two radically opposite points of view from which the subject is now surveyed.

The one view is, that we have an instinct or *intuition* of the mind by which we are compelled to recognize this law, so that to us it is a necessary truth, which we cannot escape from if we would. Our experience of the outer world, doubtless, shows us that things follow one another in an orderly and uniform manner, that the stone that sinks in water to-day does not float to-morrow, but no experience could give us the sense of commanding necessity that we have of the law of C. and effect. "Causation is not the mere invariable association of antecedent and consequent; we *feel* that it implies

something more than this." The philosophers who maintain this side give forth two different affirmations; the *one*, that we actually possess an intuitive belief of necessary causation; the *other*, that our possession of the belief is a sufficient proof that the law actually pervades the universe. Experience operates to confirm us in those instinctive tendencies, but no amount of experience would have been able to create them.

The latest modification of the theory that ascribes our belief in causation to an intuition of the mind, is the doctrine promulgated by sir W. Hamilton, to the effect that "we are unable to think that the quantity of existence, of which the universe is the conceived sum, can be either amplified or diminished. We are able to conceive, indeed, the creation of a world; this, in fact, as easily as the creation of an atom. But what is our thought of creation? It is not a thought of the mere springing of nothing into something. On the contrary, creation is conceived, and is by us conceivable, only as the evolution of existence from possibility into actuality, by the fiat of the Deity. And what is true of our concept of creation, holds of our concept of annihilation. We can think no real annihilation—no absolute sinking of something into nothing."—*Discussions*, p. 619. Thus, every effect must have a C., and every C. must have its effect, because, if it were not so, there would be either a pure creation or a pure annihilation, neither of which, according to sir W. Hamilton, is thinkable or conceivable by the human mind. This doctrine, however, has not found acceptance even by those who, if not actual disciples of the author, are most disposed to receive his philosophy generally, as may be seen by referring to prof. Fraser's *Essays in Philosophy*, p. 170; M'Cosh *On the Divine Government*, p. 529, 4th edition; and Mansel, art. metaphysics, *Encyclopædia Britannica*. So far from the creation or annihilation of matter or force being inconceivable, it may be said with truth that until the end of last century it was not known as a fact that the materials of the globe are absolutely indestructible. The effects of combustion and evaporation could hardly suggest anything else than the annihilation of a certain portion of material. Combustion merely transformed the material consumed into other shapes, nothing being absolutely lost. So much for ponderable matter. As regards force, or moving power, the demonstration that this is never absolutely lost, even on the many occasions when it is so to all appearance, is a still later result of laborious scientific inquiries, being, in fact, one of the conclusions arrived at within the last few years. See FORCE. To represent, therefore, one of the latest achievements of experimental science as a primitive intuition of the human mind, is to violate, in the strongest manner, our sense of propriety and consistency.

As opposed to the intuitional doctrine of causation, we have a variety of views by Hume, Dr. Thomas Brown, and others, which need not be specified in detail. One may be given as an example. It has been seen that there are two affirmations in the theory just discussed; that the mind possesses an intuitive belief of causation, and that the possession of this belief is evidence of the existence of the law. Now, one or both of these affirmations may be denied; and the *denial* of either, by even a small minority of the human race, is held to be fatal to the theory, because *unanimity* is essential to the establishment of a universal instinct. Now, many men may possess an instinctive belief in the necessity of a cause to all effects, and of an effect to all causes; some, it is affirmed, do not; it cannot, therefore, be a universal or essential part of human nature.

In like manner, the second affirmation—namely, that the possession of an instinctive belief is a proof of the truth of the thing believed—is denied, on the ground that our instincts often dispose us to believe things that experience shows to be untrue. We have a strong natural tendency to believe in the universality and continuance of the exact order of things that we are ourselves born into, and are only put right by seeing the contrary. "A mere disposition to believe, even if supposed instinctive, is no guarantee for the truth of the thing believed. If, indeed, the belief ever amounted to an irresistible necessity, there would be then no *use* in appealing from it, because there would be no possibility of altering it. But even then the truth of the belief would not follow: it would only follow that mankind were under a permanent necessity of believing what might possibly not be true; just as they were under a temporary necessity—quite as irresistible while it lasted—of believing that the heavens moved, and the earth stood still. But, in fact, there is no such permanent necessity. Many of the propositions of which this is most confidently stated, great numbers of human beings have disbelieved. The things which it has been supposed that nobody could possibly help believing, are innumerable; but no two generations would make out the same catalogue of them."—*Mill's Logic*, book iii. chap. 21. Mr. Mill and others hold that the proof of the law of causation rests exclusively on the uniform and growing experience of the human race. This, however, is not inconsistent with our possessing the natural instinct above alluded to, by which we are led to suppose that what is will continue, and what has been will be repeated; an instinct that *coincides*, to a certain extent, with the law of C. and effect, and is therefore a predisposition on our part to accept what experience teaches on this head. It is only maintained that the instinct is of itself *no proof*, although useful in so far as it prepares us for what there is real evidence for believing. By yielding to the instinct in its crudest shape, the inhabitant of the tropics scouts the idea that water can ever be solid; the African would deny the existence of white men; and even an intelligent European could not be persuaded that any metal would float. Experience must correct the instinctive tend-

encies, otherwise no reliance can ever be placed upon them; by which we acknowledge it as the sole test of truth, while intuitive dispositions are no test whatever

Even those who maintain the instinctive necessity of the conviction we are discussing, admit two great exceptions—viz., the existence of a FIRST C., itself uncaused, and the liberty of the will, or the exemption of human actions from the rule that applies so strictly to physical nature.

It is further contested between the two opposite schools of philosophy, whether or not MIND be the sole ultimate C. of all phenomena, as it is the C. most familiar to us—namely, the source of our voluntary exertions. On one side, it is affirmed to be “inconceivable that dead force could continue unsupported for a moment beyond its creation. We cannot even conceive of change or phenomena without the energy of a mind.” “The word action has no real significance, except when applied to the doings of an intelligent agent.” “Phenomena may have the semblance of being produced by physical causes, but they are in reality produced by the immediate agency of a mind; if they do not proceed from the human, they are the result of the divine will.” To this it is replied, that we are here taking for granted that every kind of power is analogous to that which we happen to be first acquainted with; but it is a pure assumption without proof or relevance, to suppose that all modes of energy must conform to this one type. Mill, book iii. chap. 5. It is further pointed out that even in ourselves, pure mind, or mind acting by itself, is not known to be an efficient C.; it must be mind together with body. The laborer cannot sustain a day’s toil merely because of his *wish* to do so; he must be fed, and rested, and have all his bodily organs in good condition, in order to do his work. The human system, when employed as a prime mover, can no more dispense with the material conditions, than a steam-engine can work without coal, or when out of repair.—Bain *On the Emotions and the Will*, p. 472.

The subject of causation was very particularly studied by Aristotle. He enumerated four different kinds of causes, which have ever since had a place in philosophy. These are the *material*, the *formal*, the *efficient*, and the *final*. The first, or *material*, is what anything is made of; brass or marble is the material C. of a statue. The *formal* is the form, type, or pattern according to which anything is made; the drawings of the architect would be the formal C. of a house. The *efficient* is the power acting to produce the work, the manual energy and skill of the workmen, or the mechanical prime mover, whether that be human or any other. The *final* C. is the end or motive on whose account the work is produced, the subsistence, profit, or pleasure of the workman. Aristotle mentions the case of a physician curing himself, as exemplifying all the causes in one and the same subject. It is obvious that these are what we should now term the aggregate of *conditions* necessary to the production of any work of man; it being essential that there should be a motive for the work (final), a material to operate upon (material), a plan to proceed by (formal), and an exertion of energy to do what is wanted (efficient). When nature is viewed as the result of a creative mind, these causes are considered as inhering in the Divine contriver.

In popular language, C. is held as identical with *explanation*. In other words, when a phenomenon which we are puzzled to account for is explained to our satisfaction, we say that we know its cause, but we often seek for, and are satisfied with, explanations that have no value in the view of science; and on the other hand, refuse to rest content with such as are scientifically valid. People occasionally insist on knowing the C. of gravity itself, something deeper than the discovery of Newton, and whatever explanation satisfies the mind, would be accepted as the cause. Sometimes a theological explanation is offered, and at other times, a metaphysical necessity is put forth.

CAUSTIC (Gr. burning), in medicine and in chemistry, is the term applied to such substances as exert a corroding or disintegrating action on the skin and flesh. *Lunar C.* is nitrate of silver, and *common C.* is potash. When used as a C. in medicine, the substance is fused and cast into molds, which yield the C. in small sticks the thickness of an ordinary lead pencil, or rather less.—C. is also used in chemistry in an adjective sense—thus C. lime, or pure lime (CaO), as distinguished from mild lime, or the carbonate of lime (CaO, CO₂), C. magnesia (MgO), and mild magnesia (MgO, CO₂), etc.

CAUSTIC, CATACAUSTIC, and DIACAUSTIC. In optics, C. is the name given to the curved line formed by the ultimate intersections of a system of rays reflected or refracted from a reflecting or refracting surface, when the reflection or refraction is inaccurate. When the C. curve is formed by reflection, it is called the catacaustic—sometimes simply the C.; when formed by refraction, it is called the diacaustic curve. In mathematical language, a curve formed by the ultimate intersections of a system of lines drawn according to a given law is called the *envelope*, and is such that the lines are all tangents to it. As in a system of rays reflected or refracted by the same surface *all* follow the same law, it follows that the C. is the envelope of reflected or refracted rays.

An example of the catacaustic is given in the annexed figure for the case of rays falling directly on a concave spherical mirror, BAB', from a point so distant as to be practically parallel. The curve may be said to be made up of an infinite number of points, such as C, where two very near rays, such as P, Q, intersect after reflection. This catacaustic is an epicycloid. The curve varies, of course, with the nature of the

reflecting surface. In the case represented in the figure, the cusp point is at F, the principal focus. No such simple example can be given of the diacaustic curve as that

above given of the catacaustic. It is only in the simplest cases that the curve takes a recognizable form. In the case of refraction at a plane surface, it is shown that the diacaustic curve is the evolute either of the hyperbola or ellipse, according as the refractive index of the medium is greater or less than unity.

The reader may see a catacaustic on the surface of tea in a tea-cup about half full, by holding the circular rim to the sun's light. The space within the caustic curve is all brighter than that without, as it clearly should be, as *all* the light reflected affects that space, while no point without the curve is affected by more than the light reflected from half of the surface.

CAUTERETS', a watering place in Hautes-Pyrénées, France, 26 m. from Tarbes. It is in a basin 3,254 ft. above tide, and is noted for its many hot sulphur springs ranging from 102° to 140° F. Pop. 1300.

CAUTERY. See BLEEDING, and MOXA, *ante*.

CAUTION, in the law of Scotland, like guaranty (q.v.) in England, is an obligation undertaken by a second party, whereby he binds himself, failing the primary obligant, to fulfill his obligation, whether it be of a pecuniary nature or otherwise. Cautionary obligations, like engagements of guaranty, are thus essentially of a secondary nature; and, previous to the passing of the mercantile law amendment act (19 and 20 Vict. c. 60), it was customary in Scotland to distinguish between what was called *cautionary proper*, where the cautioner was bound avowedly as such, and *improper cautionary*, where both cautioner and principal were bound as principals. Since this period (1856), however, cautionary proper has ceased to exist otherwise than as the result of positive stipulation, under the saving clause attached to the eighth section of the statute referred to, which enacts that "nothing herein contained shall prevent any cautioner from stipulating, in the instrument of C., that the creditor shall be bound, before proceeding against him, to discuss and do diligence against the principal debtor." Cautionary obligations are generally gratuitous, being, for the most part, undertaken from motives of friendship; but it is by no means uncommon for them to be entered into in consideration of a premium paid by the person guaranteed, or by those interested in his fortunes. The existence of such a consideration has always been optional in Scotland, and this rule has recently been adopted in England (19 and 20 Vict. c. 97, § 3). Where a premium is paid, the transaction becomes a mere insurance of solvency, honesty, or efficiency; and associations of great public utility (see GUARANTEE ASSOCIATION) have been formed, both in England and Scotland, for the purpose of undertaking, as a speculation, to guarantee the good conduct of persons employed either in public or private offices of trust. The tendency of judicial decisions, both in England and Scotland, for many years past, has been to require greater strictness than formerly in the constitution of cautionary obligations; and latterly, the legislature itself has stepped in with the same object in view. By the statute which we have already quoted, it is enacted that all such engagements shall be in writing, subscribed by the person undertaking or making them, or by some person duly authorized by him, otherwise they shall have no effect. If a cautionary obligation is dependent on a condition, it will, of course, be ineffectual unless the condition be complied with. The cautioner may, in general, plead every defence which was competent to the principal debtor, and the extinction of the primary obligation extinguishes the secondary one. The discharge of one cautioner, moreover, unless consented to by the rest, is a discharge to all. Cautioners bound subsequent to the passing of the act mentioned, have, in consequence of the eighth section already referred to, no right to what in Scotland was called *discussion* (q.v.); but those bound prior to that act are entitled, as formerly, to require that the creditor shall first call on the principal debtor, and compel him to pay in so far as he is able, or in law language, *discuss* him. The cautioner is entitled, on payment of the obligation, to an assignation of the debt and diligence, by which means he comes, in all respects, into the creditor's place; and, moreover, if the solvency or other conditions of the principal debtor should seem precarious, he may adopt legal measures for his relief. Co-cautioners, or persons bound together, whether their obligations be embodied in one or several deeds, are entitled to mutual relief. But, where a co-cautioner obtains relief from the others, he must communicate to them the benefit of any deduction or ease which may have been allowed him in paying the debt.

Cautionary obligations are often undertaken in behalf of persons in situations in which the engagements and liabilities are prospective. In order that such obligations may be binding, the nature and extent of the liability must be fairly and fully disclosed to the cautioner. But while the cautioner must not be exposed to the danger arising from any transaction not in his view in entering into the contract, he is not entitled to withdraw without due notice and a reasonable time being given for entering into a new arrangement. The question whether the effects of a bond are prospective, or retrospec-

tive merely, will depend on its terms; the *presumption*, where these are in any way doubtful, being always in favor of the latter alternative. The creditor is bound to exercise a certain degree of vigilance over the conduct and circumstances of the person guaranteed, and not to permit any very gross departure from the terms of the contract, to the prejudice of the cautioner. Should this obligation be neglected, the cautioner will be freed from his obligation.

CAUTION, for a cash credit. See CASH ACCOUNT.

CAUTION, JUDICIAL, in the law of Scotland, is of two kinds—for appearance, and for payment. If a creditor makes oath before a magistrate, that he believes his debtor to be meditating flight (*in meditatione fuga*), he may obtain a warrant for his apprehension; and should he succeed in proving the alleged intention to flee, he may compel him to find C. to abide the judgment of a court (*judicio sisti*). The second kind of judicial C. is by *bond of presentation*, which is granted when the creditor is about to execute personal diligence, or has done so, and the cautioner, on condition of an indulgence to the debtor, binds himself that the debtor shall be forthcoming at the appointed time, otherwise he himself will pay the debt. The object of this form of C. is simply to protect the debtor from imprisonment, and allow him time.

CAUTION, JURATORY. See POOR'S ROLL, and 13 and 14 Vict. c. 36, § 34.

CAUVERIPURAM, a t. of the district of Coimbatore, in the presidency of Madras, on the right bank of the Cauvery, in lat. 11° 54' n., and long. 77° 48' east. It takes its name from the neighboring gorge of 30 m. in length through the eastern Ghauts, along which the Cauvery finds a passage. Pop. of C. (or *Kaveripuram*) in 1871, 6,532.

CAUVERY, or **KAVERI**, a river in the s. of Hindustan, rising in Curg, and flowing through Mysore and Madras, with a course of 472 m., into the bay of Bengal by various mouths. Its delta, with a coast of 80 m., and a depth of 70, lies almost wholly in the district of Tanjore. The C. is peculiarly available for irrigation; and for improving it in this respect, a grant of £50,000 was sanctioned in 1841. During the rainy season, the stream is navigable for small-craft.

CA'VA, LA, a t. of Italy, in the province of Salerno, 3½ m. n.w. of the town of Salerno. It is a flourishing place, with manufactures of silk, cotton, linen, and pottery. Pop. 6,397. About a mile from C. is the celebrated Benedictine monastery of the Trinity, with its magnificent archives, containing 60,000 MSS. and 40,000 parchment rolls. Its library, at one time also rich in MSS. and rare printed books, has been dispersed. In the monastery church are the tombs of queen Sibilla and of various anti-popes.

CAVAIGNAC, ELÉONORE LOUIS GODEFROY, 1801–45; a journalist of Paris, son of Jean Baptiste. He was an opponent of Louis Philippe and one of the prominent founders of the "Societe des Amis du Peuple," and of the "Societe des Droits de l'Homme." He was often arrested and sometimes imprisoned, but escaped in 1835 and went to Belgium. In 1841, he returned to Paris and became one of the editors of the *Reforme*, the ablest of the opposition newspapers.

CAVAIGNAC, LOUIS EUGÈNE, was b. in Paris, 1802, and was educated in the Polytechnic school, and the *Ecole d'Application* at Metz. He first served in the Morea, and afterwards in Africa (whither he was sent in 1832 into a kind of honorable exile, in consequence of a too free expression of opinion in favor of republican institutions), where he acquired great distinction by his energy, coolness, and intrepidity. He was made chef de bataillon in 1837, and rose to the rank of brigade-gen. in 1844. In 1848, he was appointed governor-general of Algeria, but in view of the impending revolutionary dangers, was called to Paris, he having also been elected as a delegate to the national assembly by the two departments of Lot and Seine. In the insurrection of June which followed, C., as minister of war, had a most difficult task to play, and he displayed, during the four days and nights of the contest, remarkable presence of mind, firmness, and activity. His plan of action appeared strange and almost traitorous at the time. In opposition to the wishes of the national assembly, who desired that the troops should be dispersed over Paris, he divided his men into three separate bodies, which had to clear their several routes from obstacles in order to effect a reunion, streets and even quarters of the city being left for some time without military protection. Regarding the outbreak more as the beginning of a civil war than a mere insurrection, he, in fact, met the insurgents in true order of battle. His operations were successful, and his clemency was as remarkable as his generalship. When he had the power of assuming the dictatorship, he resigned it into the hands of the national assembly, which appointed him president of the council. As a candidate for the presidency of the republic, when Louis Napoleon was elected, he received about a million and a half of votes. On the *coup d'état* of Dec., 1851, C. was arrested, but released after a short detention; and though he consistently refused to give in his adhesion to the empire, he was permitted to reside in France without molestation. He died very suddenly of heart disease in Oct., 1857, at his country-house near Tours, and was buried in the cemetery of Montmartre, Paris, in presence of many thousand spectators, including several republican leaders. In debates, C. was remarkably unlike his countrymen, being not voluble and declamatory, but sober, clear, and moderate.

CAVAILLON, a t. and important railway junction in Vaucluse, France, 13 m. s.e. of Avignon. It is a poorly built and dirty place, but has a fine town-house, an old church of the 12th c., and the remains of a triumphal arch of about the time of Constantine; other relics of the Roman period are found in the neighborhood. There is considerable trade in dried fruits, madder, and the agricultural productions of the fertile region around. Pop. '72, 3,906.

CAVALCANTI, GUIDO, d. about 1300; an Italian poet and philosopher, the son of the philosopher whom Dante pictured in torment among the Epicureans and Atheists—but himself a friend of the great poet. By marriage C. became the head of the Ghibellines, and, after some years, was banished with the other leaders, and died in exile. His poems are chiefly in honor of a French lady by him called Mandetta. He also wrote on philosophy and oratory.

CAVALIER, in fortification, is a defense-work constructed on the *terre-plein* or level ground of a bastion. It rises to a height varying from 8 to 12 ft. above the rampart, and has a parapet about 6 ft. high. Its uses are to command any rising ground held by the enemy, within cannon-shot; and to guard the curtain, or plain wall between two bastions, from being enfiladed. For these purposes, it mounts heavy ordnance. It may be either curved, or bounded by straight sides.

CAVALIER (Fr. *chevalier*; Ital. *cavaliere*; Span. *caballero*, probably from the Latin *caballus*, a horse), originally meant any horse-soldier, but in English history is the name given to the party which adhered to king Charles I., in opposition to the round-heads (q. v.) or friends of the parliament.

CAVALIER, JEAN, 1680-1740; a native of lower Languedoc, in southern France; the famous chief of the Camisards (who in some particulars seem to have been the precursors of the English and American shakers). He was a peasant's son, and was employed in sheep-keeping, afterwards as apprentice to a baker, and within that period trained by a pious Protestant mother. He was driven from his native place by the pitiless persecution of Protestants that followed upon the revocation of the edict of Nantes, and took refuge in Geneva. The murderous dragoonades of Louis XIV. drove the Protestants of the Cevennes at last to revolt, and C., inspired with the hope of being their deliverer, returned in 1702 to his own country, where he became one of the chosen leaders of the insurrection, which broke out in July of that year. It was Roland who was put in chief command, but C. soon rose to be his equal, and, though untrained in arms, he displayed not only fiery courage, but extraordinary military skill. Although these "children of God," as the insurgents were called, numbered at the most not more than 3,000 men-at-arms, they coped successfully again and again with the far greater forces of the king, and were never entirely conquered. After several conflicts, C. changed the seat of the war to the Vivarais; and Feb. 10, 1703, defeated the royal troops at Ardeche; but only a few days later he was completely defeated on the same ground, and was supposed to have fallen. He reappeared, however; was again defeated at Tour-de-Bellot; and again recovered himself, recruits gladly flocking to his standard to take the places of the slain. By a long series of successes he raised his reputation to the highest pitch, and gained the full confidence of the people. The harshest measures were tried in vain against the Camisards; their mountain retreat was invaded by the Roman Catholics, and their houses sacked and burned; but C. retaliated in kind, invaded the region of the plains, and even threatened the city of Nismes. April 16, 1704, he encountered marshal Montrevel at the bridge of Nages with 1000 men against 5,000, and, although defeated, managed to retreat with two thirds of his forces. Marshal Villiers was next sent against him, but proposed to negotiate instead of fighting. Roland refused to listen, but C. agreed to treat, and did so, the result being that C. received for himself a commission and a pension of 1200 livres, and for his brother a captain's commission. C. was authorized to raise a regiment of Camisards to be sent to Spain, and liberty was given to his father and other Protestant prisoners. This treaty, which did not include any provision for general liberty of conscience, excited great indignation among the companions of C., who called him coward and traitor, and deserted him. He was greatly disheartened at this treatment, and soon afterward visited the king in Paris, by whom he was coldly received. These disappointments and rebuffs, together with stories current of probable attempts upon his life, impelled him to leave France. He went to Switzerland, and then to Holland, where he married a daughter of Mme. Dionoyer, a lady of Nismes, who had once been sought in marriage by Voltaire. C. then went to England to recruit his regiment of Camisards, and had an interview with queen Anne, who sent him with his regiment to Spain under the earl of Peterborough and sir Cloudsley Shovel, in May, 1705. At the battle of Almanza his Camisards encountered a French regiment which they had met in the Cevennes, and, without firing, both bodies rushed upon each other in a fierce hand to hand fight, and made a fearful slaughter, C. being severely wounded, but saved from death by an English officer. Long after his return to England he was made a maj. gen., and governor of Jersey; and finally governor of the Isle of Wight. He died at Chelsea, where he was buried.

CAVALIER-MAGGIORE, a t. of n. Italy, in the province of Cuneo, 24 m. n.e. of Coni. It was formerly fortified and defended by two castles, but of these there is now hardly a vestige remaining. It is a busy place, with a pop. of 5,300.

CAVALLINI, PIETRO, 1259-1344; a Roman artist taught by Giotto, whom it is believed he assisted in the mosaic of the ship of St. Peter, in the porch of St. Peter's church. He was also an adept at painting, and his grand fresco of the crucifixion at Assisi is still in tolerable preservation.

CAVALRY is a general name for horse-soldiers or troopers. The subdivisions are very numerous; such as guards, dragoons, lancers, hussars, cuirassiers, mounted rifles, etc. The C. force of the British army is usually divided into *household* and *line*. The numbers voted for 1876-77 were:

	Household cavalry.	Line cavalry, home service.	Line cavalry in India.
Officers	81	558	234
Non-commissioned officers.	192	1,178	424
Rank and file	1,029	9,907	3,672
	<hr/> 1,202	<hr/> 11,643	<hr/> 4,330

The difference between the household C. and the line is this: The former belong to the *guards*, a specially favored body of troops; while the latter comprise all who are *not* guards. The regiments are 31 altogether. During more than half a century, the number was 26; but in 1853, two new regiments were created—to restore the 5th and 18th dragoons, which had been struck out of the army list in 1799 for disloyalty in the Irish rebellion; and in 1862, 3 regiments were taken over from the abolished local European army of India. The list comprises 2 regiments of life guards (red), 1 of horse guards (blue), 7 of dragoon guards, and 21 of dragoons. Of these last-named 21 regiments, the 1st, 2d, and 6th are simply called dragoons; the 5th, 9th, 12th, 16th, and 17th, lancers; the 3d, 4th, 7th, 8th, 10th, 11th, 13th, 14th, 15th, 18th, 19th, 20th, and 21st, hussars. A distinction is often made between *heavy* and *light* C.; and, in continental armies, this distinction is very marked; but in England, the men and horses are not selected with much reference to this matter; the heavy being often too light, and the light too heavy, to correspond with their designations. In so far as the distinction holds in the British army, the dragoon guards, horse guards, and life guards are classed and equipped as heavy C., the dragoons medium, and the lancers and hussars as light C., for scouring a country. It was in the capacity of light C. that the Prussian Uhlans played so important a part in the late war between Prussia and France, acting as wide-stretching feelers to the main bodies to which they were attached.

The line C. regiments in the British service have generally 8 troops of 55 rank and file each, with 88 commissioned and non-commissioned officers to the regiment. The officers for a full C. regiment comprise 1 col. (as general officer), 1 lieutenant-col., 1 maj., 8 capt., 18 subalterns and other commissioned officers, and 59 non-commissioned officers. A lieutenant-col. in the guards C. takes rank with a full col. in the line C.; and a maj. in the former with a lieutenant-col. in the latter—an arrangement that gives rise to some favoritism and jealousy; for the guards are in no sense more meritorious soldiers than the line.

Nine months of drilling is the least time requisite to make a recruit fit to mount on duty, during which period he is drilled for eight hours a day. Londoners and agricultural laborers are mostly sought for; provincial mechanics are not found so available. The purchase of C. horses is an important matter. The veterinary surgeon of the regiment is sent out to buy; but no horse is paid for till approved by the commanding officer. The usual maximum of price fixed is £33 for a horse 3 to 5 years old; but the horse costs the nation £50 or £60 pounds by the time it is thoroughly fit for service. See DRAGOONS, GUARDS, LANCERS, etc.

CAVALRY (*ante*). The earliest records of C. as a distinct military organization date far back in the history of Egypt. Diodorus of Sicily states that Osymandias, who lived long before the Trojan war, led 20,000 mounted men against the rebels in Bactriana. Josephus states that the host of Israelites which escaped from Egypt included 50,000 horsemen and 600 chariots of war. Herodotus often alludes to C.; and Xenophon relates that in the first Messenian war, 743 B.C., Lycergus formed his C. in divisions. In the year 371 B.C., Epaminondas had a C. force of 5,000 men, and we know that C. contributed greatly to the victories of Philip and Alexander of Macedon. It had an important part in the battle of the Granicus, 334 B.C.; and at the battle of Arbela, 331 B.C. Alexander, who led the Macedonian C. of 7,000 men, dashed into a gap of the Persian army, and by this brilliant feat utterly routed the enemy. After the death of Alexander, the C. of Greece and Macedon greatly degenerated. The Roman cavalry was very inferior to that of Hamilcar and Hannibal, and most of the victories of these two generals were won by cavalry over the splendid infantry of the Romans. Publius Scipio's defeat at the Ticinus, 218 B.C., was due to the superiority of the Carthaginian horse; and the bitter experience at the Trebia and the battle of Cannæ, 216 B.C., taught the Romans the value of cavalry, by which Scipio finally defeated Hannibal at Zama, 202 B.C. Vegetius states that the Roman C. was organized into ten troops or squadrons, forming a regiment of 726 horses, generally attached to some special legion. It is a singular fact that saddles were not in use until the time of Constantine, and stirrups were introduced by the Franks

in the 5th century. During the middle ages C. may be said to have constituted almost the only efficient arm of battle. This was owing to the unwillingness of the nobility in all countries of western Europe to intrust any military power to the serfs; the upper classes went into battle mounted, and both riders and horses had heavy defensive armor. The feudal cavalry consisted of mail-clad knights with their men-at-arms. Their weapons were lances, battle-axes, and swords. The infantry was looked down upon during the middle ages, being composed principally of serfs and such as had not the means to keep a horse; but with the invention of gunpowder, the introduction of muskets, and the use of field artillery, a complete change took place; the infantry gradually rose in reputation, and the number of this class of troops was augmented. It seems that light C. did not exist as a distinct body, with general officers and a staff, before the time of Louis XII. Montluc, however, mentions a general of 12,000 light horse in the time of that monarch; and we hear of Henry II. in 1552, taking a troop of 3,000 cavalry in his expedition to Germany. In 1554, marshal De Brissac formed a corps of mounted infantry, called dragoons, trained to fight either on horseback or on foot. Maurice of Nassau, who saw the importance of giving more mobility to this arm, was the first to organize cavalry regiments, each regiment being composed of four squadrons, formed in five ranks, and numbering about 1000 horses. Gustavus Adolphus was a great C. general, and used his cuirassiers and dragoons to good advantage. His tactics were much admired, and were adopted by many European nations. The French, especially, distinguished themselves after his death in the employment of C. Turenne, Condé, Montecuculi, and Marlborough were considered excellent C. leaders in the wars of Louis XIII. and Louis XIV. Cromwell was indebted to his abilities as a C. officer for the victories of Marston Moor and Naseby. Defensive armor for C. had been abolished in his time, and the C. troops were taught to use the carbine. Charges of cavalry were seldom made in battle except by the French; though Charles XII. always made use of cavalry charges at full speed with great effect. Marshal Saxe made many improvements in this arm, and used guns in connection with cavalry at the battle of Fontenoy, although regular horse artillery was not introduced till 1762. It was not until the wars of Frederick the great, however, that the full importance of cavalry was developed; he saw the necessity of training these troops to use swords instead of fire-arms, and endeavored to make them perfect riders. No firing whatever was allowed in the battle during the first charge; he claimed that the only two things required to beat the enemy were to charge him with the greatest possible speed and force, and then to outflank him. The brilliant victories he obtained from the adoption of these tactics under the able leadership of Seydlitz have probably never been excelled. At the battle of Hohenfriedberg the Prussian cavalry of 10 squadrons broke 21 battalions, routed the entire left wing of the Austrian infantry, and captured 66 standards, 5 guns, and 4,000 prisoners. At the battle of Zorndorf, after the Russians had compelled the Prussian infantry to retreat, Seydlitz with 36 squadrons rode down the Russian cavalry, and then completely routed their infantry. Frederick had learned to appreciate the true principles of mounted warfare through long experience and the occasional disasters which he had met in the first and second Silesian wars; and it was due to the efficient reforms which he instituted in the Prussian cavalry that he was able to win the battles of Rossbach, Striegan, Kesselsdorf, Leutheu, and others. One of the first improvements made in the French army by Napoleon was the reorganization of the cavalry. He increased the cuirassiers from one regiment to twelve, and reintroduced the use of the lance and defensive armor. Some of his splendid victories were due to this force, especially at Marengo and Austerlitz; and it was owing to the loss of the French cavalry in the Russian campaign of 1812 that some of his finest achievements in 1813 proved useless: he was well aware of this, and made the statement that had he possessed cavalry at the battles of Lutzen and Bautzen the war would then have been brought to an end. In modern warfare it may be mentioned that cavalry was conspicuous at the battle of Solferino; but in 1866, the first great European war since Waterloo, neither the Austrian nor the Prussian cavalry won great distinction, although the manner in which the Austrian cavalry covered the retreat of their army at the battle of Königgrätz was a noble example of courage and devotion. In the Franco-German war of 1870, however, the excellency of the Prussian cavalry was the chief means of Von Moltke's ability to carry out his strategic plans. The French cavalry were more remarkable for bravery than efficiency. Great progress was made in the C. of the United States during the war of the rebellion; a large number of men of both armies were good riders, and understood the management of horses. They were at first, however, quite ignorant of military tactics, and were used as scouts, as orderlies, and for outpost service. Gen. Sheridan, acting under instructions from gen. Grant, made the first successful organization of C., which was called the cavalry corps of the army of the Potomac, comprising three divisions of 5,000 mounted men each. Their weapons were repeating carbines and sabers. It was with this force that gen. Sheridan defeated the confederate C. at Yellow Tavern, near Richmond; and it contributed largely to the defeat of Early at the battle of the Opequan, near Winchester; and later, at the battles near Petersburg and at Five Forks, the C. took an important part. Gen. Wilson, whom gen. Sherman put in command of a force called the C. corps of the military division of the Mississippi, did good work in the way of organization towards the close of the war; he had 12,000 mounted

C. and 3,000 who fought on foot at the battle of Nashville, not including a detachment of 3,000 men in Kentucky.

Our C. system is similar to that of European countries; a regiment consists of 10 companies of 64 men each; 2 companies form a squadron; they are armed with sabers, pistols, and carbines. According to the army regulations, the C. in battle should be distributed in echelon on the wings and at the center, on favorable grounds; it should be instructed not to take the gallop until within charging distance; never to receive a charge at a halt, but to meet it; or, if not strong enough, to retire maneuvering; and in order to be ready for the pursuit, and prepared against a reverse, or the attacks of the reserve, not to engage all its squadrons at once, but to reserve one third, in column or in echelon, abreast of or in the rear of one of the wings; this arrangement is better than a second line with intervals. When the regular army, pursuant to the act of congress of Aug. 15, 1876, was reduced to a maximum of 25,000 men, the United States C., consisting of 10 regiments, with 439 officers and 7,911 enlisted men, was left intact.

CAVALRY TACTICS. Authorities differ concerning the proportion that ought to be observed between cavalry and infantry in an army. In France and Austria, the ratio is about 1 to 5; in Prussia and Bavaria, 1 to 4; in Russia, 1 to 6; in England, 1 to 8.

So far as concerns actual duties, heavy cavalry charge the enemy's cavalry and infantry, attack the guns, and cover a retreat; while the light cavalry make reconnaissances, carry dispatches and messages, maintain outposts, supply pickets, scour the country for forage, aid the commissariat, pursue the enemy, and strive to screen the movements of the infantry by their rapid maneuvers on the front and flanks of their army. At the battle of Balaklava, the heavy cavalry charge was within the reasonable duties of the troops, but that of the light cavalry was not; the former succeeded, the latter failed. A cavalry horse will walk 4 m. in an hour on general service, trot 8 m. in maneuvering, and gallop 11 m. in making a charge. The cavalry usually attack in line against cavalry, *en echelon* against artillery, and in column against infantry. When an attack is about to be made, the cavalry usually group into three bodies—the attacking, the supporting, and the reserve. Close combat and hand-to-hand struggle are the province of cavalry; infantry and artillery may fight at a distance, but cavalry cannot. It is rare that two bodies of cavalry stand to fight each other; the weaker of the two, or the less resolute, usually turns and gallops off. The work to be done by the horse is to pursue, to overwhelm, to cut down. They cannot wait to receive an attack like infantry; they must either pursue or retreat; and on this account it has been said, "rest is incompatible with cavalry." The infantry and artillery more frequently win the victory; but the cavalry prepare the way for doing this, capture prisoners and trophies, pursue the flying enemy, rapidly succor a menaced point, and cover the retreat of infantry and artillery, if retreat be necessary. Cavalry is necessary to finish off work mainly done by others; and, without its aid, signal success is seldom obtained on the field. Many of the brilliant achievements of the British in 1857 and the following year, in India, were rendered almost nugatory by the paucity of cavalry, while, as a contrast, the German victories of 1870 were enhanced by the splendid services of their uhlands and other light cavalry.

CAVAN, an inland co. in the s. of Ulster, Ireland. It lies in the narrowest part of Ireland, 18 m. from the Atlantic, and 20 from the Irish sea. Area, 746 sq. m. About three fourths is arable. Bogs and hills, with many small lakes, are found in the n.w. The chief rivers are the Erne, the Woodford, and the Annalee. The e. half of C. rests on clay-slate and grauwacke; the mountain-district in the w. is carboniferous formation. Of minerals, C. affords coal, iron, lead, and copper, with many mineral springs. The climate is cold and damp; and the soil is poor, wet, and clayey, except along the streams. In 1878, of 466,261 acres, 153,114 were in crop, the chief crops being oats, potatoes, turnips, and flax. The farms are small. The population, which had fallen to 153,906 in 1861, was in 1871 only 140,735, of whom 113,174 are Roman Catholics, 21,223 Episcopalians, and the rest of other denominations. Agriculture forms the chief industry, but linen is manufactured to a considerable extent. Chief towns—Cavan, Bailieborough, and Belturbet. C. returns two members to parliament. The number of children attending school in the year ending March 31, 1876, was 31,368.

CAVAN, the capital of Cavan co., Ireland, is situated on a branch of the Annalee, 70 m. n.w. of Dublin, with which it is connected by the Irish N. W. railway. The suburbs are chiefly wretched cabins. The principal buildings are in the w. outskirts. The public garden was bequeathed by a late lady Farnham, and the beautiful demesne of lord Farnham lies between C. and Lough Oughter, which is about 5 m. west. Pop. '71, 3,389. Agriculture forms the chief industry of the people.

CAVARZE, a t. of Northern Italy, province of Venice, 22 m. s.s.w. of Venice city. Pop. 12,400. It is situated on the Adige, which divides it into two parts called C. *destro* and C. *sinistro*. Its soil is fertile, and its inhabitants carry on an active trade in cattle, silk, and wood for fuel.

CAVATINA, a short form of operatic air, of a soft character, differing from the ordinary aria in consisting only of one part, and that spun out more in the form of a song. Modern composers have, however, disregarded this difference. Rossini mixes both.

Weber, in his operas, adds an introduction or a recitative. The most perfect specimen of the C. is that in Meyerbeer's opera of *Robert the Devil*.

CAVE, EDWARD, deserves mention as the founder of the *Gentleman's Magazine*, the first literary journal of the kind ever established. He was b. at Newton, in Warwickshire, in 1691; obtained a good education at Rugby; and, after many vicissitudes, became apprentice to a printer. Obtaining money enough to set up a small printing-office, he projected the *Gentleman's Magazine*, which has now existed more than a century and a quarter. He was the friend and early patron of Samuel Johnson. C. died Jan., 1754.

CAVE, WILLIAM, an English divine and scholar of distinction, was b. at Pickwell, Leicestershire, Dec., 1637. He studied at Cambridge; was appointed to the vicarage of Ilington in 1662; afterwards to the rectory of Allhallows the Great, London; and in 1690 to the vicarage of Isleworth, Middlesex. He d. at Windsor, Aug. 4, 1713. He was the author of many works of a religious character, the most important of which are the *Lives of the Apostles*; *Lives of the Fathers*; and *Primitive Christianity*, which were once standard works.

CAVEAT (Lat. *caveo*, to beware), a judicial warning or caution. Caveats, in England, are used to stop the enrollment of decrees in chancery, the issuing of lunacy commissions, etc. It consists in an intimation by the party interested to the proper officer, to prevent him from taking any step without such intimation being made to the said party as shall enable him to appear and object.

CAVEAT EMPTOR, notice to a purchaser of property to beware or be watchful of his rights. In a sale of real estate the rights of the purchaser depend entirely upon the covenants of title which he receives; but personal property the purchaser takes at his own risk, unless the seller gives an express warranty, or the law should imply such warranty from the circumstance of the case and the nature of the thing sold, or unless the seller should be guilty of fraudulent misrepresentation or concealment in respect to a material inducement to the sale.

CAVEAU, a convivial and literary association in Paris, so called from meeting in a cavern known as "the cave." It was started in 1728, and continued about ten years. Dinners were given on the first Sunday in each month, which were attended by Helvetius, Crebillon, and other celebrities. The Caveau Moderne was started in 1806, and had dinner on the 20th of each month at the Rocher de Cancale. The association declined, but was reorganized in 1834, and in 1866 Jules Janin was received as a member. The meetings are now more formal and academical than convivial.

CAVEDO'NE, JACOPO, 1577-1660; an Italian painter, educated in the school of Caracci, and workman under them in the churches of Bologna. His chief productions are "The Adoration of the Magi;" "The Four Doctors;" "The Last Supper;" and especially "The Virgin and Child in Glory," now in the Bolognese academy. He was at one time an assistant to Guido, in Rome. In his declining years he was broken down by the loss of a favorite son, and finally died in extreme poverty in a stable at Bologna.

CAVELIER, PIERRE JULES, b. 1814; a French sculptor, who studied under David d'Angers and Delaroche. He first gained celebrity about 1842 by a statue of "Penelope," for which he received the medal of honor and three years' pension. A few years later he became a member of the institute. Among his other works are "Truth," in the Louvre, a statue of Abelard, and busts of Napoleon, Ary Schaffer, and Horace Vernet.

CAVENDISH, HENRY, a distinguished philosopher of the 18th c., son of lord Charles Cavendish, and nephew of the third duke of Devonshire, was born at Nice, Oct. 10, 1731. He studied at Cambridge, and devoted his whole life to scientific investigations. The large fortune which was bequeathed to him by an uncle, enabled him to follow uninterruptedly his favorite pursuits. He almost secluded himself from the world, and was so averse to meet with strangers, that he had his library—a magnificent one—built at a distance from his house, so that he might not encounter persons coming to consult it; and his female domestic servants had orders to keep out of his sight, on pain of dismissal. His dinner he ordered daily by a note placed on the hall-table. He died, unmarried, Feb., 1810, leaving considerably more than a million sterling to his relatives. As a philosopher, C. is entitled to the highest rank. To him it may almost be said we owe the foundation of pneumatic chemistry, for prior to his time it had hardly an existence. In 1760, he discovered the extreme levity of inflammable air, now known as hydrogen gas—a discovery which led to balloon experiments, and projects for aerial navigation; and later, he ascertained that water resulted from the union of two gases—a discovery, however, to which Watt (q.v.) is supposed to have an equal claim. The accuracy and completeness of C.'s processes are remarkable. So high an authority as sir Humphry Davy declared, that they "were all of a finished nature, and though many of them were performed in the very infancy of chemical science, yet their accuracy and their beauty have remained unimpaired amidst the progress of discovery." C. also wrote papers on electricity, astronomical instruments, etc.

CAVENDISH, MARGARET, Duchess of Newcastle, second wife of WILLIAM, b. about the end of the reign of James I., is perhaps one of the most remarkable instances on

record of a person afflicted with the *cacoëthes scribendi*, who had no capacity whatever for writing. She produced no less than 13 folio volumes, 10 of which were printed, treating, indifferently, on all subjects in prose and poetry, and careless in all, both as to grammar and style. Her mania for scribbling kept up her maids at night, so that, if she chanced to wake with anything on her mind, they might be ready to note it down at once. The duchess was relieved, but a dead-weight fell upon the field of literature. She died in 1673.

CAVENDISH, THOMAS, 1560-92; the third circumnavigator of the globe. He studied for a brief period at Cambridge, but left without a degree, followed the court, and soon squandered his inheritance, to repair which he turned to maritime adventure, and fitted out a ship that accompanied sir Richard Grenville's expedition to Virginia in 1585. In July, 1586, he sailed from Plymouth with three vessels on a predatory expedition, passed through the straits of Magellan, cruised along the west coast of South America and Mexico, and burned or sunk 19 vessels, among which was the *Santa Anna*, belonging to the king of Spain, and having an immensely valuable cargo, which he seized off California. He returned to Plymouth Sept. 9, 1588, with his plunder, having gone around the globe in 2 years and 50 days. When he came home it was said that his seamen were clothed in silk, his sails were of damask, and his topmast was covered with cloth of gold. Within three years he wasted his wealth, and was under the necessity of making another voyage, which was disastrous, his crew rebelling after leaving the straits of Magellan and compelling him to return to England. This so dispirited him that he died on the voyage.

CAVENDISH, Sir WILLIAM, 1505-57; brought up in the family of cardinal Wolsey, whom he served as gentleman-usher of the chamber. He was present at the death of the cardinal, and delayed his attendance at court to see the remains of his patron properly cared for. The act so pleased Henry VIII. that he made Cavendish a member of his household, treasurer of his chamber, and a privy councillor, subsequently adding the dignity of knighthood. He filled other offices, and obtained grants of valuable lordships in Hertfordshire. His great property became the foundation of the immense estates of the dukes of Devonshire. He seems to have retained favor through the reigns of Edward VI. and Mary. He was the author of *The Life and Death of Cardinal Wolsey*.

CAVENDISH, WILLIAM, duke of Newcastle, a distinguished loyalist of the 17th e., son of sir Charles Cavendish, younger brother of the first earl of Devonshire, was b. 1592. His learning and winning address made him a favorite at the court of James I., who, in 1610, made him a knight of the Bath. Other honors rapidly succeeded. In 1620, he was made a peer of the realm. Charles I., about 1628, gave him the title of earl of Newcastle-upon-Tyne, and in 1638 intrusted him with the tuition of his son, afterwards Charles II. His support of the king during the contest with the parliamentary forces was munificent. He contributed £10,000 to the treasury, and raised a troop of 200 knights and gentlemen, who served at their own cost. As general of all the forces raised n. of the Trent, he had power to issue declarations, confer knighthood, coin money, and raise men; and the last part of his commission he executed with great zeal. The banquets C. gave to the king when he went n. were magnificent enough to find record in history; one of them cost no less than £15,000, even in those days when money was more valuable than it now is. After the battle of Marston Moor, C. retired to the continent, where he resided, at times in great poverty, until the Restoration. On his return, he was created duke of Newcastle. He died Dec. 25, 1676. On the continent, he devoted himself to literature, and wrote a book on the management of horses, and several plays, not of a character to increase any man's reputation for intelligence.

CAVENDISH'S EXPERIMENT. See EARTH, *ante*.

CA'VERY, or CAU'VERY, a river in India, rising about 12° 25' n., and 75° 34' e., and flowing s.e. to the bay of Bengal. It is about 470 m. long, but navigable only for small boats.

CAVES, or CAVERNS (Lat. *cavus*, hollow), are hollow places in the earth. They are either natural or artificial. Natural C. have been produced by the fracture and dislocation consequent on the upheaval of the strata, by water, or by both causes combined. The denuding or eroding power of water, which has produced the materials of stratified rocks, has formed caverns in the courses of rivers and on the coast-line of the sea. The moving waters, carrying with them gravel and sand, enter natural cracks and crevices, and, by abrading their walls, increase their size, so as to form C.; or they attack less indurated portions of the solid strata, and form cavities bounded by the harder rock. Such caverns are of frequent occurrence round the shores of Britain, and indicate, where they occur, an ancient sea-margin of the island. In limestone rocks, the destroying power of water is increased when it contains chemical agents which have the power of dissolving the substance of the rock, and so causing it to be carried off in solution by the water.

C. most frequently occur in limestone rocks. They especially abound in the oolitic limestone, which on this account was called by the earlier continental geologists "cavern limestone." The celebrated C. of Franconia in Germany, of Kentucky (q.v.) in America, that of Kirkdale in Yorkshire, and many others, occur in this formation. Next to limestone, the triassic measures, containing rock-salt, a material easily removed

by water, most abound in caverns. They are also frequently met with in igneous rocks—the picturesque cave of Fingal, in Staffa, is formed in basalt; and in South America and Iceland the modern lava contains large caverns.

Many caverns have a calcareous incrustation lining their interior, giving them a gorgeous appearance. Sometimes this deposit is pure white, and has, when the cave is lighted up, a richness and transparency that cannot be imagined. It is, however, more generally colored by the impurities which the water has taken up from the superincumbent strata. To the incrustations which are suspended from the roof, like icicles, the name stalactite is given, while those rising from the floor are designated stalagmites. Sometimes the pendent stalactite is produced so as to meet the ascending stalagmite, and form pillars, as if to support the roof, as in the "organ" in the Blue John Mine, Derbyshire. The source and origin of this deposit has been satisfactorily explained by Liebig as follows: The mold of the superficial soil, being acted upon by moisture and air, evolves carbonic acid, which is dissolved by rain. The rain-water thus impregnated, permeating the calcareous strata, has the power of taking up a portion of the lime, which it retains in a liquid condition, until from evaporation the excess of carbonic acid is parted with, when the lime again returns to its solid state, and forms the incrustation.

C. have an additional interest to the geologist, from the occurrence in many of osseous remains under the calcareous incrustations of the floor. The bones are imbedded in mud, and frequently concreted into a firm calcareous breccia. They belong to the pleistocene period, when the C. in Europe were inhabited by large hyenas and bears. Portions of other animals inhabiting the neighborhood were dragged by them into their dens, to serve as food. In this way the bones of herbivorous and other animals are found mixed with those of the beasts of prey; they have a broken and gnawed appearance, similar to what is produced on recent bones by the teeth of a hyena. No less than 33 species of mammals and 5 species of birds have been discovered in the C. of the British islands, of which about the half still survive in Europe, while the remainder are extinct. The mammals are species of ox, deer, horse, wolf, dog, hare, fox, weasel, water-rat, mole, bat, hippopotamus, and rhinoceros, besides the hyena and bear; and the birds are species of lark, partridge, pigeon, goose, and crow.

The most productive ossiferous cavern in Britain is that of Kirkdale, 25 m. from York, in which the remains of about 300 hyenas have been detected, besides innumerable gnawed bones of those animals on which they preyed. The carboniferous limestones of Glamorganshire abound in caves, which have been explored by Buckland, and more recently and thoroughly by Dr. Falconer. At the meeting of the geological society in June, 1860, Dr. Falconer thus describes the contents of one of them, called Bacon hole. On the limestone floor of the cave are—(1.) a few inches of marine sand, abounding with *litorina rudis*, *L. litoralis*, and *clausilia nigricans*, with bones of an *arvicola* and birds; (2.) a thin layer of stalagmite; (3.) two feet of blackish sand, containing a mass of bones of *elephas antiquus*, with remains of *meles taxus* and *putorius*; (4.) two feet of ochreous earth, limestone breccia, and sandy layers, with remains of *elephas antiquus*, *rhinoceros hemitechus*, *hyæna*, *canis lupus*, *ursus spelæus*, *bos*, and *cervus*; (5.) irregular stalagmite; (6.) two feet of limestone breccia and stalagmite, with bones of *ursus* and *bos*; (7.) a foot or so of irregular stalagmite, with *ursus*; and (8.) dark-colored superficial earth, kept sloppy by abundant drip, with bones of *bos*, *cervus*, *canis vulpes*, horns of reindeer and roebuck, together with shells of *patella*, *mytilus*, *purpura*, and *litorina* (probably brought into the cavern as food by birds), and also pieces of ancient British pottery. After a review of the fauna of the bone caves of this country and of Europe, Dr. Falconer concludes that the caves of Glamorganshire have probably been filled up with their mammalian remains since the deposition of the boulder-clay, and that there exist no mammalian remains in the ossiferous caves of England and Wales referable to a fauna of a more ancient geological date. See KENT'S CAVERN.

Ossiferous C. occur in all parts of the globe. The fossils of those in Australia show that the fauna of the pleistocene period had a remarkable resemblance to that of the present day. The remains consist chiefly of kangaroos and allied genera of marsupials.

CAVIA'NA, an island of Brazil, in the mouth of the river Amazon, about 35 m. long by 20 wide; fertile and well-stocked with cattle. The little town of Robadello, on the s.e. coast of the island, is almost exactly under the equator.

CAVIARE, the salted roes of the common sturgeon (*accipenser sturio*) and other fishes of the same genus. See STURGEON. It is chiefly prepared in Russia, where it is greatly esteemed as an article of food. It is also used to a considerable extent in Italy and France. The species of sturgeon from the roe of which it is chiefly prepared, inhabit the Caspian and Black seas and their tributary rivers. Among them are the bielga, or great sturgeon (*accipenser huso*), the osseter (*A. guldenstaadti*), the scherg or sevruga (*A. stellatus*), and the sterlet (*A. ruthenus*). The C. made from the roe of the last-named species is esteemed particularly delicious, and is reserved for the Russian court. Astrakhan is a principal seat of the preparation of caviare. More than 400,000 lbs. of C. have been prepared in the Caspian fishery in a single year.

CAVITÉ, a t. of considerable importance on the island of Luzon, one of the Philippines. It is situated on the bay of Manila, 10 m. s.s.w. of the city of that name, of which

it forms the quarantine station. It has a large cigar manufactory, is the chief naval depot of the Spanish possessions in the east, and gives name to a province with a pop. of 57,000. The population of the town itself is some 6,000 or 7,000.

CAVOR, or **CAVOUR**, a t. of n. Italy, situated at the foot of the Alps, 7 m. s.e. of Pinerolo. It has manufactures of silk-twist, linens, leather, etc., and marble and slate quarries. Pop. 6,000 or 7,000.

CAVO-RILIEVO (Ital.). In this peculiar kind of rilievo, which was extensively employed by Egyptian artists, the highest surface of the object represented is only on a level with the plane of the original stone, the rounded sides being cut into it. The effect resembles that of a concave seal. It is correctly described as *intaglio rilievato*. A wood-cut is given in Fairholt's *Dictionary of Terms in Art of the Egyptian king Amunoph III. in hieroglyphics*.

CAVOUR, Count **CAMILLA BENSO DI**, a distinguished Italian statesman of the 19th c., the descendant of a noble and wealthy family of Piedmont, was b. at Turin, Aug. 10, 1810. He was educated for a military career, but his liberal tendencies being likely to prove an insuperable barrier to his promotion, he retired during the stirring events of 1830-31, and devoted himself to agriculture, in which he introduced great improvements. He was the first to use guano in Piedmont; and, at his instigation, a national agricultural society was formed. During a residence in England, he made himself intimately acquainted with the political organization of the country, and also with its industrial institutions; knowledge of which he made good use on his return to his own country in 1842. In conjunction with Count Cesare Balbo, he in 1847 established a political daily journal, in which he advocated the interests of the middle classes—a representative system, somewhat after the pattern of the English constitution, as opposed alike to absolutism on the one hand, and mob rule on the other. On his suggestion, the king was petitioned for a constitution, which was granted in Feb., 1848. As a member of the chamber of deputies, during the stormy period which succeeded Charles Albert's declaration of war against Austria in Mar., C. strenuously opposed the ultra-democrats, and counseled an alliance with England as the surest guarantee for the success of the Italian arms. In the marquis d'Azeglio's ministry, formed soon after the fatal battle of Novara, C. was successively minister of agriculture and commerce, minister of marine, and minister of finance; and in 1852 he was appointed to succeed d'Azeglio as premier. From this time until his resignation in 1859, in consequence of the conclusion of the peace of Villafranca, C. was the originator as well as the director of the Sardinian policy. Taking upon himself at different times, in addition to the premiership, the duties of the ministers of finance, commerce, and agriculture, and latterly of home and foreign affairs, he greatly improved the financial condition of the country, introduced free-trade, consolidated constitutionalism, weakened clerical influence, and made Sardinia a power of some account in Europe, by bringing her into alliance with England and France against Russia. The dispatches which C. penned in reply to those of Austria, prior to the outbreak of the Italian war, are on all hands acknowledged as masterpieces of astute diplomacy. In Jan., 1860, C. was again called upon to preside over the Sardinian government, the duties of foreign minister likewise devolving upon him, and temporarily those of the minister of the interior also. He continued to direct the Sardinian policy until his death, June, 1861.

CAVY (*cavia*), a genus of quadrupeds of the order *rodentia*, regarded as the type of a family, *caviidæ*, differing from the hare family (*leporidæ*), in the complete want of clavicles, in the want of growing roots to the molar teeth, and in having the incisors situated as in other quadrupeds generally, and not in the peculiar manner so characteristic of the hares. There are four molar teeth in each jaw, and in the genus *C.* these are compound; and the genus is further characterized by four toes on each of the fore-feet, and three on each of the hind-feet, by the feet not being webbed, by the females having only two teats, and by the want of a tail. One species, *cavia cobaya*, has been long well known as a domesticated animal, and has been a common pet and plaything of children in Europe, almost from the time of the discovery of America. It is sometimes called the **COMMON C.** or **RESTLESS C.**, but much more frequently receives the name of **GUINEA-PIG**, although it is neither nearly related to pigs, nor a native of Guinea. Perhaps *Guinea*, in this name, may be a corruption of *Guana*, the cavies, and indeed the whole family of the *caviidæ*, being exclusively South American. The colors which the domesticated *C.* exhibits have never been seen in any of the wild cavies of South America; and as it is known to have exhibited the same variations of color from about the time of its introduction into Europe, it is supposed to have been long domesticated by some of the South American tribes. The Guinea-pig multiplies with a rapidity exceeding that of any other known quadruped, producing young ones when only two months old, and afterwards at intervals of two months, and from four to twelve in a litter. This extraordinary fecundity is probably not so much the result of domestication, as a provision for the preservation of the race in a wild state, the little animal being very defenseless and destitute of means of escape, the ready prey of every carnivorous beast and bird.—The other species of *C.* much resemble the Guinea-pig. Some of them are very numerous in some parts of South America, and are sought for food, although no such use is made of the domesticated cavy. The agouti (q.v.) and the capybara (q.v.) are ranked among the *caviidæ*.

CAWDOR, or **CALDER**, a parish in co. Nairn, Scotland, noted as the site of Cawdor castle in which Shakespeare places the murder of Duncan by Macbeth. But the murder took place 400 years before the castle was built—which may prove that Shakespeare was “not for a day but for all time.” During the rebellion of 1745, lord Lovat was for a time concealed in this castle.

CAWK, a popular name for a massive variety of the mineral called heavy spar or sulphate of baryta. See **BARYTA**.

CAWNPORE, a city of the Doab, on the right bank of the Ganges, about 140 m. above Allahabad, at the junction of the Jumna, being separated by the river from Oude, whose capital, Lucknow, lies 53 m. to the n.e. The lat. is 26° 29' n., and the long. 80° 25' east. The stream in front, varying, according to the season, from 500 yards in width to more than a mile, presents a large and motley assemblage of steam-vessels and native craft. C., at least as a place of note, is of recent origin, being indebted for its growth, besides its commercial facilities, partly to military and political considerations. In 1777, being then an appendage of Oude, it was assigned by the nabab as the station of a subsidiary force; and in 1801 it became, in name as well as in fact, British property. Its cantonments, having accommodation for 7,000 troops, have gradually accumulated about 50,000 native inhabitants; while the city itself contains a somewhat larger population of similar origin. During the mutiny of 1857, C. was the scene of Nana Sahib's massacre of his English captives. Though C. is only 379 ft. above the sea, yet, during winter, considerable quantities of ice are made for preservation, through the exposing of water by night in shallow vessels. Pop. '72 of C. (spelt also *Khanpur*), 122,770.

CAWNPORE, the district of the above-described city, in the lieutenant-governorship of the n.w. provinces. Occupying the entire breadth of the Doab, it touches at once the Jumna and the Ganges; while to the eastward it has Futtehpore, and, to the westward, Etawah and Furruckabad. With a pop. in '71 of 1,155,439, it has an area of 2,353 sq. m., stretching in lat. from 25° 55' to 27° n., and in long. from 79° 34' to 80° 37' east. It is an alluvial plain of great fertility. The vine is cultivated, and indigo grows wild. Besides its two mighty rivers and their navigable tributaries, the Ganges canal traverses the country for about 60 miles.

CAXAMARCA, or **CAJAMARCA**, a province in the n.w. of Peru, with a capital of its own name. It is on the e. side of the Andes, forming part of the basin of the Marañon. The province has 273,000 inhabitants, and the city about 20,000.

CAXAMARCA, or **CAJAMARCA**, a Peruvian city, the capital of the province of the same name, on the e. side of the Andes, in a fertile valley at an elevation of more than 9,000 ft. above tide, 7° 7' s. and 78° 31' w.; 72 m. n.n.e. of Truxillo. The streets are regular, but most of the houses are of clay. There are two or three fine churches, a monastery, a nunnery, and the remains of the palace of Atahualpa, the last of the Incas of Peru, who was murdered there by the Spaniards in 1533. Near the city are the sulphur springs of Pultamarca, called “the Inca's baths,” which have a temperature of 156° and are much frequented. There are manufactures of wool, linen, steel, silver, etc., and a good trade with Truxillo. A railway connects C. with the port of Pacasmayo. Pop. 12,000.

CAXAMARQUILLA, a t. of n. Peru, in the province of Libertad, 100 m. e.n.e. of Truxillo. Pop. about 8,000.

CAXATAMBO, or **CAJATAMBO**, a t. of n. Peru, in the province of Ancachs, 120 m. n.n.e. of Lima, with a pop. of about 6,000. There are silver-mines in the neighborhood.

CAXIAS, a t. in Brazil on the river Itapicuru, about 300 m. s.e. of Maranhao. It is a place of large trade in rice, cotton, cattle, etc.

CAXTON, **WILLIAM**, who introduced printing into England, was b. in the Weald of Kent, about 1422. The particulars of the life of this great benefactor of his country are scanty. He was apprenticed in 1439 to Robert Large, a wealthy London mercer. At the death of the latter in 1441, he went to Bruges, where in 1462 or 1463 he seems to have been governor of a chartered association of English adventurers trading to foreign parts. In 1471, C. entered the service of Margaret, the duchess of Burgundy, formerly an English princess; and apparently towards the end of 1476 he set up his wooden printing-press at the sign of the red pale in the almonry at Westminster. The art of printing he had acquired during his sojourn in Bruges, doubtless from Colard Mansion, a well-known printer of that city; and in 1474 he put through the press the first book printed in the English tongue, the *Recuyell of the Histories of Troye*, a translation of Raoul le Fevre's work. The *Game and Playe of the Chesse* was another of C.'s earliest publications; but the *Diets and Notable Wise Sayings of the Philosophers*, published in 1477, is the first book which can with certainty be maintained to have been printed in England. All the eight founts of type from which C. printed may be called black letter. Of the 99 known distinct productions of C.'s press, no less than 38 survive in single copies or in fragments only. C., who was an accomplished linguist, and translated many of the works that issued from his press, was diligent in the exercise of his craft or in translation till within a few hours of his death, which seems to have happened about the close of the year 1491. In 1877, the printer and his work were fittingly commemorated by a

typographical exhibition in London. See *The Old Printer and the New Press*, by Charles Knight (1854); *Life and Typography of William C.* (1861-63), by W. Blades; and the *Biography and Typography of C.* (1877), by the same author.

CAYAMBE, or **CAYAMBE-URCU**, a peak of the Andes, 45 m. n.e. of Quito, in Ecuador. It is of regular conical shape, 19,540 ft. high, and always capped with snow. It is especially notable for being situated almost exactly under the equator.

CAYCOS, or **CAICOS**, or **THE KEYS**, four of the Bahama islands, in the Atlantic, between 21° and 27° n., and about 72° west. Great Key is 30 m. long. Little and North Keys and Providence island are smaller.

CAYENNE, a fortified seaport, capital of French Guiana, on the west point of an island of the same name at the mouth of the river Oyak. The roadstead is excellent, and the port commodious but shallow. C., though it is the entrepôt of all the trade of the colony, is chiefly known as a great French penal settlement. The island, 32 miles in circumference, is separated from the mainland by a narrow channel; its soil is fertile, but the climate is extremely unwholesome for Europeans, large numbers of the convicts having been carried off by various malignant fevers. C. became a French colony about 1635; deportation hither began during the first French revolution. Pop. about 8,000.

CAYENNE CHERRY. See **EUGENIA**.

CAYENNE PEPPER consists of the powder of the dried pods, and more especially of the dried seeds of different species of *Capsicum* (q.v.), particularly of *C. frutescens*.

CAYLEY, Sir **GEORGE**, 1733-1857; an English physicist and inventor, whose experiments on the steam engine resulted in the invention of the air engine. Among his other inventions was an arrangement for applying the power of electricity to machinery. He was one of the originators of the London polytechnic institution, and late in life was a member of parliament for Scarborough.

CAYLUS, ANNE CLAUDE PHILIPPE DE TUBIÈRES, Count de, Marquis d'Esternay, Baron de Bransac, 1692-1765. When young he served with distinction in the French army, but after the peace of Rastadt (1714) he traveled extensively in Europe and the east, studying and collecting antiquities, on which he published several works. He rediscovered the method of encaustic painting with wax, mentioned by Pliny. He was also an engraver, and copied many of the famous pictures of the old masters. But he is best known as the author of several romances, humorous pieces, and fairy tales.

CAYLUS, MARTHE MARGUERITE DE VILLETTE DE MURCAY, Marquise de, 1673-1729; a descendant of the family of D'Aubigne, but converted by Mme. Maintenon to the Roman Catholic faith. She acquired celebrity as one of the leaders of court society. Racine so admired her abilities that he wrote the prologue to his tragedy of *Esther* as a compliment to her. Her first husband, the marquis de Caylus, was worthless and dissipated. After his death, she became the mistress of the duke of Villeroy, for which she was sent away from the court; but after the death of Mme. Maintenon she was restored to favor. Voltaire edited her *Sourcins*.

CAYMAN, a name somewhat variously used, either as the distinctive appellation of some, or as a common name for all the *crocodilidae* of South America. See **ALLIGATOR**. The genus *alligator* is by some naturalists of the present day divided into three genera, to one of which the name *C. (cayman)* is appropriated, and of which the type is the species called the eye-browed *C. (alligator palpebrosus)*, to which the name *C.* is distinctively applied in Surinam and Guiana, a species very abundant there, but not one of the largest or more dangerous of its tribe. It is remarkable for the three bony plates, separated by sutures only, which form each eyebrow or eyelid, projecting as large knobs like a man's fist; and this, and the scarcely webbed-feet, constitute the most important characters of the genus or subgenus cayman. To this subgenus belong also *A. trigonatus*, regarded by Cuvier as a mere variety of the same species, and *A. gibbiceps*.

CAYMANS—in English, *alligators*—three low islets of the Caribbean sea, which form a dependency of Jamaica, being 130 m. to the n.w. of it. Discovered by Columbus, they were by him called Tortugas, from the abundance of turtle—still the staple production of the group. On an area of about 2,000 acres, the population does not exceed 1500 or 1600. The soil yields corn and vegetables; and the people rear hogs and poultry.

CAYUGA, a co. in w. central New York, extending from lake Ontario half way across the state, intersected by the New York Central and several other railroads; 752 sq. m.; pop. '75, 62,434. It is a fine agricultural section, with undulating surface. Gypsum, salt, and limestone are among the minerals. Near the center of the co. lies Owasco lake, about 10 m. long, and on the w. border is Cayuga lake. The chief productions are wheat, corn, oats, barley, potatoes, hay, butter, wool, and tobacco. Co. seat, the city of Auburn.

CAYUGA LAKE, a fine navigable sheet of water in w. central New York, 38 m. long, and from 1 to 3½ m. wide. At the n. end it is shallow, but in some places it is very deep. It is 377 ft. above tide water, and 146 ft. higher than lake Ontario, into

which it empties through Seneca river. The lake is much frequented by tourists and pleasure seekers.

CAYUGAS, one of the Indian tribes forming the Six Nations in New York. They built the villages around Cayuga lake in central New York, and, when first known by the French explorers from Canada, were able to muster several hundred warriors. The C. were, with the other Iroquois, against the French in the wars of the 17th century. A few of their chiefs became Christians; and one who was taken in war and sent to the galleys in France, on his return to Canada became a friend of the white man. In the American revolution they were on the English side. After peace, they ceded nearly all their lands to the state except a small reservation, and that they abandoned about 1800, when some of them went to the Senecas, some to Canada, and others to the Indian country. Scarcely 200 of the tribe now remain.

CAZAL'LA DE LA SIERRA, a t. of Spain, in the province of Seville, 39 m. n.e. of the city of that name. It is situated on a declivity of the Sierra Morena; the district around is mountainous and well wooded, and abounds in minerals of various kinds, including iron, silver, copper, sulphur, and marble. The inhabitants, numbering between 7,000 and 8,000, are chiefly employed in smelting metals, manufacturing cannon, machinery, and agricultural implements. Some tanning, weaving, etc., are also carried on.

CAZEMBÉ, or **KAZEMBE**, an important country of Africa, the limits of which have not been clearly determined, but its center has been fixed at about lat. 12° s., and long. 31° east. The king's rule extends over a great portion of the established route across the continent of Africa, from the Congo, up the valley of Luluá, and down the valley of Luapula. Vegetation is generally luxuriant. Its chief products are manioc, maize, salt, copper, iron, and ivory. The people are called Balonda or Baloi.

CAZEMBE (*ante*), the hereditary name of an African chief, whose territory is s. of lake Moero, and n. of Bangweolo, between 11° and 9° s.; 120,000 sq. m.; pop. 500,000. The country forms a hollowed plain, and is watered by numerous rivers, among the most important of which is the Luapula, which is supposed to be one of the head streams of the Congo. The population consists of two races, the Messiras and the Campololas, of whom the former are natives subjugated, and the latter intruders and rulers; they alone being eligible to office, and theirs being the language of the court. Some attention is paid to agriculture, and millet, maize, manioc, sugar-cane, yams, gourds, and bananas are grown. The horse and the ass are unknown animals; sheep are scarce, but cattle are abundant. Salt is an important article of trade, and coarse cotton cloth, earthenware, and iron goods are the chief manufactures. The exports are slaves, ivory and copper-ore. The chief, or cazembe, has despotic power, and uses it barbarously. He has 600 wives, and the great nobles take as many as they can afford to keep. The capital is moved whenever a new ruler is put in power. The country of the Cazembe was first visited by white men in 1796. It has not yet been explored to any considerable extent.

CAZENOVIA, a village and township in Madison co., N. Y.; pop. '75, 4,240. The village is on Cazenovia lake, and is reached by the Cazenovia and Canastota railroad. There is a Methodist seminary in the place.

CAZOR LA, a t. of Andalusia, Spain, 40 m. e.n.e. of Jaen. C., which is a place of considerable antiquity, is pleasantly situated on a declivity, and is well watered by the Vega; has two old castles—one an Arab structure—manufactures of leather, earthenware, soap, and bricks, and a trade in agricultural produce. Pop. 7,500.

CAZOTTE, **JACQUES**, 1720–92; a French author, educated by the Jesuits. He produced at first a mock romance and a coarse song which became so popular that he undertook something more respectable and brought out his *Roman d'Olivier*. This was followed with *Le Diable Amoureux*, and another sportive creation. He also continued Voltaire's *Civil War in Geneva* with such close similarity that no one doubted the work to be that of Voltaire. Cazotte next took a wide departure, embraced the views of the Illuminati, and declared that he possessed the power of prophecy. He adhered to the royal cause, in consequence of which he was arrested by the revolutionary tribunal and executed.

CEANO THUS. See **RED ROOT**.

CEARA, a province of Brazil, on the n. coast, situated in lat. 2° 40' to 7° 25' s., long. 37° 40' to 41° 30' west. It has an area of 42,600 sq. m., with, '72, 700,000 inhabitants. It abounds in balsams, gums, resins, and fruits; and among its minerals are gold, iron, copper, and salt. The port of C. had a trade with Great Britain in 1874 amounting to £969,584.

CEBADIL'LA. See **SABADILLA**.

CEBES, a Greek philosopher, disciple of Socrates, mentioned by Plato and by Xenophon as distinguished for virtue and love of truth. The work *Tabula Cebetis* attributed to him professes to be an explanation of an allegorical picture, and begins with the Platonic doctrine that men enter the earth from a pre-existent state, in which they were taught how to guide their course in this world; but the draught of oblivion, which all

must drink, though not in equal quantities, causes them to forget the instructions. Many allurements entice them to vice, but by patience and endurance they may attain to virtue and happiness. Sciences are declared not to be the true discipline, but yet to be useful, especially as restraint for the young.

CEBU, a city on the island of Cebu, one of the Philippines, 400 m. s.e. of Manila. Cebu is the oldest provincial town in the archipelago, and still ranks as one of the best built, while its position makes it the chief commercial center for the southern Philippines. It is the residence of a military governor, and an alcalde, as well as the governor-general of the Vissagas. There are exports of sugar, hemp, tobacco, Japan-wood, etc. The grave of Magellan, the navigator, is on the island of Matan, opposite the town. Pop., inclusive of the suburb of St. Nicholas, about 34,000.

CEBU, or **ZEBU**, one of the Philippine islands, between $9^{\circ} 35'$ and 11° n., and 123° and $123^{\circ} 50'$ e.; about 1200 sq.m. The surface is rough, and the soil not suited to agriculture, though there are fertile valleys producing cotton, sugar, rice, tobacco, and cocoa. The climate, though very hot, is salubrious.

CEBUS (Gr. an ape or monkey), a genus of American monkeys, characterized by a round head and short muzzle, a facial angle of about 60° , long thumbs, and a long prehensile tail entirely covered with hair. The species are numerous, all of very lively disposition and gregarious habits, living in trees. They feed chiefly on fruits, but also on insects, worms, and mollusks. They are included under the popular designation **SAPAJOU** in its wider sense, and some of them are the monkeys to which this name is sometimes more strictly appropriated. The names **SAJOU** and **SAR** are also given to some of them, and some are called **Capuchin** (q.v.) monkeys. One of the most common species in Guiana is the **WEEPER MONKEY**, or **WEEPER SAPAJOU** (*C. apella*).—The name capuchin is perhaps most frequently given to *C. capuchinus*, a brownish species, with head, feet, and hands generally black, and front, shoulders, and cheeks whitish. Some of the species of *C.* are adorned with beards.—The name *cebula* is sometimes given to the American monkeys collectively, as a family or tribe. See **MONKEY**.

CEC'CO D'ASCOLI, 1257–1327; the popular name of **FRANCESCO DEGLI STABILI**, a mediæval poet and encyclopædist. He studied mathematics and astrology, and was professor of the latter science in the university of Bologna. Having published a commentary on the sphere of John de Sacrobosco, in which he propounded bold theories concerning the employment and agency of demons, the clerical party caused him to be condemned to certain fasts, prayers, and fines; but he eluded punishment by going to Florence. His free-thinking and plain-speaking, however, raised up many enemies; he had attacked Dante's *Commedia* and his fate was sealed; an old accusation of impiety was renewed, and he was tried, sentenced, and burnt at the stake in Florence, in the 70th year of his age.

CECIDOMYIA (Gr. *kekidion*, a gall-nut; and *myia*, a fly or gnat), a genus of dipterous (two-winged) insects of the family *tipularia*—the gnat and mosquito family; having downy wings, which have three nervures, and are horizontal when at rest; antennæ as long as the body, with bead-like joints and whirls of hairs at the joints; long legs, and the first joint of the tarsi very short. The species are numerous; nearly thirty are British. All are of small size, but some of them are very important on account of the ravages which their maggots effect in grain-crops. *C. cerealis*, sometimes called the **barley midge**, a brownish-red fly with silvery wings, of which the maggot is vermilion-colored, is often very destructive to crops of barley and spelt in Germany. The little maggots live in families between the stalk and the sheath of the leaf, abstracting the juice of the plant.—The **WHEAT-FLY** (q.v.) and the **Hessian FLY** (q.v.) belong to this genus.—Some of the species of *C.* deposit their eggs on the young buds of trees, which the larvæ transform into galls.

CECIL, a co. in n.e. Maryland, on the Delaware and Pennsylvania border, intersected by three railroads; 300 sq.m.; pop. '70, 25,874—4,014 colored. It has an uneven surface and fertile soil, its products are wheat, corn, oats, potatoes, hay, butter, and wool. Of stone and minerals there are granite, gneiss, slate, iron, chrome, and sulphate of magnesia. There are flouring mills, and several other manufactories. Co. seat, Elkton.

CECIL, RICHARD, 1748–1810; a minister of the church of England, celebrated as a pulpit orator. His works have been published in England and in New York. They are prized for deep spiritual fervor.

CECIL, ROBERT, Earl of **SALISBURY**, son of **WILLIAM**, was b. about 1550. On the death of his father, having previously held important state offices, he succeeded to what would now be called the premiership. On the accession of James I., C., who had carried on a private correspondence with that monarch before Elizabeth's death, was confirmed in his office and received many high honors, culminating in that of earl of Salisbury. In 1608, he was made lord high treasurer, and the exchequer was greatly improved in his hands. C. was a man of immense energy and far-reaching sagacity, undoubtedly the best minister the country had in his time; but he was cold, selfish, and unscrupulous as to the means he took to gain his ends, and get rid of his rivals. His connection with the disgrace of Essex and Raleigh laid him open to great and deserved odium, in

the latter case especially. Like his father, however, he was free from the meanness and dishonesty of enriching himself out of the public money. He died May 24, 1612.

CECIL, WILLIAM, Lord BURLEIGH, one of England's greatest statesmen, was b. at Bourne, Lincolnshire, Sept. 15, 1520. Educated at the grammar-schools of Grantham and Stamford, he thence passed to St. John's college, Cambridge, where he was remarkable alike for his diligence and aptitude in learning. Entering Gray's inn at the age of 21, he devoted himself assiduously to the study of law. History, genealogy, and theology also formed part of his studies at this time; and his knowledge of the last recommended him to the notice of Henry VIII., who presented him with the reversion of the *custos brevium*, an office of value in the common pleas. An alliance with the daughter of sir Anthony Cook procured him the friendship of the protector Somerset, who, in 1547, appointed him master of requests; and in the following year his great talents procured for him the office of secretary of state. He shared in the disgrace of Somerset, even to imprisonment for three months; but in less than two years after his release, his pre-eminent abilities secured for him a reappointment to the state secretaryship by the duke of Northumberland, his former patron's sworn enemy. During his second secretaryship, C. effected most important and beneficial changes in the commercial policy of the country. With a sagacity far beyond the spirit of his age, he endeavored to throw trade open, and did succeed in abolishing some monopolies; but others proved too strong for him, standing as he did alone, at a time when exclusive privileges were considered the only sureties of a profitable trade. When queen Mary ascended the throne, C., being a Protestant, resigned his official employment, because he could not conscientiously serve a Roman Catholic court; but as a private gentleman he maintained good relations with the Roman Catholic party, and was one of the few eminent Protestants who escaped in purse and person during that short but infamous reign. His freedom from persecution has given rise to the charge, that he was a "trimmer"—a very unjust accusation, indeed. C. was naturally cautious and politic, and averse to extremes in religion; but though he took no part in bitter sectarian discussions, he never belied his conscience, and to him is mainly owing the rejection of the bill which the Roman Catholics had introduced into parliament, with the view to a wholesale confiscation of the estates of Protestants. Prior to Mary's death, C., foreseeing her end, had entered into correspondence with Elizabeth, who, on her accession to the throne (Nov. 16, 1558), at once recognizing C.'s capacity for government, appointed him secretary of state. A biography of C. from this time until his death would be a forty years' history of England, for he was alike the originator and director of that policy which, hitherto, has made Elizabeth's reign memorable above that of any other English sovereign; for although Elizabeth occasionally, in her caprice, favored other courtiers, C. was the statesman whose judgment she relied on in all matters of consequence. His policy at home and abroad was at once shrewd and cautious, and also liberal and comprehensive, while he displayed a power of decision, ready and stern, when necessity demanded. As a statesman, C. was above animosities and favoritism; his enemies never suffered, and his friends profited nothing, by his power. Capacity, truth, and honor were what he sought in public men. Had he been less just, history might have been more generous to his memory. The queen created him baron Burleigh in 1571, and conferred on him the order of the garter in the succeeding year, when he was also made lord high treasurer, an office he held until his death, Aug. 15, 1598.

CECILIA, St., the patroness of music, is said to have suffered martyrdom in 230 A.D. Her heathen parents, as we are told, belonged to a noble Roman family, and betrothed their daughter, who had been converted to Christianity, to a heathen youth named Valerian. This youth and his brother Tiberius became Christian converts, and suffered martyrdom. C., when commanded to sacrifice to idols, firmly refused, and was condemned to death. Her persecutors, it is said, first threw her into a boiling bath, but on the following day they found her unhurt. The executioner next attempted to cut off her head, but found it impossible. Three days later, she died—rather a lame conclusion to such miraculous interference! As early as the 5th c., there is mention of a church dedicated to her at Rome; and in 821, by order of pope Paschal, her bones were deposited there. St. C. is regarded as the inventor of the organ, and in the Roman Catholic church her festival-day, Nov. 22, is celebrated with splendid music. Chaucer, Dryden, and Pope have celebrated St. C., and the painters Raphael, Domenichino, Dolce, and others have represented her in fine pictures.—Another St. C. was born in Africa, and suffered martyrdom by starvation under Diocletian. The Roman Catholic church celebrates her festival on the 11th of Feb.

CECROPIA, a genus of trees of the natural order *artocarpaceæ*. *C. peltata*, a native of the West Indies and of South America, sometimes called trumpet-wood and snake-wood, is remarkable for its hollow stem and branches, exhibiting merely membranous partitions at the nodes. The small branches, these partitions being removed, are made into wind-instruments. The wood is very light, readily takes fire by friction against a harder piece of wood, and is much used by the Indians for procuring fire in this way. The fruit is agreeable, and resembles a raspberry. Both the trunk and branches yield a large quantity of saline matter, which is employed by the French planters in the

purification of sugar. The bark is strong and fibrous, and is much used for cordage. It is also astringent, and is applied in diarrhoea and other diseases.

CECROPIA MOTH, *Platysamia cecropia*, the largest moth of the United States; belonging to the family bembeycidae, it is akin to the silk-worm. Its larva grows to be between 3 and 4 in. long, and is a most beautiful object; its color is a tender green, shading into blue upon its sides; on its head it wears an amber-colored knob raised upon a short stem, and armed with short black points; rows of smaller knobs adorn the back and sides, those along the sides being turquoise blue; the foremost four on the back are amber-colored. The larva feeds upon nearly all kinds of fruit trees, the maple, willow, and some other trees. It spins a large cocoon, sometimes attached to the under-side of a twig, when it is closely woven and tapers to a point at each end; sometimes in the space between forking limbs, when it is loosely made, and is often as large as a goose-egg. The outer and inner surfaces of the cocoon are somewhat condensed, so that there appear to be two cocoons or coverings. In the earlier stages of the spinning, the insect often thrusts the silk in loops through the openings between the threads, and these loops make it difficult to reel the silk; by dissolving in an alkali the gum which the insect exudes to harden the cocoon, and by using great care, it is possible to reel the silk, but it is dark and coarse, and would be fit for only coarse and strong fabrics. It has been carded and spun. The larva does not thrive in confinement, but might be cultivated in the open air with a little pains. The moth appears in June; its wings expand from 5 to 7 in.; its general color is dark brown thickly powdered with gray; the borders of the wings are clay-colored, and each wing bears a light gray kidney-shaped spot, bordered with lines of red and black. The antennae of the males are particularly large and fine, the main stem being feathered on each side with long branches in pairs. Like other lepidopterous larvæ, the cecropia is preyed upon by various parasites, two species of ichneumon flies being notable.

CECROPS, the first king of Attica, figures in Greek mythology as an autochthon (q. v.), half-man and half-dragon. Belonging, as he does, to the prehistoric ages of Greece, his real character can only be guessed at. Tradition declared him to be the founder of marriage, the author of the political division of Attica into twelve states, and the introducer of agriculture, of navigation, and commerce. He is also said to have civilized the religious rites of the people. The name C. is given to various towns in Greece, and the legends in general seem to indicate a Pelasgic origin for the hero. The later accounts, that he came from Sais in Egypt, have no historic basis.

CEDAR, a co. in e. Iowa, watered by Cedar and Wapsipinicon rivers, and intersected by the Chicago, Rock Island and Pacific, and the Chicago and Northwestern railroads; 576 sq. m.; pop. '70, 19,731. The surface is divided between woodland and prairie; the productions are mostly agricultural. Co. seat, Tipton.

CEDAR, a co. in s. w. Missouri, on Sac river; 435 sq. m.; pop. '70, 9,474—111 colored. The surface is uneven, but the soil is productive. Agriculture is the chief business. Co. seat, Stockton.

CEDAR, a co. in n. e. Nebraska, on the Missouri river, watered chiefly by Bow creek; 650 sq. m.; pop. '70, 1032. It is an agricultural region, but as yet not much cultivated. Co. seat, St. James.

CEDAR, **BARBADOES**, *Cedrela odorata*, a tree of the natural order *cedrelaceæ* (q. v.), and of the same genus with the toon of India, a native of the West Indies and warm parts of America. It is simply called C. in the West Indies. It is often upwards of 80 ft. high, with a trunk remarkable for thickness. It has panicles of flowers resembling those of the hyacinth. The fruit, bark, and leaves have the smell of asafœtida, but the wood has an agreeable fragrance. Being soft and light, it is used for canoes, and for shingles. Havana cigar-boxes are very generally made of it. In France, it is used in making black-lead pencils.

CEDAR, or **CEDAR OR LEBANON**, a tree much celebrated from the most ancient times for its beauty, its magnificence, and its longevity, as well as for the excellence and durability of its timber. It is often mentioned in Scripture; it supplied the wood-work of Solomon's temple; and in the poetry of the Old Testament it is a frequent emblem of prosperity, strength, and stability. It belongs to the natural order *conifera*, and is the *pinus cedrus* of the older botanists; but is now ranked in the genus *abies* (see FIR), in the genus *larix* (see LARCH), by those who make *larix* a distinct genus from *abies*, or is made the type of a genus, *cedrus*, distinguished from *larix* by evergreen leaves and carpels separating from the axis, and receives the name of *C. libani*.

Of the celebrated CEDARS OF LEBANON, only a few now remain. They consist of a grove of some 400 trees, about three quarters of a mile in circumference, partly old trees and partly young ones. Learned travelers think that most of the trees in the grove may be 200 years old, and several between the ages of 400 and 800 years. There are 12 trees whose age is incalculable—seven standing very near each other; three more a little further on, nearly in a line with them; and two, not observed by any recent traveler except Lord Lindsay, on the northern edge of the grove. The largest of these two is 63 ft. in circumference—following the sinuosities of the bark; one of the others measures 49 feet.

These trees are more remarkable for girth than stature, their height hardly exceeding

50 feet. Their age is variously estimated; the rules by which botanists determine the age of trees are not applicable to them, for their stems have ceased to grow in regular concentric rings; they owe their prolonged existence to the superior vitality of a portion of their bark, which has survived the decay of the rest. Russeger is inclined to admit that these trees may possibly number some 2,000 years.

The Arabs, of all creeds, have a traditional veneration for these trees; they believe that an evil fate would surely overtake any one who shall dare to lay sacrilegious hands on the *saints*, as they fondly call them. Every year, at the feast of the transfiguration, the Maronites, Greeks, and Armenians mount to the cedars, and celebrate mass on a homely altar of stone at their feet.

The C. has been planted in parks in many parts of Europe; it was introduced into England in the latter part of the 17th c., and a tree at Sion house, London, is now 8 ft. in diameter at 3 ft. above the ground. Even in Inverness-shire it succeeds so well, that trees at Beaufort castle, the seat of lord Lovat, planted in 1783, are now 3 or 4 ft. in diameter. On its native mountains, the C. is found at the base of the highest peaks, at an altitude of about 8,000 ft. above the sea. It seems to delight in a dry open soil, where, however, its roots can have access to abundance of water. Although in foliage and some other particulars the C. considerably resembles the common larch, it differs in form and habit very widely both from the larch and from the pines in general. Its stem bears almost down to the ground irregularly placed branches, often of prodigious size and expanse, which divide irregularly into branchlets. The leaves are dark green, 10 to 15 lines long, pointed, united in clusters of 20 to 30: on the young shoots they are very numerous, and not in clusters; the small branchlets also are crowded together and pensile. The cones are erect, oval, broadly rounded at both ends, about 4 in. long, and 3 in. in diameter; their scales closely crowded, large, and broad. The cones take two years to come to maturity, and hang on the tree for years before their scales come off and their seeds are set free. The wood of the trunk is reddish, and full of a fragrant resin. The ancients kept their writings in cabinets or boxes of cedar-wood. Extraordinary indestructibility and other virtues were ascribed to it. It is not nearly so much prized at the present day, because it is soft and light, and apt to crack in drying. This inferiority is, however, not improbably owing to the inferior age of the trees from which the timber is now procured. A resinous substance, called *cedar resin*, or *cedria*, flows spontaneously from the trunk of the C., or from incisions; it resembles mastic, and was anciently used, along with other resins, in the embalming of the dead. It was also used as a medicine. In very ancient times, C. OIL, a kind of turpentine, was prepared from the wood, and was spread on books in order to their better preservation. At the present day, the oil and the resin are scarcely known. The branches of the C., like those of the larch in warm countries, exude a sweet substance, which is known by the name of C. MANNA.—The DEODAR or HIMALAYAN C. (*cedrus deodara*), a tree held in great veneration by the Hindus, and of which the name is said to be properly *deodara*, and to signify *god-tree*, is common in the Himalaya mountains, at elevations of 7,000 to 12,000 ft., forming magnificent forests, and attaining a great size, a height sometimes of 150 ft., with a trunk 30 ft. or more in circumference, an ample head, and spreading branches. It is described as having cones somewhat larger than those of the C. of Lebanon, the scales of the cones falling off as soon as the seed is ripe, and as differing from the C. of Lebanon also in more pensile branches and longer leaves; but Dr. Hooker expresses a strong opinion that they will prove to be really the same species, as well as the C. of ALGIERS (*C. Atlantica* or *Africana*), which is found in the mountainous regions of the n. of Africa. The wood of the deodar is resinous, fragrant, compact, and very durable. It is susceptible of a high polish, and in its polished state has been compared to brown agate. Owing to the abundance of resin, laths of it burn like candles. Its turpentine is very fluid, and although coarse, is much used in India for medical purposes; and tar and pitch are obtained from the trunk. The deodar has now become very common as an ornamental tree in Britain, although few specimens have yet attained a very considerable size. On account of its extreme gracefulness when young, it is often planted in situations to which large trees are unsuitable, and is to be seen in many suburban parterres.—The name C. is often given to other coniferous trees besides the true cedars. Thus, the Siberian stone pine, or Cembra pine, is called the SIBERIAN C. (see PINE), and a species of fir (*abies religiosa*) is the RED C. of California (see FIR). A species of cypress (q.v.) is known as WHITE C., and another as the C. OF GOA. Several of the trees which bear the name C. are species of juniper (q.v.), among which are the VIRGINIAN C., or RED C. of North America, and the BERMUDA C.—which yield the cedar-wood used for pencils—the SPANISH C. of the s. of Europe, etc. The name C. is even given to trees which have no resemblance to the true cedars, except in the resinous quality of the wood; thus the cedar-wood of Guiana is produced by *iceia altissima*, a tree of the natural order *amyridaceæ* (q.v.); the C. of the West Indies (see next article) belongs to the natural order *cedrelacæ*; and the name BASTARD C. is given in India to a tree of the natural order *bytneriacæ* (q.v.).

CEDAR BIRD. See WAXWING

CEDAR CREEK, a stream in Shenandoah co., Va., falling into the Shenandoah river. On this creek, Oct. 19, 1864, the confederates, under gen. Early, surprised Sheri-

dan's (union) camp, during that officer's absence. The unionists were compelled to retreat. Gen. Sheridan, who was at Winchester when he heard of the disaster, hastened to the front, and, rallying his forces, in turn surprised the confederates who had stopped to plunder the union camp, recovered nearly all that had been lost, took 2,000 prisoners, and 50 pieces of artillery, and the next day cleared the valley of the Shenandoah of confederate troops. This brilliant achievement was the theme of T. Buchanan Read's stirring poem, *Sheridan's Ride*.

CEDAR FALLS, a city in Black Hawk co., on Cedar river and the Iowa division of the Illinois Central, at the intersection of the Burlington, Cedar Rapids and Minnesota railroads, 93 m. from Dubuque. It is a manufacturing place of importance. Pop. '80, 3,035.

CEDAR MOUNTAIN, a hill in Culpepper co., Va., near which, Oct. 8, 1862, there was an engagement between the federal forces under gen. Banks and the confederates led by gen. Jackson. The confederates had the advantage and held the field, but two days later fell back towards Gordonville to join gen. Lee. The reported losses were: On the union side, 1,400 killed and wounded, and 400 prisoners; of the confederates, 1,283 killed and wounded, and 31 missing.

CEDAR MOUNTAINS, a range of the Cape colony, parallel with the Atlantic, and nearly half way between it and the dividing ridge of the country. They form the height of land between the Oliphant on the w., and the Great Thorn, its principal tributary, on the e., varying in altitude from 1600 f. to 5,000. They lie about lat. 32° s., and long 19° e., in the division of Clanwilliam, and supply the village of that name with cedar planks.

CEDAR RAPIDS, a city in Linn co., Ia., on Red Cedar river, and the Burlington, Cedar Rapids, and Minnesota railroad, at the intersection of the Iowa division of the Chicago and Western railroad, and the junction of the Dubuque and Northwestern railroad. There are many important manufactories in and near the place. Pop. 5,940.

CEDAR, or RED CEDAR, RIVER, rises in s.e. Minnesota, and flows s. and s. e. through more than three quarters of the breadth of Iowa, falling into the Iowa river about 20 m. e. of the Mississippi. The entire length is about 350 miles.

CEDAR SPRINGS, a village in Spartanburg co., S. C., formerly a popular watering-place. It is now the seat of a deaf and dumb asylum. The village is on the Spartanburg and Union railroad.

CEDRATE. See CITRON.

CEDRELA'CEÆ, a natural order of exogenous plants, very nearly allied to *melicææ* (q. v.), and chiefly distinguished by the winged seeds, numerous in each cell of the fruit, which is a capsule. The known species are few, all tropical or sub-tropical trees or shrubs, with pinnate leaves, most of them trees valuable for their timber. To this order belong mahogany, satin-wood, toon, Barbadoes cedar, the yellow-wood of New South Wales, etc. The barks of some species are febrifugal. That of *soumida febrifuga*, the Rohuna or East Indian mahogany, has been imported into Britain as a medicine.

CEDRON, an extract of a bitter nature from a small tree growing in Central and South America. In those countries the bitter is thought to be a remedy for the bite of serpents, and a prophylactic against hydrophobia. In medical practice it is used as a simple bitter principle.

CEFALU', a t. of Sicily, on the n. coast, 47 m. e.s.e. of Palermo. It is situated at the foot of a rock, and is surrounded by old walls. It has a cathedral, and the ruins of a Saracenic castle occupy a neighboring hill. As a seaport, it has little traffic. The inhabitants, numbering some 10,000, are chiefly engaged in fishing.

CEFALU', a seaport in n. Sicily, 39 m. e.s.e. of Palermo; pop. 10,200. The new town, founded in 1131 by Roger I. of Sicily, is at the base of a steep promontory which overlooks the magnificent bay of Cefalu. The houses are well built, and the cathedral, begun in 1132, is distinguished for the beauty of its façade, with antique pillars and mosaics. There is a small but good harbor, and some trade in manna, oil, and sardines; but most of the people are engaged in the sea-fishery.

CEG' LIE, a t. in southern Italy, province of Lecce, 18 m. n.e. of Taranto. Pop. about 12,580. It produces much grain, and has fine pastures.

CEHEGIN', a t. of Spain, in the province of Murcia, 37 m. w.n.w. of the city of that name. It has some spacious streets, with handsome buildings, and manufactures of paper, cloth, and pottery. Pop. about 10,000.

CEILING (Fr. *ciel*; Lat. *caelum*, heaven). This term seems to have been suggested by the use of arched coverings for churches, and even for rooms, which prevailed in the middle ages, and was not unknown to the Romans. Whether the term was further suggested by the habit of tinting ceilings of a blue color, and decorating them with stars, or whether that usage arose from the use of the term already introduced, is more doubtful. Arched ceilings among the Romans were known by the name *cameræ* or *camera*, the Greek origin of which seems to furnish an argument in favor of the view that the arch was known to the latter people. The camera was formed by semicircular beams of wood, at small distances from each other, over which was placed a coating of lath and

plaster. In later times, the camerae were frequently lined with plates of glass; whence they were termed *vitreae*. But the ceilings most commonly in use amongst the Romans were flat, the beams, as in modern times, having been at first visible, and afterwards covered with planks and plaster. Sometimes hollow spaces were left between the planks, which were frequently covered with gold and ivory, or paintings. The oldest flat C. in existence is believed to be that of Peterborough cathedral. Like that at St. Alban's abbey, it is made of wood, and plastered over like a modern ceiling. Ceilings of churches, in the middle ages, were generally painted and gilded in the most brilliant manner; and many existing ceilings still exhibit the traces of early decoration of this kind. The older ceilings generally follow the line of the timbers of the roof, which, in the early English and decorated, are often arranged so as to give the shape of a barrel vault. In ceilings of this description there are seldom many ribs, often only a single one along the top. In the perpendicular style, the C. often consists of a series of flat surfaces or cants, formed on the timbers of the roof. Though sometimes altogether destitute of ornament, they are more frequently enriched with ribs, dividing them into square panels, with bosses (q. v.) or flowers at the intersections. Wooden ceilings are sometimes formed in imitation of stone-groining, with ribs and bosses, examples of which will be found at York, Winchester, and Lincoln. In the Elizabethan age, ceilings were generally of plaster, but they were ornamented with ribs having bosses or small pendants at the intersections. It is not unusual for the C. immediately over the altar, or the roodloft, to be richly ornamented, whilst the rest is plain.

CELANDINE, *Chelidonium*, a genus of plants of the natural order *papaveraceæ* (the poppy family), having a corolla of four petals, and a podlike capsule. The common C. (*C. majus*) is a perennial, with pinnate leaves, lobed leaflets, and yellow flowers in simple umbels, frequent under hedges, in waste places, etc., in Britain and most parts of Europe. It flowers from May to Sept. The root, stem, and leaves, when fresh, have a disagreeable smell, and are full of a yellow juice, which is very acrid, causing inflammation when applied to the skin. C. is sometimes used in medicine: it is a drastic purgative, and in large doses an active poison; in small doses it is said to act beneficially on the lymphatic system and on the organs of secretion, and to be useful in scrofulous diseases, disease of the mesenteric glands, etc. The fresh juice, applied externally to warts, corns, etc., removes them by stimulating them beyond what their languid vital powers can bear. Mixed with milk, it is applied to the eye for the cure of opacities of the cornea, but is a remedy that requires great caution in its use.

CELANO, LAKE OF. See FUCINO, LAKE OF.

CELA STRA CEE. See SPINDLE-TREE.

CELEBES, a large island in the Eastern archipelago, e. of Borneo, between 5° 45' s. lat., 1° 45' n. lat., and 118°, 126° e. longitude. Area, 37,485 sq. miles. It is irregular in shape, and four peninsulas springing from a common root form the large bays of Gorontalo and Tolo, and the gulf of Boni. C. is covered with mountains and valleys: a chain running throughout it sends spurs into the peninsulas. Some are active volcanoes, and earthquakes are frequent. The peak of Bonthaim is 9,788 ft. high. The island has a rich soil and extensive pastures. The vegetable kingdom gives sago, cocoa-nuts, bread-fruit, coffee, tamarinds, bananas, oranges, pine-apples, maize, rice, tobacco, sugarcane, indigo, sandal, sapan-, and ebony-wood. The animals include excellent horses, buffalo, cattle, wild swine, elands, goats, sheep, parrots, lorries, birds of paradise, beautiful butterflies, wild bees, etc. The minerals are gold, iron, coal, and salt. The people spin and weave cottons. Pop., of various races, is reckoned at 3,000,000, of whom (1874) 568,338, including 2,000 Europeans, are under Dutch rule. The chief t. is Macassar, which names the strait between C. and Borneo. In Nov., 1874, a fire destroyed 774 houses of the town.

CELEBES (*ante*), was first discovered by the Portuguese in the early part of the 16th c., the exact date being given by some authors as 1512. At that time the Macassars were the most powerful people in the island, having successfully defended themselves against the king of the Moluccas and the sultan of Ternate. In 1609, the English endeavored to gain a foothold. The Dutch arrived near the end of the 16th or the beginning of the 17th century. In 1611, the Dutch East India company obtained a monopoly of the trade on the island of Buton, and in 1618, an insurrection in Macassar gave them an opportunity of obtaining a definite settlement in Celebes. In 1660, the native kingdom was forcibly subjugated by the Dutch, with 33 ships, and 2,700 men. Six years later, the war began again, but was ended in 1667, and a treaty was signed by which the Dutch were recognized as protectors and mediators of the different states who were parties to the treaty. In 1683, the n.e. part of the island was conquered and put under the command of the governor of the Moluccas; and in 1824, the kingdom of Boni was reduced. Since that time there has been no important military event except the speedily suppressed insurrection in Boni in 1859. The island is very irregular in outline, and has been compared to a star-fish with its limbs torn away from the w. side. There are few rivers, and none are navigable for any considerable distance; but the lakes are numerous, and some of them large. The most important of these is the Tamp-arang-Labaya, or Tempe, in the s.e. section of the peninsula. It has a depth of 30 ft., and is richly stocked with fish.

The scenery throughout the island is varied and picturesque. There are wonderful gorges, chasms, and precipices, many of the latter 600 ft. high, and yet covered with a tapestry of vegetation. Much of the country is still covered with the primeval forest, which is traversed here and there by scarcely perceptible paths, or broken by occasional clearings or villages. The fauna of Celebes exhibits some specimens peculiar to the island. Of 200 species of birds, 80 are not elsewhere found. There are only 14 species of mammalia, and of these 11 are almost entirely confined to the area. The most remarkable of these are an ape found in but one other country, a small ox-like quadruped that inhabits the mountainous districts, and the pig-deer of the Malays. Neither the elephant, the tapir, the rhinoceros, nor any large beast of prey is represented. Not much attention has been given to agriculture, except where the Dutch influence and example are strong; and manufactures are few and crude. The women weave a tolerable cotton cloth. The houses are of wood and bamboo, and are usually very frail. The whole of Celebes is practically in the hands of the Dutch government, though but a comparatively small portion is under their direct administration, and many of the petty princes are permitted to manage their internal affairs much as they please. For administrative purposes there are three "residences," Celebes, Manado, and Ternate, the former two belonging solely to the island, while the third includes a large part of the Moluccas. The most important and interesting people in the island are those in the department of Macassar. They consist mainly of Macassars and Malays proper, of Endinese from the island of Flores, and immigrants from the neighboring kingdom of Wadjo. The foreign colonies are each under the management of a separate captain, and the Malays are under the care of a head priest. The Macassars belong to the Malay race; they are well built and muscular; with dark brown complexion, a broad and expansive face, black and sparkling eyes, high forehead, nose rather flat, large mouth, and black soft hair which they let fall over their shoulders. The women are sprightly, clever and amiable, and formerly brought large prices as slaves. The men are brave, ambitious, jealous, and revengeful, but not treacherous. Drunkenness is rare, but gambling and cock-fighting are passionately engaged in. Running "amok" was once so common that the Dutch dismissed the Macassar soldiers from their service to break up the evil. They take great pleasure in all bodily exercise. In religion they call themselves Mohammedans, but their worship is full of pagan superstitions; they worship animals and a divinity called Kareng Lové, who has power over their fortune and health. Their language, which belongs to the Malayo-Javanese group, is spoken by about 300,000; but it has a much smaller area than Buginese, which is the language of Boni. Their literature is poor, and consists mainly of romantic stories from the Malay, and religious treatises from the Arabic. Of their few original works the most important are the early histories of Goa, and some other states of the Celebes, and a collection of laws and maxims of the old princes and sages. In no part of their possessions, however, have the Dutch made more important transformations than in Minahassa, or the confederation of Manado. At the beginning of the century the people were still savages, and in almost continual warfare among themselves. About 1822, it was discovered that the soil of the mountain sides was very favorable for growing coffee; the cultivation was introduced, and a system established by which the native chiefs undertook the management of the plantation. The result has been not only to make one of the best coffee districts in the archipelago, but wonderfully to advance the civilization of the inhabitants. Missions and education have been successful; villages of handsome houses have grown up; the country is traversed by roads shaded by trees, and rivers have been bridged. The trade of the district is in a flourishing condition, and promises to become still more important. The coffee plant produces a fine kernel of transparent greenish-blue color, and brings a much higher price than that from Java. Besides other large district divisions, for the most part physically similar to those described, there is the district or state of Toradja, lying entirely inland, which is in possession of a wild pagan race who shun intercourse with other races, and are generally regarded as the aborigines of the island.

CEL'ERES, a body-guard of 300 young men of the best Roman families, organized, according to tradition, by Romulus. Next to the king, their leader was the highest officer of the state. This position was held by Brutus when he expelled the Tarquins.

CELERY, *Apium*, a genus of plants of the natural order *umbellifera*, distinguished by a mere rudimentary calyx, roundish entire petals, very short styles, and roundish fruit. The common *C. (A. graveolens)* is found wild in Britain and most parts of Europe, in ditches, brooks, etc., especially near the sea and in saline soils. Its leaves are dark green and smooth, its petals involute at the tip. The wild plant, also called **SMALLAGE**, has a stem about 2 ft. high, a tapering slender root, a penetrating offensive odor, a bitterish acrid taste, and almost poisonous qualities. By cultivation, it is so much changed that its taste becomes agreeably sweetish and aromatic, whilst either the leaf-stalks much increase in thickness, or the root swells in a turnip-like manner. These parts, blanched, are much used as a salad, or to impart flavor to soups, etc., and sometimes as a boiled vegetable. They contain sugar, mucilage, starch, and a substance resembling manna-sugar, which acts as a stimulant, particularly on the urino-genital organs, so that a very free and frequent indulgence in the use of *C.* cannot, in ordinary circumstances, be altogether favorable to health. Two principal varieties of *C.* are cul-

tivated, that most common in Britain having long thick leaf-stalks, which are more or less tubular, sometimes almost solid, and, after blanching, either white or more or less tinged with red; whilst the other, called TURNIP-ROOTED C., or CELERIAC, is chiefly remarkable for its swollen turnip-like root, and is in most general cultivation on the continent of Europe. The "red" varieties of C. are esteemed rather more hardy than the "white." The blanching of the leaf-stalks is generally accomplished by drawing up earth to the plants, which are transplanted from the seed-bed into richly manured trenches; and as they grow, the trenches are filled up, and the earth finally raised into ridges, above which little more than the tops of the leaves appear. C. is thus obtained for use throughout the winter. In the northern parts of Britain, the seed is generally sown on a hot-bed. C. seed is often used for flavoring, when the leaf-stalks cannot be obtained.—Another species of C. (*apium australe*) grows abundantly in wet places on the shore about Cape Horn and in Staten Island. It is a large, hardy, and luxuriant plant, and is described as wholesome and very palatable, nearly equal in its wild state to our garden-celery. It seems well worthy of the attention of horticulturists.

CÉLESTE, MADAME, b. 1814; a dancer and melodramatic actress of French descent, and a pupil of the Paris conservatory. She came to the United States about 1829, and not long after married a man named Elliot. After his death she went to England, and in 1830 began a career of remarkable success in the sensational drama of *The French Spy*. She made two other American tours, 1851 and in 1865. In 1866, she returned to England and retired from the stage.

CEL ESTINE, a mineral bearing the same relation to stromtia (q.v.) that heavy spar bears to baryta. It is essentially sulphate of stromtia StOSO_3 , with occasional admixture of sulphate of baryta, carbonate of lime, oxide of iron, etc., in small proportions. It much resembles heavy spar, but is not quite equal to it in specific gravity; is usually blue, often of a very beautiful indigo-blue; sometimes colorless, more rarely reddish or yellowish. Its crystallization is rhombic, like that of heavy spar. Most beautiful specimens of crystallized C. are found in Sicily. C. derives its name from its color. It is used as a source of stromtia.

CELESTINE, the name of five popes. 1. SAINT CELESTINE, d. 432, is supposed to have been a near relative of the emperor Valentinian. He held the council of Ephesus in 431, at which the Nestorians were condemned; actively persecuted the Pelagians; struggled for Roman orthodoxy; sent Palladius to Scotland, and Patricius (St. Patrick) to Ireland; raged against the Novatians in Rome, imprisoning their bishop, and forbidding their worship, and was intolerant of the least innovation of the constitutions of his predecessors. His papacy lasted nearly $8\frac{1}{2}$ years. 2. GUIDO DI CASTELLO, chosen in 1143; d. 1144, after a reign of 5 months and 13 days. He gave absolution to Louis VII. of France, on the king's humble subjection, and removed the papal interdict from that country. 3. GRACINTO BOBONE ORSINI, elected Mar. 30, 1191; d. 1198, after ruling nearly 9 years, and was buried in the Lateran; supposed to have been 90 years old when chosen. He crowned the emperor Henry VI. of Germany, and subsequently excommunicated him for keeping Richard I. of England in prison. In 1192, he confirmed the statutes of the Teutonic order of knights. 4. GOFREDO CASTIGLIONE of Milan, a nephew of Urban III. He was elected pope by only seven cardinals, Sept. 22, 1241, and occupied the chair only 17 days, dying Oct. 8, before he was consecrated. He was the author of a history of Scotland, in which country he was once a monk. 5. PIETRO DI MORONE, the son of a peasant of Naples; became a Benedictine monk, and lived many years in caves after the manner of John the Baptist. Terrible stories are told of the severity of his penitential discipline. During his hermit life he founded the order that bears his name (see CELESTINES, *ante*). After the death of Nicholas IV. he was elected pope, but refused to accept until persuaded by a deputation of cardinals reinforced by the kings of Naples and Hungary. He was chosen July 7, 1294, was crowned Aug. 29. He issued two decrees; one confirming that of Gregory X. ordering the shutting up of the cardinals when in conclave, and one declaring the right of any pope to abdicate at pleasure—a right which, after ruling 5 months and 8 days, he exercised, Dec. 13, 1294. In his document of renunciation he assigned as the moving causes "the desire for humility, for a purer life, for a stainless conscience; the deficiencies of his own physical strength; his ignorance, the perverseness of the people, and his longing for the tranquillity of his former life." Having divested himself of every outward symbol of dignity, he returned to his old solitude; but he was not permitted to remain; his successor, Boniface VIII., sent for him, and, despite his efforts to escape, imprisoned him in a castle, where, after languishing ten months in the infected atmosphere, he died, May 19, 1296. He, like the first of the name, is recognized as a saint by the Roman church.

CEL ESTINES, an order of hermits of St. Damianus, founded by Peter de Morrone about 1264, and confirmed as a monkish order by Urban IV. in 1264 and 1274. They called themselves C. when their founder ascended the papal chair under the name of Celestine V. They are regarded as a branch of the great order of St. Benedict, whose rule they follow; they wear a white garment with black hood and scapulary, and live a purely contemplative life. In the 13th and 14th centuries, the order rapidly spread through France, Italy, and Germany, but subsequently decayed. The French C. were

secularized by order of pope Pius VI. in 1776-78; so also were the Neapolitan Celestines. In the present day, the order is almost extinct.

CELIBACY, from Lat. *caelebs*, unmarried. Notwithstanding the divine commendation of marriage given in the Jewish Scriptures (Gen. i. 28), the opinion had become prevalent, even before the time of Christ, that C. was favorable to an intimate union with God. This notion took its origin in the wide-spread philosophy of a good and an evil principle. The body, consisting of matter, the seat of evil, was looked upon as the prison of the pure soul, which was thought to be defiled by bodily enjoyments. Among the Jewish sect of the Essenes, accordingly, a life of C. was held to be the chief road to sanctity. These ascetic views naturally led, in the first place, to the disapproval of second marriages. While, therefore, in the first Christian churches, every one was left at liberty to marry or not as he thought fit, the objection to those who married a second time had become so generally spread, that the apostle Paul saw occasion to counsel such Christian converts as were in widowhood to remain so.

By the 2d c., however, the unmarried life generally had begun to be extolled, and to be held necessary for a life of sanctity, although several, at least, of the apostles themselves had been married. Two passages of Scripture (1 Cor. vii. and Rev. xiv. 4) were specially cited as proving that C. was the genuine condition of a Christian; and with the platonizing fathers of the 2d and 3d centuries, the unmarried of both sexes were held as standing higher than the married. Accordingly, although there was no express law against the marriage of the clergy, many, especially of the bishops, remained unmarried; a second marriage was, in their case, already strictly prohibited.

As the bishops of Rome rose in consideration, and gradually developed a firmer church government, they called upon all who belonged to the clerical order to live for the church alone, and not marry. This requirement met with constant resistance; still, it became more and more the custom, in the 4th c., for the higher clergy to refrain from marriage, and from them it went over to the lower orders and to the monks. Provincial synods now began expressly to interdict the clergy from marrying. The council of Tours (566) suspended for a year all secular priests and deacons who were found with their wives; and the emperor Justinian by an edict declared all children born to a clergyman, after ordination, to be illegitimate, and incapable of inheritance. There were still, however, many married priests who resisted the law, and found encouragement in the opposition which the Greek church made to that of Rome in this matter of celibacy. The council held at Constantinople in 692, declared, in opposition to the church of Rome, that priests and deacons might live with their wives as the laity do, according to the ancient custom and ordinance of the apostles. The orthodox Greek church has continued to adhere to this decision. Priests and deacons in that church may marry before ordination, and live in marriage after it; but they are not allowed to marry a second time. However, only a priest living in C. can be chosen as bishop or patriarch.

The Church of Rome continued its endeavors to enforce the law of C.; though, for several centuries they were attended with only partial success. There still continued to be numbers of priests with wives, although the councils were always issuing new orders against them. Popes Leo IX. (1048-54) and Nicolas II. (1058-61) interdicted all priests that had wives or concubines from the exercise of any spiritual function, on pain of excommunication. Alexander II. (1061-73) decreed excommunication against all who should attend a mass celebrated by a priest having a wife or concubine. This decision was renewed by Gregory VII. in a council held at Rome in 1074, and a decretal was issued that every layman who should receive the communion from the hands of a married priest should be excommunicated, and that every priest who married or lived in concubinage, should be deposed. The decree met with the most violent opposition in all countries; but Gregory succeeded in carrying it out with the greatest rigor; and though individual instances of married priests were still to be found in the 12th and 13th centuries, the C. of the Roman Catholic clergy was established, and has since continued both in theory and practice.

The violence thus done to human nature did not fail to avenge itself in those rude times. The licentiousness and corruption of the priests and monks became in many cases boundless, and it was in vain that strict individuals, as well as councils, strove against it. The immorality and debasement of the clergy became a reproach and by-word in the mouth of the people, and gave a powerful impulse to the religious movement that began in the 16th century. The leading reformers declared against the C. of the clergy as unfounded in Scripture, and contrary to the natural ordinance of God, and Luther set the example of marrying. This was not without effect on the Roman Catholic clergy, and the question of the abolition of C. was raised at the council of Trent (1563). But the majority of voices decided that God would not withhold the gift of chastity from those that rightly prayed for it, and the rule of C. was thus finally and for ever imposed on the ministers of the Roman Catholic church. Those who have only received the lower kinds of consecration may marry on resigning their office. For all grades above a sub-deacon, a papal dispensation is necessary. A priest that marries incurs excommunication, and is incapable of any spiritual function. If a married man wishes to become a priest, he receives consecration only on condition that he separate from his wife, and that she of her free will consent to the separation and enter a religious order, or take the

vow of chastity. The priests of the united Græco-Catholic congregations in Rome have received permission from the popes to continue in marriage, if entered into before consecration, but on condition of always living apart from their wives three days before they celebrate mass.

Notwithstanding these decisions, the contest against clerical C. has again and again been resumed, in recent times, both within and without the Roman Catholic church. In fact, all attempts at innovation within the bosom of Catholicism, connect themselves with the attack on C., the abolition of which would deeply affect the constitution and position of that church. So far back as 1817, the Catholic faculty of Tübingen expressed the opinion that compulsory C. was one of the chief causes of the want of Catholic ministers. In 1826, the Catholic clergy of Silesia put in petitions to the bishop for the abolition of C.; and unions were afterwards formed in Baden, Würtemberg, Bavaria, Silesia, and Rhenish Prussia, which, along with alterations in the doctrines and ritual of the Romish church, combined attacks on the prohibition of marriage to the clergy. A work was also published, entitled *The Introduction of Compulsory Celibacy among the Christian Priesthood, and its Consequences* (Altenb. 1828, new ed. 1845), which excited great attention. At last the abolition of the law came to be discussed in the legislatures of Baden, Saxony, and other countries. The church claimed this subject as belonging exclusively to her jurisdiction, and not to that of the state; and in Würtemberg the clergy induced the government to suppress the anti-celibacy society; but this only made their opponents in the press the more zealous. In France, also, the question, about 1829, was eagerly discussed. And in Spain, the academy of ecclesiastical science took the subject into consideration in a meeting held in 1842; while the Portuguese chambers had previously, in 1835, discussed it, though without result. The same took place in Brazil, about 1827.

During the commotions of 1848, the subject was again brought into prominence in Germany. The German Catholics (q. v.) had already abolished C.; and a general measure was called for in the Frankfort parliament, in the Prussian assembly, and in the press. In Austria, also, voices were raised against it; but here the state took the side of the pope, who, in a bull of 1847, had added fresh stringency to the rule of C., and condemned its infringement. See BACHELOR.

CELL (Lat. *cella*, from *celo*, to conceal). The Latin word had nearly all the significations which we attach to the English one, and a good many besides which we have not borrowed. For example, the whole space between the walls of an ancient temple was called the *cella*. But the interior was frequently divided into several *cellæ*, in which case each C. took the name of the deity whose statue it contained, and was called the C. of Jupiter, Juno, Minerva, and the like. In these cases, the word approached to its general meaning, which, with the Romans as with us, was that of a store room, or small apartment where objects of any kind were stowed away. In modern architecture, the term vaulting C. signifies the hollow space between the principal ribs of a vaulted roof.

CELLARER, a person under the Roman emperors who supervised the domestic affairs of the household and examined accounts. The same title was given in later times to the purveyors for monasteries or priests. As an officer of a monastery the C. regulated every matter affecting provisions.

CELLÉ, or **ZELL**, a t. of Hanover, on the left bank of the Aller, which at this point becomes navigable, 23 m. n.e. of the city of Hanover. It is situated in the midst of a sandy plain, well built, and has a palace with a garden, in which Matilda, sister of George III., is buried. Pop. '75, 18,163. The inhabitants are very industrious. The chief manufactures are linen, hosiery, tobacco, wafers, soap, etc. An active commerce is also carried on by the Aller, and by railway.

CELLINI, **BENVENUTO**, a celebrated Italian gold-worker, sculptor, founder, and medaillieur, remarkable not only for his skill as an artist, but also for his checkered life, was b. at Florence in the year 1500, and first displayed skill as a chaser and gold-worker. His autobiography is a remarkably curious and interesting work, presenting us with a complete picture of the author's life and character; his activity, his extraordinary weaknesses, the impetuosity of his passions, the perilous circumstances in which his quarrelsome disposition placed him (for C. thought nothing of committing manslaughter in a moment of rage), and the ludicrous vanity and credulity which are never absent from him. The book is also of great value in a historico-social point of view, but does not impress us favorably in regard either to the personal or social morals of the time.

At an early period, having been banished from Florence in consequence of an "affray," C. went to Rome, where he was employed by many distinguished patrons of art, but afterwards was allowed to return to Florence. Another "affray" compelled him to flee to Rome a second time, where he secured the favor of Clement VII. C., by his own account, was as great in arms as in art; he declares that it was himself who killed the constable Bourbon and the prince of Orange at the siege of Rome. His reckless conduct for some years compelled his constant shifting between Rome and Florence, Mantua, and Naples. In 1537, he went to the court of France, where he was very honorably received. Illness, however, induced him to return yet once more to Rome, where he had the misfortune to be imprisoned on a charge of plundering the treasures in the

castle of St. Angelo during the siege of Rome. At length he was liberated, through the intercession of the cardinal of Ferrara, for whom he executed, out of gratitude, a fine cup, and various other works. He now accompanied his deliverer to France, and entered the service of Francis I.; but having incurred the displeasure of the ruling favorite, Mme. d'Estampes, he returned to Florence—not, however, until, as usual, he had settled some matters with his "sword"—where, under the patronage of Cosmo de' Medici, he executed several fine works in metal and marble—among them, the celebrated bronze group of "Perseus with the Head of Medusa," now in the market-place in Florence. Among other preserved works of C., the splendid shield in Windsor castle may be noticed. In his 58th year he began to write his autobiography, and died in 1570 or 1572. In 1876, a number of C.'s original papers were found.

CELLS, in Physiology.—I. **ANIMAL CELLS**.—On examining, under a high magnifying power, any of the constituents of the animal body, we perceive that the smallest parts which appear to the naked eye as fibers, tubes, etc., are not ultimate elements in respect to form (morphotic elements), but that they contain and are built up of certain extremely minute particles, which differ in different organs, but always have a similar appearance in the same organs. By far the most important of these microscopic forms, which are known by histologists as "simple elementary parts," are the C., which not only form the starting-point of every animal and vegetable organism (the ovum in either kingdom of nature being simply a cell), but also—either as C., or after having undergone certain modifications which will be presently described—make up the tissues and organs of the perfect animal. Indeed, some of the lowest plants (red snow, gory dew), and of the simplest forms of animal life (Gregorinae, etc., q.v.), appear to consist of a single cell.

While in plants the elementary parts generally unite directly with one another, in animals they are usually combined by an interstitial substance, which may be either solid or fluid, and is always derived from the blood or general nutrient fluid. If this interstitial substance take a part in the formation of the C., it is called a cytoblastema or a blastema, from *kutos*, a cell or vesicle, and *blastema*, germ substance; if it has nothing to do with their maintenance, it is called the matrix. The cytoblastema is usually fluid, as in the blood, chyle, etc.; while the matrix is solid, as in cartilage, bone, etc.

In every cell, we can distinguish, if we use sufficiently high magnifying powers, a membranous envelope, known as the cell-wall or membrane, and certain contents. The latter are fluid or gelatinous, and besides containing particles or granules, usually exhibit a peculiar rounded body, the nucleus; which, again, contains in its interior a fluid and a still smaller corpuscle, the nucleolus.

The fundamental form of the cell is spherical or lenticular; it is such in all young C. and is persistent in those which occur in fluids, as, for example, the blood-corpuscles. Amongst other well-known forms may be mentioned: the polygonal, as in pavement epithelium, or the pigment of the eye; the conical or pyramidal, as in ciliated epithelium; the cylindrical, as in cylinder epithelium; the fusiform, or spindle-shaped, as in contractile fiber-cells; the squamous, as epidermic scales; and the caudate, polar, or stellate, as the C. in the gray nervous tissue.

With regard to size, the largest animal C.—excepting the unicellular organisms—are the yolk-cells of the ova of birds and amphibia, while the blood-cells of certain animals may be taken as representing the smallest cells. Average C. range from 0.005 to 0.01 of a line in diameter.

The cell-membrane is usually transparent and colorless, mostly smooth, and so thin as to exhibit only a single contour, rarely of any measurable thickness. No traces of structure can be detected in it. The granular appearance which the membrane occasionally presents, is due to projections depending on granules lying on the inside; and it vanishes on the addition of water, which causes the cell to be distended by endosmosis. See OSMOTIC ACTION.

C. which contain only fluid are rare (fat-cell, blood-cell); generally, besides fluid, they contain elementary granules and vesicles, and sometimes crystals. As a general rule, the number of these morphotic elements increases with the age of the cell; sometimes, however, this is not apparent, in consequence of their being grouped in a single mass around the nucleus.

The nucleus is usually spherical or lenticular, transparent and either colorless or yellowish, and ranges from 0.002 to 0.004 of a line in diameter. All nuclei are vesicles, as was originally maintained, in 1841, by Schwann (*Microscopical Researches into the Accordance in the Structure and Growth of Animals and Plants*, Sydenham society's translation, 1847, p. 173), who must be regarded as the founder of the cell-theory in its relation to animal tissues, and as has since been confirmed by Kölliker and other later observers. The contents of the nucleus usually consist, with the exception of the nucleolus, of a limpid or slightly yellowish fluid, from which water and acetic acid precipitate granular matter. In general, only one nucleus exists in each cell, except when it is multiplying (a process which we shall presently explain); occasionally, however, we meet with several nuclei—four, ten, or even twenty.

The nucleolus is round, sharply defined, and often so small as to be almost immeasurable. Nucleoli are found in most nuclei so long as the latter are still young, and in many during their whole existence. As, however, nuclei exist in which no nucleolus

can be detected, we cannot regard the nucleolus as so essential an element of the cell as the nucleus. Most commonly a nucleus contains only one nucleolus; two are not unfrequently seen; more are rare.

Our knowledge of the chemical composition of C. is very imperfect. That the cell-membrane is a protein substance (q. v.)—at all events in young C.—is obvious from its solubility in acetic acid and in dilute caustic alkalies; and the membrane of the nucleus seems to have a similar composition; while there are chemical reasons for believing that the nucleolus is composed of fat. In the contents of most C. we usually find such substances as occur in solution in the cytoblastema—viz., water, albumen, fat, extractive matters, and salts; and in the C. of secreting organs, as for instance, the liver and kidneys, we find the special secretions of those glands; in the blood-cells, we find hemato-crystalline, etc.

There are two perfectly distinct ways in which C. can be generated: they may be developed independently of other C. in a plastic fluid (the cytoblastema); or they may be developed from pre-existing C. by cell-multiplication, the existing C. either producing secondary C. within themselves, or multiplying by division. In both these latter kinds of cell-development, the nucleus seems to be the center of development of the young cells.

In order that free or independent cell-development shall take place, we must have a cytoblastema containing protein substances (probably fibrin), fat, and certain salts (especially phosphates) in solution; and very possibly the presence of the particles of pre-existing C. may also be necessary, in which case free cell-development ceases to exist. The chyle and lymph corpuscles may be mentioned as examples of this mode of cell-formation. The steps of the process are not very clearly made out, but we know that the nuclei are first formed, and that the cell-membranes are developed around them. Free cell-development is far less common in man and the higher animals than cell-multiplication, and, we believe, never occurs in the vegetable kingdom. All pathological cell-formations—the C. in pus (q. v.), and in other morbid exudations—come, however, under this head.

The development of C. within other C. is of very common occurrence. An original or parent cell produces two or more secondary or daughter C., and the process of formation is said to be endogenous. Cartilage-cells afford a good example of this process. The nucleus and the contents of each parent cell undergo division into two parts, so that the number of C. is successively doubled. The mode in which the multiplication of the nucleus takes place cannot be definitely made out in all cases, but when clear observation is possible, the nucleoli first divide into two, and then separate.

A multiplication of C. by division has been proved to take place in the red blood-cells of the embryos of birds and mammals, and in the first colorless blood-cell of the tadpole, and very probably occurs extensively in many embryonic and adult tissues, in which a self-multiplication of C. is certain, but where no parent C. with secondary C. can be detected. In this and similar cases we have an elongation of the cell, and the single nucleus becomes divided into two; the cell then suffers constriction in the middle, which proceeds till it finally separates into two parts, each of which contains a nucleus. This variety of cell-formation affords a good illustration of the doubt and difficulty connected with this class of investigations. It was altogether unknown to Schwann when he published his great work in 1839, and was first noticed and described by Remak in 1841, who, however, subsequently retracted his published view, and did not again advocate it till Kölliker confirmed his observation, and declared it to be correct.

No satisfactory theory has been propounded with the view of explaining the development of cells. Schwann compares the formation of C. with that of crystals, but it must be recollected that the molecular attraction concerned in the formation of C. is so far peculiar, that—1. It never produces geometrical solids, but even in the nucleus and nucleolus determines a globular form; 2. That it aggregates not homogeneous, but chemically different substances; and 3. That the final result of its action—namely, the cell—is extremely limited in size, while a crystal may be of a comparatively indefinite magnitude.

The growth of C. requires some notice. Growth probably occurs in all C., although not in all to the same extent. It is most obvious in those which are formed directly round a nucleus, since in these the membranes which at first closely invest the nucleus, in time become distended and enlarged, and merely remain in contact with the nucleus at one point. Growth may take place either in surface or in thickness. The former is most commonly general—viz., in all those cases where C. increase without altering their form; but is sometimes partial—viz., in those cases in which the cell deviates considerably from the primary globular form. The latter occurs to a certain degree in all C., but in some kinds to a far greater extent than in others. The nuclei and nucleoli also take part to a certain extent in the growth of the cells. Schwann gives the following general explanation of the process of growth. He considers that the molecules of the cell-membrane exert an attractive influence on the fluid which surrounds them, and deposit its newly formed particles amongst themselves. If the deposition take place between the molecules already present in the substance of the membrane, the cell

becomes distended; if it take place only in one or more definite directions, the membrane becomes thickened.

Having now traced the cell to the period of its full growth, we are prepared to consider the processes which occur in the interior of this minute organic structure, or, in other words, the physiology of cells. To enter satisfactorily into this subject, we ought to have an exact knowledge of the chemical composition of the contents of different cells. All that we know of the contents of C. generally is, as we have already stated, that they usually consist of a moderately concentrated solution of protein matters, with alkaline and earthy salts, and dissolved or suspended fat-particles; and that besides these ingredients many C. contain either a great preponderance of one of these constituents, to the almost entire exclusion of others, or are found to contain altogether new substances. Thus, there are C. with much protein matters, as the nerve-cells, and with much fat, like the fat-cells; while there are other cells which specially contain hæmatine (the red coloring matter of the blood), pigment, biliary and urinary constituents, mucus, milk, sugar, etc.

The main cell-processes occurring in these variously constituted C. are absorption, secretion, and excretion. These depend principally, if not entirely, upon chemical and physical laws, and are to a great extent amenable to micro-chemical observation.

Absorption, or the appropriation of matters from without, is most manifest to those C. which at first have little or no contents save the nucleus. Although endosmosis must be taken into account as a condition of absorption, C. must not be regarded merely as vesicles provided with indifferent porous membranes; for the filling of C. does not take place by their admitting every kind of matter indiscriminately; but they have the power of taking up one constituent, and rejecting another, and thus exhibit a selective faculty.

The cell having thus become filled from without, we have next to inquire into the changes which take place in the membrane and in the contents. As regards the former, the membranes of most C. not only become denser and more solid with age, but they undergo changes in their chemical constitution. Thus, in the horny tissues, the young C. are easily soluble in alkalis and acids, while older C. of the same nature are scarcely affected by these re-agents; again, in cartilage C., the membrane not only becomes firmer with age, and thickens as ossification proceeds, but is changed into a tissue yielding gelatine or glue on boiling, which subsequently becomes impregnated with salts of lime (phosphate and carbonate). See *Boxe*.

The function of secretion is mainly carried on by changes in the contents of the C. Thus, mucous is formed in the epithelial C. of the mucous membranes, pepsin in those of the gastric glands, bile in the C. of the liver, and sepia in the C. of the ink-bag of the cuttle-fish. In these cases, the C. do not separate mucus, pepsin, etc., from the blood, but merely the materials from which they elaborate these substances. In other cases, as, for instance, in the C. of the kidney, the function of these minute organisms is not to manufacture new products, but merely to separate certain substances (urea, uric acid, etc.) from the blood, which, if not immediately removed from the general circulation, would speedily accumulate, and act as a deadly poison. That these C. merely separate the urea from the blood, and do not form it in their interior, is proved by the fact that, if the kidneys of an animal are extirpated, the urea and other urinary constituents may speedily be found in large quantity in the blood.

Excretion takes place by the bursting or solution of the distended secreting cell, usually into the duct of a secreting gland. The reader who desires further information on the functions of the C. in relation to secretion and excretion, is especially referred to an admirable memoir by prof. Goodsir, "On Secreting Structures," published in John and Harry D. S. Goodsir's *Anatomical and Pathological Researches*, 1845.

In conclusion, we must notice the metamorphoses of C. The ovum itself is, as we have already mentioned, merely a nucleated cell; after impregnation, a number of secondary C. are formed within it, by a process of cleavage or segmentation. See articles *GENERATION* and *OVUM*. Some of the C. which occur in the ovum in its early stages soon coalesce with others to form the higher elementary parts, which we shall shortly enumerate; others, without entering into combinations, more or less change their previous nature, as the horny plates of the epidermis and nails; while others, again, undergo no change of form throughout the period of their existence.

The permanent C. are arranged by Kölliker (*Manual of Human Histology*, translated by Busk and Huxley, 1853, vol. i. p. 47) under the following heads:

1. *True Cells*, which have in no essential respect altered their cellular character. These occur in the epidermis and the epithelium; in the blood, chyle, and lymph; in the glandular secretions, in the fatty tissue, in the gray nervous substance, in the glands (liver, spleen, etc.), and the cartilages. Their varieties of form and contents have been already noticed. Regarding their modes of occurrence, some are either isolated in fluids or in solid tissues; others are united by apposition, without any intervening structure, into a cellular parenchyma; while others, again, are conjoined by an intercellular substance of some kind.

2. *Metamorphosed Cells*. To these belong—the *horny scales*: flattened, polygonal, or fusiform; their membrane being fused into one mass with their contents. They occur in the epidermis, the laminated pavement epithelium, and the hair and nails. *The con-*

tractile fiber C.: fusiform, slightly flattened, considerably elongated C., whose membrane, with its soft, solid contents, is changed into a contractile substance. They occur in the smooth or involuntary muscles. *The tubules of the crystalline lens of the eye*: very elongated C., with viscid, albuminous contents. *The prisms of the enamel of the teeth*: greatly elongated, prismatic, and strongly calcified cells. *The bone C.*: thickened C. (with *canaliculi*, or minute branching canals) which have coalesced with the matrix of the bones. *The transversely striated muscular C.*: large polygonal C. whose contents have become metamorphosed into a transversely striated or striped tissue, such as is found in voluntary muscular fiber. From these C. are formed all the different fibers, net-works, membranes, tubes, etc.; in short, all the higher elementary parts of which the animal body is composed.

For further information on C. and cell-development, the reader is referred, in addition to the works quoted in this article, to Leydig, *Lehrbuch der Histologie des Menschen und der Thiere*, 1857; and to Frey, *Histologie und Histochemie des Menschen*, 1859 (translated by Barker, 1874). He will find full details on morbid cell-development (the growth of C. in tubercle, cancer, and other morbid deposits) in Vogel's *Pathological Anatomy of the Human Body*, translated by Day, 1847; and in Wedl's *Pathological Histology*, translated (for the Sydenham society) by Busk, 1855.

II. VEGETABLE CELLS.—In the vegetable, as in the animal kingdom, the primary form of the cell is that of a sphere. There are, however, interfering influences, which usually alter or modify the primary form, of which the most important are, (1.) Special directions assumed in the development, in obedience to a law regulating the structure of the tissue in which the cell occurs; and (2.) Obstructions to the expansion of the cell in certain directions from the pressure of surrounding cells.

The most common forms referable to the law of development are, (1.) The *spherical* or fundamental form; (2.) The *cylindrical*, in which there is a tendency to elongation in the direction of a vertical axis; and (3.) The *tubular*, in which there is an excess of development in the direction of the two transverse axes.

The secondary modifications of these forms are numerous. Thus, in lax tissues, the spherical form may become an irregular spheroid, running out into *lobed*, and even *stellate* forms, as may be seen in the pith of rushes and the stems of various aquatic plants. Again, in seeds, the hard part of fruits, etc., the mutual pressure of the C. converts the spherical into *polyhedral* forms, of which the *dodecahedron*—giving a hexagonal section, and arising from equal pressure in all directions—is the most common, although *cubic* and many other forms occasionally occur.

The magnitude of the vegetable C. is very varied. In flax, the liber-cells have been found $\frac{1}{4}$, or even $\frac{3}{8}$ of an inch in length, and the cylindrical C. of some of the confervæ are more than an inch long—although their transverse diameter is very minute—whilst, on the other hand, the spores of fungi are C. of a diameter of $\frac{1}{5000}$ of an inch. The average diameter of the C. in the parenchymatous tissues is about $\frac{1}{1000}$ of an inch.

Both the cell-wall and the contents differ from the corresponding parts in animal cells. In all young C. the wall is membranous, freely permeable by water, elastic, and flexible. In many cases it retains these properties, whilst in others it becomes much modified, as the cell grows older. It consists mainly of cellulose (q.v.). As the vital and chemical phenomena exhibited by plants depend primarily upon operations in the interior of the cell, the careful study of the cell contents is of the highest importance. Of these contents, the most important are the *primordial utricle*, with the *protoplasm*, the *nucleus*, *chlorophyll corpuscles*, and *starch granules*.

The primordial utricle is a layer of substance of mucilaginous consistence (colored yellow by iodine), lining the entire wall of the young cell, but often disappearing at a comparatively early period. The protoplasm is a tough mucilaginous and frequently granular fluid, which fills up the space in the interior of the cell not occupied by the nucleus. The nucleus or cytoblast is a globular or lenticular body, identical in its character with the substance of the primordial utricle, and occurring in the protoplasm of most young cells. Little is known with certainty regarding the chlorophyll corpuscles, except that, under the influence of solar light, green coloring matter is developed from them. Of the starch granules, which are very commonly found in the cell contents, we need not speak, as they are sufficiently described in the article STARCH.

In addition to the above organized structures, we must mention as frequent constituents of the cell-contents, fluid coloring matters, essential and fixed oils, resins, sugar, dextrine, gum, alkaloids, and mineral or organic salts, which are not unfrequently found in a crystalline form, when they are termed raphides.

There are two modes of cell-development in the vegetable kingdom—viz., (1) *Cell-division*, where two or more new cells fill the cavity of the parent cell, and adhere to its membranes, appearing to divide it into compartments; and (2) *Free cell-formation*—not to be confounded with a process of the same name which is supposed to occur in the animal kingdom—in which the whole or part of the cell-contents become detached from the cell-wall and resolved into new loose C., which ultimately escape from the parent cell. The former mode universally occurs in the formation of the C. by which growth is effected; the latter occurs only in the production of C. connected with reproduction. For further information, we must refer the reader to Von Mohl's *Principles of the Anatomy and Physiology of the Vegetable Cell*, translated by Henfrey, London, 1852.

CELLULARES, in botany, a designation applied to those plants which consist entirely of *cellular tissue* (q. v.), without proper vessels of any kind. C., thus defined, are a subclass of acotyledonous plants, containing the orders of *lichens*, *fungi*, and *algæ*. In the system of De Candolle, however, the name C. was given to the second grand division of plants, the first being called *vasculares*, and the distinction between them being the presence or absence of vessels, the C. including all acotyledonous or cryptogamous plants. But ferns and mosses are not destitute of vessels; so that this system is not strictly accurate with regard to them: whilst, as all vessels are now known to be formed by the elongation and union of cells, the distinction between vascular and cellular tissue is not generally regarded as affording a good basis for primary divisions in the classification of plants.

CELLULAR TISSUE. This is the old term for a widely diffused animal texture, which has also received the names of areolar, reticular, filamentous, and connective tissue. If we make a cut through the skin, and proceed to raise it, we see that it is loosely connected with the subjacent parts by a soft, filamentous, elastic substance, which, when free from fat, has a white fleecy aspect. This is the tissue in question. It is also found underneath the serous and mucous membranes which are spread over internal surfaces, and serves to attach these membranes to the parts which they line. We likewise find it lying between the muscles, the blood-vessels, nerves, etc., occupying the interspaces between the different organs, and often investing each of them with a special sheath. While it thus connects and insulates entire organs, it at the same time performs a similar function in regard to the minute parts of which each organ is made up. Thus, for instance, in muscular tissue, it enters between the fibers of the muscle, uniting them into bundles; and similarly, it enters into glands, etc. This is termed *penetrating* or *parenchymal* cellular tissue.

It is not only one of the most general and most extensively distributed of the tissues, but it is continuous through the whole organism, and may be traced without interruption from any one region of the body to any other. It is in consequence of this continuity that dropsical fluids, air, etc., effused into the C. T., may spread far from the spot where they were first introduced.

On examining a fragment of this tissue, when stretched out, we see with the naked eye that it presents the appearance of a multitude of fine, soft, colorless, elastic threads, like spun glass; intermixed with these are delicate films or laminae, crossing one another in all directions, and leaving open spaces, or areolæ; hence the name of areolar tissue.

A small quantity of colorless transparent fluid is always present in this tissue; when abnormally increased, it gives rise to the form of general dropsy known as *anasarca*. The microscopic characters of C. T. are briefly noticed in the article **TISSUES, ANIMAL**.

CELLULAR TISSUE, in botany, is any vegetable tissue formed of cohering cells alone, and in which there are no vessels. It is often called *parenchyma* (Gr. something spread out), although an attempt has been made to restrict that term to one kind of it, with cells of a particular form, and terms of Greek derivation have been multiplied for other kinds. The cells of C. T. vary much, both in form and size (see **CELLS**); but particular forms and sizes are characteristic of particular kinds or particular parts of plants. The products of the vital activity of plants are formed in the interior of cells, or by secretion from the inner side of their walls. Vessels being formed from cells, it is not easy to fix the limits between C. T. and *vascular tissue* (q. v.). Some kinds of plants, however, are entirely composed of C. T. (see next article); all consist of it in the earliest stages of their growth; none are at any time destitute of it. Fluids are transmitted from cell to cell, through the mass of C. T., passing through the walls of the cells where there are no openings that can be detected by the microscope. The soft and succulent parts of plants, which it is the care of the gardener to cherish and increase, consist chiefly of cellular tissue.

CELLULOID, a remarkable modern invention, apparently capable of wide usefulness, wherever India-rubber and various kinds of cloth are now employed. Celluloid is produced by mixing gum camphor with a pulp of gun-cotton, and subjecting the combination to a high degree of pressure and heat. The result is a hard product of extraordinary toughness and elasticity. It can be made plastic again and molded into any required form. Any color can be given to it by the use of coloring matter during the process of manufacture. It is extensively used as a substitute for ivory, which it resembles so closely that it is sometimes difficult to detect the difference. It is said to equal ivory in strength and elasticity, and not to warp or discolor with time. It has proved a good material for piano and organ keys, billiard-balls, backs of brushes, looking-glass frames, handles for knives, forks, umbrellas, and many other articles. It is much cheaper than ivory, and is claimed to be better for decorative purposes. It is also used with much success to imitate tortoise-shell, malachite, amber, pink coral, and other costly materials. In imitation of tortoise-shell, it is made into combs, napkin-rings, match-boxes, card-cases, etc. Imitations of pink coral jewelry are made and sold at prices much below those of the genuine. The same is true of imitations of malachite and amber. Mouth-pieces for pipes, cigar-holders, etc., are common. It is also used as a substitute for porcelain in making dolls' heads. The frames of eye-glasses, opera-glasses, and spectacles are made of it. More recently it has come into use in

combination with linen, cotton, or paper, for shirt bosoms, cuffs, and collars. The material has a hard glistening surface, like that of newly laundered linen; is elastic and impervious to moisture, and when soiled can be renovated with a moistened sponge. There seems to be some danger in the manufacture of C. Though there have been explosions and several persons killed in one of the manufactories, it is said that with due care, and avoidance of unwarrantable experiments, the manufacture is not unsafe.

CELLULOSE is the term applied to the carbohydrate, $C_{12}H_{10}O_{10}$, which forms the mass of the cell-membranes of all plants. It is one of a class of compounds intimately connected in their chemical constitution, but presenting remarkable physical differences. Without entering into chemical details, we may mention the following points of difference between it and the chemically allied substances—sugar, dextrine, and starch. Sugar and dextrine are soluble in cold water, and occur in the cell sap in solution; starch is insoluble in cold water, but softens into a mucilage in boiling-water, and is found in granules in the cell-contents; while C. is insoluble in cold or boiling water, and, as far as is at present known, is very slightly soluble in the strong mineral acids, its only perfect solvent being a solution of oxide of copper in ammonia.

The occurrence of C. in an organism was formerly regarded as a certain proof that the latter belonged to the vegetable kingdom. It has, however, been shown to be a constituent of the lower animals.

Although C. forms a large proportion of the food of herbivorous animals, it is supposed to pass through the intestinal canal unchanged, and not to contribute directly to nutrition.

CELSIUS, ANDERS, 1701–44; a Swedish astronomer, b. at Upsala. He traveled in Germany, France, Italy, and took part in the expedition of 1736 led by Maupertius and others to measure a degree of latitude in Lapland. C. was a member of the academies at Stockholm and Berlin, of the British royal society, and secretary of the royal society of Upsala. Among his works are *Observations on the Measurement of the Earth*, and *A New Method of Measuring the Distance of the Sun from the Earth*, in which he endeavored to show that the waters of the ocean are decreasing in volume.

CELSUS, an Epicurean philosopher, but tinged with Platonism, lived in the 2d c. after Christ, and wrote, after 150 A.D., under the title *Logos Alethes* (the True Word) the first considerable polemic against Christianity. The book itself has perished; but considerable fragments have been preserved as quotations given by Origen in his answer, *Contra Celsum*, in eight books. In the fragments—which are very interesting, as showing the views of a heathen philosopher in regard to Christianity—C., with wit and acuteness, but without depth or earnestness of thought, prefers against the new religion charges of unphilosophicalness and blind credulity; and especially endeavors to convict Christians of self-contradiction in their spiritual doctrine contrasted with their anthropomorphic representations of Deity; in their religious arrogance contrasted with their confession of sinfulness; and in their views of the necessity of redemption. He also reproaches Christians with their party divisions and ever-varying opinion. With regard to his own positive doctrines, he speaks of evil as necessary and eternal, as an essential property of the material world (*hylé*); sin as something that can never be entirely removed, and least of all through a vicarious sacrifice. He charges Christians with having willfully altered their sacred writings.

CELSUS, AULUS CORNELIUS, a Latin physician and writer, who flourished probably in the reign of Augustus. He was called the Roman Hippocrates, because he generally followed the great "father of medicine," and introduced the Hippocratic system among the Romans. C. wrote not only on medicine, but also on rhetoric, history, philosophy, the art of war, and agriculture. His style is succinct and clear, but full of Græcisms. The only great work of his which survives, is the *De Medicinâ*, which is divided into eight books. The portions relating to surgery are exceedingly interesting and valuable, because C. has there given an account of the opinions and observations of the Alexandrian school of medicine. The first edition of the *De Medicinâ* appeared at Florence in 1478. C.'s works have been translated into several modern languages. A translation into English was made by Dr. Grieve, London, 1756. Among the best editions are those of Krause (Leip. 1766), Dr. Milligan's 2d edition (Edin. 1831), and one at Cologne, 1835.

CELT (Lat. *celtis*, a chisel), the name by which certain weapons or implements of the early inhabitants of western Europe are known among archæologists. Celts are either of stone or of bronze.

Stone celts vary in length from about 1 in. to 22 in.; but the most common size is from 6 to 8 in. in length, and from 2 to 3½ in. in breadth. They are made of almost every kind of stone, and show considerable diversity of shape, almost all, however, having more or less resemblance to the muscle-shell. The ruder celts are generally of slate, shale, schist, or grit; the finer, of flint, porphyry, greenstone, syenite, or agate. Many of the finer celts are beautifully shaped and highly polished. A remarkable example of this class, the property of Sir Coutts Lindsay, found near St. Andrews, in Scotland, is described by sir David Brewster in the *Philosophical Journal* for 1823. Recently, a class of celts found in the later geological strata have excited

much interest as well among archæologists as among geologists. They are obviously of the same type with the more common celts, but of ruder construction, as if fashioned by a more barbarous people. The stone C. was fastened into a handle of horn, bone, or wood. A C. of serpentine, with a handle of deerhorn, was found in one of the Swiss lakes in July, 1859, and a stone C. with a wooden handle, in the county of Tyrone, in Ireland.

Bronze celts vary in length from about 1 in. to 8 or 10 in., the most common length being about 6 inches. They are sometimes ornamented with rudely incised lines or circles, and have occasionally been found wrapped up in linen, or inclosed in bronze cases or sheaths. They show much greater diversity of shape than the stone celt. As many as four classes have been distinguished by archæologists—1st, The simple wedge-shaped C., most nearly resembling the common form of the stone celt. 2d, The wedge-shaped C., with sides more or less overlapping, and a stop ridge or elevation between the blade and the part which received the handle. 3d, The wedge-shaped C., with sides greatly overlapping, with or without the stop-ridge, but with a loop or ear upon, and parallel to, its lower surface. 4th, The socketed C., or the C. with a hollow to receive the handle, and generally with a loop or ear upon its lower surface.

Both stone and bronze celts were probably used for several purposes, serving for chisels, adzes, and axes, as well as for weapons of war, like the stone hatchets of the South Sea islanders and other savage or barbarous tribes. Examples of stone and bronze celts of all classes (together with the molds in which bronze celts were cast) may be seen in the British museum at London, in the national museum of the antiquaries of Scotland at Edinburgh, and in the museum of the Royal Irish academy at Dublin. The last collection has more than 500 examples of stone celts, about one half of which were found in deepening the bed of the Shannon or its tributaries, between the years 1843 and 1848. A bushel of bronze celts has more than once been discovered at one spot.

CELTIBERI, a powerful people of ancient Spain, supposed to have sprung from a blending of the Iberians or Spanish aborigines with Celtic invaders from Gaul. The C. inhabited a large inland district of the peninsula, corresponding to the s.w. half of Aragon, nearly the whole of Cuença and Soria, and a great part of Burgos, but the name Celtiberia had often a wider signification, including the country as far s. as the sources of the Guadalquivir. The C. were divided into four tribes, and were unquestionably one of the bravest and noblest peoples in the peninsula. Their cavalry and infantry were equally excellent. For many years, they withstood the efforts of the Romans to subdue them, and it was not till after the campaigns of Sertorius that they began to adopt the Roman language, dress, and manners.

CELTIC NATIONS, one of the groups of the great Aryan (q.v.) family.

Languages.—In addition to the English, and retreating before it, there are at present four languages spoken in the British isles—the Irish, the Highland Scotch (or Gaelic), the Manx, in the isle of Man—all three nearly related to one another, and constituting the northern (Erse, Gadhelic) branch of the Celtic languages; whilst the fourth language, the Welsh, constitutes, together with the Cornish of Cornwall (extinct since 1778) and the Bas Breton of Brittany, the southern (Briton, Cymric, Cambric) branch. The remains of the language of the Gauls or Celts, the ancient inhabitants of France, closely resemble the British and Gadhelic idioms; hence the name Celtic languages has been applied to the whole of them. The Celtic idioms belong to the Indo-German (Aryan) family, as their numerals show. Compare

Old Irish.	Old Welsh.	Sanscrit.
1. óin	un	êka
2. dá	dou	dvâu
3. trí	tri	trayas
4. cethir (c=k)	pedwar	chatvâras
5. cóic	pimp	panchan
6. se	chwech	shash
7. secht(n)	seith	saptan
8. oct(n)	wyth	ashtan
9. noi(n)	nau	navan
10. deich	dec	daçan
20. fichet	ugeint	vinçati
100. cét	cant	çata

The Gaulish was nearer to the Cymric branch, its numerals 4 and 5 having been *petor*, *pempe*. There are a few Gaulish inscriptions which show a declension with full inflections; in old Irish, five cases still exist, but the terminations are very much mutilated; in Welsh, they have disappeared. Thus, the Gaulish name *Segomarus* is declined: gen. *-ri*, dat. *-ru*, acc. *-ron*; the old Irish, *fer*, a man, has the gen. *fir*, dat. *fiur*, acc. *fer*, voc. *fir*; whilst the correspondent Welsh *gŵer* is inflexible. Hence it follows that the pseudo-simplicity of the Welsh is the result of grammatical decay, common in all Aryan languages, and does not at all warrant Latham's theory, that the Celts branched off from the primitive Indo-German nation before the development of case inflections.

History.—Of the separation of the Celts from the other Aryans or Indo-Germans, and

their early migrations to western Europe; no record has come down, the stories about Milesian colonies in Ireland, and migrations from Troy into Wales, being simply monkish fictions. At the dawn of history, we find the *Gauls* (Galli, Celte, *Galatai*) occupying France (Gallia), which was divided into *Aquitania*, between the Pyrenees and Garonne; *Gallia Celtica* proper, between Garonne and Seine; and *Belgica*, from the Seine to the Rhine. The land about the *Rhone* being more early conquered by the Romans than the rest, was set apart by them under the name of *Gallia Narbonensis*, or *Gallia Lugdunensis* (from the towns Narbo and Lugdunum, Narbonne and Lyon). The whole of the four was called Gaul beyond the Alps (*Gallia Transalpina*). A great many tribes of Gauls had settled in Lombardy, where they founded *Mediolanum* (Milan), and which therefore took the name *Gallia Cisalpina* (Gaul this side the Alps). Other Gauls had penetrated into Spain, where they became mixed with the native Iberians, and thus gave rise to the *Celtiberians* about the river Iberus (Ebro). Numerous hosts migrated across the Rhine, occupied southern Germany and Bohemia, and, following the course of the Danube, some invaded Thrace and Greece (278 B. C.); but being repelled, the main body of them settled in Asia Minor, in the province called after them *Galatia*. The Romans found the Gauls at first very formidable enemies; Rome itself was burned by them (389 B. C.), but gradually the Romans conquered first *Gallia Cisalpina* (222), then *Gallia Narbonensis* (112), and lastly, Cæsar subjected all France (52 B. C.), after which the Gauls soon became Romanized. The Gauls of Asia Minor, for a long time the terror of all the neighborhood, were defeated by the Romans (187), and their land finally made a province of the empire (25 B. C.).—The *Britons* (*Britanni*; Welsh, *Brython*) were little known before Cæsar's two unsuccessful expeditions into Britannia; the country was conquered by the Roman gen. Agricola (78–84 A. D.), who secured the new province against the inroads of the Caledonians of Scotland by a fortification across the Scotch lowlands, between the Forth and the Clyde, afterwards removed by the emperor Hadrian further southward, to between Solway firth and the mouth of the Tyne. The Britons were so much influenced by Roman civilization—they were also early converted to Christianity—that the heathen Angles and Saxons, who conquered them in the 5th and 6th centuries, called them *Welsh*; a name which, with the other Teutons, applies to all nations speaking languages of Latin descent. A few of the Britons maintained their independence in Cornwall, Cumberland, and in the mountains of *Wales*. On the last, the name Welsh was ultimately fixed by the English; they themselves, however, called their nation *Cymro*, pl. *Cymry* (a compound of *cyn*, with, in common, and *bro*, land = having a common country, countrymen, in contradistinction to the foreign invader), a name which has nothing to do with Cimbri and Cimmerii. The Welsh remained independent under different petty princes till 1282, when Edward I. conquered them. A part of the Britons went over in the 4th c. to France, where they took possession of *Brittany*, which maintained a doubtful independence under dukes of its own till about 1500.—Whether the *Caledonians*, the oldest inhabitants of Scotland, were Celts of the Cymric or Erse branch, is unknown. After the 3d c., their name disappears, and we hear, instead, of the *Scoti* and *Picti*. As to the latter, the same doubt prevails; but the *Scoti* were emigrants from Ireland, both *Scotus* and *Gadhelus* being common national names of the old Irish. From *Gadhel*, the modern *Gael*, *Gaelic* is derived, which has nothing to do with the name of the Galli.—*Ireland* (*Hibernia*, whence the modern *Eirinn* is derived), enters into the light of history with its conversion to Christianity by St. Patrick (460). The four centuries following on this event are the brightest period in its history. Ireland was then the seat of piety and learning, and sent forth numerous missionaries, by whom many monasteries, centers of civilization, were founded—as *Iona*, in Scotland, by Columba (563); *St. Gall*, by Gallus (615); *Würzburg*, by Kilian (687). In the 7th c., we find Irish bishops at Ratisbon; and *Virgilius* (Feargál), (died 784), bishop of Salzburg, played no small part in the ecclesiastical history of Germany. But Ireland remained politically divided among many princes, and so became an easy prey of those “black heathens” the Scandinavians, whose invasions began 795, and who founded Norse kingdoms at Dublin, Waterford, Limerick, etc. In the fierce battles between the two nations, the prosperity of Ireland rapidly declined, and the English conquest (1171) only completed the ruin.—The isle of *Man*, inhabited by a branch of the Irish, after having been subject to Welsh, Scotch, Norse princes in turn, acknowledged England's sovereignty in 1344.

Religion and Mythology.—A few notices in the classics and the Latin inscriptions of Gaul are our rather meager sources of information on the Celtic paganism. As the three chief gods, or three of the chief gods, Lucan mentions *Teutates*, *Hesus*, and *Taranis*, all of them worshiped with human sacrifices. *Taranis* reappears as *Jupiter Iaranuncus* on an inscription; and from this identification with Jupiter, as well as from the fact that in Welsh *taran* means thunder, we may infer that he was the god of the thunderstorm. Other gods frequently occurring on inscriptions are *Apollo Grannus*, *Apollo Belenus*, *Mars Camulus*, *Minerva Belisama*, etc., all of them, however, empty names to us. A remarkable feature in Gaulish religion was the worship of certain *Mother Goddesses* (called on the inscriptions *Junones*, *Matrones*, *Deæ Matres*, *Campestræ*, *Nymphæ*). They are frequently connected with special localities, as in the inscriptions dedicated to *Matronis Lanchiabus*, *M. Hamavehis*, *M. Rumanehabus*, and on the one, in Gaulish: *Matrebo Namancieabo*, “to the Mothers of Nîmes.” To this class apparently belongs the *Dea*

Nehalennia, once represented on a relief with a basket of fruit, and a dog for companion. Mela, the geographer, speaks of an island in the Atlantic, near Gaul, where there was an oracle superintended by nine maidens, who could cause storms, take the form of any animal, could cure what otherwise was incurable, and predicted the future. These goddesses, at once motherly and maidenly, residing in field and wood (caupestræ, nymphæ), givers of plenty and prophets of the future, are the heathen prototypes of the *fées* (fairies, as distinguished from "elfs") of the middle ages. The "little folk" were known to the Gauls under the name of *Dusii*. They believed in the existence of individual tutelary genii, as a stone of Lausanne shows, being erected by three Gauls *Suljis* suts (hence our sylph?). The belief in the transmigration of souls was common amongst the Gauls, or at least their priests the *Druids*, so called from their performing sacred rites in oak-woods (Welsh, *derw*, an oak; *derwydd*, a Druid). These Druids were also the depositaries of knowledge and tradition, and constituted, in Gaul at least, a powerful hierarchy, with a supreme pontiff. Druids are found both in Ireland and in Wales, and the *fées* abound in Welsh tradition; but it is very doubtful whether the superhuman beings appearing in the Welsh poems of the 12th and 13th centuries—such as *Ihu Gadarn*, the reputed founder of Bardic institutions (see beneath)—are genuine relics of the British religion. The belief in transmigration lasted very long, as the mediæval Welsh tale of *Taliesin* speaks distinctly of Taliesin's successive existences. Though not properly mythological, we may mention here the romantic stories of the Britons about king *Arthur* and his knights. He is first mentioned by Nennius in the 9th c.; but his fable was further developed in the next centuries both in Wales and Brittany, then embodied in Geoffrey of Monmouth's *Historia Britonum*, which served as the groundwork of the French *Roman de Brut* of Wace. Through these works, and partly, also, through the direct influence of the oral traditions of Brittany, it passed into French literature, and thence spread over all Europe.

Literature.—The Gauls learned writing from the Greeks; later, they employed the Roman alphabet, as do the Welsh and Irish, the now used Irish character being nothing but the common Anglo-Saxon form of the Latin alphabet. Besides, however, the Irish claim an old character of their own, the Ogham, in which the letters are represented by a number of vertical strokes put in a right angle to a horizontal line, or else by horizontal strokes to a vertical line. Some of the Ogham inscriptions are said to be older than Christianity. Even more doubtful is the antiquity of a Welsh so-called Bardic alphabet, in which there seem to be no inscriptions extant, and which is, at any rate, an alteration of the Roman character. A feature common to all Celts is the existence of a kind of literary order, the *Bards* (q.v.), poets and guardians of tradition—in Gaul, nearly related to or part of the priesthood; in Wales and Ireland, in immediate connection with the kings.—A *Gaulish* literature there certainly was, as Cæsar informs us that, in the schools of the Druids, the young men used to learn by heart a great number of verses on theological and historical subjects. But these poems were never written down. It is highly probable that rhyme, first used by St. Ambrosius (397) in his hymns, is of Gaulish origin, this being the common form even of the oldest Irish and Welsh poems.—The *Irish* literature began with the conversion, but our existing manuscripts are not older than the 9th or 8th century. Interlinear versions of biblical and other theological, or of grammatical writings are about the oldest manuscripts, many of which, in consequence of the missionary zeal of the nation, are to be found at St. Gall, Milan, and other continental places. Then there are ecclesiastic *hymns*, one of the oldest ascribed to Patrick. A renowned author of poems, in the 10th c., was Eochad O'Flin. Secular poetry of ancient times there has come down to us none, but we have testimonies as old as the 12th c. of the existence of such, ascribed in a general way to the old pagan hero Oisín, son of Mac-Cumhal. The existing specimens, mostly warlike—except some dialogues between Oisín and St. Patrick—are recent. Those Gaels that went over to Scotland, took, of course, similar traditions with them. With a partial knowledge of these, Macpherson composed (1765) the work which he declared (rather loosely) to be an English translation of the songs of the old Scotch poet Ossian, son of Fingal (the true Oisín was an Irishman). The would-be Gaelic original of Macpherson's work, edited in 1807, is either a compilation or retranslation. Of Irish prose, the annals are the most important part: first, those of Tighernach (1088), then the *Annales Inisfulienses*, *A. Ultonienses*; lastly, the *Annals of the Four Masters*, being a compilation made (1634) from older sources chiefly by four Franciscans, beginning with 242 after the deluge, and ending with 1616 A.D.—The oldest remains of *Welsh* literature are the songs, so far as they are genuine, of the bards of the 6th c.—*Livarch Hen*, *Aneurin*, *Taliesin*—having chiefly the life and deeds of contemporary princes for their subject, but few in number. In the 10th c., we have the collection of laws by Howel Dda. The historians Gildas and Nennius, of the 9th c., wrote in Latin.

The great age of *Welsh* literature is the 12th and succeeding centuries, when the energies of the nation were roused in the struggle with England. In this contest, the bards played a conspicuous part as agitators. After a long interval, we hear again of a great bard, Meylyr (1100); many follow, amongst whom Kynddelw (1200) deserves special mention, both as a poet (we have 49 pieces of his) and a patriot. Welsh poetry consists in—1. Political lyrics, war-songs, songs in praise of chieftains, elegies on the same. 2. Religious hymns. 3. Pseudonymous poems, ascribed to Merddin (Merlin), the

mythical enchanter, and Taliesen, the old bard, having generally the form of prophesies on the struggle between the Saxons and Welsh, and the ultimate triumph of the latter. Thus, in the *Avalemmaw* (or apple trees), attributed to Merlin, the Welsh nation is enigmatically represented under the image of "seven score and seven sweet apple trees," whose fruits, princes (viz., the English) wish in vain to despoil. 4. The Triads, short memorial (?) verses in which three remarkable events, subjects, or persons are respectively mentioned (hence the name), embracing history, theology, jurisprudence. 5. Dialogues of dramatic character. There were—apparently now lost—also miracle plays actually represented.

The only remarkable remnant of *Cornish literature* comes under this head, being three ecclesiastical plays of the 14th c.—the *Creation*, the *Passion*, and the *Resurrection*.—In Welsh prose, we have first the chronicles. Geoffrey's chronicle, though Latin, is thoroughly national; then there is that of Caradoc, who begins where Geoffrey leaves off; and the *Liber Landavensis*, a history of the bishops of Llandaff down to 1132. Further, we have the *Mabinogion* (Children's Tales), romantic stories. The most interesting of these refer to Arthur and his champions; the lady of the fountain, Peredur, Geraint (now revived by Tennyson), Arthur's boar-hunt. Amongst the non-Arthurian tales, special mention is deserved by the *Mabinogi of Taliesin*, interspersed with verses, relating the adventures, transformations into animal shape, and transmigrations of that bard. There are besides some scientific writings, a treatise on medicine, another on geometry, and one on Welsh prosody by Edeyrn (1260). This last, a grammatical essay in and on a vernacular tongue, is paralleled in the middle ages only by Icelandic literature, to which, upon the whole, the Welsh, although not quite so high, bears a marked resemblance.

Concluding Remarks.—Altogether, the Celts are a very important branch of our Indo-German family. The incessant warfares of the Gauls bespeak at least activity of mind and body; the Irish missions have done a great deal for European civilization; whilst the traditions of the Britons have deeply influenced mediæval literature. The one great defect of the Celts is incapacity for political organization. Their very enthusiasm, lively feeling, and vivid imagination, have ever prevented them from taking coolly and deliberately those measures which lead to national unity; hence it is that they gave way before the more practical Roman and Teuton. But while they lost their independence; and oftentimes their very language, in the contest with the foreigner, whose strong hand molded them into national unity, yet they reacted on him in their turn. They are fast disappearing by merging into the English; but if the quiet resolution, the sturdy common sense, the talent for public life, state organization, and political dominion, that characterize the modern British nation, are altogether Teutonic—on the other hand, their genuine refinement of manner and feeling, and their high poetical susceptibilities, are to no small extent due to the admixture of Celtic blood.

CELTIS. See NETTLE-TREE.

CEMBRA NUT AND CEMBRA PINE. See PINE.

CEMENTATION OF STEEL is the process followed in the production of *blistered steel* (q.v.), or *steel of cementation*.

CEMENTS. A cement is a substance used to make the surfaces of solid bodies adhere to one another; it is applied in a liquid or viscous state, and hardens after the surfaces are brought together. When fused metals or alloys are used in this manner, they are called solders. There is a great variety of C. derived from animal, vegetable, and mineral substances. The animal C. are chiefly composed of gelatine and albumen as their bases. Joiners' glue is an example. See GLUE. The binding materials of vegetable C. are gums, resins, and wax. The mineral C. are chiefly of lime and its compounds. In many C., animal, vegetable, and mineral substances are combined. The simplest of the mineral C. is plaster of Paris, which is used for uniting slabs of marble, alabaster, and many similar purposes. It is mixed with water to the consistence of thick cream, and then applied. This hardens rapidly, but is not very strong. Its hardening depends upon the true chemical combination of the water with anhydrous sulphate of lime, of which plaster of Paris is composed, and the formation thereby of a solid hydrate. The plaster of Paris may be mixed with thin glue, with diluted white of egg, or a solution of size or gum, instead of water, and is strengthened thereby.

Keene's marble cement is prepared by steeping plaster of Paris in a concentrated solution of alum, then recalcining and powdering. This powder is mixed with water in the same manner as plaster of Paris. It is used as a stucco for internal decorations, takes a high polish, and when colored, forms beautiful imitations of mosaic, marbles, scagliola, etc.

A mixture of paper pulp, size, and plaster of Paris in equal proportions, forms a useful cement, and is also used as a sort of papier-mâché for casting into architectural ornaments, etc.

Common mortar is one of the most important of the lime cements. It is composed of slaked lime, or a mixture of this with sand; its hardening depends upon the slow formation of carbonate of lime by the absorption of carbonic acid from the atmosphere, and a partial combination with the silica of the sand. Cow-hair is sometimes mixed with it, to bind it when laid in masses. In order to obtain a fine smooth paste, which

is required for good mortar, the lime should be slaked rapidly by adding about three parts of water to one of lime; if the quantity of water is too small, a coarser or semi-crystalline hydrate of lime is produced by the slaking. For the mode of applying mortar, see BRICKWORK.

Ordinary mortar, when exposed to the continuous action of water, softens and disintegrates, and some of the lime dissolves away. Lime which contains 20 or 30 per cent of clay, or finely divided silica, produces a mortar which is not liable to this softening, but possesses the property of hardening under water; such lime is called *hydraulic*, and the mortar made from it, hydraulic cement or mortar.

Puzzolana, a porous lava found at Puzzuoli, near Naples, has been long celebrated for its property of forming a hydraulic cement, when mixed with ordinary lime. It is mainly composed of silicates of alumina, lime, and soda. Portland cement, so named from its resemblance to Portland stone when dry, is made from clay found in the valley of the Medway, which is intimately mixed with the neighboring chalk, and then burned. Roman cement is similar to the Portland, but of a darker color; it contains a larger proportion of clay, and solidifies more rapidly. These C. should be mixed with a sufficient quantity of water to form a moderately thick paste; the surfaces to which they are applied should be well wetted, and the cement kept slightly moist until it hardens. The solidification of hydraulic C. depends upon the combination of the lime with the silica and alumina forming, first a hydrated compound, and finally a true silicate. They expand slightly in solidifying.

The following receipts include some of the most useful and reliable C. applicable to the purposes specified: for water-tight joints, such as slate cisterns, aquaria, etc., and for uniting broken pieces of stone, and filling up metallic joints—take equal parts of red and white lead, and work them into a stiff paste with boiled linseed oil. When used for metal joints, it should be made rather thin, and both pieces of metal, as well as the washer, well smeared with it. This cement hardens slowly, but becomes ultimately of almost flinty hardness. We have before us an aquarium, holding fifteen gallons of water, made of plate-glass, cemented at the angles to mahogany columns with this composition. It has stood without leaking for above three years, in spite of much rough handling and moving about; and the cement is now so hard, that it is difficult to scratch it with a knife.

Cement composed of ox-blood thickened with finely powdered quicklime, is used by coppersmiths, for securing the edges of rivets of copper boilers, and for steam-joints. Another cement for steam-joints is made with borings or turnings of cast-iron mixed with a little sal ammoniac and flowers of sulphur. It should be stirred up with a small quantity of water, just sufficient to moisten it, then rammed into the joint, which should be bolted up as tightly as possible: 5 lbs. of iron borings to 2 oz. of sal ammoniac, and 1 oz. of sulphur, are the proportions recommended. A cement of this kind may be made of 4 lbs. iron borings, 2 lbs. pipe-clay, and 1 lb. of powdered earthenware fragments made into a paste with salt and water; or 2 parts litharge in fine powder, 1 part very fine sand, and 1 of quicklime that has slaked spontaneously in a damp place. These should be mixed, and kept from the air, and made into a paste with boiled linseed oil when about to be used. This is a valuable cement for steam joints, for mending cracks in boilers, ovens, etc. Beale's patent fireproof cement, for similar purposes, is composed of chalk, 12 parts; lime and salt, each 4 parts; Barsey sand, 2 parts; iron filings or dust, 1 part; and blue or red clay, 1 part. These are ground and calcined together.

Electrical Cement—so called from its use in uniting the cylinders of electrical machines to their axes, and for a variety of similar purposes—is composed of 5 lbs. rosin, 1 lb. each of bees'-wax and red ochre, and 4 oz. of plaster of Paris. This is Singer's formula. A cheaper cement of this kind may be made from 14 parts rosin, 2 red ochre, and 1 plaster of Paris. These should be melted together till the frothing ceases, and the composition runs smoothly. This is applicable to a variety of purposes, where a cheap and tolerably adhesive cement is required. It will serve as bottle-wax for sealing the tops of corks; but this is usually prepared from 4 parts rosin with one of tallow or suet, and red ochre or other coloring matter added.

For mending earthenware and china, etc., a variety of C. are recommended. For ornamental glass or china, which is not subjected to heat or rough usage, Canada balsam that has evaporated until rather hard, is a very useful cement; from its transparency, it makes an almost invisible joint. The surfaces should be slightly warmed, and the balsam brushed over them, after which they should be kept pressed together for a short time. Thick copal or mastic varnish may be used in the same manner. Gum shellac, dissolved in spirits of wine in sufficient quantity to form a treacly liquid, forms a stronger cement than the above, but its color is objectionable for some purposes. The shellac may be dissolved in naphtha, but is not equal to that in spirits of wine. The *liquid glue* sold in the shops is usually prepared in this manner; another kind is made of a mixture of the solutions of shellac and India rubber. The cement sold in sticks at fairs and in the streets of London by loquacious itinerants, is shellac or gum mastic fused and molded into a convenient form, and is one of the most useful C. when properly applied, by heating the surfaces to be joined just sufficiently to fuse the shellac and then smearing them thinly with it, and pressing them together. If shellac is heated much above its fusing-point, it becomes carbonized and rotten, and therefore great care

must be used in fusing any composition of which it is an ingredient. The *marine glue*, a mixture of shellac and India rubber, is a remarkable cement, and when applied, as the last, with the precautions just alluded to, is so strong, that glass or china cemented with it, and then dashed on the ground, or otherwise broken again, will give way in any part rather than that cemented. This cement may be purchased ready made. For the mode of preparing it, see **GLUE**.

Universal Cement, used for the above and many other purposes, is prepared as follows: Curdle skim-milk with rennet or vinegar, press out the whey, and dry the curd at a very gentle heat, but as quickly as possible. When it has become quite dry, grind it in a coffee or pepper mill, and next triturate it in a mortar until reduced to a very fine powder. Mix this powder with $\frac{1}{10}$ th of its weight of new dry quicklime, also in very fine powder, and to every ounce of the mixture add 5 or 6 grains of powdered camphor; triturate the whole well together, and keep it in small wide-mouthed phials well corked. When required, make it into a paste with a little water, and apply it immediately.

Cheese Cement is similar in composition and uses. Take two parts of grated cheese and one of quicklime in fine powder; beat these together with white of egg to form a paste, and use immediately.

The following is the reputed formula for preparing the *Armenian or diamond cement*, used by the Armenian jewelers for attaching diamonds, etc., without any metallic setting: "Dissolve 5 or 6 bits of gum-mastic, each the size of a large pea, in as much rectified spirit of wine as will suffice to render it liquid; and in another vessel dissolve as much isinglass, previously a little softened in water—though none of the water must be used—in French brandy, or good rum, as will make a 2-ounce phial of very strong glue, adding two very small bits of gum galbanum or ammoniacum, which must be rubbed or ground till they are dissolved. Then mix the whole with a sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used, set the phial in boiling water." This cement has a great reputation, but our experience does not confirm it. We have tried the above, and several other receipts, with very little success. We doubt whether the true method of preparing it is known in this country, and suspect that it still remains one of the oriental trade-secrets. White of egg, thickened with finely powdered quicklime, forms a useful cement, especially if the cemented article is warmed for a short time in a slow oven.

Cutlers' Cement, used for fixing knives and forks in handles, is made of equal weights of rosin and brick-dust melted together; or, for a superior quality, 4 parts of rosin, 1 of bees-wax, and 1 of brick-dust.

Mahogany Cement, used for stopping cracks and holes in mahogany, may be prepared by melting 4 parts of bees-wax with 1 of Indian red, and as much yellow ocher as is found requisite to give the color. If shellac be substituted for the bees-wax, and less red used, a much harder cement is made.

For *French Cement*, *rice glue*, and other light C. for joining paper articles and artificial flowers, see **GLUE** and **PASTE**.

CEMETERY, from the Greek, may mean any grave-yard, or other place of deposit for the dead; but it has lately acquired a special meaning, applicable to those extensive ornamental burial-grounds which have recently come into use in this and other European countries, as the practice of burying within and around churches was gradually abandoned (see **BURIAL**). The fine burial-grounds of the Turks, extending over large tracts adorned by cedars and other trees, may have suggested the plan to Europeans. It was first exemplified on a great scale in Paris, in which, as the largest walled town in Europe, the disposal of the dead was long a matter of extreme anxiety and difficulty. There are few considerable towns in Britain near which there is not at least one C., and the legislation mentioned under the head of **BURIAL** has rendered their establishment, to a certain extent, a legal necessity. There was at first a natural feeling of regret at the prospect of deserting places of deposit for the dead so hallowed by ancient use and recent associations as the church and the churchyard. In many instances, however, the places thus professedly hallowed were in reality surrounded by degrading and disgusting circumstances. On the other hand, the new places of interment began to develop humanizing and elevating influences, in beautiful trees and flowers, natural scenery, and works of monumental art. The new cemeteries are in many instances cheerful open places of recreation, and in them the place of rest for the dead has rather tended to improve than to undermine the health of the living. One of the oldest established and most celebrated of the European cemeteries, is that of Père la Chaise (q. v.), near Paris, the arrangements of which have been generally followed in the cemeteries of London and other English cities; with, however, this distinct difference, that the English cemeteries are divided into two portions—one consecrated for the burials of members of the established church, over whose remains the funeral service is read, and one unconsecrated for the burials of dissenters. In the Scottish such distinctions are not required, though the Episcopal church has some consecrated burying-places. In the United States, as at Philadelphia and New York, there are cemeteries equal in point of arrangement to any in Europe.

CEMETERY (*ante*). The famous Père la Chaise, in Paris, is the most celebrated of modern cemeteries, although by no means the largest. It was laid out in 1804, and com-

prises about 200 acres, and more than 16,000 monuments erected to the memory of nearly all the great men of France of the present century. Twice this C. and the neighboring heights have been the scene of desperate fighting. In 1814, during the attack on Paris by the allies, it was stormed by a Russian column; and in 1871 the communists made their last stand among these tombs, where 900 of them were killed, 200 being buried in quicklime in one huge grave, and 700 in another. Paris has also the cemeteries of Mont Parnasse and Montmartre, besides many smaller burial-grounds. In 1874, a very large C. was laid out 16 m. n. of Paris, covering nearly 1300 acres. In France, every city and town is required by law to provide a burial-ground beyond its barriers, properly laid out and planted, and each interment must take place in a separate grave. This law does not apply to Paris, however. There the dead are buried 40 or 50 at a time in the *fosses communes*, the poor being interred gratuitously, and a charge of 20 francs being made in all other cases. The *fosse* when full is left undisturbed for 5 years; then all the crosses and other memorials are removed, the level of the ground is raised 4 or 5 ft. by fresh earth, and interments begin again. For 50 francs a grave can be leased for 10 years; but when permanent monuments are desired the ground must be purchased in fee.

In English cities, about 1840, the people began to discuss the dangers to public health arising from the condition of the grave-yards surrounding, and the vaults within and underneath, the great churches. In London, these receptacles were literally crammed with coffins, and the surrounding air was infected to a dangerous degree. Coffins were piled upon each other until they came within a few inches of the surface of the ground, and then the ground was raised from time to time until its level came nearly up to the lower windows of the church. To make room for new burials, old bones were thrown out, and this led to systematic robbing of graves for the sake of the coffin plates and the pretty ornaments sometimes buried with the bodies. The result of this action and discussion was an entire change in the system. Burials within the limits of cities and villages were prohibited, and as a necessity rural cemeteries were founded. The chief cemeteries of London at present are: Kensal Green, on the Harrow road, 2½ m. from Paddington; Highgate, on a slope of Highgate hill; Abney Park; the Norwood and Nunhead cemeteries, on the s.; the west London C., at Brompton; Ilford and Leystone cemeteries in Essex; the Victoria and Tower Hamlets cemeteries in e. London; while farther from the city were the cemeteries of Woking and Colney Hatch.

The dead-houses (*Leichenhäuser*) of Frankfort and Munich form a remarkable feature of the burial customs of those cities. The objects of the founders were to obviate the remotest danger of premature interment, and to provide a respectable place for the reception of the dead, in order to remove the bodies from the often confined dwellings of the friends. At Frankfort, the dead-house is at the entrance to the cemetery. It consists of a warder's room, where an attendant is always on duty; on each side are five rooms, well ventilated, and kept at even temperature, and each one is furnished with a bier, on which a corpse can be laid. On one of the fingers of a corpse is placed a ring, to which is attached a light cord, connecting with a bell which hangs outside of the attendant's room. Bodies deposited here are inspected at regular intervals by a medical officer, and the warden is always on the watch for the ringing of the bell. The importance of this care was once proved at Frankfort by the revival of a child. The attendants are required to receive and treat the dead with all respect, and no interment is permitted until signs of decomposition appear. The relations are then notified, and a funeral is held. Similar mortuaries have been established in many English towns.

Of the cemeteries still in use in southern Europe, the catacombs of Sicily are the most remarkable. In one of these, near Palermo, under an old Capuchin monastery, there are four subterranean corridors, in which more than 2,000 corpses are ranged in niches in the wall, many of them shrunk into the most grotesque attitudes, or hanging with pendent heads or limbs from their receptacles. As a preparation for its niche, the body is desiccated in an oven, and then dressed as if in life and put in its place in the wall. At one end of this C. there is an altar, strangely ornamented with a mosaic of human skulls and bones.

Among nations in the east cemeteries have been in use from the earliest times. In China the high grounds near Macao and Canton are crowded with tombs, many of them in the form of small tumuli with a low encircling wall, like the ringed barrows of western Europe. But the most picturesque of all cemeteries are those of the Turks. From them it was, perhaps, that the first idea of the modern C., with its ornamental plantations, was derived. Around Constantinople the cemeteries form vast tracts of cypress woods, under whose branches stand thousands of tombstones. A grave is never reopened; a new resting-place is given to every one, and so the dead now occupy a wider territory than that which is covered by the homes of the living. The Turks believe that until the body is buried the soul is in a state of discomfort, and the funeral, therefore, takes place as soon as possible after death. No coffin is used; the body is laid in the grave, a few boards are placed around it, and then the earth is shoveled in, care being taken to leave a small opening extending from the head of the corpse to the surface of the ground, an opening not unfrequently enlarged by dogs and other beasts which plunder the graves. A tombstone of white marble is then erected, surmounted by a carved turban, in case of a man, and ornamented by a palm branch in low relief, if the grave be that of a woman.

The turban by its varying form indicates not only the rank of the sleeper below, but also the period of his death, for the fashion of the Turkish head-dress is always changing. A cypress is usually planted beside the grave, its odor being supposed to neutralize any noxious exhalations from the ground, and thus, every C. is a forest, where by day hundreds of turtle-doves are on the wing or perching on the trees, and where bats and owls swarm undisturbed at night. These cemeteries are a favorite resort for Turkish women, some of whom are always to be seen praying beside the narrow openings that lead down into a parent's, a husband's, or a brother's grave. The cemeteries of the Armenians abound in bas-reliefs, which show the manner of the death of the person beneath, and on these singular tombstones are frequent representations of men being decapitated or hanging on a gibbet.

America closely followed England in the sanitary reform of burial-places, and many years ago burial within certain limits of cities was prohibited except in special cases, such as the use of private vaults in church-yards. The earliest of the great cemeteries in the United States was Mount Auburn, near Boston, covering 125 acres, lovely by nature, and most elaborately adorned.

Laurel Hill C., in Philadelphia, was opened in 1836. It is on the Schuylkill river, about 4 m. n. of the center of the city, and is part of a region of romantic beauty, abounding in gentle declivities, picturesque lawns, rugged ascents, rocky ravines, and flowery dells. A carriage drive, along the river front, connects Fairmount park and the Wissahickon; thus bringing the ever-varying activity of the living into association with the tranquil resting-places of the dead. Since the first purchase of ground, several larger tracts have been added to it; while, under the management of various associations, other portions of the beautiful vicinity have been, in a similar manner, consecrated and adorned. This was followed by Greenwood C., the first and one of the greatest popular burial-places for New York and Brooklyn. The company was chartered in 1838. The grounds, which comprise 450 acres, occupy the hills and valleys on the e. side of the bay of New York, about 3 m. s. of the city hall in Brooklyn. The situation is one of the finest in all the region. From the higher points of the C. the eye takes in the two cities of New York and Brooklyn, the bay, half a dozen cities in New Jersey, the far-off Palisades, the broad lower bay, the highlands near Sandy Hook, Coney island, the rich garden lands of Kings county, and a grand view of the Atlantic ocean. This C. has five entrances; nearly 20 m. of stone-bedded avenues, and 17 m. of concrete paths. Water for drinking and irrigation is supplied from the city works to nearly 40 hydrants. There are eight akes of varying dimensions, and four ornamental fountains. The grounds are drained by 17 m. of subterranean sewer pipes, with 1140 receiving basins. There have been 23,000 lots sold, and over 200,000 interments made, the first one on the 5th of Sept., 1840. Among the edifices and monuments of note are: the entrance buildings, the receiving tomb, the shelter house, and the following monuments and statues: to Horace Greeley, statue of a printer setting type; to John Matthews, a sarcophagus with marble effigy; of the Brown brothers, representing the loss of the steamship *Arctic* and the loss of five members of the family; on Highwood hill, a tribute to Samuel B. Morse, inventor of the telegraph; the Firemen's monument, a fireman rescuing a child; monument to Henry Howard, ex-chief of the New York fire department; chapel monument to Mary M. Danser, noted for charitable bequests; marble temple of A. S. Scribner, of fine Italian marble, containing a figure of *Hope*, under a marble canopy, supported on eight pillars, and on the sides, in bas-relief, illustrations from the life of Christ, from birth to ascension; monument to Thomas J. Read, a granite figure of *Faith Clasp ing the Cross*; statue of John Correja, a sea-captain taking an observation with the sextant (put up by himself many years before his death); the monument to Charlotte Canda, who was killed on her 17th birthday by falling from her carriage. (This is an elaborate Gothic temple, and was for many years the great attraction of the place; more people have visited this structure, probably, than any other of the points of interest.) The Soldiers' monument, in honor of those who fell in the union cause during the rebellion, with four life-size statues representing the different branches of the service; the Pilots' monument, to Thomas Freeborn, who lost his life in trying to save the ship *John Minturn*, in 1846; the statutory group of James Gordon Bennett, founder of the *New York Herald*, of the finest Carrara marble, representing a life-sized female figure, kneeling on a cushion, in an attitude of prayer, commending to the Almighty Giver her child held in suspense by an angelic figure; the colossal bronze statue of De Witt Clinton; monument to Louis Bonard, who was one of the founders of the society for the prevention of cruelty to animals. This C. is not a stock corporation, but a public trust, managed by trustees chosen by the lot owners.

CENCI, BEATRICE, called "the beautiful parricide," was the daughter of Francesco Cenci, a wealthy Roman nobleman. According to Muratori (*Annales*, lib. x.), Francesco was twice married, Beatrice being his daughter by the first wife. After his second marriage, he treated the children of his first wife in a revolting manner, and was even accused of hiring bandits to murder two of his sons on their return from Spain. The beauty of Beatrice inspired him with the horrible and incestuous desire to possess her person; with mingled lust and hate, he persecuted her from day to day, until circum-

stances enabled him to consummate his brutality. The unfortunate girl besought the help of her relatives, and of pope Clement VII. (Aldobrandini), but did not receive it; whereupon, in company with her step-mother, and her brother, Giacomo, she planned and executed the murder of her unnatural parent. The crime was discovered, and both she and Giacomo were put to the torture; Giacomo confessed, but Beatrice persisted in the delation that she was innocent. All, however, were condemned, and put to death, August, 1599, in spite of efforts made in their behalf. Such is Muratori's narrative. Others allege that Beatrice was the innocent victim of an infernal plot. The results of Bertolotti's investigations (*Francesco Cenci e la sua Famiglia*, 1877), based on original documents and contemporary notices, go far to deprive the story of the Cenci tragedy of the romantic elements on which Shelley's powerful tragedy mainly turns. Francesco, it would appear, was profligate, but no monster; Beatrice at the time she murdered her father, was not 16 but 21 years of age, was far from beautiful, and probably had already a tarnished moral reputation. And Bertolotti is further convinced that the sweet and mournful countenance which forms one of the treasures of the Barberini palace in Rome, is not only not the portrait of Beatrice, but was not even painted by Guido, to whom it has long been unhesitatingly attributed.

CENEDA, now officially called VITTORIO, a city of northern Italy, province of Treviso, 36 m. n. of Venice. Pop. 10,530. It is an episcopal see, has a very handsome modern cathedral and a fine monolithic fountain. Under the republic of Venice it was rich, and famed for its manufactures of woolen cloth, silk, and paper. C. is very ancient, dating from the time of the Romans, but now it is a decayed city.

CENIS, MONT, or MONTE CENISIO, a mountain-pass of the Alps, between Savoy and Piedmont, forming part of the water-shed between the valleys of the Doire and the Arc. The culminating point of the pass reaches an elevation of 6,775 ft. above the sea. Schist, limestone, and gypsum, in alternate beds, compose the strata of the mountain, the vegetation of which is rich in the rarer kinds of Alpine plants. Over the pass a road was constructed (1803-10) by the chevalier Fabbroni, under Napoleon's orders, at an expense of £300,000. This is the safest, and most frequented road across the Alps. Near the pass, a railway tunnel, $7\frac{1}{2}$ m. long, was finished in 1870. For detail see TUNNEL.

CENIS, MONT (ante), the site of some remarkable railroad building within the last 15 years. In 1865, an English engineer obtained permission from the Italian and French governments to lay a railway on the line of Napoleon's carriage road over the mountains. The road was built in the ordinary way with the addition of a third rail midway between the outer ones, and raised nearly a foot higher. This third rail was strongly gripped by the driving wheels, by which means the trains could safely traverse very sharp curves and descend grades as steep as 1 ft. in 12. On the French side the rise to the summit in $6\frac{1}{2}$ m. of road was 4,460 feet. Then there was a stretch of 5 m. nearly level, and after that the descent to Susa on the Italian side, a distance of 20 m. over curves so numerous and so sharp that the view changed almost every minute, trains descended by the momentum of weight, the speed being regulated by brakes. This road was superseded by the one now in use, which runs through the great tunnel. (See TUNNEL, *ante*.)

CENOBITES. See MONACHISM.

CENOMYCE. See REINDEER MOSS.

CENOTAPH (Gr. *kenotafion*, from *kenos*, empty, and *tafos*, a tomb), a monument which does not contain the remains of the deceased. They were originally erected for those whose bones could not be found, e.g., for those who had perished at sea. Latterly, the name was applied to tombs built by a man during his lifetime, for himself and the members of his family.

CENSER (Fr. *encensoir*, from Lat. *incendo*, to burn), a vase, or other sacred vessel, used for burning perfumes. See INCENSE. Censers were much used in the Hebrew service of the temple, but their form is not accurately ascertained, and it is probable that they varied in this respect, according to the occasions on which they were used. The C., called also a *thurible* (Lat. *thuribulum*, from *thus*, frankincense), is used in the Roman Catholic church at mass, vespers and other offices. It is suspended by chains, which are held in the hand, and is tossed in the air, so as to throw the smoke of the incense in all directions. It varies very much in form.

CENSORINUS, a chronologist and grammarian of the 3d c., known by a work called *De Die Natali*, in which he treated of man's generations, his natal hour, and the influence that the stars and genii exercise over his fate. It was by some work of his on chronology that certain important dates have been ascertained.

CENSORS, the name of two Roman officers of state. The office was established by Servius Tullius, the fifth king of Rome. After the expulsion of the kings, it was held by the consuls, special magistrates not being appointed till 443 B. C. It continued to be filled by patricians till 351 B. C., when C. Marcus Rutilus, a plebeian, was elected. Twelve years later, it was enacted that one of the C. (there were always two) must be a plebeian. In 131 B. C., both C. for the first time were plebeians. The C. were

elected in the *comitia centuriata*, presided over by a consul. The term of office at first lasted five years, but was shortly afterwards limited to 18 months. The censorship was regarded as the highest dignity in the state, except the dictatorship. It was a sacred and irresponsible magistracy, whose powers were vast and undefined, and whose decisions were received with solemn reverence. The duties of the C. were threefold. 1. The taking of the census, or register of the citizens and of their property. 2. The *regimen morum* (regulation of morals). 3. The administration of the finances of the state. The taking of the census (Lat. *censeo*, to value, to take an account of) was originally their sole function (hence their name), and was held in the *campus martius*, in a building called *villa publica*. The *regimen morum* was the most dreaded and absolute of their powers. It grew naturally out of the exercise of the previous duty, which compelled them to exclude unworthy persons from the lists of citizens. Gradually, the superintendence of the C. extended from the public to the private life of citizens. They could inflict disgrace (*ignominia*) on any one whose conduct did not square with their notions of rectitude or duty. For instance, if a man neglected the cultivation of his fields, or carried on a disreputable trade, or refused to marry, or treated his family either too kindly or too harshly, or was extravagant, or guilty of bribery, cowardice, etc., he might be degraded, according to his rank, or otherwise punished. The administration of the finances of the state included the regulation of the *tributum*, or property-tax; of the *vectigalia*, such as the tithes paid for the public lands, salt-works, mines, customs, etc., which were usually leased out to speculators for five years; the preparation of the state budget, etc.—See Rovers, *De Censorum apud Romanos Auctoritate et Existimatione* (Utrecht, 1825).

CENSORSHIP OF THE PRESS, the term generally applied to the arrangements for regulating what may be printed, in countries where the press is not free. The simplest form of C. is when a public officer—the censor, or licenser, as he is sometimes called—reads over the MS. to be printed, and, after striking out any objectionable passages, certifies that the work may be printed. Thence it is common in old books to see the word *imprimatur*—let it be printed—followed by one or more signatures. Though it has its name from an analogy with the functions of the Roman censor, the C. did not come into operation until the invention of printing. It was common to all European countries, Great Britain included. The C. was established by act of parliament in 1662, 13 Char. II. c. 33: “An act for preventing the frequent abuses in printing seditious, treasonable, and unlicensed books and pamphlets, and for regulating of printing and printing-presses.” This was a temporary act, renewed from time to time; and its renewal was refused in 1693, owing to a quarrel between the house of commons and the licenser. Since that time there has been, generally speaking, no restriction in this country on what any man may publish; and he is merely responsible to the law, if in his publication he should commit any public or private wrong. See LIBEL, LAW OF; see also PRESS, FREEDOM OF THE; BOOK-TRADE; and COPYRIGHT.

CENSUS means, in this country, the periodical counting of the people. It is a Latin word applied by the Romans to one of the functions of their censors (q. v.). They had to enumerate the people, but only for immediate purposes of taxation, so that no accounts of the results of such enumerations has been preserved. The idea of ascertaining the numbers of the people, and the proportions in which they are divided according to sex, age, profession, rank, and the like, as statistical information, is of late origin. The first C. of Britain was taken in the first year of the present c.—1801. From that time it has been taken at each period of ten years. An attempt, but a rather unsuccessful one, was made to take the statistics of Ireland in 1811. Ten years after, the attempt was repeated, but the accuracy of the bare enumeration it furnished was doubtful. That of 1831, which was an improvement, was corrected three years after, in order that it might form the basis of a new system of education. The four subsequent enumerations have been very trustworthy, and have furnished besides valuable statistics regarding the agricultural condition of the country. The system of registration under a registrar-general, established in England in 1836, has given considerable assistance by supplying a staff for carrying out the enumeration, and also by affording the means of checking the census. A similar registration system was extended to Scotland in 1854, of which the C. of 1861 and 1871 have had the advantage. A C. must be taken for the whole empire simultaneously, otherwise it cannot be accurate. The practice is for the enumerating officer in each petty district to leave a schedule at each house, which he receives filled up, aiding, when necessary, in the filling up. The C. of 1851 was taken for the night of the 31st March. This C. supplied important, but not altogether satisfactory information, as to the educational and ecclesiastical condition of the country, elements of which the latter has been left out in 1861 and 1871. The C. of 1861 was taken for the night of Sunday, 7th April; that of 1871 for the night of Sunday, 2d April, a schedule being left in each house on the Saturday, and called for on Monday. The schedule of 1871 contained compartments for “particulars of the name, sex, age, rank, profession or occupation, condition, relation to head of family, and birthplace of every living person” who passed the night of Sunday in the house; whether any was blind, deaf, dumb, imbecile, or lunatic; and how many between the ages of 6 and 13 were receiving education. Most civilized nations take a C. at regular intervals—France,

every five years, the last in 1872; Belgium, every ten years, the last in 1866, with calculated estimate in 1873; Austria, every ten years, the last in 1869; the United States, the same, the last in 1870; in Germany, the last two censuses were taken in 1871 and 1875. The first C. for India was taken between 1867 and 1872.

CENSUS (*ante*). The tenth C. of the United States was taken in June, 1880. Up to 1860 our decennial progress in population and material wealth had been uniformly rapid and wonderful. The war of the rebellion then interfered, and both directly and indirectly tended to arrest that progress—directly in the destruction, through war and disease, of more than three quarters of a million of men in the beginning of life, when, in the natural course of events, they would have largely increased the population; and indirectly in checking the flood of immigration, a flood that had been bringing us half a million inhabitants in a single year. The regularity of progress from 1790 to 1860 is very remarkable. The percentage of increase in each decade is here shown:

Decade.	Per Cent.	Decade.	Per Cent.
1790 to 1800.....	35.02	1830 to 1840.....	32.67
1800 to 1810.....	36.45	1840 to 1850.....	35.87
1810 to 1820.....	33.13	1850 to 1860.....	35.58
1820 to 1830.....	33.49	1860 to 1870.....	22.22

So, for the 70 years up to 1860 the population grew at an average rate of $3\frac{1}{2}$ per cent per annum, dividing the whole period into periods of ten years each. Without the war the population of the United States in 1870 would have been 42,600,000; in 1880, by the same ratio, it would have been upward of 57,000,000.

The numbering of the people, though on one special occasion forbidden by the highest power, is an ancient custom. Moses numbered the Israelites in the wilderness, and, in later times, Joshua and David followed his example. The Chinese tell of a C. of their people taken 2,042 years before the birth of Christ. In Japan an enumeration was made about 1,900 years ago. Solon ordered the C. of Athens to be taken, especially with reference to classes of the people and taxable property. Servius Tullius, sixth king of Rome, ordered a C., when every citizen had to appear on the field of Mars and declare on oath his name and residence, the number and names of his children, and the value of his property. Failing to do this, his property might be confiscated and himself scourged and sold for a slave. Augustus enlarged the scope and improved the manner of taking the census. In the 16th c. the church began to record births, marriages, and deaths, and from this practice gradually grew up the modern C., though there does not appear to have been any exact popular C. made until after the beginning of the 18th century.

Russia, then almost a barbarous country, appears to have led other nations in C. taking. Partial enumerations were made in 1700, 1704-5, and 1710. In 1719, Peter the great sent a commission into all the provinces to make a general census. This commission took account of the number of peasants, mechanics, domestics, and men unemployed. Women were not taken into account at all at the commencement, but they were recognized before the work closed, and in some districts were partially enumerated. In 1722, the C. distinguished the insane and infirm without means of subsistence, and the czar ordered that a C. should be taken every twentieth year. In 1802, a central bureau of statistics was organized, reorganized in 1852, and again in 1858. This bureau is charged with the taking of the C., which now includes much the same information as that obtained in the United States. Prussian enumerations were begun under Frederick William I., and improved by his successor. From 1748 to 1800, the C. was taken annually, except when prevented by war. In 1805, the central bureau of statistics was established. In 1834, a triennial C. was ordered. The schedules for questioning were very full, and the enumeration was to be made some one day in December. The first C. of the German empire was taken on the 1st of Dec., 1871. Austria first took a C. in 1754, and kept it up triennially until 1857, when it was enacted that the enumeration should be made every sixth year. In Sweden, as early as 1686, there was a law requiring the clergy to record marriages, legitimate and illegitimate births, deaths, persons removed from or settled in parishes, and all the population, arranged by place of habitation and households. Such information was first published in 1746. A statistical bureau was established in 1857, to collate and publish C. and other statistical information. Norway has kept up a decennial C. since 1815, and the work is usually thoroughly done. In Spain, enumerations were made in 1787, 1798, 1857, and 1860, and, by calculation, in 1867. The work is done by government officials in one night. Denmark had a C. once in five years, from 1840 to 1860; now it is decennial, the last enumeration being on the 1st of Feb., 1870. The first and only C. of Portugal was made Jan. 1, 1864, and extended only to the number of the population. Switzerland began enumerations about 1750. Her C. is now decennial. Belgium doubtless leads all nations in the fullness and accuracy of her statistics, although her C. is taken but once in ten years. The last was in 1876. The Netherlands C. is decennial. The last was taken Dec. 1, 1870. Italy has an enumeration once in ten years, the last Dec. 31, 1871. Greece counts up irregularly. From 1836 to 1845, a C. was made every year; then in 1848, 1853, 1856, 1861, 1868, and 1870. Turkey has never taken a C. except for conscription or taxation. The first C.

on record in France was taken in 1760 and published in 1720. There was a general C. taken in 1800, and a decree of the national convention ordered that it should be continued every fifth year. Since about 1820, the C. has been taken very regularly. Brazil began in 1872, the Argentine Republic in 1869, Colombia in 1870, and Egypt in 1862.

The first real effort to record the population of Great Britain was made in 1801, and then it did not extend to Ireland, which had just become a part of the empire by the celebrated union. This C. was crude and unsatisfactory, and the returns were impossible of classification. The chief value of the C. of 1801 was in calling attention to the importance of such statistics and evoking better methods for getting and classifying them. Much better work was done in 1841 and 1851, when advantage was taken of the elaborate records of births, marriages, and deaths, which were begun the 1st of July, 1837. The first attempt at a general C. in Ireland was made in 1811, but it was a failure. Some improvements were made in 1821 and 1831, since which satisfactory enumerations have been made by the constabulary. We lack space to go over the enumerations in Great Britain and Ireland in 1841, 1851, and 1861, and must come directly to the first imperial C.—1871. This first attempted complete enumeration of the population of the empire was, so far as Great Britain and Ireland were a part, made in one day, April 3, 1871. The returns for the whole empire showed a population of 234,762,593, living upon 7,769,449 sq. m. of territory, viz.:—England and Wales, 22,856,164 population; Scotland, 3,392,259; Ireland, 5,449,186; islands in British seas, 147,470; colonies and possessions, 202,917,214. The annual rate of increase from 1861 was:—In England and Wales, 1.23 per cent; Scotland, 0.92; Ireland (decrease), 0.71. The work of this C. was in charge of the registrar-general, assisted by Dr. W. Farr and J. T. Hammick. The main work was done by 32,543 enumerators, employed under 2,195 registrars and 626 superintendent registrars. All the enumerators were required to be intelligent, trustworthy, and active; to write well, and to have some knowledge of arithmetic. They were to be not under eighteen nor over sixty-five, and to be in good health and of unexceptionable character. The whole country was divided into minute districts, and so great was the care taken, that every unnumbered house or dwelling had a fixed number put upon it before the schedules were sent out. Every means was taken through the press and by means of special publications to apprise the people of what was wanted, and instructing them how to facilitate the work. The householders' schedules were delivered in person by the enumerators who were to take them up. Every separate occupier received a schedule arranged so as to record the name, day, age, rank, profession or occupation, conjugal relation, relation to the head of the family and birth-place of every person who abode in any house on the night of Sunday, 2d of April, 1871. There were special blanks for blind, deaf and dumb, etc. There were 6,500,000 of these schedules, weighing 41 tons. In addition to schedules and enumeration books, there were sent from the central office 115 different printed forms of instructions and circulars. The houseless population were enumerated by the police, the navy by the admiralty, the merchant seamen by the customs bureau, and the army through the field-marshal's office. The tenacity of the Welsh tongue was shown by the return of 17,276 schedules filled out in that language. The care exercised in taking this enumeration may be inferred from the fact that the enumerators were instructed to consider a house as comprising all the space within the external and party walls of a building, whether occupied by one or several families; they were also instructed to make an exact record of each house and the number of schedules left. With the help of the police they were to return all persons not on that night dwelling in houses, but sleeping in barns, sheds, caravans or tents, or in the open air. Special schedules were printed for the enumeration of persons in public institutions, on board vessels, or in charge of boats and barges employed in inland navigation. Persons traveling during the night of Sunday, April 2, were to be included in the schedules of the hotel, or the house at which they arrived on the morning of Monday. Persons engaged in work away from home during the night of Sunday were to be included in the schedule left at the house where they usually resided. The causes why an unusual number of persons were present or absent at any given places were to be reported. The expedition with which the enormous mass of information was assorted and compiled may be known from the fact that the abstract showing the population of Great Britain was laid before parliament in print on the 20th of June, only eleven weeks from the day for collecting the schedules. The C. of Ireland at the same time was taken by 4,536 members of the royal constabulary, aided in cities by the local police. In Scotland there were 1016 local registrars, and 8,342 enumerators. The cost of this imperial C. was, in England, £5 5s. 7½d. for each 1000 of population; in Scotland, £8 1s. 4d.; in Ireland, £7 2s. 7d.

Census work began in the United States with the beginning of the government. In order to secure a proper apportionment of representatives in the lower house of congress a C. is taken every tenth year. At first it was nothing more than an enumeration of the people, classifying slave and free. Additions and improvements were made until the schedules of 1870 comprised questions as to name, age, sex, color, conjugal condition, place of birth and place of birth of father and mother. To these were added particulars as to schools, libraries, newspapers, churches, disease and mortality, pauperism and crime, school, military and citizenship ages; areas of farms, families and dwellings;

the blind, deaf and dumb, insane and idiotic, occupations of the people, wealth, taxation, and public indebtedness, and the amount and value of the products of agriculture and manufactures. The questions were certainly comprehensive enough, but the mode of taking the C. was slow, cumbrous, and unsatisfactory. It was two years and six months after the beginning of the work when the compilation known as the *Compendium* was sent to congress. In the introduction to this compendium gen. Walker, superintendent of the ninth C., says: "There is no reason, however, why, with such modifications of existing laws as would insure that the material should come originally to the census office in proper shape for tabulation, the entire compilation should not be concluded within a year from the date of the first receipt of returns. It is not possible for one who has had such painful occasion as the present superintendent to observe the workings of the census law of 1850, to characterize it otherwise than as clumsy, antiquated and barbarous. The machinery it provides is as unfit for use in the C. of the United States, in this day of advanced statistical science, as the smooth-bore muzzle-loading queen's arm of the revolution would be for service against the repeating rifle of the present time. It ought not to be possible that another C. should be taken under this law; such a thing ought not to be seriously proposed. The country has suffered more than enough already of discredit and of loss on account of the wretched insufficiency and inappropriateness of the provisions of this ill-constructed and outgrown statute."

In 1850 Mr. Joseph C. G. Kennedy, who superintended the C. of that decade, ventured to prophesy our future population, basing his estimates upon the progress already achieved. Of course, he did not make allowances for the war, then undreamed of. He reckoned that in 1870 we should have a population of 42,328,432, and in 1880 it would rise to 56,450,241. His estimates were high, but without the war we should probably have come well up to them. Taking the whole country, we lost through battle and diseases consequent upon military service more than a million of men; and these were men in the prime of life—just the period for natural increase of families. Three times as many, who did not lose their lives, were away from their homes one, two, or three years, and this, too, greatly reduced natural increase.

CENT (*ante*), a coin of the United States valued at the hundredth part of a dollar. The first one authorized by act of congress, April 2, 1792, was copper, and weighed 264 grains. The next year the weight was reduced to 208 grains, and in 1796 to 168 grains. Half cents were also coined, but not to great extent. Collectors of coins should remember that no coins other than gold or silver were issued from the United States mint in the year 1815 or 1832. By the act of Feb. 2, 1857 the issue of half cents was discontinued, and the copper C. was made of .88 copper and 12 zinc, and to weigh 72 grains. April 22, 1864, the bronze C. was introduced, consisting of .95 copper and .5 tin and zinc, and weighing 48 grains. Ten of the present cents weigh just a troy ounce, and 120 cents weigh a troy pound. They cannot be conveniently used for avoirdupois or common weight. Cents are legal tender to the amount of 25 cents.

CENTAUREA, a genus of plants of the natural order *compositæ*, sub-order *cynaraceæ*, containing many species of annual and perennial herbaceous plants, chiefly natives of the temperate and cold regions of the eastern hemisphere. Six or seven species are natives of Britain, some of them common weeds, whilst some species appear among the frequent ornaments of flower-gardens.—The BLUE-BOTTLE, or CORN BLUE-BOTTLE (*C. cyanus*), is common in cornfields in Britain and other parts of Europe, and has now become frequent also in similar situations in America, and indeed over the greater part of the world. It is an annual, growing to the height of about 2 ft., and producing its flowers in July and August. The florets of the disk are small and purple; those of the ray are few, comparatively large, and of a bright blue. Its flowers have long been much used in wreaths and garlands. It is common in gardens, with flowers variously modified by cultivation. Water distilled from the flowers of the blue-bottle was at one time in high repute as a remedy for weak eyes. The juice of the florets of the disk, with a little alum, dyes a beautiful and permanent blue.—The large blue-bottle (*C. montana*), a native of central Europe, is still more frequently cultivated in flower-gardens. Its flowers are considerably larger, and it is a perennial.—SWEET SULTAN (*C. moschata*), a native of the Levant, with fragrant flowers, is also common in flower-gardens. It is an annual or biennial.—Several species, having the involucre spiny, bear the name of STAR-THISTLE. The common STAR-THISTLE (*C. calcitrapa*) is a native of the southern parts of Britain and of Europe.—The common or black KNAWEED, called in Scotland *horse knot* (*C. nigra*), is abundant in the meadows and pastures of most parts of Britain, and is a troublesome perennial weed, difficult of extirpation. *C. jacea*, also called KNAWEED, more rare in Britain, is very common in some parts of Europe, and its bitter astringent root, and indeed the whole plant, were formerly used in medicine. It affords a beautiful bright yellow dye, almost as good as saw-wort.—The name C. has its origin in an ancient legend concerning the cure of a centaur by one of the species.

CENTAURS ("bull-killers"), a wild race of men who inhabited, in early times, the forests and mountains of Thessaly, and whose chief occupation was bull-hunting. Homer, the first who mentions them, describes them merely as savage, gigantic, and covered with hair. They do not appear as monsters, half-man and half-horse, until the

age of Pindar. The C. are celebrated in Greek mythology on account of their war with the *Lapithæ* (q. v.), and their contest with Hercules. The fact lying at the bottom of Pindar's myth may refer to the impression which the old bull-hunters of Thessaly, who spent almost their whole life, it is said, on horseback, first made on some of the neighboring tribes—viz., that the man and the horse were one creature, which, at least, we know was the opinion entertained by the Mexicans of the Spanish cavalry. On account of their resemblance to the Satyrs, the C. were at a later period introduced into the artistic representation of the Bacchic worship.

CENTAURUS, the *Centaur*, one of the constellations in the southern hemisphere, represented on the celestial globe by a form half-man and half-horse. The stars in this constellation are, according to Ptolemy's catalogue, 37 in number; according to the Britannic catalogue, 35. It contains the stars α Centauri and β Centauri, both of the first magnitude.

CENTAURY, *Erythræa*, a genus of plants of the natural order *gentianeæ*, having a funnel-shaped regular 5-partite corolla. The species are pretty little annuals, natives chiefly of the temperate parts of Europe and Asia, with pink or rose-colored flowers. They possess the tonic and other medicinal virtues of gentian, and although not frequently administered by physicians, are an important domestic medicine; and the tops are collected, when the plant is in flower, by the country people both in England and on the continent of Europe, to be employed in cases of dyspepsia, in intermittent fevers, and as a vermifuge. They contain a substance called *centaurine*, the hydrochlorate of which is said to be an excellent febrifuge.—The common C. (*E. centaurium*) is the species most frequent in Britain; a plant of 8 in. to a foot in height, with flowers collected in loose heads, growing in dry pastures. Two or three other species are found on sandy sea-shores. Nearly allied to these is the AMERICAN C. (*sabbatia angularis*), an annual plant with an erect quadrangular stem, extensively distributed throughout the United States and Canada, and much used in the domestic practice of America, as a prophylactic against autumnal fevers in strong infusions and large and repeated doses. The name C. owes its origin to the same legend with the name *centaurea*, although appropriated to plants so different.

CENT and **CENTIME** (Lat. *centum*, a hundred), names of coins. The Dutch cent is a copper coin = $\frac{1}{100}$ th of the guilder, which is equal to 1s. 8d. sterling. In the U. S. of America, the cent is a copper coin = $\frac{1}{100}$ th part of the dollar, or nearly one half-penny English. The centime is the 100th of the French franc (q. v.), and is of the value of $\frac{1}{10}$ th of an English penny.

CENTE NES. See **TENREC**.

CENTENNIAL EXHIBITION, in the United States, held at Philadelphia in 1876, a hundred years after the declaration of independence. It was opened in Fairmount park, May 10, 1876. An area of 236 acres was used, and the cost of the five main buildings was \$4,500,000. Before the close there were more than 200 separate buildings within the inclosure. Some idea of the magnitude of the preparations may be obtained from the apportionment of space in the main building, designed for the exhibition of the manufactured products and products of mines and metallurgy, as well as the condition of science and education in all nations. This building covered 20 acres, and was 1880 ft. long and 464 wide, with projecting wings in the center of the sides 416 ft. long, and in the center of the ends 216 ft. long. The exhibition space was on one floor. The roof of the main portion was 70 ft. high. In the center was an elevated square, with sides of 184 ft., having towers 120 ft. high and 48 ft. square at the corners. At the four corners of the building were towers 75 ft. high. The roof was supported by wrought-iron roof-trusses resting upon 672 wrought-iron columns. The sides were closed with glazed sash, above a substructure of brick 7 ft. high, resting on a foundation of massive masonry. Space was apportioned as follows, in square feet: Argentine Republic, 2,861; Austria-Hungary, 24,727; Belgium, 15,593; Brazil, 6,899; Canada, 24,118; Chili, 3,244; China, 6,628; France, 45,460; Germany, 29,629; Great Britain and Ireland, 54,155; India and British colonies, 24,193; Hawaiian islands, 1575; Italy, 8,943; Japan, 17,831; Luxemburg, 247; Mexico, 6,567; Netherlands, 15,948; Norway, 6,959; Orange Free State, 1058; Peru, 1462; Spain and colonies, 11,253; Sweden, 17,799; Switzerland, 6,693; Tunis, 2,015; Turkey, 3,347; United States, 136,684. Within this vast space the nations vied with each other in showing proofs of their industry, wealth, and greatness. A most interesting part of the exhibition was that devoted to the progress of modern education. Another building was the women's pavilion, covering an acre of ground, designed to receive the products of woman's ingenuity and progress. Besides the United States more than a dozen other nations were here represented. This was the first collective display of women's work ever attempted. The art building was called Memorial hall, and remains as a permanent monument of the exhibition. It is a splendid structure, in the renaissance style. On a central tower 150 ft. high stands a colossal statue of America; at the base are four figures of smaller proportions, representing the four quarters of the globe. The building is 365 ft. long by 210 wide, and 59 high; it is of granite, glass, and iron. Machinery hall, next in size to the main building, was 1402 ft. long by 360 wide, its area, including that of its annex, being nearly 13 acres. Steam, water-power, and

shafting were provided by the commissioners. The United States building was 504 by 306 feet. In it were exhibited, as fully as possible, all the operations of government service, Horticultural hall, in the Moorish style of the 12th c., was built by the city of Philadelphia, and was intended to be permanent. It is of iron and glass, 383 by 193 ft., and 73 in height. Agricultural hall covered a rectangular space 820 ft. long and 540 wide. Great Britain erected three buildings for the use and entertainment of her commissioners; and Germany, Brazil, and Portugal each had a pavilion. The English buildings were fine specimens of the later Tudor architecture. Sweden exhibited a national school-house with educational appliances and furniture complete. France had a building containing charts, drawings, and models of public works. Canada displayed her woods and lumber in log and frame houses. Spain had a soldiers' barracks, and Cuba had an acclimatization garden. Turkey showed in a special building her sponge fisheries. Japan had a model dwelling. Morocco had a Moorish villa for the display and sale of her productions. Chili had a building containing models of amalgamating machines. There were also a number of special edifices belonging to private exhibitors. There was a Turkish café of true oriental type, where Mocha, mastic, Syrian tobacco, and Samian wine were dispensed. There were a Tunisian bazar, and an Algerine pavilion; Japanese booths, houses, and gardens; a New England farmer's home with the old style of kitchen, and other peculiar structures. There were 26 buildings for the headquarters of as many states, some of them containing large exhibitions of state products; several were made of the stone or wood of the state represented. Thirty or more buildings were erected by private companies or individuals. Among them were the telegraph building, the transportation building, the bankers' building, the American kindergarten, the Bible building, and others showing the manufacture of innumerable articles; finally, the ingenuity of man was supplemented by bees making honey in the midst of all the crowd and turmoil. The exhibition was opened to visitors every day except Sunday for six months, closing on the 10th of November. The number of admissions was 9,910,966, of which number 7,250,620 paid the regular fee of 50 cts., and 753,654 the special rate of 25 cts.; 1,906,692 admissions were free, representing exhibitors, officers, employés, the press, and complimentary passes.

CENTER, a co. in middle Pennsylvania, traversed by the Allegheny and other mountain ridges, Bald Eagle creek, and two or three branches of the Pennsylvania railroad; 1000 sq.m.; pop. '70, 34,418. The chief business is agriculture. Coal, iron, and limestone are abundant. Co. seat, Bellefonte.

CENTER or GRAVITY is that point in a body or system of bodies rigidly connected, upon which the body or system acted upon only by the force of gravity, will balance itself in all positions. Though the action of gravity enters this definition, many of the properties of the point are independent of that force, and might be enunciated and proved without conceiving it to exist. By some, accordingly, the point has been called the *center of magnitude*, and by others, the *center of parallel forces*. Such a point exists in every body and system, and only one such point. Every body may be supposed to be made up of a multitude of minute particles connected by cohesion, and so far as its balance under gravity is concerned, each of these may be supposed to be removed, and its place occupied by a force proportioned to its weight. Instead of the body, on these suppositions, we should then have a system of parallel forces, the lines from the various particles to the earth's center being regarded as parallel. But a system of parallel forces (see PARALLEL FORCES) has a single resultant acting through a fixed point, whose position is independent of the position in space of the points of application of the component forces, provided their relative positions in the system continue unchanged. This

Fig. 1.

Fig. 2.

point is the C. of G.; and if it be supported, it is clear that the body will balance itself upon it in all positions. The same reasoning obviously applies to any system of bodies rigidly connected. It is usual to demonstrate this and the general rule for finding the C. of G. by proving it first in the case of two heavy particles forming a body or system, and then extending the proof to the case of any number of particles. Let P and Q (see fig. 1) be two heavy particles. Join P and Q, and divide the line PQ in C, so that weight of P : weight of Q :: CQ : CP. Then C will be the C. of G. of P and Q. Draw ACB horizontal, and PM, QN vertical, meeting AB in M and N. Then if P and Q represent the weights of P and Q, we have P : Q :: CQ : CP. But CQ : CP :: CN : CM by similar triangles. Therefore P : Q :: CN : CM, and P.CM = Q.CN. P and Q, therefore, are balanced about C. See BALANCE and LEVER. This is true in all positions of P and Q, for no assumption was made as to their positions. C, therefore, is their center of gravity. Also, we may conceive P and Q to be removed (see PARALLEL FORCES), and in their stead a particle at C equal to them taken together in weight. If

now, the system contained three, it is clear how we should proceed to find its center of gravity; having found the C. of G. of two, we should consider the system as formed of two—viz., the equivalent of the first two at their C. of G., and the third, when the case would fall under that already treated; and so on, extending the rule to a system containing any number of particles. Apart from this rule, however, it is possible, in the case of most regular homogeneous bodies, to fix upon their centers of gravity from general considerations. The C. of G. of a straight line, for instance, must clearly be in its middle point. So the C. of G. of a uniform homogeneous cylinder must be in the middle point of its axis. It must be in the axis, for the cylinder clearly is equally balanced about its axis. It must also be somewhere in its middle circular section, for it will balance itself on a knife-edge under that section. It must, therefore, be in the point where that section cuts the axis, or in the middle of the axis. The C. of G. of a uniform material plane triangle may be found from similar considerations. The triangle ABC (see fig. 2) may be supposed to be made up of uniform material lines parallel to its base AB; each of these will balance upon its middle point. The whole triangle, therefore, will balance upon the line CD, which bisects the base AB and all lines parallel to it. In the same way, the triangle will balance upon the line AE, bisecting BC. But if a figure balances itself upon a line, its C. of G. must lie in that line. The C. of G. of the triangle is therefore in CD, and also in CB. It must therefore be at g where these lines intersect, g being the only point they have in common. Now, by geometry, we know that g divides CD, so that $Cg = \frac{2}{3} CD$. Hence the rule for finding the C. of G. of a triangle: Draw a line from the vertex, bisecting the base, and measure off Cg , two thirds of the line. g is the center of gravity. By a similar method, the C. of G. of a great number of figures may be determined.

The above method applies only where the figure of the body is regular, and its mass homogeneous. But many bodies, besides being irregular, are formed by the agglomeration of particles of different specific gravities. Of these, the C. of G. can be found only by experiment, though not always satisfactorily. Let the body be suspended by a string, and allowed to find its position of equilibrium. The equilibrium being due to the tension of the string counterbalancing gravity, it follows that the tension is in the same line with that on which gravity acts on the body. But the tension acts on the line of the string, which therefore passes through the center of gravity. Mark its direction through the body. Suspending it then by another point, we should ascertain a second line in which lies the center of gravity. The C. of G., then, must be where these lines intersect.—For the effect on the stability of bodies of the position of the C. of G., see STABILITY.

CENTER OF GRAVITY is the point at which, if the whole mass of a body rotating round an axis or point of suspension were collected, a given force applied would produce the same angular velocity as it would if applied at the same point to the body itself. The C. of G. bears a strong analogy to the center of oscillation. The cases differ only in this, that in the latter the operating forces are supposed to act at every point of the moving body, while in the former there is only one force acting upon one point. The C. of G. is found by the following rule: Divide the moment of inertia of the rotating mass by the mass of the body, and extract the square root of the quotient. The result is the distance of the point from the axis of rotation. The moment of inertia, it may be stated, is the sum of the products of the weight of each point of the mass by the square of the perpendicular distance of that point from the axis.

CENTERING, the frame-work upon which an arch or vault of stone, brick, or iron is supported during its construction. The simplest form of C. is that used by masons and bricklayers for the arches of common windows and doors. This is merely a deal-board of the required shape, upon the curved edge of which the bricks or stones of the arch are supported until they are keyed in. In building bridges or other structures where arches of great span are to be constructed, the C. is usually made of framed timbers, or timbers and iron combined. The arrangement of the timbers should be such, that the strain upon each shall be mainly a thrust in the direction of its length, for if the strain were transverse, a comparatively slight force would snap it, and if a longitudinal pull, the whole structure would be no stronger than the joints holding the pieces of timber together. In arches of great span, such as that of Waterloo bridge, London, a longitudinal pulling strain is almost inevitable in some parts, as a beam of great length would bend to some extent under a thrusting strain. In such cases great skill and care are demanded in the designing and construction of the joints. As an arch is built from the piers towards the keystone, the weight upon the haunches during construction tends to push the crown upwards, and therefore the problem of designing a framed C. involves the resistance of this tendency, as well as the supporting of the weight of the materials.

The C. of Waterloo bridge, designed by Rennie, presents a fine example of the fulfillment of these requirements. The weight is resisted by direct thrust upon beams passing obliquely downwards from various parts; one of each pair of these oblique beams thrusts outwards, and is directly supported by the abutments; the other thrusts inwards towards a support equidistant from the abutments, the yielding of which is prevented by the longitudinal pull of lower and longer oblique beams. In this, and other modern structures, cast-iron shoes have been successfully used for the tying joints subject to the

longitudinal pulling strain. The flexible C., so called from its yielding at the joints, and varying its form with the load put upon it, is now abandoned. It was chiefly used by French engineers. That of Perronet for the bridge of Neuilly is a celebrated example.

Occasionally, when a very great span is required, and the navigation will permit, piers are built, or piles are driven, to support the C., and the design is much simplified thereby.

Cupolas like the pantheon and St. Peter's at Rome, St. Paul's in London, or the flat domes of the Turkish mosques, require very effective centerings.

CENTER OF MAGNITUDE or **FIGURE** (see **CENTER OF GRAVITY**). C. of M. is the point on which plane figures and curved surfaces would balance themselves, supposing their areas to have weight. Thus, the center of a circle is its center of magnitude. Otherwise, C. of M. or F. is a point so situated that all straight lines passing through it, and terminated by the circumference or superficies of the figure or surface, are bisected in it.

CENTER OF OSCILLATION. Referring to the article **PENDULUM**, the reader will see that the time of a pendulum's vibration increases with its length, being always proportioned to the square root of its length. This is strictly true only of the simple pendulum, in which the pendulous body is supposed to have no determinate magnitude, and to be connected with the point of suspension by an inflexible wire without weight. If, however, the vibrating body have a determinate magnitude, then the time of vibration will vary, not with the square root of its length, but with the square root of the distance from the axis of suspension of a point in the body called its center of oscillation.

If each part of the vibrating body were separately connected with the axis of suspension by a fine thread, and entirely disconnected from the rest of the body, it would form an independent simple pendulum, and oscillate as such—the time of each vibration being as the square root of the length of its thread. It follows that those particles of the body which are nearest to the axis of suspension would, as simple pendulums, vibrate more rapidly than those more remote. Being connected, however, as parts of the solid body, they vibrate all in the same time. But this connection does not affect their *tendencies* to vibrate as simple pendulums, and the motion of the body which they compose is a compromise of these tendencies of its particles. Those nearest the axis are retarded by the more remote, while the more remote are urged on by the nearer. Among these particles there is always one to be found in which the accelerating and retarding effects of the rest are mutually neutralized, and which vibrates in the same time as it would if it were unconnected with the other parts of the body, and simply connected by a fine thread to the axis of suspension. The point in the body occupied by this particle is its center of oscillation. By this C. of O. the calculations respecting the vibration of a solid body are rendered as simple as those of a molecule of inconsiderable magnitude. All the properties which belong to a simple pendulum may be transferred to a vibrating body of any magnitude and figure, by considering it as equivalent to a single particle of matter vibrating at its centre of oscillation.

The determination of the position of the C. of O. of a body usually requires the aid of the calculus. It is always further from the axis of suspension than the center of gravity is, and always in the line joining the center of gravity and the point of suspension, when the body is suspended from a point. The rule for finding it in such a case is: If S be the point of suspension, and O the C. of O., $SO = \frac{\sum (md^2)}{M.Sg}$; or it is the quotient obtained by dividing the moment of inertia of the body by the product of its mass into the distance of its center of gravity from the point of suspension.

CENTER OF PERCUSSION. The C. of P. of a body or a system of bodies revolving about a point or axis, is that point in it, which striking an immovable object, the whole mass shall not incline to either side, but rest, as it were, in equilibrio, without acting on the center or axis of suspension. If the body be moving freely, then the C. of P. is that point in it at which its whole impetus is supposed to be concentrated. In this case, if the body struck with its C. of P. an immovable obstacle, and if it were perfectly rigid and inelastic, it would come to perfect repose; whereas, if it struck the obstacle with any other point, a rotatory motion would be produced in it. When the body is moving freely, and there is no rotatory motion, the C. of P. coincides with the center of gravity. If the body be moving round a point or axis of suspension, the C. of P. coincides with the center of oscillation. The more complicated case of a body rotating round an axis within it, would require, for its explanation, analytical formulæ which cannot conveniently be translated into ordinary language. There are many positions which the axis may have in which there will be no C. of P.—i.e., there will be no direction in which an impulse could be applied without producing a shock upon the axis. One case of this sort is that of the axis being a principal axis through the center of gravity.

CENTER OF PRESSURE. The C. of P. of any surface immersed in a fluid is the point in which the resultant of the pressures of the fluid on the several points meets the surface. When the bottom of a vessel containing fluid, or when a plane immersed in

fluid, is horizontal, a pressure on every point of it is the same, being that due to the weight of the column of fluid standing above the bottom or plane. In either case, the pressures at the different points obviously form a system of equal parallel forces, whose center will be the center of gravity of the bottom or plane, their resultant passing through this point being the sum of all their forces. But when the plane is inclined at any angle to the surface of the fluid, the pressure is not the same at all points, but is obviously greater at the lower than at the upper points, for the lower have to support taller columns of the fluid. The resultant of these forces, then, will not pass through the center of gravity of the surface, but through a point below it. This point is the C. of P., and evidently will lie below the center of gravity for all fluids in which the pressure increases with the depth. If the surface pressed upon form part of the containing vessel, and be supposed movable, it will be kept at rest by a pressure equal to the sum of the fluid pressures applied at the C. of P., and acting in the opposite direction. In the case of a vessel with a parallelogram for one side, the C. of P. is at the distance of one third of the height from the bottom. In the case of a triangular vessel whose base is at the bottom, it is one fourth of the height only.

CENTIGRADE. See THERMOMETER.

CENTIPEDE, *Scolopendra*, a genus of *myriapoda* (q. v.), having a long slender depressed body, protected by coriaceous plates, 21 pair of legs, distinct eyes, four on each side, and antennæ with 17 joints. The name is, however, popularly extended to species of nearly allied genera. Centipedes run nimbly, feed on insects, and pursue them into their lurking-places. They have not only a pair of horny jaws, like those of insects, but also another pair of organs closely connected with the mouth, and which are regarded as transformed legs, dilated and united at the base, terminated by a strong hook, and pierced beneath the extremity for the emission of a venomous fluid, which makes their bite quickly fatal to insects, and in the case of the larger species, very painful and even dangerous to the larger animals and to man. The common C. of tropical America (*S. morsitans*) is often 9 in. or a foot in length. A species found in the s. of Europe (*S. cingulata*) is nearly as large, but its bite does not seem to be equally venomous. It may seem strange that creatures of such aspect as centipedes should ever have been thought of as human food, but Humboldt, in his personal narrative, tells us that he has seen Indian children of the tribe of the Chuyinas draw large centipedes out of the earth and eat them.—The most common British C. is not a true *scolopendra*, as that genus is now restricted, but is very nearly allied to it. It is known to naturalists as *lithobius forficatus*. It is very plentiful under stones, etc., in summer. Another allied genus, *geophilus*, of more numerous joints and slender form, contains some species which are occasionally phosphorescent, one of which, *G. longicornis*, yellow, with a rust-colored head, is very abundant at the roots of turnips, etc. It is supposed, however, to be rather useful than injurious, preying on the destructive larvæ of insects.

CENTLIVRE, SUSANNA, an English dramatic authoress, was the daughter of a Lincolnshire gentleman, named Freeman, b. (most probably) in Ireland, about 1670. Her early history is obscure; but such were her wit and beauty, that on her arrival in London, though a destitute orphan, and only 16 years of age, she won the heart of a nephew of sir Stephen Fox, who, however, died shortly after their marriage. Her second husband, an officer named Carrol, lost his life in a duel. Left in extreme poverty, his widow endeavored to support herself by writing for the stage, and after producing a tragedy called *The Perjured Husband* (performed first in 1700), made her appearance on the stage. She afterwards married (1706) Joseph Centlivre, principal cook to queen Anne, with whom she lived happily until the time of her death, Dec. 1, 1723. Her plays—*The Busybody* (of which the leading character, "Marplot," is highly amusing); *A Bold Stroke for a Wife* (1717); and *The Wonder* (1714)—though not distinguished by purity of style or truthfulness of portraiture, are lively in their plots, and have kept their place on the stage.

CENTO (from Gr. *kentrôn*, patchwork), a name applied to literary trivialities in the form of poems manufactured by putting together distinct verses or passages of one author, or of several authors, so as to make a new meaning. After the decay of genuine poetry among the Greeks, this worthless verse-manufacture came into vogue, as is proved by the *Homero-centones*, a patchwork of lines taken from Homer (edited by Teucher at Leipsic, 1793); but it was much more common among the Romans in the later times of the empire, when Virgil was frequently abused in this fashion, as in the *C. Nuptialis* of Ausonius (who gives rules for the composition of the C.), and especially in the *C. Virgiliannus*, constructed in the 4th c. by Proba Falconia, wife of the proconsul Adelfius, and giving, in Virgil's misplaced words, an epitome of sacred history! The C. was a favorite recreation in the middle ages. In the 12th c., a monk named Metellus contrived to make a C. of spiritual hymns out of Horace and Virgil.—See *Littérature du Centon*, by M. Delepierre (1875).

CENTO, a t. of central Italy, 16 m. n.w. of Bologna, is pleasantly situated on a fertile plain near the Reno. It is celebrated as the birth-place of the famous painter, Guercino, whose house, adorned with paintings, is still preserved; and in the church of C. are many of his works. Pop. about 5,000.

CENTRAL AMERICA, in geography that portion of North America included between the isthmus of Tehuantepec and the isthmus of Darien; politically including the states or republics of Guatemala, Honduras, Nicaragua, Costa Rica, and British Honduras, or Belize. The geographical limits would take in on the n. from Mexico the states of Tehuantepec, Chiapa, Campeche, and Yucatan; and on the s. from the republic of Colombia the greater portion of the state of Panama. Further details will be found under the titles of the respective countries. Also, see *AMERICA, ante*.

CENTRAL CITY, in Gilpin co., Col., about 40 m. w. of Denver; the center of supply for a rich mining district. Pop. '80, 2626.

CENTRAL FORCES are those which cause a moving body to tend towards some point or center, called the center of force or motion. The doctrine of C. F. has for its starting-point the first law of motion—viz., that a body not acted on by any external force will remain at rest, or move uniformly in a straight line. It follows from this law that if a body in motion either changes its velocity or direction, some external force is acting upon it. The doctrine of C. F. considers the paths which bodies will describe round centers of force, and the varying velocity with which they will pass along in these paths. It investigates the law of the force round which a body describes a known curve, and solves the inverse problem, and many others, the general statement of which could convey no clear idea to the unmathematical reader. As gravity is a force which acts on all bodies from the earth's center, it affords the simplest general illustration of the action of a central force. If a stone be slung from a string, gravity deflects it from the linear path which it would otherwise pursue, and makes it describe a curved line which we know would, in vacuo, be a parabola. Again, the moon is held in her orbit round the earth by the action of gravity, which is constantly preventing her from going off in the line of the tangent to her path at any instant, which she would do, according to the first law of motion, if not deflected therefrom by any external force. To that property of matter by which it maintains its state of rest or motion, unless acted upon by other matter, has been given the name *inertia*.

We will now explain how, through the action of a central force, a body is made to describe a curved path. Suppose it to have moved for a finite time, and conceive the time divided into very small equal parts; and instead of the central force acting constantly, conceive a series of sudden impulses to be given to the body in the direction of the center, at the end of each of the equal intervals, and then observe what, on these suppositions, will happen. Let S (see Fig. 1) be the center, and let the original motion be from A, on the line AB, which does not pass through S. In the first interval, the body will move with a uniform velocity, say from A to B. In the second, if acted on by no force, it would move on in AB produced to c, Bc being = AB. But when it arrives at B, it receives the first sudden impulse towards S. By the composition of velocities (q.v.), it will move now with a new but still uniform velocity in BC instead of Bc, BC being the diagonal of the parallelogram of which the sides represent its impressed and original velocity. Having reached C at the end of the second interval, it receives the second impulse towards S. It will now move in CD instead of in BC produced. If, then, we suppose the periods of time to be indefinitely diminished in length, and increased in number, the broken line ABCD will become ultimately a continuous curve and the series of impulses a continuous force. This completes the explanation.

Going back, however, on our suppositions, we may here establish Newton's leading law of central forces. That the body must always move in the same plane, results from the absence of any force to remove it from the plane in which at any time it may be moving. The triangles ASB and BSC are clearly in the same plane, as the latter is on that in which lie the lines Bc and BS. Also, since the triangles ASB, BSc are equal, being on equal bases, AB, Bc, and triangle BSC = triangle BSc, as they are between the same parallels, cC and BS, it follows (by Euclid I. 37) that ASB = BSC. So BSC = CSD; and so on. In other words, the areas, described in equal times by the line (called the radius vector) joining the center of force and the body, are equal. As this is true in the limit, we arrive, by the composition of the small equal areas, at the law: that the areas described by the lines drawn from the moving body to the fixed center of force, are all in one plane, and proportional to the times of describing them. Very few of the laws of C. F. are capable of being proved like the preceding, without drawing largely on Newton's lemmas, with which we shall not suppose the reader to be acquainted.

Centrifugal and Centripetal Force.—We have shown that a body continually drawn to a center, if it has an original motion in a line that does not pass through the center, will describe a curve. At each point in the curve, it tends, through its inertia, to

Fig. 1.

recede from the curve, and proceed in the tangent to it at that point. It always tends to move in a straight line in the direction in which it may at any time be moving, and that line, by the definitions of a tangent and of curvature, is the tangent to the curve at the point. At the point A (see fig. 2), it will endeavor to proceed in AD: if nothing hindered it, it would actually proceed in that line, so as, in the time in which it describes the arc of the curve AE, to reach the point D, and thus recede the length DE from the curve; but being continually drawn out of its direction into a curve by a force to a center, it falls below the point D by the distance DE. The force which draws it through this distance is called the centripetal force, and that which would make it recede in the same time through

Fig. 2.

the distance DE from the curve is called the centrifugal force. It may be remarked that the centrifugal force is not, like the centripetal, an impressed or external force acting on the body. It is simply the assertion of the body's inertia under the circumstances produced by the centripetal force.

Many familiar illustrations will occur to the reader of the action of what is called the centrifugal force. A ball fastened to the end of a string, and whirled round, will, if the motion is made sufficiently rapid, at last break the string, and fly off. A glass of water may be whirled so rapidly that, even when the mouth is pressed downwards, the water will still be retained in it, by the centrifugal force pressing it up against the bottom of the glass. The centrifugal action will be found to increase with the velocity. In all cases of a body moving in a circle, the force, it can be proved, varies as the square of the velocity of the body at the moment, and in the inverse ratio of the radius. As in this case the velocity varies as the radius inversely, it follows that the force is as the inverse cube of the radius. As in the case of circular motion the body always is at the same distance from the center, it follows that the centrifugal and centripetal forces are equal at all points of a circular orbit. The general law for all orbits is, that the centrifugal force varies as the inverse cube of the distance from the center. As the attractive force of gravitation varies as the inverse square of the distance, it may hence be shown that the centrifugal force gives perfect security, notwithstanding the constant attraction of the sun, that the planets, so far as that attraction is concerned, will never fall into the sun.

The doctrine of C. F. owes more to Kepler and sir Isaac Newton, of whose philosophy it makes a considerable branch, than to all the rest of the philosophers, though almost all the leading mathematicians have contributed to it. The doctrine of centrifugal forces was first mentioned by Huygens, at the end of his *Horologium Oscillatorium*, published in 1673; but Newton was the first who fully handled the doctrine, at least so far as regards the conic sections.

CENTRAL HEAT involves the theory that the temperature of the earth increases from its surface towards its center. Observations in mines and in boring artesian wells seem to justify such a conclusion, and the inference therefore is that the solid earth is a mere crust, at most but a few miles thick, within which all matter must be in a state of fusion. Observers have estimated the increase of heat at 1° F. for 50 to 60 ft. of depth. Eminent philosophers, however, reject the theory, and attribute the phenomena to local heat. They argue that if such a mass of fire existed in the interior the crust would soon be melted. Some contend that if the earth ever cooled from a state of fire to its solid form, the cooling must have commenced in the center. The most that can be said is that it is still an open question, while experiments and indications seem to favor the theory of a fiery and fluid interior.

CENTRALIA, a city in Marion co., Ill., on the Illinois Central railroad, at a junction of the Chicago branch with the main line, 112 m. n. of Cairo. There are repair shops of the Illinois Central railroad, which give employment to many persons. Pop. 3,190.

CENTRAL INDIA POLITICAL AGENCY, the official name for a group of feudatory states in the middle of India, the principal of which are Gwalior (Scindiah), Indor (Holkar), Rewah, and Bhopal. The total number, great and small, comprised in the C. I. P. A. is 71; covering about 90,000 sq. m., and having a pop. of 8,000,000. These states have nothing in common except a diplomatic connection with the British government through the agent to the governor-general.

CENTRALIZATION, a term which has lately come into general use for expressing a tendency to administer, by the sovereign or the central government, matters which had been previously under local management. We cannot properly use the term towards an established despotism, for there everything is already directed from the center. The legitimate application is to a state of change from local to central management—a change in the opposite direction would, on the same principle, be called localization. Of this latter change, however, it can scarcely be said that we have any recent example, unless it may be found in the systems of self-government lately communicated to some of the British colonies. Ever since the existing European states began to grow out of

the chaos of the fall of the Roman empire, there has been a continued progress in centralization. That empire itself was, however, the greatest instance of C. which the world has yet seen. In it the numerous municipalities and other local organizations originally existing in Italy, and communicated to the colonies, were entirely centralized. The empire, such as it had been in the days of Constantine, was the type after which the European monarchs, such of them especially as became more powerful than their neighbors, were ever striving; and a few of them, such as Charlemagne, and, long afterwards, Charles V., seemed to have almost restored it. In this country, we trace C. from the time when there were about a dozen kings in Britain, and perhaps as many in Ireland, till the united kingdom came under the rule of one monarch. A subsidiary C. at the same time made silent progress, absorbing the feudal power of the aristocracy and the municipal privileges of the corporations. In other countries—as, for instance, in France, notwithstanding her desperate struggles for freedom, this process of C. has tended to a pure irresponsible despotism. With so sad a result before their eyes, a distrust of C. has not unnaturally been felt by some inhabitants of Great Britain. But the British constitution possesses a grand remedy, which turns the process to good use instead of mischief. While administrative authority has been centralizing in the crown, the controlling power of parliament has been increasing at a more rapid ratio, so that the vesting of a function in the crown or central government, means the putting it under the control of parliament, and especially of the people's representatives in the house of commons. There is nothing done in any of the offices under the government for which a secretary of state, or some other member of the ministry, may not at any time be called to account in parliament. The efficiency of this control was in a manner proved by one or two instances in which offices with central powers were created, without being connected with any of the great state departments. There were, for instance, the English poor-law board, and the board of health. Both created much discontent and outcry about C., and it was found necessary to transfer their functions to the great government departments, the heads of which are immediately responsible to parliament. It is not the policy of this country in any case to abolish local management, but rather to aid and direct it from the central authority. The constituents of local bodies are often disinclined to watch or control them, and the business falls into the hands of incapable or designing men, or is otherwise mismanaged. A very little central help—especially from a quarter where the proceedings of other bodies of the same kind are known—remedies such defects. One of the methods in which the government has of late been in use to exercise its central power, has been by the appointment of inspectors, who make reports which are laid before parliament. This is, in reality, nothing more than a method of concentrating public opinion on the proceedings inspected and reported on, and as such it is very efficacious.

CENTRAL PARK. See NEW YORK CITY.

CENTRAL PROVINCES, a chief commissionership of British India, between 17° 50' and 24° 30' n., and 76° and 85° e.; 80,078 sq.m.; pop. '72, 8,201,519. The chief-commissionership was constituted in 1861, when the territories previously known as the Nagpur province and the Sagar and Nerbudda territories were united under the name of the Central provinces. This tract comprising almost every variety of soil and physical aspect, inhabited by races of very diverse origin, is bounded n. by the feudatory state of Rewah, the small native states of Bundelkhand, and by the district of Latatpur in the Northwest Provinces; on the n. and e. by the Chhota Nagpur division, the Oressa tributary states, and the n. districts of Madras; on the s. by the Godavari district; and on the s.w. and n.w. by the states comprising the Central India Political Agency. The Central Provinces are separated into four divisions, or commissionerships: Nagpur, Jabalpur, Nerbudda, and Chhatisgarh, comprising 19 British districts. The country is intersected by the Great Indian Peninsular and the East Indian railroads. The pop. is made up in each thousand, of 717 Hindus, 28 Mohammedans, 4 Buddhists, 2 Christians, and 249 "others," who consist of descendants of Gonds and original inhabitants.

CENTRIFUGAL AND CENTRIPETAL are terms used in botany to designate two different kinds of inflorescence, or modes of flowering of plants. When the flower-bud which terminates the floral axis, and is central in the inflorescence, is the first to expand—in which case the others are developed in succession from the center outwards—the inflorescence is said to be *centrifugal*. When the outermost flowers expand first, the inflorescence is *centripetal*, as is the case in catkins, spikes, and racemes, in which the flowers nearest the base are the first to expand, and those nearest the apex the last. These modes of inflorescence are very characteristic of different plants, of genera, and of orders.

CENTRIFUGAL FORCE. See CENTRAL FORCES.

CENTRIPETAL FORCE. See CENTRAL FORCES.

CENTUMVIRI, judges among the Romans appointed to decide common causes among the people. Three were chosen in each tribe. The extent of their jurisdiction is not clearly understood, but it was probably confined to unimportant causes.

CENTURION, a Roman infantry officer who originally commanded a hundred men, but afterwards an indefinite number. They were of two grades, and were chosen by the tribunes. Their duties were to drill the soldiers and appoint them tasks; and they had power to punish for minor offenses.

CENTURY PLANT. See *AGAVE*, *ante*.

CEPHAËLIS. See *IPECACUANHA*.

CEPHALASPIS, a genus of fossil ganoid fishes, of which six species have been described, two belonging to the upper Silurian and four to the Devonian measures. The head was protected by a large ganoid plate, sculptured externally with circular radiating markings. Agassiz gave the name *C.* (buckler-headed) from this extraordinary covering, which has very much the appearance of, and was formerly supposed to be, the cephalic shield of an *asaphus*. The body was covered with rhomboidal enameled scales, and furnished with dorsal and pectoral fins; it terminated in a large heterocercal tail. In a graphic description of this fossil in his *Old Red Sandstone*, Miller thus sketches the general appearance of the animal: "Has the reader ever seen a saddler's cutting-knife—a tool with a crescent-shaped blade, and the handle fixed transversely in the center of its concave side? In general outline, the *C.* resembled this tool, the crescent-shaped blade representing the head, the transverse handle the body." The endo-skeleton was cartilaginous, retaining the notochord through life. The flexible body, assisted by the large tail and the fins, would give the *C.* the power of moving rapidly through the water. Being a predaceous fish, it must have been a formidable enemy to its associates in the palaeozoic seas, for, besides its power of rapid motion, the sharp margin of its shield probably did the work of a vigorously hurled javelin, as in the sword-fish. This genus was originally named *asterolepis* (star-scale), from the circular marking on its cephalic shield.

CEPHALIZATION, a word used to indicate the degree in which the head, or, more accurately, the brain, dominates over the remainder of the animal structure. The distinction between a higher and a lower cephalization may be indicated thus:

SUPERIOR CEPHALIZATION.

More of the anterior appendages serve the head, in supplying food, etc.

The structure of the head is compacted, and its form abbreviated.

The posterior part of the body is abbreviated and compacted.

The anterior extremity tends upward; finds its limit in man, and is erect.

Degradation often extends to the absence of essential parts, as teeth, limbs, senses, and is often indicated by gross enlargement of mass, accompanied by stupidity and sluggishness.

Degrees of cephalization may be illustrated by the subdivisions of the mammalia, beginning with the lowest: 1. The mutilates, in which the limbs are wanting, or are degraded to fins; as whales, dolphins, etc.: 2. Herbivores, or plant-eaters; as the elephant, horse, deer, hog, etc.: 3. Carnivores, or flesh-eaters; as the lion, bear, dog, wolf, etc.: 4. Quadrumanes, including monkeys: 5. Bimanes, including mankind. Following this arrangement, as we ascend step by step, we find constant degrees of development corresponding to higher cephalic character, and showing itself in every phase of organized structure. In locomotion, for example, we find the limbs of (1) the mutilates fit only for paddling the body about in the element which gives it support; those of (2) the herbivores carry them from place to place; those of (3) the carnivores carry them about, and serve to grasp and tear their prey; those of (4) the quadrumanes serve for locomotion, for grasping prey, for carrying food to the mouth, and for carrying and defending their young; while in (5) man the fore limbs are relieved from service of locomotion, and are fitted not merely for feeding, for carrying, for defense, but also for an infinity of purposes, to which they are guided by the acuter sensibility of the brain. Similar steps of gradation may be found in other respects, as in the tail, the teeth, the form of the skull, etc. The principle may be further illustrated by the gradations of the lower orders, as in the articulate, going from the worms through the crustaceans to the insects; or in insects, from myriapods through spiders to the true insects; as in the varieties of man, in which the lower races have projecting jaws, retreating foreheads, and enlarged basal brains. With increased brain-force we find diminished jaw, less facial angle, elevated and enlarged forehead, the head generally shortened from front to rear, a larger cavity for the brain, and a greater weight thereof. Finding this constant progression from lower to higher developments, whose exponent is larger and more efficient brain, with nicer adaptation of mechanism for all the functions of life; finding also evidence of a similar gradation in sensation, sensibility, intelligence—everywhere the material more and more subordinated to the immaterial, the body conformed to the spirit, and ruled by it—it is not strange that men should look for a law of development, pervading and controlling all animated nature, or that they should expect to find in this law a formula of the relation between thought and matter, as a function of

INFERIOR CEPHALIZATION.

Fewer of the anterior appendages serve the head.

The structure of the head is loose and imperfect; the form is elongated and enlarged. Great length of tail shows inferiority of grade.

The anterior extremity tends downward, finds its limit and is horizontal in the fish.

the brain. But, while there may be abundant reason for supposing that such a law of relationship might exist, and that if demonstrated it might account logically for a vast and rapidly growing mass of observed facts, it is evident that no such law has yet been proved. Nor, indeed, does it now seem that such a law can be demonstrated without the admission of axioms and postulates, which involve as great strains upon the philosophic imagination as the very principles which such demonstrated law would antagonize and overthrow.

CEPHALONIA, or CEFALONIA, the largest of the seven Ionian islands (q.v.), is situated at the entrance of the gulf of Lepanto or Corinth, in lat. $38^{\circ} 3'$ to $38^{\circ} 30'$ n., and long. $20^{\circ} 21'$ to $20^{\circ} 49'$ east. It is irregular in shape. Its greatest length is about 30 m., and its total area 348 sq. miles. Its surface is mountainous, the soil, for the most part thin, and water very scarce. The inhabitants, however, are industrious and enterprising, and have planted vineyards wherever the grape will grow, and currants and olive-oil are also produced for export. The climate is warm and agreeable. The population in 1870 amounted to 77,382. The numbers who are brought up to the medical profession are remarkable; it is said that there is hardly a town in the Levant which has not a practitioner from Cephalonia. The inhabitants are also much more disposed to engage in foreign trade than those of Corfu or Zante, and own more vessels. In 1874, the exports amounted to £189,309, and the imports to £240,410. The island is subject to frequent, but slight earthquakes. There was formerly a small English garrison at Cephalonia. Steamers ply between it and Malta, Patras, and Triest. The language spoken is a Greek dialect. The chief towns are Argostoli (q.v.) and Lixuri.

C. is called by Homer Same or Samos, and during the heroic ages was subject to Ulysses, whose residence was in the neighboring isle of Ithaca (q.v.). Later, C. appears under the name of Cephallenia. It successively fell into the hands of the Athenians, Romans, Byzantines, and Venetians, from the last of whom it was several times wrested by the Turks. On the ruin of the Venetian republic in 1797, it was seized by the French, who were in their turn dislodged by the Russians. In 1809, it came into the possession of England. It was ceded to Greece in 1864.

CEPHALOP'ODA (Gr. head-footed), a class of mollusks, the highest in organization of that division of the animal kingdom. To this class belong the nautili, spirulæ, argonauts, poulpes, squids or calamaries, cuttle-fish, etc., of the present time, and the ammonites, belemnites, etc., of former geological periods. The C. are all marine, and only a few of them are capable of leaving the water, and moving about in search of food on shore.

The C. receive their name from having organs of prehension and locomotion attached to the head, an arrangement towards which a gradual approach may be traced in the highest gasteropod (q.v.) mollusks. These organs have been variously designated *arms*, *feet*, and *tentacula*. They "have no true homology" with the limbs of vertebrate animals, but are only analogous to them in respect of the purposes which they serve.—The body of the C. is a bag, formed of the *mantle* (see MOLLUSCA), open only at the end to which the head is attached. In some, this bag is almost spherical, and locomotion is accomplished only by the appendages of the head; in others, the body is elongated, and furnished with two fin-like expansions, which are the principal instruments of locomotion. In locomotion by the fins, a cephalopod swims like a fish, with the head first, and often very rapidly; in locomotion by the arms, it draws itself along, laying hold of any object within reach by means of suckers, with which the arms are furnished. Some C. are capable also of moving backwards through the water by alternate contractions and expansions of a muscular web which unites the bases of the arms; some appear to depend for a similar power of swimming backwards upon the forcible ejection of water from the 'funnel' below the eye.

The head of a cephalopod is roundish, generally furnished with two large and prominent eyes, very similar in structure to those of vertebrate animals. There are also ears, but they consist merely of little cavities, one on each side of the brain, in each of which is suspended a membranous sac containing a small stone. The organs of smell are not very certainly known, but it appears that the C. possess this sense, as well as that of taste, of which the character of the tongue is much more indicative than in many vertebrate animals.—The brain forms a ring around the gullet. The whole nervous system is more complex than in the lower mollusks.—The mouth opens in the midst of the circle of arms. It is furnished with a strong horny beak of two mandibles, moving vertically, not unlike the bill of a parrot, but the upper mandible the shorter of the two.—The digestive apparatus is very complicated. The gullet swells out into a crop, and there is a gizzard as muscular as that of a bird. The intestine, after a few convolutions, terminates in the cavity which contains the gills, at the base of the funnel by which the water is ejected after having supplied air for respiration. This cavity is situated within the mantle or bag, and separated from the other viscera by a membranous partition. Into it the water is freely admitted by means of a slit or valvular opening, being drawn in by muscular action, and again expelled with considerable force through the funnel, which opens at the neck, and with its current all secretions, eggs, and excrements are carried forth. There are only two gills in the greater number of existing C., the only exceptions being the two or three known species of *nautilus*, which have four gills; and

two-gilled C.—the order *dibranchiata*—are in many respects of higher organization than the four-gilled—the order *tetrabranchiata*—which, although containing so few recent, contains a vast number of fossil species. Each gill consists of many membranous plates, fixed to two sides of a stalk.—The heart in the *tetrabranchiata* consists of a single ventricle only; but besides this *systemic* heart, the *dibranchiata* have two *branchial* or *respiratory* hearts, contractile reservoirs, one for each gill, by which the blood is forced into these organs.

The “arms” or “feet” are very numerous in the *tetrabranchiata*, not provided with suckers, but hollow, and with long retractile tentacula; in the *dibranchiata* they are only eight or ten in number, furnished with suckers (*acetabula*); two of them, when they are ten in number, being much longer than the rest, and differing from them in form. The suckers are very admirably constructed—an adhesive disk of muscular membrane, often having a cartilaginous circlet, capable of most exact application to any object, with an aperture in the center leading into a cavity, the bottom of which can be retracted like a piston so as to form a vacuum, and render the adhesion of the sucker close and firm, whilst on the muscular action being interrupted or reversed, it immediately lets go its hold. The poulpe has each of its eight flexible arms crowded with 120 pairs of such suckers, and as an animal of this kind exists on some tropical shores, with arms about 2 ft. long, it is not wonderful that it is reckoned dangerous. Still more formidable, however, are the hook-squids of the South seas, the two long arms of which have suckers furnished in the center with a hook to enter into the flesh of any creature of which they may lay hold, and so more effectually to secure their prey.

The sexes are distinct in all the cephalopoda. The eggs have a horny covering, and after their extrusion from the parent, become agglutinated into masses of various forms. The young, from the first, very much resemble the mature animals, except in size.

All the *dibranchiata* are provided with a peculiar organ of defense, called an “ink-bag,” which is wanting in the *tetrabranchiata*. This ink-bag is filled with a peculiar secretion, capable of being expelled at will to darken the water, and facilitate the escape of the cephalopod.

The tetrabranchiate C. have a chambered shell. See NAUTILUS. The dibranchiate C. have no external shell—the shell of the female argonaut (q.v.) being scarcely an exception—but they have an internal shell (cuttle-fish bone, etc.), sometimes merely rudimentary, included between two folds of the mantle, and apparently intended to give support to the soft body of the animal.

The C. are all very voracious, feeding on fish, mollusks, crustaceans, etc. Even a powerful crab is not safe from the attacks of a dibranchiate C. little bigger than itself; the arms, so abundantly provided with suckers, seize it, and trammel every movement, whilst the parrot-like beak is strong enough to break the hard shell. Cuttle-fish and squids are often very troublesome to fishermen, following shoals of fish, and devouring great numbers of them after they are entangled in the net.

Fossil C. exist in all the strata which form the earth's crust. The order *tetrabranchiata* is almost exclusively a fossil order, being represented by not more than four recent species. With the exception of two genera, *nautilus* and *aturia*, this order is confined to primary and secondary rocks. The two groups into which it is divided are also characteristic of geological epochs. The *nautilidae*, with simple or gently undulating septa, and siphuncle central or in the inner margin, belong, with the exception of the two genera just referred to, to the paleozoic rocks. Including a small group which, while it has the siphon on the external margin, has yet simple septa, the *nautilidae* are represented by 145 Silurian, 158 Devonian, and 91 carboniferous species. The *ammonitidae* have the siphuncle always on the outer margin of the shell, and the septa with corrugated or lobed margins. This group, with the exception of *goniatites*, a paleozoic genus, is peculiar to, and co-extensive with, the secondary strata. Of the 930 species that have been described, more than the half belong to the genus *ammonites* (q.v.).

The order *dibranchiata* is found first in the lias, and extends through the more recent strata, receiving its full development in our present seas. Scarcely 90 fossil species have been described, while more than double that number are known as recent animals. See AMMONITES, ARGONAUT, BELEMNITES, CALAMARY, CERATITES, CUTTLE-FISH, GONIATITES, HOOK-SQUID, NAUTILUS, OCTOPODA, ORTHOCERAS, POULPE, etc.

CEPHALOPTERA (Gr. head-wing), a genus of cartilaginous fishes of the ray family, the type of a sub-family, *cephalopteridae*. The pectoral fins are very much elongated, so as to give great breadth to the fish. The tail is slender and without fin, but armed near its origin with a great spine. The head is terminated in front by a straight line, and on each side of it there projects a membrane (*precephalic fin*) rolled upon itself, and resembling in shape a pointed horn. The name HORNED RAY has therefore sometimes been given to these creatures, of which only one species, *C. giorna*, has ever been found on the British coasts. It is not uncommon in the Mediterranean, and there acquires a great size; one is mentioned as having been taken off Messina, which weighed 1250 lbs.—more than half a ton. But this is small in comparison with the size of some of the *cephalopteridae* which occur in tropical seas: one taken at Barbadoes required seven yoke of oxen to draw it. They are very dangerous to swimmers and bathers.

CEPHEUS, a constellation of the northern hemisphere, containing, according to the Britannic catalogue, 35 stars. Its principal star is Alderamin, of the third magnitude.

CEPOLA. See **BANDFISH**.

CERACCHI, GIUSEPPE, 1760-1801: a native of Corsica who was active in establishing a republic in that island in 1798. He took refuge in France, and with others undertook the assassination of Napoleon. The deed was to have been done while the consul was at the opera, Oct. 10, 1800, but there was a traitor among the conspirators, and C. and three others were seized, tried, and executed. C. was a sculptor of some note.

CERAM, an island in the Moluccas archipelago, lies n.e. of Amboyna, between 2° 44' 30" and 3° 30' 30" s. lat., and 129° 30' and 130° 53' e. long., and is divided into Great and Little Ceram by the isthmus of Tariño. Area, 7,140 sq. miles. Pop. 195,000. Malays inhabit the coasts; Papuans the interior. A mountain chain runs through C., reaching in Nūsa Keli 9,250 feet. The soil is very fertile. The vegetable products include timber-trees, rice, sago, maize, sugar-cane, bananas, and edible roots. The Malays fish. Exports are Ceram clothing, textiles, iron, copper-wire, earthenware, birds of paradise, trepang, sago, dried fish, edible nests, etc. C. belongs to the Netherlands.

CERAMBYX, a Linnæan genus of coleopterous insects, included among those which, on account of the length of their antennæ, are usually known as **LONG-HORNED BEETLES**, and now generally regarded as the type of a tribe or family. To this tribe belongs the musk beetle of England (*callichroma moschata*), remarkable for its strong and agreeable odor, which, however, is rather that of roses than of musk. Some foreign species have the odor of musk in great perfection. *C. heros*, one of the largest European beetles, extremely rare in Britain, deposits its eggs in a hole which it excavates for that purpose in the wood of the oak; and the grub feeds upon the wood, excavating long passages through it.

CERAMIA CÆ, a sub-order of *algæ* (q.v.), also called **FLORIDEÆ**, and consisting of sea-weeds of a rose or purplish color, with fronds formed of cells arranged in rows, sometimes in a single row; the *sporocarpis* containing cells or *spores*, often in fours (*tetraspores*), with a transparent *perispore*, and inclosed in receptacles of very various form and structure. They are most abundant in the seas of the northern temperate zone. Many of them are very delicate and beautiful. A considerable number furnish agreeable articles of food of a gelatinous nature, as *dulse* (q.v.), *carrageen* (q.v.) or Irish moss, and certain species of *plocaria* (q.v.), which are much used on the sea-coasts of the East Indies. The edible swallows' nests of the east are supposed to be formed of a seaweed of this sub-order, a species of *gelidium*.

CERAMIC (Gr. *keramos*, potter's clay, from *kaio*, to burn, and *era*, earth), a term used to designate the department of plastic art which comprises all objects made of clay, such as vases, cups, bassi-rilievi, cornices, and the like.

CERAMICUS, a public ground, or potter's field, outside of the walls of Athens, where citizens killed in war were buried at the expense of the state.

CERAS TES, or **HORNED VIPER**, a genus of serpents of the family *viperidæ*, distinguished by a broad depressed heart-shaped head, the scales of which are similar to those of the back, and particularly remarkable for the development of one of the scales of each eyelid into a spine or horn, often of considerable length. The tail is very distinct from the body. This genus is exclusively African, and very venomous. The best known species, *C. vulgaris*, the horned viper of the n. of Africa, was called C. by the ancients, the name being derived from the Greek *keras*, a horn. It was correctly described by the traveler Bruce, but his description was for some time regarded with incredulity. Other species of the same genus are *C. nasicornis* of the western coast of Africa, and *C. caudalis* of the cape of Good Hope.

CERATE. (Lat. *cera*, wax), a compound of wax with other oily and medicinal substances in such proportions as to have the consistence of an ointment (q.v.). Simple C. is made by melting together equal parts of white wax and olive-oil; they are to be heated together, and carefully stirred into a uniform substance, while cooling.

CERATITES, a genus of ammonitidæ, peculiar to, and characteristic of, the trias. They are distinguished from the other members of the family by having the lobes of the sutures serrated, while the intervening curves, directed towards the aperture, are simple. Twenty-six species have been described.

CERAUNIAN MOUNTAINS, a name given by the Greeks to two mountain chains, the first being probably the e. extremity of Caucasus; according to Strabo that portion of the Caucasus which looks down upon the Caspian sea, where he locates the land of the Amazons. The second, called also "Acroceraunian," extended along the coast of the Ionian sea. These mountains were often mentioned in ancient poetry. The chain is now called **Khimara**, **Chimara**, or **Chinari**.

CERBERUS (Gr. *kerberos*), in Greek mythology, was the name of the many-headed dog—the offspring (according to Hesiod) of Typhon and Echidna—who guarded the portal of the infernal regions. Later writers describe C. as only three-headed, with the tail and mane composed of serpents, though the poets sometimes encumber him with

100 heads.—A northern constellation, near the hand of Hercules, was named C. by Hevelius.

CERCA'RIA, a name formerly given to a supposed genus of *entozoa*, at first, from their minute size, mistaken for *infusoria*, but now known to be the young of *trematode worms*. In the form to which the name C. was given, these creatures consist of an oval body with a thread-like tail; and swim about with great activity in water, but exhibit a strong instinctive propensity to penetrate into the soft bodies of insect larvae, which they do by means of a spine-like weapon projecting from their head. The tail, as no longer needed, is now left behind, the closing of the wound through which the C. enters apparently nipping it off. Within the body which it enters, the C. loses also its spine, becomes encysted, and awaits its passive migration into an animal of higher kind, there to become a trematode worm. When it does not succeed in finding, in due time, a larva into which to enter, the C. gathers itself up into a ball; emits a mucous secretion, which soon hardens; and incessantly turning round within this mucous mass, becomes invested with a sort of shell, in which form it is not unlikely to be swallowed by some vertebrate animal. The C. is not the immediate offspring of a parent like itself. It is generated in a curious little animated sac, which is to be found buried among the organs of freshwater mollusks, and within which this development of young takes place by gemmation. See GENERATIONS, ALTERNATION OF.

CERCELEÉ, or **RECERCELEÉ**, in heraldry, is a cross circling, or curling at the ends, like a ram's horn.

CER CIS. See **JUDAS'S TREE**.

CERCOBUS (Gr. tail-ape), a genus of monkeys, natives of Asia and Africa, included by some naturalists in the large genus *cercopithecus*. These monkeys have large cheek-pouches, large callosities, and long tails. The species commonly called **MANGABEYS**, or **WHITE EYELID MONKEYS**, are commonly referred to this genus, besides the **CALITHRIX**, or **GREEN MONKEY**, and the **MALBROUK**, or **DOG-TAILED BABOON**.

CERCOPI'THES CUS (Gr. tail-ape), a genus of monkeys, containing a large number of species, natives of Asia and Africa, but chiefly of Africa. They are called *guenons* by French naturalists, but they have no common English name more distinctive than monkey. They have cheek-pouches and callosities, and a long but not prehensile tail. A **MONA**, or **VARIED MONKEY** (*C. mona*)—an African species—in the Parisian menagerie, was remarkable not only for the cunning and adroitness with which it searched and rifled the pockets of visitors, but also for the readiness with which it applied a key to the opening of a lock, untied knots, undid the rings of a chain, and performed other similar feats.

CERDO'CYON (Gr. cunning-dog), a genus of *canidæ*, apparently intermediate between true dogs and foxes, natives of South America. They are sometimes called **Aguara foxes**. Their aspect is thoroughly vulpine, as are also their manners. Some of them add to the dispositions of ordinary foxes a singular propensity to steal and secrete brilliant or gaudy objects. A Brazilian species has been known to carry pocket-handkerchiefs into the woods. Some are natives of the coldest parts of South America, and have a rich fur.

CERDONIANS, a sect of Gnostics, founded by Cerdo, a Syrian, who came to Rome about 140 A.D. They held that there were two primal causes—the perfectly good, and the perfectly evil. The good created the world, is the God of the Jews, and the author of the Old Testament. Jesus Christ is the son of the good Deity: he was sent into the world to oppose evil; but his incarnation, and consequently his sufferings, were mere appearance. Deeming the human body the work of the evil deity, the Cerdonians prohibited marriage, wine, and flesh-eating, and advocated fasting and other austerities. Cerdo rejected the Old Testament, and all of the New, except a part of Luke's gospel and Paul's epistles.

CERE. See **BILL**.

CERE'A, a t. of n. Italy, about 19 m. s.s.e. of Verona. It is a straggling place, with the remains of an old castle. Pop. 5,930. The Austrians defeated the French here in 1798.

CEREA LIA, or **CE'RÉAL GRASSES**, so named from Ceres (q.v.), are the plants which produce grain or corn; in other words, all the species of grass (*graminæ*) cultivated for the sake of their seed as an article of food. They are also called **corn-plants** or **bread-plants**. They do not belong to any particular tribes of the great order of grasses, but differ from each other botanically, perhaps as much as any plants within the limits of that order. The seeds of the grasses in general being indeed farinaceous and wholesome, the employment of particular species as bread-plants seems to have been determined chiefly by the superior size of the seed, or by the facility of procuring it in sufficient quantity, and of freeing it from its unedible envelopes. Some of the grains, as wheat and barley, are produced in ears or close-set spikes; some, as a few of those called millet, in spike-like panicles; others, as oats and rice, in very loose panicles. The form and size of the grains vary not a little, some being roundish, and some elongated; maize is the largest; many of the millets are very small. The plants themselves vary in size

almost as much as their seeds, the millets being the smallest, and maize the largest of ordinary corn-plants.—Buckwheat and spurry are sometimes ranked with the C., but incorrectly, if the term is regarded as having any botanical limits, for they are not grasses; but their seeds are used in the same way. The quinoa of South America, and the kiery (*amaranthus*) of India, with other plants of different orders, might be added to the list on the same account; even the lotus of the Nile, the *Victoria regia*, and other species of water-lilies might thus be reckoned as cereal plants. The most extensively cultivated grains are wheat (*triticum*), barley (*hordeum*), rye (*secale*), oats (*avena*), rice (*oryza*), maize or Indian corn (*zea*), different kinds of millet (*setaria*, *panicum*, *paspalum*, *pennisetum*, and *penicillaria*), and durra or Guinea corn (*sorghum* or *andropogon*). These have all been cultivated from time immemorial, and there is great uncertainty as to the number of species to which the many existing varieties belong; their original forms and native countries cannot confidently be determined. Barley, oats, and rye are the grains of the coldest regions, the cultivation of the two former extending even within the arctic circle. Wheat is next to these, and in the warmer regions of the temperate zone its cultivation is associated with that of maize and rice, which are extensively cultivated within the tropics. The millets belong to warm climates, and durra is tropical or sub-tropical. Rice is the food of a greater number of the human race than any other kind of grain. Maize has the greatest range of temperature.—Besides these, other grasses are cultivated to some extent, in different parts of the world, for the grain they yield: a species of *eleusine* (mand) in India, and another (tocusso) in Abyssinia; a species of *poa* (teff) in Abyssinia, and a species of *coix* (Job's tears) in India. Canary grass (*phalaris*) may also be named. Canadian rice (*zizania*) is used as a grain, but is scarcely cultivated, and the same remark applies to the manna grass (*glyceria*) of the n. of Europe, to some species of bamboo (*bambusa*), and to the sea lyme grass (*clymus*), which affords an esteemed article of food, in small quantity, to the inhabitants of Iceland.

Of all the C., wheat is by common consent admitted to be that of which the grain is best fitted for the making of bread, although others are to some extent employed for this purpose. But some, as rice and maize, are scarcely suited for it, and other methods are chiefly employed of preparing them for food. All the grains are also used to produce some kind of fermented liquor or beer, and spirituous liquors are obtained from them by distillation.

CEREBELLUM. See CEREBRUM.

CEREBRINE, or CEREBRIC ACID, is an organic acid of very complex composition, found in the liver, blood, and nerves, but especially the brain of animals.

CEREBRO-SPINAL FLUID. There is an interval, termed the *sub-arachnoid space*, lying between the two innermost of the membranes of the brain and spinal cord—viz., the arachnoid and the pia mater. This space, which is narrow on the surface of the cerebral hemispheres, but is comparatively wide at the base of the brain between the two middle lobes of the cerebrum, and, posteriorly, between the hemispheres of the cerebellum and the medulla oblongata, is occupied by the cerebro-spinal fluid, which fills up the interval between the arachnoid and pia mater, and keeps the opposed surfaces of the former membrane (which is a closed serous sac) in contact. The cerebro-spinal fluid is a clear, limpid, slightly albuminous fluid, having a saltish taste, and a faintly alkaline reaction, and not containing more than 1.5 per cent of solid matters. It varies in quantity from 2 to 10 ozs., and is said to be most abundant in aged persons. Its chief use is to afford mechanical protection to the nervous centers, and to prevent the effects of external shocks or concussions.

CEREBRO-SPINAL MENINGITIS. See MENINGITIS, ante.

CEREBRUM-CEREBELLUM. Cerebrum (Lat. the brain) is sometimes applied to the whole contents of the cranium or skull; but more usually it denotes the upper portion, while the under and posterior portion is called the CEREBELLUM, or little brain. In this article we shall briefly notice the chief results which have as yet been obtained regarding the uses of the various parts of the mass, referring to the article BRAIN for the necessary anatomical details.

The *crura cerebri* appear as the principal conductors of impressions to and from the cerebrum. When one is divided, the animal moves round and round, from the injured towards the sound side, as if from a partial paralysis of the latter side. The effect may be referred to the interruption of the voluntary impulses from the C., for although the cerebellum seems to have the office of combining the muscles, whose co-operation is necessary for each action, the effort of the will must proceed from the cerebrum.

The *corpora quadrigemina* are, as stated in the article BRAIN, "analogues of the optic ganglia of the lower animals." Their removal wholly destroys the power of seeing, and diseases by which they are seriously affected are usually accompanied with blindness. Disease or destruction of one *corpus quad.* produces blindness of the opposite eye. Probably their connection with vision is not their only function.

The *optic thalami* probably participate slightly in the visual function of the *corpora quadrigemina*; but we have no definite evidence on this point. They are intimately connected with the power of movement. Destruction of one of them causes rotation of the animal, similarly to division of one of the *crura cerebri*. Longuet has shown, that

after removing all the cerebral hemispheres and the *corpora striata*, the animal can still stand and walk, but that on removing one of the optic thalami, it falls down paralyzed on the opposite side, or commences rotatory motion.

The function of the *corpora striata* is very uncertain; they have probably some connection with sensation and volition, the precise nature of which is at present unknown.

The parts hitherto considered—including the cerebellum—appear to comprise the apparatus (1.) For the direction and government of all the unfelt and involuntary movements of the parts which they supply; (2.) For the perception of sensations; and (3.) For the direction of such instinctive and habitual movements as do not require the exercise of any reasoning or intellectual act. They cannot be regarded as organs of the higher faculties of the mind.

The functions of the *cerebral hemispheres* are, in the words of Dr. Kirkes (*Handbook of Physiology*), those of organs by which the mind, 1st, perceives those clear and more impressive sensations which it can retain and judge according to; 2d, performs those acts of will, each of which requires a deliberate, however quick, determination; 3d, retains impressions of sensible things, and reproduces them in subjective sensations and ideas; 4th, manifests itself in its higher and peculiarly human emotions and feelings, and in its faculties of judgment, understanding, memory, reflection, induction, and imagination, and others of the like class.

"The evidences that the cerebral hemispheres are, in the sense and degree indicated above, the organs of the mind, are chiefly these: 1. That any severe injury of them, such as a general concussion, of sudden pressure by apoplexy, may instantly deprive a man of all power of manifesting externally any mental faculty; 2. That in the same general proportion as the higher mental faculties are developed in the vertebrate animals, and in man at different ages, the more is the size of the cerebral hemispheres developed in comparison with the rest of the cerebro-spinal system; 3. That no other part of the nervous system bears a corresponding proportion to the development of the mental faculties; 4. That congenital and other morbid defects of the cerebral hemispheres are, in general, accompanied with corresponding deficiencies in the range or power of the intellectual faculties and the higher instincts." See MIND, THE HUMAN.

Cerebellum.—The functions of this organ have been made the subject of much discussion and investigation. It is itself insensible to irritation, and has been cut away in various animals (by Longet and other French physiologists), without eliciting signs of pain; moreover its removal or disorganization by disease is generally unaccompanied with loss or disorder of sensibility, animals from whom it has been removed being apparently able to smell, see, hear, and feel, as perfectly as before. Flourens seems by his vivisections to have arrived at the correct view regarding the functions of this organ, and his results have been fully confirmed by Longet and others. He extirpated the C. in birds by successive layers. Feebleness and want of harmony of the movements resulted from the removal of the superficial layers; when he reached the middle layers, the animals became restless; their movements were violent and irregular; but they were not convulsed, and their sight and hearing were perfect. By the time that the organ was entirely removed, the animals had completely lost the power of flying, walking, standing, and preserving their equilibrium. When a pigeon in this state was laid upon its back, it could not recover its former position; but fluttered its wings, and saw and tried to avoid a threatened blow. Hence volition, sensation, and memory were not lost, but merely the faculty of combining the actions of the muscles. From a large series of experiments of this kind, subsequently made on all classes of animals, Flourens infers that the C. belongs neither to the sensitive nor to the intellectual apparatus; and that it is not the source of voluntary movements, although it belongs to the motor apparatus; but that it is the organ for the co-ordination of the voluntary movements, or for the excitement of the combined and harmonious action of the muscles.

This view is confirmed by the phenomena observed in certain cases of disease, and to a certain extent by comparative anatomy, for to each of the four classes of vertebrata—if we reckon amphibians and reptiles as a single class—the species whose natural movements require the most rapid and exact combinations of muscular actions are those in which the C. is most developed in proportion to the spinal cord; and if we compare different species of the same class, we usually find the development of the C. to correspond very closely with the perfection and variety of the muscular movements. For example, in the frog the movements are exceedingly simple in character, consisting of little else than flexion and extension of the posterior limbs; and the C. of this animal is extremely small compared with the rest of the brain, being merely a thin narrow band of nervous matter. In the common sea-turtles, the movements of the body are of a more varied character, and the motions of the head and neck are more extensive; and here we have a much more highly developed cerebellum. In the alligator, again, a reptile whose motions closely resemble those of quadrepeds, the C. is still more fully developed.

The influence of each half of the C. is directed to the muscles of the opposite side of the body, and for the right ordering of the movements, the actions of its two halves must be mutually balanced and adjusted; for if the nervous structures uniting one of the halves of the C. with the medulla oblongata and spinal cord be divided, strangely disordered movements occur, the animal falling down on the side opposite to that which

has been injured, and continually rotating round the long axis of its body, sometimes for several days, at the rate of fifty or sixty times in a minute. Similar movements have been observed in men in whom one of the crura of the C. has been diseased.

Phrenologists are of opinion, in accordance with the view originally propounded by Gall, that the C. is the seat of the sexual impulse and instincts; but this view has been long abandoned by almost all physiologists, for the reason that it has not been found to be sufficiently supported by anatomical and experimental facts, many of which are indeed directly opposed to it.

Our limited space compels us to leave altogether untouched many most interesting topics in cerebral physiology, as, for instance, the quality of the brain, the plurality of the cerebral organs, etc. The reader who wishes for further information, is referred to Kirkes's *Physiology* (from which we have freely quoted), Carpenter's *Human Physiology*, Noble's *On the Brain*, Holland's *Chapters on Mental Physiology*, and Brodie's *Psychological Inquiries*.

CEREMONY (Fr. *cérémonie*; Lat. *cerimonia*, a sacred rite). Almost any act, when performed in a regular, orderly, and formal manner, and when viewed, not with reference to its object, but the mode of its performance, becomes a C.; and the more entirely the attention of the performers is withdrawn from the object of the act, and fixed upon the manner of its performance, the more *ceremonious* does it become. The purely formal character of C. is thus illustrated by Hooker: "The name ceremony," he says, "we do not use in so large a meaning as to bring sacraments within the compass and reach thereof, although things belonging to the outward form and seemly administration of them are contained in that name." The remark is applicable to the most trivial ceremonies of social life and of state pageantry, as well as to the most sacred rites of religion, for a C. which is its own object would scarcely be entitled to be regarded even as a ceremony. The most empty display has always the ulterior object of imposing on somebody.

Ceremonies may be divided into four classes: 1. Religious ceremonies; 2. Social ceremonies; 3. State ceremonies; 4. International ceremonies.

Religious and state ceremonies will be treated of respectively under their various denominations; see, for the first, RITES, LITURGY, MASS, PROCESSIONS, etc., and for the second, CORONATION; COURT; COURT, PRESENTATION AT; PARLIAMENT; etc. Social C. will in a great measure fall under the heads, ETIQUETTE, PRECEDENCY, COURTESY, FORMS OF ADDRESS, etc.; and international C. under DIPLOMACY, CONSUL, AMBASSADOR, etc.

CEREOPSIS (Gr. wax-face), a genus of birds of the family *anatidae*, to which the New Holland goose (*C. Novæ Hollandiæ*) belongs. This bird has been known since the southern shores of that country were first visited by navigators. There, and on the adjacent islands, it is found in great abundance; and the earlier navigators easily supplied themselves with fresh provisions by knocking them down with sticks, so little were they acquainted with the danger to be apprehended from man. The cere is remarkably large, whence the name.

CERÉS, among the Greeks named *Dēmêter*, daughter of *Chronos* (Saturn), by *Rhea* (Ops), sister of Jupiter, Neptune, Juno, etc. She had the misfortune, along with her other brothers and sister, to be devoured by her father, who, however, vomited her forth again after taking the emetic which Metis gave him. By her brother Jupiter she became the mother of Persephone or Proserpina (q. v.). The chief myth relating to C. tells how her daughter Proserpina was stolen by Pluto, and how the mother wandered far in quest of the maiden. After traveling in human form nine days, and everywhere distributing her gifts to mankind, she excited the pity of Jupiter, by whom Mercury was dispatched to bring back Proserpina from the infernal world, but on the condition that she must spend there a third part (or, as others say, one half) of every year. The myth of C. was symbolical of the growth of grain; some consider that this is intimated in the name Demeter, which is thought to be equivalent to *ge meter*, "Mother Earth." The relations of the worship of C. with agriculture, social order, etc., were expressed in her two great festivals—the *Eleusinia* (q. v.) and *Thesmophoria* (q. v.). C. was especially worshiped in Crete, Delos, Sicily, Asia Minor, Arcadia, Argolis, and Attica. Bulls, cows, pigs, honey-cakes, and fruits were offered to her. Among the Romans, her festivals were styled **CEREALES**; and of these, the most interesting was the feast celebrated by the rural population shortly before harvest, when the country people, dressed in white, and crowned with oak-leaves, danced and sang harvest songs in honor of the goddess. The feast in April lasted several days, and was celebrated by games of the circus. C. was represented, most commonly, in a chariot drawn by dragons, having her head crowned with a garland of corn-ears, and holding a torch, a basket, or a poppy in her hand.

CERES, one of the planetoids (q. v.), and the first of them that was discovered. It was first seen by Piazzi at Palermo, Jan. 1, 1801. He continued to observe its motion till the 13th of Feb., when illness obliged him to discontinue his observations, which, however, sufficed to enable astronomers approximately to calculate its orbit. It was nearly a year after before it again became visible, owing to its approach to the sun.

C.'s magnitude is less than that of the moon; and it looks like a star between the seventh and eighth magnitudes.

CEREUS, a genus of plants of the natural order *cactææ* (q.v.), containing about 100 known species, among which are some of the most splendid flowers of that order. One of these is *C. speciosissimus*, now one of the most common greenhouse plants in Britain, and sometimes cultivated even in windows. Its large flowers are of a fine scarlet color, the inner petals with a violet tinge: they spring singly from the younger branches. The fruit, when well ripened, is of a delicious flavor. The plant is a native of Mexico.

CERIGNOLA, a t. of Italy, in the province of Foggia, 23 m. s.e. of Foggia. It is divided into two parts—the old and new town, in the former of which a portion of the ancient walls still remain—and is celebrated for the decisive victory obtained over the French by the Spaniards in 1503, and which established the supremacy of Spain in Naples. C. has manufactures of linen, and a trade in cotton and fruits. Pop, '71, 25,131.

CERĪGO, one of the smaller of the seven Ionian islands, was anciently called Cythera; is situated in the Mediterranean, and is separated from the coast of Morea by a narrow strait; lat. 36° 28' n., long. 23° e. It has an area of 107 sq.m., with a pop., in 1870, of 10,637. With the exception of a few tracts of land, it is a very barren, dry, and mountainous island. In some parts, however, corn, wine, and olive-oil are raised. There are two great caverns in the island—one in the sea-cliff at the termination of the wild glen of Milopotamos; the other known by the name of the cavern of St. Sophia, from a small chapel at its mouth dedicated to this saint, is situated at about one and a half hour's ride from Capsali (q.v.), the capital of the island. The former cavern is said to be 3 m. in length, and so low that it is necessary to creep, in many places, on hands and knees to explore it. The latter—that of St. Sophia—is a very remarkable one, and possesses singular beauty; it abounds in enormous stalactites of various shapes and great beauty. In ancient times, C. was sacred to Venus, being, according to the old mythology, the island that received this goddess when she arose from the sea.

CERINTHUS (abusively named **MERINTHUS**, i.e., a halter), a heretic who lived at the close of the apostolic age, but of whom we have nothing better than uncertain and confused accounts. It is said that he was a Jew by birth, and studied philosophy in Alexandria. From Egypt he passed into Asia Minor, and lived in Ephesus contemporaneously (according to the belief of the church) with the aged apostle John. Tradition tells us that John held the heretic in such detestation, that, on a certain occasion, when he encountered C. in the baths of Ephesus, he immediately left the place, saying to those about him: "Let us flee home, lest the bath should fall while Cerinthus is within." It was believed in the ancient church, that the gospel of St. John was written in opposition to the tenets of C.; and the Roman presbyter Caius (about the close of the 2d c.) supposed that C. had revenged himself by falsely ascribing the authorship of the Apocalypse to St. John—it being in reality his own work! The fathers contradict one another in their accounts of Cerinthus. Some describe him as a complete Gnostic, in which case he would be the earliest recorded teacher of that sect; others say that he held coarse and sensual millenarian views, making the *millennium* (q.v.), with the licentious fancy of an Arab, consist chiefly in "nuptial delights;" and that he believed the Jewish ceremonial law to be in part binding upon Christians. There can be no doubt that C. made use of the Jewish law at least as a symbol for his Gnostic doctrines, and also employed millenarian terms in a symbolical manner; a very natural thing for him to do, on the hypothesis which Neander and others have suggested—that Gnosticism originated, not among the minds which had received a true Hellenic culture, but among the Judaizing sects, whose theosophy was a jumble of the spiritual and the material. C. being the oldest teacher of Judaico-Gnostic principles, there would naturally be a greater incongruity and want of harmony in his language and ideas than characterized Gnosticism at a later period of its development; and subsequent ecclesiastical writers, destitute as all of them were of precise historical knowledge and sound principles of criticism, could hardly avoid misunderstanding a system which is not consistent throughout, but bears evident marks of being formed in a transition epoch.—Paulus *Historia Cerinthi* (Jena, 1799); Neander, *Kirchengeschichte*, vol. i., part 2.

CERITE, or O'CHRÖTE, is the *silicate of cerium*. It is found as a mineral in gneiss, at Westmanland, Redderhyttan, and Bastnäs. It contains in 100 parts—silica, 16; peroxide of cerium, 26.55; oxide of lanthanum, 33.38; carbonic acid, 4.62; alumina, 1.68; peroxide of iron, 3.53; lime, 3.56; oxide of manganese, 0.27; and water, 9.1. It occurs in granular pieces of a clove-brown, cherry-red, or gray color, with a white streak, a splintery fracture, an adamantine luster, and is translucent at the edges.

CERITHIUM, a genus and the type of a family, *cerithiadae*, of gasteropodous mollusca of the order *pectinibranchiata* of Cuvier. The shell is spiral, elongated, and many-whirled, with an oval oblique aperture, which has a short canal in front. The species of this family are numerous, most of them marine, but many inhabiting estuaries and brackish rather than salt water; some are found in lakes and rivers. A few belong to temperate climates, but most of them are tropical, and in mangrove swamps they par-

ticularly abound. The fossil species are very numerous, almost all limited to the tertiary formations. See BAGSHOT BEDS.

CERIUM is a rare metal found native in cerite (q.v.) and a few other minerals. It is a white metal, has not been obtained in any quantity, is not therefore employed in any manufacture, and forms two oxides and a numerous class of salts.

CEROPLASTIC (Lat. *cera*, wax), the art of modeling in wax. See WAX-WORK.

CEROSTROTUM, or **CESTROTUM**, (Lat.), a species of encaustic painting upon horn or ivory, the lines of the design being burned in with the *cestrum* or burning needle, and wax introduced in the furrows thus made.

CEROXYLON. See WAX PALM.

CERRETO, a t. of South Italy, in the province of Benevento, situated on a slope of the Apennines, about 23 m. n.e. of Capua. It is a well-built town, with a cathedral, and manufactures of coarse cloth. The district produces good wine. Pop. 6,469.

CERRO DE PASCO, or **PASCO**. See **CERRO GORDO**, *ante*.

CERRO GORDO, the name of several localities of Spanish America.—1. A plateau in Mexico, the most easterly on the route from Vera Cruz to the capital. Here, on the 18th April, 1847, the Americans totally defeated the Mexicans.—2. A city of Peru, the capital of the province of Pasco, in the department of Junin. It is in the vicinity of the richest silver mines in the republic; and standing at an elevation of 14,100 ft., it has, all the year round, the temperature of an English winter. The estimates of the population range from 7,000 to 16,000. C. G. is 140 m. to the n.e. of Lima.

CERRO GORDO. See **CERRO GORDO**, *ante*, a mountain pass on the national road from Vera Cruz to the city of Mexico. April 18, 1847, gen. Scott with a United States force of 8,500 defeated Santa Anna, the Mexican leader, with 12,000 men, at this place. The Mexican loss was from 1,000 to 1,200 killed and wounded and 3,000 prisoners; that of the other side, 63 killed and 368 wounded.

CERRO GORDO, a co. in n. Iowa, intersected both e. and w., and n. and s. by railroads, and watered by Shell Rock river, Lime creek, and the head waters of Beaver Dam river; 652.sq.m.; pop. '70, 4,722. It is an agricultural region. Co. seat, Mason City.

CERRO GORDO DE POTOSI, a mountain in Bolivia, directly s.w. of Potosi, containing very rich silver mines. The summit is 16,150 ft. above sea level.

CERTALDO, a market t. of central Italy, is picturesquely situated on the Elsa, about 18 m. s.w. of Florence. It is noteworthy as the residence of Boccaccio, as well as the scene of his death. His house, surmounted with a tower, is still standing, and contains the articles of furniture belonging to the poet's time, and a fresco painting of him by Benvenuto Cellini. Pop. 6,562.

CERTHIAE, a family of birds, generally placed in the great order *insessores* or *passerine*, and tribe *tenuirostres*, although some naturalists have ranked them in the order *scansores*. They mostly live on the trunks and branches of trees, feeding on insects which they find in the crevices of the bark; and many of them aid themselves by their stiff tail-feathers in retaining their position as they search for their food on the perpendicular stem. Their claws are long and sharp; the hind-toe is also elongated, so that they can take firm hold of the bark or of a small branch; and many of them can pass round a horizontal branch, clinging to its under-surface with their backs to the ground. The bill of many is slender and curved; others, however, have a comparatively short and straight bill. The tongue is cartilaginous at the extremity, and so fitted to aid in seizing insect prey. The plumage is usually dull and uniform; but the birds are lively and active in their habits. The species are numerous and widely diffused; they are divided into a number of genera. All of them are small birds. The creepers (q.v.), forming the genus *certhia*, are regarded as exhibiting the type of the family. Wrens and nut-hatches, although referred to it, depart very considerably from this type. Many small tropical and subtropical birds, which live by sucking honey from flowers, formerly referred to this family, are now separated from it.

CERTIFICATE, a written testimony to the truth of a certain fact or facts. The law of England recognizes certificates for various purposes. 1. Annual C. of attorneys. See ATTORNEY. 2. C. of appointment of the creditors' assignees to a bankrupt's estate and effects. 3. C. of conformity of a bankrupt. 4. C. of counsel, to enable a pauper to litigate *in forma pauperis*. 5. C. of the judges of the superior common-law courts at Westminster, which are of various kinds and for various purposes. 6. C. of registry of a ship; which is a copy of what is entered in the registry of the ship in the books of the custom-house. This C. is granted by the collector, comptroller, or principal officer of the customs at the port of registry, and delivered to the captain as a voucher of the character and privileges of the vessel as a British ship.

CERTIFICATION, in the law of Scotland, signifies the judicial assurance given to a party of the course to be followed by the judge in case he disobeys the will of a summons, or other writ or order of the court. Reiterated contumacy on the part of the defender was at one time punished with confiscation of his property (1449. c. 29), but now C. amounts to nothing beyond an intimation that if he fails to appear in the usual

manner, the judge will decern, or pronounce judgment against him. The most important C. is in the process of reduction-improbation (q.v.). In this action, two terms are allowed for the production of the deed called for, and sought to be reduced. Thereafter, an additional ten days are given; but should production not be satisfied on their expiry, decree of C. will be pronounced, and this decree has the effect of declaring the deed to be forged and fabricated. Such a decree, even though pronounced in absence, can hardly be recalled. In simple reduction (see REDUCTION), the C. is only to the effect that the deed shall be void and null, till produced.

CERTIFIED COPY. See EVIDENCE.

CERTIORARI (Lat. to be certiorated, or more fully and accurately informed of), in English law, is an original writ issuing, in civil cases, out of the chancery division of the high court of justice, and in criminal from the queen's bench division of the same court. This writ, which runs in the queen's name, is addressed to judges or officers of an inferior court, commanding them to certify or to return the records of a cause depending before them, in order that the party may obtain more sure and speedy justice, from such justices as shall be assigned to determine the cause. A writ of C. may be granted at the instance either of the prosecutor or defender; but to prevent its being used as an instrument of oppression by the one party against the other, it is provided (5 and 6 Will. IV. c. 33, and 16 and 17 Vict. c. 30) that either party, before applying for it, must obtain the leave of the court, and enter into recognizances.

The writ passes on a *bill of C.*, which states the proceedings in the inferior court, so far as they have gone; sets forth the alleged ground of incompetency, by suggesting that the cause is beyond the jurisdiction of the court, that the defendant or witnesses live beyond it, or the like reason why substantial justice cannot be done. The writ is now chiefly used in the queen's bench division, and is the usual mode of correcting excesses of justices of the peace in miscellaneous matters.

CERTIORARI (*ante*), a writ by a superior to an inferior court of record, requiring the latter to send to the former some proceeding pending, or the record of some cause terminated in cases where the proceedings were not in accordance with the course of common law. The writ is granted or refused at the discretion of the superior court, and the usual result is that the proceedings below are either quashed or affirmed.

CERTOSA DI PAVIA, LA, one of the most celebrated monasteries in the world, is situated in the neighborhood of Pavia, and was founded, 1396, by Giovanni Galeazzo Visconti, first duke of Milan, to appease his conscience for the murder of his uncle. The church is a splendid structure in the form of a Latin cross, the ground-plan being 249 ft. long by 173 ft. broad. It has altogether 12 chapels, 7 in the whole length of the church, and 5 in the transept, some of which are decorated with fine frescoes and paintings. The richly sculptured façade, designed by Ambrogio da Fossano, named Borgognone, was commenced in 1473. The building is made up of various styles, but the pointed prevails in the interior, which is decorated with frescoes, paintings, etc., by Dan Crespi, Andrea Solari, Campi, and Ambrogio Fossano, and contains a gorgeous high-altar, the mausoleum of the founder, and several monuments.

CERUMEN. This term is applied to yellow waxy matter which is secreted by certain glands lying in the external auditory canal, or the passage that leads from the external opening of the ear to the membrane of the tympanum. Its main use, doubtless, is to lubricate this passage. It possesses a peculiarly bitter taste, and some physiologists have believed that in consequence of this property it prevents insects from entering the auditory canal. It is popularly known as ear-wax.

CERUSE, or **WHITE-LEAD**, the basis of white oil-paint, is a *carbonate of lead*. It has several other names—kreams, Nottingham white, flake-white, etc. Like all other preparations of lead, C. is liable to be acted upon by exhalations from sewers, or by anything which contains sulphuretted hydrogen, in which case it is changed to a dull and leaden hue. Neither will it bear to be mixed with any pigment containing sulphur, such as vermilion. It is supposed that the white oxide of zinc might be substituted for C. as a white pigment with advantage.

CERUTTI, GIUSEPPE ANTOINE JOACHIM, 1738-92; a Jesuit and professor in the college of that order in Lyons. Among his works are an *Apology for the Institute of the Jesuits*; a *Memoir of the People of France*; a poem entitled *The Garden of Bietz*. He also edited a weekly journal, and was once elected to the legislative assembly.

CERVANTES SAAVEDRA, MIGUEL DE, one of the greatest imaginative writers of Spain, was b. of an old Galician family, at Alcalá de Henares, Oct. 9, 1547. He studied at Salamanca, and afterwards at Madrid, where he was placed under the care of a learned theologian, Juan Lopez de Hoyos, who was then professor of belles-lettres in the university. But his natural love of poetry led him to spend most of his time in writing elegies, ballads, sonnets, and a pastoral romance entitled *Filena*. When 22 years old, C. served for some time as valet-de-chambre to cardinal Giulio Acquaviva of Rome. In 1570, he served as a volunteer under the command of the papal admiral, Marco Antonio Colonna, and fought gallantly against the Turks. At the battle of Lepanto, he was maimed for life by a gunshot wound in the left hand. He afterwards took part in various campaigns. Captured by an Algerine squadron, he was made a slave, but was ran-

somed in 1580, after a four years' captivity. On his return to Spain, he rejoined his regiment in the army sent by Philip II. to support his claims in Portugal, and distinguished himself in the expedition to the Azores. In 1584, he returned to Spain, and retired into private life, to devote his attention to literature. Soon after his publication of the pastoral romance, *Galatea* (1584), he married, commenced writing for the stage, and produced, in the course of a few years, as many as 30 dramatic pieces, of which the tragedy *Numancia* is the most remarkable. During the years 1588-99, he lived in straitened circumstances in Seville. In 1605, he once more appeared as an author, and now in a sphere exactly suited to his genius. In his immortal work, *Don Quixote*, C. intended to put an end to that taste for extravagant romances of chivalry which had so long prevailed. The first part of this great satirical work appeared in Madrid, and was received at first coolly, but soon afterwards with loud applause, which, at a later period, was echoed from all parts of educated Europe. *Don Quixote*, though written with a satirical purpose, is throughout pervaded by the true spirit of poetry. With that universality which belongs to the highest genius, C. connected a universal human interest with descriptions of local and temporary characteristics. He did not intend by his *Don Quixote* to burlesque the old Spanish knight-errantry, for, as Mr. Ford remarks (see *Handbook of Spain*, part i., p. 238), "the thing had expired a century before his birth;" but to put an end to the absurd and affected romances which it was then the fashion to read, and which were believed to be true pictures of chivalry. He had also, it is quite clear, another object in view—viz., to show that the deeper and truer and more guileless a nature is, the more will it become the jest and butt of real life; but he likewise teaches us that the pure heart and the high soul obtain a triumph which misfortunes and blunders cannot tarnish; for the knight always "disinterested, generous, elevated, and beneficent," though "the sweet bells of his intellect are jangled and out of tune," maintains throughout a firm hold on our affections and esteem. Charles Lamb has truly said, that readers who see nothing more than a burlesque in *Don Quixote*, have but a shallow appreciation of the work.

Though received with enthusiasm, *Don Quixote* brought no pecuniary reward to the author. He was left in the obscurity and poverty in which he had passed so many years, and vainly endeavored to improve his circumstances. After silence during several years, C. published his twelve *Novelas Exemplares* (Exemplary Tales), 1613; his *Viage al Parnaso* (Journey to Parnassus), 1614—his next best production to *Don Quixote*; and in the following year he produced eight new dramas, but these were indifferently received. In 1614, a certain Alonso Fernandez de Avellaneda published at Tarragona a so-called continuation of *Don Quixote*, which was made a vehicle of abuse lavished on Cervantes. It appears that C. suffered considerably under these despicable attacks; but he revenged himself in noble style by publishing (1615) the true continuation of *Don Quixote*. Near the close of his career, C. found a patron in the count of Lemos, who relieved his poverty. During the last few years of his life, he resided in Madrid, where he died, April 23, 1616. No stone marks the spot where his remains were interred. His novel, *The Sorrows of Persiles and Sigismunda*, was posthumously published. In 1835, when the house in which the poet had lived in Madrid was rebuilt, a bust of C., by the sculptor Don Antonio Solá, was placed in the front.

Among the several editions of *Don Quixote*, we may mention the splendid one in 4 vols. (Madrid, 1780); that by Pellicer (5 vols., Madrid, 1798); the fourth published by the Madrid academy, with an admirable life of C. by Navarrete (5 vols., Madrid, 1819); Diego Clemencin's edition, with the most complete commentary (6 vols., Madrid, 1833-39); and a good pocket-edition, published at Leipsic (6 vols., 1800-7). Of the collected works of C., an edition, not containing the comedies, appeared at Madrid (16 vols., 1803-5); and another, without the *Journey to Parnassus*, was published in the same city (11 vols., 1829). Don Aug. Garcia de Arrieta published a selection from the works of C. (10 vols., Paris, 1826-32); and a reprint of the collected works is included in Baudry's *Celeccion de los Mejores Autores Españoles* (Paris, 1840-41). England has been fertile in translations of C.'s immortal work. The first is that of Thomas Skelton (1612-20), in addition to which may be mentioned those of Phillips, Motteux, Smollett, Dufrey, Jarvis, Wilmot, and Clark. The best are those of Skelton, Jarvis, and Clark.

CERVEIRA, a t. of Spain, in the province of Barcelona, 28 m. e. of the city of Lerida. It is situated on an eminence, is surrounded by old walls pierced with nine gates, and the west approach is commanded by a castle, which is now in a ruinous condition. The university of Lérida was removed here by Philip V., but it was afterwards transferred to Barcelona. The university building, a massive but unsightly edifice, is still standing. C. has manufactures of linen, woolen, and cotton fabrics. Pop. 5,300.

CERVE TERÉ, or **CERVETRI** (ancient Cære or Agylla), a t. of central Italy, 27 m. w. of Rome. Though now a place of some 700 or 800 inhabitants, it was formerly one of the most important cities of Etruria, possessing, it is said, a famous collection of paintings before even Rome was founded. Many Etruscan remains of value have been found here.

CERVETERÉ, or **CERVETRI** (*ante*), a village on the site of the ancient Cære, in s. Etruria, near the Tyrrhenian sea, in the district of Civita Vecchia, 32 m. from Rome. It afforded refuge to the Tarquins after their expulsion from Rome, and was by the

Romans chosen as the safest hiding-place of their treasures during the occupation of the capital by the Gauls. The old city thenceforward declined, and in 1250 was deserted by a large portion of its inhabitants, who removed to the present village of Ceri. From the fact that the old inhabitants were admitted to Roman citizenship without the right of suffrage, the "Cærite franchise" came to be a proverbial expression denoting disfranchisement. Many interesting Etruscan remains have been found in the tombs of the city. One of the sepulchres belonged to the Tarquin family.

CERVIA, a t. of central Italy, situated on the Adriatic, 13 m. s.e. of Ravenna. It is regularly built, has a cathedral and several convents; and from a marsh in the neighborhood about 50,000 tons of salt are annually obtained, the salt-works employing a considerable number of the population, which is about 6,000.

CERVIDÆ AND **CERVUS**. See **DEER**.

CERVIN, **MONT** (Ger. *Matterhorn*; Ital. *Monte Silvio*), a mountain of the Pennine Alps, about 40 m. e.n.e. of Mont Blanc, and between the Valais in Switzerland and the Val d'Aosta in Piedmont. Above an unbroken glacier line of 11,000 ft. high, it rises in an inaccessible obelisk of rock, more than 3000 ft. higher, and is described by the late prof. Forbes as the most striking natural object he had ever seen. The total elevation of the mountain is 14,836 feet. The Col of Mont C., used as a passage for horses and mules in summer, has an elevation of 10,938 feet.

CERVINARA, a t. of Italy, in the province of Avellino, 12 m. n.w. of Avellino. It has a convent and several churches, and a trade in the produce of the district. Pop. 2,328.

CESARI, **GIUSEPPE** (sometimes called **GIUSEPPINO**, or **IL CAVALIERE D'ARPINO**), an Italian painter, was b. at Rome, 1570, and d. there in 1640 (or 1642). He was greatly honored by no less than five popes, and his paintings were always highly popular. His works—in fresco and oil—display lively imagination, gay coloring, and great tact in execution; but are deficient in natural simplicity, correctness of design, symmetry of arrangement, and dignity of style. As he was the most brilliant of the mannerists, he was the chief object of the attacks made by the artistic reformers, Caravaggio, the Caracci, and their followers—who constituted the *naturalisti*—on the conventional or pseudo-idealistic style of painting.

CESAROTTI, **MELCHIORE**, an excellent Italian poet, was b. at Padua, 15th May, 1730, and d. 3d Nov., 1808. He gained a reputation by the vigor and originality of his style, especially in his translation of Macpherson's *Ossian* (2 vols., Padua, 1763). The versification of this work, like that of C.'s free translation of the *Iliad*, under the title of *La Morte di Ettore*, was admired by Alfieri. C. unquestionably threw fresh life into Italian literature, but few in this country will consider his enthusiasm very rational, when it could induce him to think poor Macpherson a better poet than Homer. C.'s best work was his *Saggio sulla Filosofia delle Lingue* (Padua, 1785), written in opposition to the academical pedantry of La Crusca. His prose style is vigorous, but full of innovations, especially Gallicisms.

CESENA, a t. of central Italy, about 12 m. s.e. of Forlì, on the Emilian Way. It is pleasantly situated on a hill-slope, washed by the Savio. Its principal buildings are the *Palazzo Pubblico*, the Capuchin church, and the library founded by Domenico Malatesta Novello, in 1452, with a rich collection of MSS. There are many monasteries and nunneries, as befits a place that gave birth to two popes—Pius VI. and VII. It has some silk factories, with a trade in wine and silk; and in the vicinity are productive sulphur-mines. Pop. '72, 35,870.

CESNO LA, **LUIGI PALMA DI**, LL.D., Count, b. in Turin, Italy, 1832. When but 15 years old he enlisted in the war against Austria. In 1850, he graduated from the Turin royal military academy, receiving a commission which he surrendered in 1854. In the Crimean war he was a staff officer. He emigrated to New York in 1860, and began teaching languages. The next year he married one of his pupils, a daughter of commodore Reid, of the U. S. navy. In the war of the rebellion, he was col. of cavalry and participated in many engagements until June, 1863, when he was wounded and made prisoner. He was exchanged not long after, and left the service at the close of the war, with the rank of brig.gen.; at once became an American citizen, and was appointed consul at Cyprus. There he soon interested himself deeply in archaeological researches, and brought to light some of the most valuable remains of ancient Greek art thus far recovered (see **ARCHÆOLOGY**). Gen. Cesnola has devoted the greater portion of his time to Cyprian or Grecian exploration for the past 15 years. In 1878, he gave lectures in New York and elsewhere, and in 1879, was made a director of the metropolitan museum of art, in which his great collection is deposited. (See **NEW YORK CITY**.)

CÉSPEDES, **CARLOS MANUEL DE**, b. in Cuba, 1819; educated in the university at Havana, and admitted to the bar. He traveled in Europe and learned several languages. At Madrid he was concerned with Prim in a conspiracy to overthrow the government, and was compelled to fly. He returned to Cuba and began the practice of law. When Lopez made his revolutionary experiment, C. sympathized with the acts and was

imprisoned. When the revolt of 1868 began he was the leader, and one of his first acts was to liberate the slaves on his sugar estate. On the 10th of Oct., 1868, he proclaimed the independence of Cuba on the field of Yara, and when the republic was formally organized, April 10, 1869, he was elected president. The attempt at revolution was kept up at intervals until 1878. On the 21st of Feb., in that year, the rebellion was officially declared at an end.

CÉSPEDES, PABLO DE, 1538-1608; a Spanish theologian, linguist, poet, painter, architect, and sculptor; b. at Cordova, and educated at Alcalá de Henares, and in art at Rome. He was a bold and correct draughtsman, a skillful anatomist, and a master of color and composition. His best picture is "The Last Supper," at Cordova. But little of his poetry has been preserved, the most important being fragments of *The Art of Painting*. C. held the office of prebend of the cathedral of Cordova.

CESS, probably a corruption for *assess*, from the Ital. *assessare*, to impose a tax. It has long been used in England as synonymous with the more modern noun *assessment*. Camden, in the time of Elizabeth, speaks of every man being "cessed by the pole, man by man, according to the valuation of their goods and lands." See **LAND-TAX**.

CESSIO BONORUM (Lat. cession or surrender of goods), a process which the law of Scotland has borrowed from that of Rome, and which, like many others, is common to it with most of the continental systems. A C. B. may be defined to be an equitable relief from the severity of the earlier laws of imprisonment for debt, granted to a debtor in consideration of a cession of his goods to his creditors. The jurisdiction in cessios formerly belonged exclusively to the court of session, but by 6 and 7 Will. IV. c. 56, it was extended to sheriffs. The principal regulations, with reference to this process, at present in force, are the following: Any debtor in prison, or who has been in prison, or even against whom a warrant of imprisonment has been issued, may apply for a *cessio bonorum*. In his petition, he sets forth his inability to pay his debts, and his willingness to surrender his estates, and prays for interim protection. This petition must be intimated in the *Gazette*. The bankrupt then lodges with the sheriff-clerk a state of his affairs, subscribed by himself, with all the relative books and papers. On a day appointed for the purpose, he is examined before the sheriff on oath; and if his creditors object to the petition, they are heard, and a proof, if necessary, allowed them. Whatever order the sheriff may pronounce is subject to review by the court of session, or a lord ordinary in vacation. Cessios originating in the court of session are sued out in the form of a summons, by which all the creditors are called as defenders to the action. Any one or more of them may appear; and the pursuer will not be allowed the benefit of the process, till he has satisfied the court that his insolvency has arisen from misfortune, and that his disclosure of the state of his affairs is full and honest. The burden of proving objections to his statements, and to the evidence which he may produce, will be laid on the creditors. If the debtor can find caution (q.v.) to attend all diets when called on, the sheriff or the court of session may grant him liberation or protection whilst the process is pending. A decree of C. B. operates as an assignation of the debtor's movable estate in favor of a trustee for behoof of the creditors. These trustees, like those in sequestrations, are now placed under the supervision of the accountant in bankruptcy. A C. B. differs from a sequestration (q.v.) in this, that it confers no power on the bankrupt to insist on his discharge, and affords no protection against the attachment of his subsequent acquisitions by his creditors. The debtor has the privilege of retaining his working tools; but nothing beyond what is necessary for mere aliment will be allowed, even to half-pay officers and clergymen.

CESTIUS, PYRAMID OF, a Roman monument of the Augustan age, situated close to the Porto San Paolo, partly without and partly within the walls of Aurelian. It is known to every English traveler, being in the immediate vicinity of the cemetery where Protestants dying in Rome are buried. The exterior form is perfectly preserved; but of the paintings which formerly decorated the internal walls, only a few traces remain. Several copies of these paintings have been made, of which we may mention those edited by Falconieri, 1661. The pyramid is 125 ft. high, 100 ft. in width at the base; the walls 25 ft. thick. It is built of brick and tufa, faced with slabs of Carrara marble, now perfectly black with age, and rests on a base of travertine 3 ft. high. The interior contains burial chambers of considerable extent. The inner walls are covered with hard stucco, and the roof is vaulted. Both the walls and the roof were covered with paintings of female figures. The memory of the Caius Cestius for whom this pyramid was built has perished, but it has been supposed that he was the Cestius whom Cicero—in the oration *pro Flacco*—mentions as a rich man of business, who, having no children, left a large sum of money for the erection of a monument to himself. Two fluted columns of white marble, now standing before the pyramid of C., with their bases and two other bases, were discovered in the excavations of 1663, at the foot of the pyramid. In the cemetery, the remains of several celebrated men have their resting-place, among whom are the poets Keats and Shelley, Wyatt the sculptor, and Bell the anatomist.

CESTOID WORMS (Lat. *cestus*, a band or throng), a family of *entozoa*, or intestinal worms, of the order *Celmintha* (q.v.), consisting of tape-worms and other creatures which resemble them in structure and habits. The number of different kinds of C. W.

is great. Their natural history is important in reference to the health of human beings and of the most valuable domesticated animals; and although the subject is not in all respects an agreeable one, it presents much that is interesting and wonderful. Recent discoveries have given it an entirely new character.

C. W., in their most perfect state, when alone they possess the form from which their name is derived, are in reality compound animals, like many zoophytes and ascidians. They do not, however, like these, subsist by food entering the system through mouths with which the individuals composing it are furnished; for the joints of a cestoid worm, the individuals composing the system or "colony," have no mouth; nor is there any mouth in what is, on various accounts, quite properly regarded as the head, but nutriment is obtained from the surrounding medium by *endosmose* (q. v.); nourishing juices entering everywhere through the skin, as in the spongioles of the roots of plants, into the cellular tissue or *parenchyma* of which the whole body consists. The head of a cestoid worm is furnished with organs—different in different kinds—by which it affixes itself to the inner surface of the intestine of a vertebrate animal. When first it gets into this situation, the body is very short, and has no joints; but they soon begin to appear as transverse striæ, and gradually increasing in size, become in most of the kinds very distinct, and at last separate from the system in which they were produced, and are carried away out of the intestines of the animal which contained them. This does not take place, however, till they have not only become mature in the development of the sexual organs—the principal organs to be observed in them—but until they are full of what are called eggs, which, indeed, are rather young ones ready for a separate existence, and each enveloped in a sort of protective shell. Each joint of a cestoid worm is androgynous. Whilst the most matured joints are thrown off from the posterior end, new joints are continually formed, as at first, in the part nearest to the head. The number of joints thus formed from a single individual is very great, as will appear when it is considered that tape worms have been found 20 feet long or upwards, and that these have probably been throwing off joints in large numbers before opportunity has been obtained of measuring them.

As the C. W. have no mouth, so they have no alimentary canal. Some of them, as the true tape-worms, have been supposed to imbibe nourishment by the sucking disks of the head; but these are more probably mere organs of attachment, and the canals which are seen to arise behind them, apparently belong, not to the digestive, but to the vascular system, and are united by transverse vessels or vascular rings in the head and in each of the segments. The only trace of a nervous system hitherto observed is a single ganglion in the head, which in some is seen to send off nerves to the suckers.

The division into segments remains imperfect in some cestoid worms. Those of the genus *ligula*—chiefly found in birds and fishes—resemble a long flat ribbon, not even notched along the edge, and containing a mere series of hermaphrodite brood-places. When segmentation is perfect, the segments (*proglottides*), on separating from the parent system (*strobila*), possess life and a little power of independent motion, creeping away on moist ground, plants, etc. Their period of separate existence, however, is brief; they burst or decay, and the numerous minute embryos which they contain are ready to commence their career, if in any way transferred into the stomach of an animal of proper kind, which is generally different from that whose intestine their parent inhabited. This may happen by their being swallowed—or even the *proglottis* itself—along with water, grass, etc. Some of the C. W. in this embryo state find their appropriate place in the stomachs of vertebrate, and others in those of invertebrate animals.

The shell being broken or digested, the young cestoid worm is set free. It is extremely unlike the *proglottis* by which it was generated. It presents the appearance of a vesicle furnished with a few microscopic hooks. It possesses, however, a power of active migration by means of these hooks, and is able to perforate the stomach of the animal which contains it. To this its instinct seems immediately to prompt it, and it is so minute that it passes through the stomach without any serious inconvenience to the animal. It now probably gets into the blood, and is lodged in some of the capillaries, from which it makes its way again by perforation, until it finds a suitable place in some of the tissues or of the serous cavities, in the flesh, or in such organs as the liver or the brain; and here relinquishing all active migration, it rapidly increases in size, at the same time developing a head, which is in fact that of a cestoid worm, and generally either encysts itself or is encysted—included in a cyst (q. v.)—according to circumstances, or according to its species. Great numbers of such parasites are sometimes present in a single animal, causing disease and even death. Until recently, they were regarded by naturalists as constituting species and genera quite distinct from the C. W., of which they are really the young; and the name *scolex*, formerly given to one of these supposed genera, has now become a common name for the young of all C. W. in this stage, as *larva* is the common name for the young of insects in their first stage after being hatched from the egg. Those scolices which inhabit vertebrate animals very generally become distended with a watery fluid, and in this state were formerly regarded as hydatids (q. v.); little else, indeed, appearing without very careful examination, but a small bag filled with fluid, the scolex head being formed within the bag, although capable of being everted from it, as the finger of a glove which has been drawn in at the end is turned out. Such is the young of the common tape-worm (*tenia solium*), formerly known to

naturalists as *cysticercus cellulosa*, and found in the flesh of the pig and of some other animals, and sometimes of man. It is this scolex, existing in great numbers, which produces in the pig the diseased state commonly known as *measly*; and it is very unsafe even to handle measly pork in a raw state, because a scolex accidentally getting into the mouth, and thence into the stomach, is likely to become a formidable inmate of the intestinal canal. It does not appear that this particular species has the power of multiplying in its scolex state, or the circumstances in which it exists in the flesh of the pig may be unfavorable to its so doing, and the prodigious numbers sometimes existing in a single animal have probably all entered by the mouth in the way already described, the contents of a single proglottis or joint of a tape-worm being perhaps sufficient to account for them; but some scolices, as that called *cœnurus cerebralis*, found in the brain of sheep, and the cause of the disease called *staggers*—now known to be the scolex of a *taenia* of the dog—are prolific by a sort of pullulation, so that clusters of scolices cover the same parental vesicle. Until, however, the scolex reaches the intestine of an animal suited to it, its propagation is entirely unsexual, and no organs of sex exist; but no sooner is it there, than it begins to develop itself into a cestoid worm, and to produce androgynous joints, fertile of new embryos, as already described. Thus we have in these creatures an instance, in its relations the most important known, of the recently discovered alternation of generations. See GENERATIONS, ALTERNATION OF. The transference of the scolex from its place of growth to that in which it becomes a cestoid worm, usually if not always takes place by the animal which contains it being eaten by that whose intestine is suitable to its perfect development. Each kind of cestoid worm is limited to certain kinds of vertebrate animals, and it has been proved by experiment that if introduced into the stomach of other kinds, the scolices soon die. The only C. W. which infest the human species are *bothriocephalus* (q.v.) *lutus*, and tape-worms (q.v.). See Von Siebold's interesting work on tape and cystic worms, printed for the Sydenham society (London, 1857).

CESTRACION, a genus of sharks, regarded as constituting a distinct family, *cestraciontidae*, although not more than two species are known as now existing. It is characterized by having two dorsal fins and one anal, the first dorsal situated over the space between the pectorals and ventrals; a spine forming the front of each dorsal; a short, wide tail, with its upper lobe strongly notched beneath; the mouth at the fore-end of the snout; spout-holes distinctly visible, rather behind the eyes; eyes destitute of nictitating membrane; small gill-openings; and the front of the mouth armed with sharp angular teeth, whilst the margins and inner surface of the jaws are covered with pavement-like teeth, presenting a general continuity of surface, as in skates, and disposed in rounded oblique scrolls—the former evidently adapted to the seizing of food, the latter to the crushing and bruising of it. The Port Jackson shark or “nurse” (*C. Philippi*) of the Australian seas, and the cat shark of Japan and China (*C. zebra*), seems to differ chiefly in the patterns of color. The *cestraciontidae* are particularly interesting to geologists; for the oldest fossil sharks belong in great part to this family, of which “remains are found even in the paleozoic strata; they become more numerous in the carboniferous series; they are very numerous in the lias and chalk formations; but there they cease almost entirely, the strata of the tertiary series scarcely containing any of them;” whilst now the species are reduced, as we have seen, to one or two, and other types of shark have become more prevalent.

CESTRUM, the style or spatula used by the ancients in encaustic painting in wax and ivory. See ENCAUSTIC.

CESTUI QUE TRUST, a person who possesses the equitable right to deal with property, the legal estate in which is vested in a trustee. There is such a confidence between the cestui que trust and his trustee, that no action at law will lie between them, but they must settle their differences and arrange their disputes in a court of equity. “The phrase *cestui que trust* is a barbarous Norman law French phrase, and is so ungainly and ill adapted to the English idiom, that it is surprising that the good sense of the English legal profession has not long banished it, and substituted some phrase in the English idiom, furnishing an analogous meaning.”—Wharton's *Law Lexicon*.

CESTUI QUE VIE, a person whose life is the measure of the duration of an estate. If A. grants to B. an estate to be B.'s own so long as another person named C. lives, then C. is the *cestui que vie*.

CESTUS (Gr. *kestos*, embroidered), a girdle worn by Greek and Roman women close under the breasts, and so distinguished from the *zone*, worn round the loins. The C. of Venus was covered with alluring representations, so that Juno borrowed it when she desired to win the love of Jupiter.—**CESTUS**—or, more correctly, **CÆSTUS**, from the Lat. *cædere*, to slay—is also the name of the covering for the hands worn by Roman pugilists. It was at first nothing more than a leathern thong or bandage to strengthen the fist; but afterwards it was covered with knots and nails, and loaded with lead and iron, etc., to increase the force of the blow. It was not uncommon for a pugilist armed with the C. to dash out the brains or break the limbs of his antagonist. The Roman pugilist (*cæstuaris*) was often represented in sculpture.

CETA'CEA (Gr. *ketos*, a whale), an order of mammalia (q.v.) greatly differing in general form and habits from the rest of that class, so as indeed to be popularly reckoned among fishes. The C. have a fish-like form, terminating in a fish-like tail or tail-fin, which, however, is not vertical, as in fishes, but horizontal, and is the great instrument of progression; being moved by very powerful muscles, commonly with an oblique downward and lateral movement, like that by which a boat is propelled in sculling, but sometimes by direct upward and downward strokes, when greater velocity is requisite. There are no hinder limbs, and even the pelvis is represented only by two small rudimentary bones, suspended in the soft parts, so that the body tapers gradually and uninterruptedly towards the tail. The fore-limbs are exclusively, or almost exclusively, adapted for swimming; their bones, however, appearing in the skeleton as those of a hand, placed at the extremity of an arm, of which the bones are much abbreviated and consolidated, with little power of motion except at the shoulder-joint, and are entirely concealed in the soft parts of the animal. The head is connected with the body without any apparent neck, and the vertebrae of the neck are partly ankylosed or soldered together. The skin is naked, having no general covering of hair, although some of the species possess conspicuous whiskers. The C. agree with quadrupeds, notwithstanding the great differences already indicated, in the most important parts of their organization. They are viviparous, and suckle their young, for which they exhibit great affection; they are also warm-blooded, breathe by lungs, and not by gills, and come to the surface of the water for the purpose of inhaling air. An approach to their fish-like form is to be seen in seals (q.v.) and other *phocidæ* (q.v.); in which, however, the hinder limbs are largely, although peculiarly developed, whilst the fish-like tail-fin is wanting; the skin has a covering of hair; and the head and fore-limbs more resemble those of ordinary quadrupeds.

The C. are usually divided into two sections—the *herbivorous* and the *ordinary* C.; but the former, constituting the family of *manatidæ* (q.v.), have recently, by some systematic naturalists, been rejected from this order altogether, and associated with the *pachydermata*. They differ very widely from the ordinary or true C., not only in their adaptation for the use of vegetable instead of animal food, which appears both in their dentition and in their digestive apparatus, but also in their pectoral instead of abdominal teats, and in their want of *blow-holes* and of any provision for retiring to great depths of the ocean, and remaining there for a considerable time, without returning to the surface to breathe.

The ordinary or true C. are divided into the families of *delphinidæ* (dolphin, porpoise, beluga, bottlenose, narwhal, etc.), *physeteridæ* or *catodontidæ* (cacholot, or spermaceti, whale, etc.), and *balenidæ* (Greenland whale, rorqual, etc.), the distinguishing characters of which are given under separate heads. They all feed on animal food, some of them pursuing and devouring fishes; others, and these the largest, subsisting chiefly on smaller prey, mollusks, small crustaceans, and even zoophytes, which they strain out of the water by a peculiar apparatus in their mouths. None of the true C. have molar teeth or grinders like the *manatidæ*; all the teeth which any of them have are conical; but some of the largest are entirely destitute of teeth. The females of all of them have the teats situated far back on the abdomen. The fore-limbs of the true C. are mere fins, the slight power of grasping with them, which the *manatidæ* possess, having entirely disappeared. The resemblance to fishes is increased in many of them by the presence of a dorsal fin. There is a wonderful provision to enable them to spend some time under water, before returning again to the surface to breathe—an arterial plexus or prodigious intertwining of branches of arteries, under the pleura and between the ribs, on each side of the spine. This being filled with oxygenated blood, after the animal has spent some time at the surface breathing, the wants of the system are supplied from it, whilst breathing is suspended, so that some whales can remain below even for an hour. The position of the nostrils is remarkable, almost on the very top of the head, so that the animal can breathe as soon as the head comes to the surface of the water; and the nostrils are furnished with a valve of singular but very perfect construction, a sort of conical stopper of fibrous substance, preventing the ingress of water even under the pressure of the greatest depths. The nostrils appear to be little used for the purpose of smelling, the sense of smell being one which these animals either do not possess at all, or in a very imperfect degree; but they are much used, not only for breathing, but also for *spouting*, or the ejection of water from the mouth, for which reason they are generally called *blow-holes*—the water being forced through them by the compression of two large pouches or reservoirs which are situated beneath them. This compression is accomplished by an action similar to that of swallowing; the throat, however, not being open, but closed. The height to which the water is thrown into the air is extraordinary, and the spouting of the whale is one of those wonders of the ocean never to be forgotten by those who have seen it.

A peculiarity in the skin of the true C. adapts them for their manner of life. The skin is extremely thick, the inner part of it consisting of elastic fibers interlacing each other in every direction, the interstices of which are filled with oil, forming the substance usually called *blubber*. The oil deposited in this unusual situation, not only serves the ordinary purposes of fat, but that also of keeping the body warm, which to a warm-blooded animal, continually surrounded with water, is of great importance;

whilst the elasticity of this extraordinary skin affords protection in the great depths to which some of the whales descend, and in which the pressure must sometimes amount to a ton on every square inch.

The number of known species of *C.* is not great, but their natural history has as yet been very imperfectly studied. All of them are large animals, some of them by far the largest that now exist. Almost all of them—both herbivorous and ordinary—are marine, but some of the smaller species ascend large rivers to a great distance from the sea; and one, of the family *delphinidae*, belongs exclusively to fresh waters, being found only in the upper tributaries of the Amazon and the elevated lakes of Peru.

Fossil cetacea have been hitherto discovered only in the tertiary formation. Their remains represent species not only belonging to each of the recent families of true *C.*, but have supplied materials for forming a new family intermediate between the true whales and the herbivorous cetacea. These fossils were originally described as reptiles; but they have been satisfactorily shown to be carnivorous *C.* by Owen, who, from their remarkable conjugate teeth, has given the typical genus the name of *zeuglodon* (q.v.), and the family that of *zeuglodontidae*. In all, six or seven species have been described belonging to this family, from the eocene and miocene beds of Europe and America. The *delphinidae* appears first in the miocene strata, and continue through the newer beds. The remains of a narwhal, which cannot be distinguished from the living species, have been found in several places in England. Of *physcteridae*, three species have been noticed in pleiocene and pleistocene strata, belonging to the recent genus *physeter*. Fossil *balænidæ* occur in the miocene and newer beds. Only four species have been described, if we exclude *cetotolites* (q.v.), a name given to teeth and ear-bones, belonging to animals of this family, which occur in great numbers in the Suffolk Crag.

CETOTOLITES, a name given by Owen to fossil cetacean teeth and ear-bones, which occur in great abundance in the Red Crag of Suffolk, a member of the pleiocene period. They are rubbed and water-worn, and have evidently been washed out of some earlier strata, which remain yet unrecognized. The extent of these earlier strata must have been very great, seeing that the remains now extend over a large district in Essex and Suffolk, and attain a thickness, in some places, of not less than 40 ft. Prof. Henslow, in 1843, drew the attention of agricultural chemists to this deposit, as a source of materials for manure, and since then superphosphate manures have been manufactured from it to the value of many thousand pounds annually; a striking example of the valuable practical results which frequently flow from a purely scientific discovery.

CETRA'RO, a t. of s. Italy, in the province of Cosenza, situated on the Mediterranean, 24 m. n.w. of Cosenza. It has anchovy fisheries, and a population of 2,619.

CETTE, a seaport t. of France, in the department of Hérault, is built on a neck of land between the lagoon of Thau and the Mediterranean, in lat. 43° 24' n., long. 3° 42' east. The town, which is entered by a causeway raised above the Thau lagoon, and a bridge of 52 arches, is fortified, and the harbor is defended by a citadel and forts. The space inclosed by the piers and breakwater forming the harbor is about 30 acres, and has a depth of from 16 to 19 feet. A broad deep canal, lined with excellent quays, connects the port with the lake of Thau, and so with the Canal du Midi and the Rhone, thus giving to *C.* an extensive inland traffic; it has likewise an active foreign commerce. The principal trade is in wine, brandy, salt, dyestuffs, perfumery, and verdigris. *C.* has ship-building yards, and fisheries of oysters and anchovies. Pop. '76, 28,152.

CETTIGNÉ, or **CETINJÉ**. See MONTENEGRO.

CETUS, or **THE WHALE**, the largest of all the constellations. It reaches from 0° to 25° s. declination, and from 0 to 2h. 30m. right ascension. *Mira*, a variable star, is the most conspicuous feature.

CEU'TA, a t. belonging to Spain, situated in the kingdom of Fez, on the n. coast of Africa, and opposite to Gibraltar, in lat. 35° 54' n., and long. 5° 16' west. It is strongly fortified, and defended by a citadel and forts erected on mount Hacho, the ancient *Abyla*, or south pillar of Hercules. It is the most important of the four Spanish *presidios*, or convict establishments, on this coast. The harbor is small and not very safe; and the population, which amounts to 8,200, is composed of Spaniards, Moors, Negroes, Mulattoes, and Jews, mostly very poor, and employed in trade and fisheries. Many of the Spaniards living here are state-prisoners, and even the garrison is partly manned by convicts. *C.*, formerly called *Septa* or *Septum*, was taken from the Vandals in 534 by Justinian, who fortified the place anew. In 618, it fell into the hands of the western Goths; afterwards it was taken by the Moors, who held it until 1415, when it was captured by the Portuguese. It was annexed, with Portugal, to the crown of Spain in 1580, and was the only place on the African coast retained by Spain when Portugal was restored to its independence in 1640.

CEVADIL'LA. See SABADILLA.

CEVENNES (ancient *Cebenna*), the chief mountain range in the s. of France. With its continuations and offsets, it forms the water-shed between the river systems of the Rhone and the Garonne. Its general direction is from n.e. to s.w., commencing at the southern extremity of the Lyonnais mountains, and extending under different

local names as far as the canal du Midi, which divides it from the northern slopes of the Pyrenees. The central mass of the C. lies in the departments Lozère and Ardèche, Mont Lozère reaching an elevation of 4,884 ft., and Mont Mézen (the culminating point of the chain) an elevation of 5,794 feet. The average height is from 3000 to 4000 feet. The masses consist chiefly of amphibolic rocks, grauwacke, and limestone, covered with tertiary formations, which in many places are interrupted by volcanic rocks.

The C. has been celebrated as the arena of religious warfare. As early as the 12th c., the several sects known by the names, the "Poor of Lyon," the *Albigenses* (q. v.), and the *Waldenses* (q. v.), were known and persecuted in this district. After the revocation of the edict of Nantes by Louis XIV. in 1685, a series of cruel persecutions of the Protestants in the C. began, especially in 1697, after the peace of Ryswick. "Dragonades" (q. v.) were employed to enforce the doctrines of the monks sent as missionaries into the heretical district. All persons suspected of Protestantism met with the most harsh and cruel treatment. Some of the inhabitants emigrated, others fled into the fastnesses of the mountains. Driven to desperation, the persecuted people at length rose to arms, and the murder of the abbé du Chaila, who was at the head of the dragonades, gave the signal of a general insurrection in 1702. The insurgent peasants were styled *camisards*—possibly from *camise*, a smock worn by the peasantry. Headed by bold leaders, the most famous of whom were Cavalier and Roland, they defeated the troops sent against them by Louis again and again, until that king thought the insurrection of sufficient importance to require the presence of the distinguished general, marshal Villars; but he was recalled before the revolt had been put down, and it was left to the duke of Berwick to extinguish it in blood; the contest terminating in an entire desolation of the province, and the destruction or banishment of a great portion of the inhabitants. The embers of religious hatred still remained glimmering through the following century, and, after the restoration of the Bourbons in 1815, burst out into flames in the terrible persecution of the Protestants in Nîmes (q. v.) and other places in the s. of France. See *Histoire des Troubles des Cévennes* by Court de Gébelin (1760); Schulz's *Geschichte der Camisarden* (1790); Bray's *Revolt of the Protestants of the C.* (1870).

CEYLANITE. See SPINEL.

CEYLON' (the *taprobane* of the Greeks and Romans, and the *serendib* of the *Arabian Nights*), a valuable island and British colony in the Indian ocean, to the s.e. of the peninsula of Hindustan, from which it is separated by the gulf of Manaar and Palk's strait. Recent observations have shown its true place to be between 5° 55' and 9° 51' n. lat., and 79° 42' and 81° 55' e. long. Extreme length from n. to s., from Point Palmyra to Dondera Head, 271½ m.; greatest width, from Colombo to Sangemankande, 137½ miles. Area, including dependent islands, 24,454 sq. miles.

Physical Features.—In natural scenery, C. can vie with any part of the world; and as it rises from the ocean, clothed with the rich luxuriance of a tropical vegetation, it seems to the voyager like some enchanted island of eastern story. Its hills, "draped with forests of perennial green," tower grandly from height to height, till they are lost in clouds and mist. Near at hand, a sea of sapphire blue dashes against the battlemented rocks that occur at isolated points, and the yellow strands are shaded by groves of noble palms. In shape, C. resembles a pear, but its inhabitants more poetically compare it to one of their elongated pearls. Undulating plains cover about four parts of the island, and the fifth is occupied by the mountain-zone of the central s., which has an elevation of from 6,000 to 8,000 ft. above the sea-level. Pedrotallagalla, the highest mountain in the range, attains the height of 8,280 ft.; the celebrated mountain of Adam's peak, 7,420 ft.; and the table-land of Neuera Ellia, 6,210 feet.

Geology.—The mountain system is mainly composed of metamorphic rocks, chiefly gneiss, frequently broken up by intruded granite. With the exception of some local beds of dolomitic limestone, the gneiss is everywhere the surface rock, and the soil is composed of its disintegrated materials. No fossils, as was to be expected, have been noticed in C., if we except the semi-fossil remains of mollusca, crustacea, and corals, belonging to living species, which occur in the rude breccias of the n. in the neighborhood of the sea. The northern part of the island is rising, and there also the land is making encroachments on the sea from another agency. The immense masses of corals continually increasing, retain the debris brought from the Indian continent by the currents of the sea, and thus form a flat, ever-increasing madreporic plain.

Of metals and minerals, iron, in the form of a carbonate, can be obtained in great quantities, and of such purity as to resemble silver. Tin is found in the alluvium at the base of the mountains, and on the heights the rare metal tellurium has been discovered. Nickel and cobalt are scarce. Anthracite and rich veins of plumbago exist on the southern range of hills. The *gems* of C. have been celebrated from time immemorial, and they are most plentiful in the alluvial plains at the foot of the hills of Saffragam. Sapphires, rubies, the oriental topaz, garnets, amethysts, cinnamon stone, and cat's-eye, are the principal gems and precious stones of the island. The most valuable is the sapphire; and one of these, found in the year 1853, was worth more than £4,000. The value of the precious stones annually found in the island is estimated at £10,000. The pearl fisheries of C. have long been famous, and since the beginning of the century are conducted directly for behoof of the government. But sometimes fishing operations

have to be suspended for a considerable period; thus there was no fishery from 1863, when the value obtained was £46,000, till 1874, when pearls worth £9,500, were secured.

Rivers.—The most important river in C. is the Mahawelli-ganga. It has its source in the vicinity of Adam's peak, and after draining more than 4,000 sq. m., it separates into several branches, and enters the ocean near Trincomalee. The s. side of the island is watered by 10 rivers of considerable size, which flow into the sea between Point de Galle and Manaar. On the e. coast, the rivers are smaller, but still more numerous, and many others traverse the northern and eastern provinces.

Harbors.—Point de Galle (q. v.) and Trincomalee (q. v.) are the two harbors of Ceylon. The former is small and dangerous, but the latter is unsurpassed as a safe and commodious port. The variation of the tides is very trifling; the rise and fall not generally exceeding 18 to 24 in., with a third of increase at spring-tides.

In *climate*, C. has a great advantage over the mainland of India, and as an island, enjoys a more equable temperature. The average for the year in Colombo (q. v.) is 80° in ordinary seasons. April is the hottest month; and in May the s. w. monsoon commences amid a deluge of rain, and continues the prevailing wind till Oct., when the n. e. monsoon sets in: 80 in. is the average annual fall of rain, though in an exceptional year, 120 in. have been registered. The beautiful table-land of Neuera Ellia was first visited by Europeans in 1826, and is now used as a sanatorium. Here the thermometer in the shade never rises above 70°, while the average is 62°; the nights are cool and refreshing. The n. of the island, including the peninsula of Jaffna, the plains of Neuera Kalawa, and the Wannya, may be reckoned as a third climatic division. Here the annual fall of rain does not exceed 30 in., and irrigation is largely employed in agriculture.

Flora.—The general botanical features of C., especially of the lowlands, are nearly identical with those of southern India and the Deccan, although it possesses a few genera of plants not to be found in those regions. Its phænogamic plants are limited to about 3,000. The beautiful ixoras, erythrinas, buteas, Jonesias, and other flowering shrubs bloom in the forests. At an elevation of 6,500 ft., the acanthaceæ cover large tracts of ground, and the tree-fern reaches the height of 20 feet. On the highest ground, rhododendron attain the size of timber-trees. The coral-tree (*eurythrina Indica*), the murutu (*lagerstræmia regina*), and the *Jonesia asoca* are amongst the most magnificent of the flowering trees. The fig tribe are planted in the vicinity of the temples. In the forests, climbing-plants and epiphytes of prodigious size and striking appearance cover the trees with a mass of parasitical foliage of extraordinary growth. The palmaceæ are very conspicuous in the vegetation of C., although not more than 10 or 12 species are indigenous: the cocoa-palm—of which it is estimated there are not less than 20 millions of trees—the talipot, the palmyra—which forms extensive forests in the n. of the island—and the jaggary palm are the most noteworthy. Of timber-trees, 416 varieties are known, and amongst these the satin-wood holds the first rank. The flora of the highlands, above 2,000 ft., and up to 6,000 or 7,000, though much resembling that of the Neigherries, has a marked affinity to the vegetation of the highlands of Malacca and Java, especially the latter.

Fauna.—A knowledge of the fauna of C. has been greatly advanced by the labors of Drs. Templeton and Kelaart and Mr. Edgar Layard. *Quadrumanous* animals are represented by the *loris gracilis*, and five species of monkeys. Sixteen species of the *chiroptera* or bat tribe, exist in C., and what is very remarkable, many of these rival the birds in the brilliancy of their colors. The *pteropus Edwardsii* (the flying-fox of Europeans) measures from 4 to 5 ft. from tip to tip of its extended wings. Of the larger *carnivora*, the bear and the leopard, and of the smaller, the palm-cat and the glossy genet (the civet of Europeans) may be mentioned. The dreaded tiger of India, the cheeta, the wolf, and the hyena are happily not met with in Ceylon. Deer, buffaloes, and the humped ox of India are amongst the *ruminantia*; the little musk-deer (*moschus meininna*) is less than 2 ft. in length. The *pachydermata* are represented by the elephant and the wild boar; the former, which is for the most part tuskless, is emphatically lord of the forests of Ceylon. The most remarkable of the *cetacea* is the dugong. Whales are captured off the coast; 320 species of *birds* have been ascertained by Drs. Templeton and Kelaart and Mr. Layard. The song of the robin and long-tailed thrush, and the flute-like voice of the oriole, are heard over the whole mountain zone, and far down into the neighboring plains. Eagles, the beautiful peregrine falcon, owls, swallows, kingfishers, sun-birds, bulbuls, crows, paroquets, pigeons, pea-fowl, jungle-fowl, and many others of the feathered tribe might be mentioned did space permit. Myriads of aquatic birds and waders, amongst which the flamingo is conspicuous, cover the lakes and lagoons. The crocodile is the largest reptile in the island; tortoises and lizards are also found. There are a few species of venomous snakes, and of these the ticpolonga and the cobra da capello are the most deadly.

Inhabitants.—The Singhalese, the most numerous of the natives of C., are the descendants of those colonists from the valley of the Ganges who first settled on the island 543 B. C. In their customs, costume, and general appearance, they have remained unchanged since the days of Ptolemy. The dress of the men, who have delicate features and slender limbs, is singularly effeminate, and consists of a *comboy* or waist-cloth, very much resembling a petticoat; their long hair, turned back from the forehead, is confined with combs, and ear-rings are worn by way of ornament. The women,

in addition to the comboy, cover the upper part of the figure with a white muslin jacket, and adorn themselves with necklaces, bangles, rings, and jewelry. The Singhalese are false and cowardly, but manifest a strong affection for their relatives, and a reverence for old age. Polyandry still lingers in the interior of C., and was formerly universal; it is now, however, chiefly confined to the wealthier classes, amongst whom one woman has often three or four husbands. The Kandyans, or Highlanders, are a more sturdy race, and maintained their independence for three centuries after the conquest of the low country by European settlers. The Malabars, or Tamils, have sprung from those early invaders of C., who from time to time swept across from southern Hindustan, and contended with the Singhalese kings for the sovereignty of the island. They have formed the chief population of Jaffna for full 2,000 years, and constitutionally excel the Singhalese and Kandyans. The Moormen, who are the most energetic and intelligent of the native communities, are met with in every province as enterprising traders. They are a very distinct race from the Singhalese, but have no tradition of their origin. Europeans generally believe them to be of Arab descent, but Tennent is of opinion that "they may be a remnant of the Persians, by whom the island was frequented in the 4th and 5th centuries.

The "burghers" of C. are a people of European descent, who have become naturalized. Those of Portuguese extraction hold the lowest place, and are mostly tradesmen and artisans; but the Dutch burghers frequently fill responsible posts, and are employed in the government offices.

Besides the races already alluded to, there is a remarkable tribe of outcasts—the Veddahs—hardly removed from the wild animals of the forest, and believed to be descended from the Yakkhos, the aboriginal inhabitants of the country. They occupy a district in the eastern part of the island, and have there preserved their ancient customs and manner of living unaltered for more than 2,000 years. They appear to be without the instinct of worship, and have no knowledge of a God. The tribe is divided into the *Rock Veddahs* and the *Village Veddahs*. The former hide themselves in the jungle, live by the chase, and sleep in trees or caves. They use fire to cook their meat, and their greatest gastronomic treats are the iguana lizard and roasted monkey. Their language—if the few words they make use of can be called by that name—is a dialect of the Singhalese. The Village Veddahs locate themselves in the vicinity of the European settlements, on the eastern coast, living in rude huts of mud and bark, and are hardly more civilized than their brethren of the jungles. The exertions of government to reclaim this harmless but degraded people have in some degree succeeded, and a promising colony has been formed.

Population.—Sir J. E. Tennent is of opinion that C., when in the height of its prosperity, must have been ten times as densely peopled as at the present day. In the official returns for the year 1870, the area and population of the six provinces of Ceylon are given as follows (total pop. in 1871, 2,405,287):

Provinces.	Area in sq. miles.	Total population.	Pop. per sq. mile.
Western.....	3,345	662,658	198.11
North-western.....	2,805	214,699	76.54
Southern.....	1,927	353,989	183.69
Eastern.....	4,545	96,601	21.25
Northern.....	6,062	426,597	70.36
Central.....	5,770	371,466	64.37
Total.....	24,454	2,126,037	86.94
Military.....		2,847	.11
Total (including military).....		2,128,884 *	87.05

Religion.—The Singhalese are devoted to Buddhism (q.v.), which is the prevailing religion of the island. It does not exist, however, in that state of purity in which it is still found in the Indo-Chinese peninsula. Its sacred books are identical with those of Burmah and Siam, and both record the doctrines of Gautama in the Pali language; the deviations are in matters of practice. The Malabar kings adulterated Buddhism to a considerable extent with Brahmanism, introducing the worship of Hindu deities into the Buddhist temples, and this continues more or less to be the case. More than once have the Buddhists of C. sought to restore the purity of their faith—at one time sending deputies to Siam, at another to Burmah, with this object in view. The Burmah or Amarapura sect have long been the reformers of Singhalese Buddhism, and maintain no very friendly relations with the party, who, supported by the priests of Siam, acknowledge the civil power in matters of religion, sanction the worship of Hindu deities and the employment of the priesthood in secular occupations, uphold caste, and restrict the sacred books. Caste was acknowledged by the Singhalese prior to the introduction of Buddhism, which in principle is opposed to it; but so firmly was it rooted, that it still endures, though more as a social than a sacred institution. Gautama Buddha is said to

* Including 4,732 British and 14,301 whites of European descent.

have visited C. three different times to preach his doctrine, and his *Sri-pada*, or sacred footstep, on the summit of Adam's Peak (q.v.), still commands the homage of the faithful. Buddhism was not, however, permanently introduced into C. till 307 B.C., when Mahindo, obtaining the support of the king, established it as the national faith. The influence of the priests gradually increased, and, by the piety of the Singhalese kings, monasteries were richly endowed; for though the Buddhist monk is individually forbidden to possess goods, a community may own property to any extent; and it is a remarkable fact that, at the present day, no less than one third of the cultivated land of the island is computed to belong to the priesthood, and is exempt from taxation. The priests of C. are divided into two orders—the *Samanaros*, and those who, after a time of probation, receive the higher grade of *Upasampada*. The fraternity are not raised by education above their countrymen, and the respect paid them is directed more to the dress than to the person of the individual. Any member is at liberty to lay aside his ascetic character, and return to a secular life. The most celebrated Buddhist relic in C. is the *Dalada*, or sacred tooth of Gautama, at Kandy, which is guarded with jealous care, and preserved in an elegant shrine; but it is well known that the original relic was destroyed by the Portuguese, and the present substitute is a piece of discolored ivory, bearing no resemblance to a human tooth. In all Buddhist countries, the sacred buildings present, with certain modifications, the same general character (see articles **BUDDHISM**, **BURMAN**, etc.); and in C. we find the three classes represented by the dagoba, or relic-shrine (*datu*, a relic, and *gabbhan*, a shrine), the temple proper, and the vihara or monastery. The labor bestowed on these edifices in the early ages of the Singhalese monarchy is truly astonishing. In the n. of the island, ruined cities—buried for ages in the depths of the forest—have been discovered, revealing monuments that in dimensions may almost compare with the pyramids of Egypt. The most remarkable of these vestiges of an early civilization is Pollanarrua, the ancient capital of C.; and here is the celebrated *Gál-wihara*, a rock-hewn temple, supposed to be “the only example in Ceylon of an attempt to fashion an architectural design out of the rock, after the manner of the cave-temples of Ajunta and Ellora.” The reclining figure of Gautama is 45 ft. in length, the upright one measures 23 ft.; and the sitting image on the left is 16 ft. from the altar to the top of the head. The cave-temple of Dambool was built 100 B.C., and is the most celebrated in the island. The bell-shaped tapering dagobas of C., as relic-shrines, answer to the pagodas of Burmah—which they very much resemble—and the topes of Afghanistan. The ruins of the Jaytawanarama dagoba still reach the height of 249 ft.; its diameter is 360 ft.; and from base to pinnacle it is covered with trees of the largest size. This enormous structure contains 20 millions of cubical ft.; and sir J. E. Tennent concludes that to erect such a mass of masonry, even in the present day, “would occupy 500 bricklayers from six to seven years,” at the cost of a million sterling. The Ambustella of Mihintala is another remarkable dagoba. A very famous object in connection with Buddhism in C. is the sacred Bo-tree of Anarajapoora (*peepul*, *ficus religiosa*), which was planted there 288 years B.C., and is by far the oldest tree in the world of which an authentic history exists. See **BO-TREE**. Amongst the antiquities of C. must be mentioned those wonderful monuments of the former greatness of the Singhalese people—the ruined tanks; with which almost nothing of a similar kind, whether ancient or modern, can be compared; 30 colossal reservoirs, and about 700 smaller tanks, still exist, though for the most part in ruins. The restoration of these magnificent works of irrigation has recently been begun. Brahmanism or Hinduism (q.v.) is the faith of the Tamils or Malabars, but the Moormen are Mohammedans. After the expulsion of the Dutch Christians, Protestant missions to the natives of C. were commenced by the Baptists in 1813. The Wesleyan Methodists followed in 1814, the Americans in 1816, the church of England in 1818, and Christian instruction has made some progress amongst the native populations. Of these the peasantry of the Kandyan hills have proved the least accessible to its influence. Schools, collegiate institutions, and female seminaries, under the direction of the missionaries, are in successful operation.

Government.—The administration of C. is vested in a governor, who is assisted by an executive council of five members, and a legislative council of fifteen members. The governor's salary is £7,000 per annum. In 1876 the revenue was £1,375,888, and the expenditure £1,276,930. The chief items of revenue are the customs, averaging £286,000; licenses, £150,000; sales and rents of public lands, £230,000. The colony made very great progress under the able administration of sir H. Ward. The civil and judicial establishments of the colony cost nearly £300,000.

The following are the trade returns for the five years 1870 to 1874:

Years.	Imports.	Exports.	Exports from Ceylon to the United Kingdom.	Imports of British Home Produce into Ceylon.
1870.....	£4,634,297	£3,803,730	£3,450,974	£908,415
1871.....	4,797,592	3,634,853	3,167,673	928,807
1872.....	5,169,524	3,139,060	3,163,153	1,017,753
1873.....	5,574,358	5,439,591	4,331,006	1,052,072
1874.....	5,691,860	4,687,388	3,600,492	1,158,283

The value of the staple coffee exported from Ceylon to the United Kingdom was, in 1867, £2,814,060; in 1869, £2,867,724; in 1871, £2,623,263; in 1872, £2,341,601; in 1873, £3,692,333; and in 1876, £2,550,688. In 1876, cocoa-nut oil valued at £236,856, and cinnamon at £119,700, were exported to the United Kingdom. To the ancient world, C. was famous as a place of traffic. Egyptians, Greeks, Romans, Persians, and Arabians traded to its ports; and many particulars, such as geographical position and natural productions, seem to identify Point de Galle with the Tarshish of the Hebrew historians.

The *history* of C., of which the limits of this article will only allow the briefest possible outline, may be conveniently divided into ancient and modern, and the latter into the Portuguese, Dutch, and British periods.

The records of its early history came to light in 1826, and Mr. Turnour, devoting himself to their study, composed an *Epitome of the History of C.*, from the year 543 B.C. to 1793 A.D.; and he records the reigns of 165 kings, who reigned during this space of 2,341 years. The most famous of the Singhalese books is the *Mahawanso*, a metrical chronicle, in the Pali language, which gives an account of the island during the above 23 centuries. The story begins with the invasion of Wijayo (543 B.C.), son of a petty Indian sovereign in the country watered by the Gauges. He subdued the Yakkhos, the aboriginal inhabitants; married a daughter of one of the native chiefs, whom he subsequently repudiated for an Indian princess; and founded a dynasty that held undivided sovereignty in C. for nearly eight centuries. He bestowed on his kingdom his patrimonial name of Sihala (whence Singhalese, Ceylon), and promoted the settlement of colonists from the mainland. In the reign of king Deveniapiatissa (307 B.C.), Buddhism was established as the national religion, and his reign was further remarkable by the planting of the sacred bo-tree, 288 B.C.; and now commenced the erection of those stupendous buildings already noticed. The next important epoch in Singhalese history is the usurpation of the Malabars (237 B.C.), foreign mercenaries from the Coromandel coast, to whom the native sovereigns had intrusted the defense of the island. Several Malabar invasions are chronicled in the history of C., and these foreigners long contended with the native princes for supreme authority. Passing on to 1071 A.D., a native dynasty was then re-established in the person of Wijayo Bahu, which, for 100 years, delivered the country from the dominion of the Malabars. Prakrama Bahu commenced a reign, in 1153, the most renowned in the records of Ceylon. He devoted himself to religion and agriculture, and besides many notable religious edifices, he caused no less than 1470 tanks to be constructed, subsequently known as the "seas of Prakrama." Thirty years after the death of this monarch, the Malabars landed with a large army, and speedily conquered the whole island. In 1235, a native dynasty recovered a part of the kingdom. During the reign of Dharma Prakrama IX. the Portuguese first visited C., 1505; but it was in 1517 that they first formed a permanent settlement at Colombo for trading purposes. Their encroachments soon raised the patriotic Kandyaus, and it is a remarkable fact, that though at the first visit of the Portuguese in 1505 they were even ignorant of the use of gunpowder, they, after a while, excelled their enemies as musketeers, and were finally able to bring 20,000 stand of arms to bear against them. "Amity, commerce, and religion," was the Portuguese motto; but their rule in C. is a sad story of rapacity, bigotry, and cruelty. They were at last driven from the island by the Dutch in 1658, after a contest of 20 years, when, as sir J. E. Tennent remarks, "the fanatical zeal of the Roman Catholic sovereign for the propagation of the faith, was replaced by the earnest toil of the Dutch traders to intrench their trading monopolies; and the almost chivalrous energy with which the soldiers of Portugal resisted the attacks of the native princes, was exchanged for the subdued humbleness with which the merchants of Holland endured the insults and outrages perpetrated by the tyrants of Kandy upon their envoys and officers." But the purely military tenure of the Dutch was destined to give place to the colonization of the British. It was during the great European war succeeding the French revolution, that the English gained possession of the island. On the 1st Aug. 1795, an expedition under col. James Stuart landed at Trincomalee, which was speedily captured, and finally the garrison of Colombo surrendered on the 16th Feb. 1796. By this capitulation all the Dutch settlements and strongholds in C. were ceded to the English; though the island was not formally annexed to the British crown till the peace of Amiens, 27th Mar. 1802. The native sovereigns, however, continued in the possession of their mountain territory; but at length the Kandyan king, Wikrama Raja Singha, after perpetrating the most frightful atrocities on his own people, seized and murdered certain native merchants, British subjects, trading to Kandy. War followed, Jan. 1815; Kandy was taken, and the tyrant sent a captive to the fortress of Vellore. On the 2d Mar. 1815, a treaty was concluded with the native chiefs, by which the king was formally deposed, and his territories annexed to the British crown.

Since then, the island has made rapid strides in material prosperity. The mountain-forests have been replaced by plantations of coffee, of which there are now about 500 under cultivation, of 150,000 acres, giving an average crop of 950,000 cwts. per annum. Many important public works have been completed, and others are still in progress. Several good roads have been constructed, including a magnificent mountain-road between Colombo and Kandy, and there is a railway 92 m. in length. In 1874, there were 243 government schools, with 11,719 pupils; 882 mission schools, with 44,449 pupils; and 329 private schools, with 9,929 pupils.

See *Ceylon, Physical, Historical, and Topographical*, etc., by sir James Emerson Tennent (Lond. 1859); *Christianity in Ceylon*, by the same author (Lond. 1850); *The Statesman's Year-book* for the current year; and *Ceylon, a General Description of the Island*, by an officer, late of the Ceylon rifles (1876).

CEYLON, ante. The Cinghalese, or Singhalese language is spoken in the interior and on the s. coast of the island of Ceylon. It is a modification of the aboriginal Ebu by the Sanskrit, with a tinge of Malay. The Cinghalese has so far degenerated that there is now a material difference between the vernacular and the written language. The former is copious and has a regular grammar. There are 50 letters, 8 vowels, 8 diphthongs, and 34 consonants, but all representing only 30 sounds, 7 vowels and 23 consonants. In literature the language has several original poems of some merit, and an extensive and interesting series of native chronicles, but the most valuable literature is written in Pali. This Pali is one of the Prakrits of ancient India, "which was spoken in the 6th c. before Christ, and has been a dead language for upwards of 2,000 years."

CEYX. See KINGFISHER.

CEZIM'BRA, a coast t. of Portugal, in the province of Estremadura, about 18 m. s. of Lisbon. C. has active fisheries, and a pop. of 5,000.

CHABAS, FRANÇOIS JOSEPH, b. 1817. He has devoted himself especially to Egyptian archæology, in which he is considered among the highest authorities. His principal works are *Le Papyrus Magique Harris*; *Voyage in Egypt and Syria*; *Les Pasteurs en Egypte*, and *Studies in Ancient History*.

CHABLAIS, an old division of the province of Annecy in Savoy, now the arrondissement of Thonon, France; 356 sq. m.; pop. 60,193. It once formed a part of the kingdom of Burgundy. Under the French empire it was a part of the department of Lemane; in 1814, its possessions went to Sardinia, and in 1860, with all of Savoy, it was given over to France.

CHABLIS, a village in France, dep. of Yonne, which gives name to a much esteemed white Burgundy (q. v.) wine

CHABOT, PHILIPPE DE, d. 1543; a French general, brought up with Francis I. He defended Marseilles in 1524, but the next year was made prisoner at Pavia. He was subsequently made admiral, and in 1535 commander in chief. He was said to have been the first to suggest the colonization of Canada. There is a monument to him in the Louvre.

CHA'BRIAS, an Athenian gen. who assumed command about 392 b. c. He defeated the Spartans at Ægina in 388, and again at Naxos in 376. He commanded with Iphicrates and Callistratus at Coreyra, and repulsed Epaminondas before the walls of Corinth. In 366, he was accused of treachery in advising the surrender of Oropus to the Thebans, and was defended by Plato. At the commencement of the social war, in 357, he joined Charos in the command of the Athenian fleet. At the siege of Chios his ship was disabled, but he refused to retire, and was killed while fighting. C. was famous for inventing a new style of receiving a charge, which was on the left knee, the shield resting on the ground, and the spears pointed at the enemy.

CHACHAPOY'AS, or SAN JUAN DE LA FRONTERA, a t. in the department of Amazonas, Peru, 410 m. w. of Lima; pop. 6,000. It is on a tributary of the Maranon, in a rich agricultural region.

CHAC'MA. See BABOON.

CHACO, EL GRAN, a large and little explored country in South America, about the middle of the continent. The n. portion is well watered and densely wooded, with intervals of grassy plains and marshes, and capable of producing nearly all tropical vegetation. The s. portion is for the most part a desert and can be cultivated only after irrigation. The n. portion belongs to Bolivia, while the s. is occupied almost entirely by Indians.

CHAD, SAINT, bishop of York, in the 7th century. He was educated under Aidan at Lindisfarne. At his death he held the see of Litchfield. His day is Mar. 2.

CHADBOURNE, PAUL ANSEL, D.D., LL.D., b. Me., 1823; professor of natural history and chemistry in Williams college and in Bowdoin college, and in 1867, chosen president of the university of Wisconsin, at the same time becoming professor of metaphysics. In 1872, he was elected president of Williams college, and resigned in 1880. He has published *Natural Theology*, and *Instinct in Animals and Men*.

CHAD DA. See BENUWE.

CHADWICK, EDWIN, C.B., a distinguished social and sanitary reformer of the present day, born in the vicinity of Manchester, 24th Jan., 1801. He studied law, but early devoting his attention to questions of social, sanitary, and political science, he attracted the notice of lord Grey's government, by whom he was appointed an assistant-commissioner to inquire into the operation of the poor-laws in England and Wales. His report, published with others in 1833, commanded most attention, being remarkable alike for the wide and searching character of its investigations, the happiness of its illustrations, and the convincing proofs it furnished as to the necessity of reform in the system of

administration. Its merit was recognized by those who had the power to reward him; and on the organization of the new poor-law board, C. was appointed secretary. In connection with this board, and the general board of health, C. for twenty years was energetic in the origination and administration of remedial measures relative to the distribution of poor-law funds, and to the sanitary condition of the country. He has also given much attention to the constitution of the constabulary force, with a view to the better prevention of offenses and the readier detection of criminals. On a change being made in the board of health, in 1854, C. retired with a pension. He has since taken great interest in promoting competitive examinations for government offices, and indeed in almost all questions of social economy. He has been an active member of the association for the promotion of social science. In 1859-60, he collected evidence for the education commission.

CHÆRONEIA, a city of Bœotia, in ancient Greece, near the Cephissus, on the borders of Phœcis. It is celebrated on account of several important battles fought in the neighborhood. In 447 B.C., the Bœotians here obtained a victory over the Athenians; and in 338 B.C., Philip of Macedon signally defeated the united forces of the Athenians and Bœotians, and so crushed the liberties of Greece. A mound of earth, about a mile from the modern village of Kapurna, which occupies the site of the old city, still marks the place where the Thebans who fell in the battle were buried; and a magnificent lion, which col. Mure pronounced to be "the most interesting sepulchral monument in Greece," was excavated from this tumulus some years ago. At C., also, 86 B.C., Sulla defeated the generals of Mithridates. Plutarch was a native of this town. A few ancient remains yet exist.

CHÆTODON'TIDÆ, a family of acanthopterous fishes, nearly corresponding to the genus *chætodon* (Gr. hair-tooth) of Linnæus; and also named *SQUAMIPENNES* (Lat. scaly-finned), because of the most distinctive character of the family, the incrustation of the soft portions of the dorsal and anal fins, and often of the spinous parts also, with scales, the fins appearing to taper gradually out of the thickness of the body, which is in general remarkably compressed, so that, without dissection, it is impossible to tell where they begin. The scales are strongly etenoid (q. v.). The typical genus *chætodon*, and those most nearly allied to it, have hair-like teeth, so that their jaws resemble brushes; some fishes of the family, however, have trenchant teeth on the jaws, and some, as *brama* (q. v.), have card-like teeth both on the jaws and palate. Most of the C. are tropical; only one species, *Brama raii*, is ever found in the British seas. They generally frequent rocky shores. Their colors are often extremely gay, and usually disposed rather in stripes or bands than in spots. "The eye of man receives the greater pleasure from their contemplation, in that, being of moderate or small size, and haunting habitually the coral basins of the transparent tropical seas, they disport themselves in the beams of a vertical sun, as if desirous of exhibiting their splendid liveries to the greatest advantage in the blaze of day." Many singularities of form occur in this family, as the long slender snout of the *chelmons*, the whip-thong-like prolongation of some of the rays of the dorsal fins in *heniochus* and *zancus*, the wing-like dorsal and anal fins of *platax*, the sharp recurved horns of the buffalo-fish (*taurichthys*), etc. To this family belong the archer-fishes (q. v.), whose singular habits have been already noticed. The flesh of most of the C. is of very fine flavor.

CHAFER, a common name of those beetles or coleopterous insects, which either in the perfect or larva state, are destructive to plants; particularly those which devour the wood, bark, or roots of trees. From these, however, it is sometimes extended to some coleopterous insects which have no such habit. The word C. is seldom used alone, but generally as part of a name, with some prefix; thus, we have *cock-chaffer*, *rose-chaffer*, *bark-chaffer*, etc.

CHAFF-CUTTER, a name commonly given to an implement now much used by farmers for cutting hay and straw into half-inch lengths. The advantage of this consists not so much in facilitating mastication or digestion, as in preventing animals from wasting their food. No small amount of mechanical ingenuity has been applied to the construction of chaff-cutters, the simplest and oldest kinds of which are mere hand-machines with a single large knife, the hay or straw being pushed forward in a trough or box, whilst others are driven by horse, steam, or water power, and are not a little complicated.

CHAF FINCH, *Fringilla œolebs*, one of the most common British birds, a species of finch (q. v.), and probably that to which the name finch, now so extended in its signification, originally belonged; *finck*, the German form of the name, and *pink* and *twink*, English provincial forms still appropriated to the C., having some resemblance of sound to its common call-note. The whole length of the C. is about 6 inches. The tail is very slightly forked. The male, in summer, has the top of the head and nape of the neck bluish-gray; the back, chestnut; the wings almost black, with two conspicuous white bars; the tail, nearly black. The colors of the female are much duller than those of the male. The C. is a very widely distributed species, being found in almost all parts of Europe, in some parts of Asia, in the n. of Africa, and as far w. as the Azores. In the colder northern countries, it is migratory; in more southern regions, it is station-

ary. Linnæus gave it the specific name *cœlebs*, from observing that the flocks congregated in winter in Sweden consisted chiefly of males, the females having, as he supposed, sought a milder climate. A partial separation of the sexes is observed also in the great winter-flocks in Britain, but it is only partial; and Yarrell thinks that the young males of the previous season, which resemble the females in plumage, are associated with them, and have been mistaken for them. The flocks seen in Britain in winter are believed to be augmented by migration from Scandinavia. The eggs are usually 4 or 5 in number, of pale purplish buff color, sparingly streaked and spotted with reddish brown. The C. feeds chiefly on insects, and does much service in summer by destroying aphides and caterpillars; but eats also seeds, and is sometimes persecuted, because in spring it pulls up and eats young turnips and radishes when in the seed-leaf. Great numbers of chaffinches are killed for the table in Italy. In Germany, this bird is in the highest esteem as a song-bird. Its notes are very clear and loud, but some individuals greatly excel the ordinary multitude of their species; and their superior notes, if heard on the Thuringian hills, speedily attract bird-catchers. Bechstein says that, in Thuringia, a cow has been given for a C. with a fine voice; and the Germans have taken the trouble to classify the different strains of chaffinches, giving them distinct names, and regarding those birds as particularly valuable by which certain of these strains are produced.—The common Scotch name of the C. is *shilfa*.

CHAGRES, a river entering the gulf of Darien on the n. side of the isthmus of Panama, near lat. 9° 18' north. Though, towards its mouth, it varies in depth from 16 to 30 ft., it is yet, by reason at once of its rapidity and its falls, but little available for navigation. At its entrance is a port of its own name. Both the town, however, and the stream have recently lost nearly all the advantages of their position, through the establishment of an inter-oceanic railway, which, on the Atlantic side, commences at Aspinwall, about 8 m. to the north.

CHAILLU, PAUL B. DU. See DU CHAILLU.

CHAIN, in surveying (called Gunter's chain, from its inventor), is a measure of 22 yards long, composed of 100 iron links, each of which is thus 7.92 in. long. As an acre contains 4,840 sq. yards, 10 sq. chains ($22 \times 22 \times 10 = 4,840$ sq. yards), or 100,000 sq. links, make an acre.

CHAIN-BRIDGE. See SUSPENSION BRIDGES.

CHAIN-CABLE. See CABLE.

CHAIN-MAIL, or **CHAIN-ARMOR**, much used in the 12th and 13th centuries, consisted of hammered iron links, connected one to another into the form of a garment. Such armor was much more flexible and convenient to the wearer than that which was formed of steel or brass plates, but was less fitted to bear the thrust of a lance.

CHAINS, on shipboard, are strong iron links or plates, bolted at the lower end to the ship-timbers, and having a block or *dead-eye* at the upper end. Their purpose is to fasten down the shrouds tightly. They are brought out laterally at the top by resting in the middle against the channels, which are broad thick planks, very strongly fixed, and projecting horizontally from the side of the ship, one pair for each mast.

CHAINS, **HANGING IN**. In atrocious cases, it was usual for courts of justice, in former times, to direct the bodies of malefactors, after execution, to be hung in C. upon a gibbet near the spot where the crime was committed; but this, says Blackstone, "was no part of the legal judgment." The reasons commonly assigned for the practice are two: first, that it might strike terror into other offenders; and second, that it might afford "a comfortable sight to the relations and friends of the deceased." This barbarous adjunct to capital punishment was not finally abolished till a very recent period, and it may surprise our readers to learn that, two years after the passing of the reform bill, it was still in accordance with the law, if not with the custom of England. The act "to abolish the practice of hanging the bodies of criminals in chains" (4 and 5 Will. IV. c. 26), was passed on 25th July, 1834. The last case of hanging in C. mentioned as having occurred in Scotland, is that of Andrew Wilson, who poisoned his wife in 1755 (Hume, vol. ii. p. 482). See PUNISHMENTS and DISSECTION.

CHAIN-SHOT, a nearly obsolete kind of ammunition, chiefly used in naval warfare, consisting of two balls connected by a short chain. The object of the chain is to destroy the rigging, etc., which otherwise might escape. As grape-shot has been found to serve the same end, the making of chain-shot has been discontinued.

CHAIN SNAKE, or **KING SNAKE**, an American serpent, haunting moist or shady places, and feeding upon mice, moles, small birds, and reptiles. It is remarkable for the beauty of its colors, the ground work on the upper part of the body being a lustrous black, while the scales are marked with white spots. The head is very small.

CHAJUG, or **CHIUG**, **JEHUDA BEN-DAVID**, b. about 1030; regarded by Jewish critics as the first of Hebrew grammarians. He made some very remarkable and valuable discoveries in philology.

CHALAZA, in botany, a membrane which unites the nucleus and integuments at the base of an ovule. It is traversed by vessels which supply nourishment to the ovule. It is often of a different color from the rest of the integuments, and is conspicuous in the

ripened seed; but it is sometimes difficult to distinguish it, particularly in *orthotopal* seeds, when it is in contact with the *hilum*, the *foramen* or *micropyle* being at the opposite extremity of the seed. See OVULE and SEED.

The cords which bind the yolk-bag of an egg to the lining membrane at the two ends of the shell, and keep it near the middle as it floats in the albumen, are also called *chalazæ*. They appear to be formed of a peculiarly viscid albumen.

CHALCEDON, a city of ancient Bithynia, at the entrance of the Euxine, opposite to Byzantium. It was founded 684 B.C. by a colony from Megara, and soon became a place of considerable trade and importance. It contained several temples, one of which, dedicated to Apollo, had an oracle. C. was taken by the Persians, suffered the vicissitudes of war during the strife for Grecian supremacy between the Athenians and Lacedæmonians, and finally merged into the Roman empire. During the Mithridatic war, it was the scene of a bold exploit of the Pontic sovereign. Having invaded Bithynia, all the wealthy Romans in the district fled for refuge to C., whereupon he broke the chains that protected the port, burned four ships, and towed away the remaining sixty. Under the empire it was made a free city, and was the scene of a general council, held 451 A.D. Chosroes the Persian captured it 616 A.D., after which it declined, until it was finally demolished by the Turks, who used its ruins to build mosques and other edifices at Constantinople. C. was the birthplace of the philosopher Xenocrates.

The *council* of C., to which allusion has been made, was the fourth universal council, and was assembled by the emperor Marcian for the purpose of drawing up a form of doctrine in regard to the nature of Christ, which should equally avoid the errors of the Nestorians (q.v.) and Monophysites (q.v.). Six hundred bishops, almost all of the eastern or Greek church, were present. The doctrine declared to be orthodox was, that in Christ there were two natures, which could not be intermixed (this clause was directed against the Monophysites), and which also were not in entire separation (this was directed against the Nestorians), but which were so conjoined, that their union destroyed neither the peculiarity of each nature, nor the oneness of Christ's person.

CHALCEDONY (often misspelled *calcedony*), a beautiful mineral of the quartz family, or rather a variety of quartz, from which it does not differ in chemical composition or in any essential character. It derives its name from Chalcedon in Bithynia, near which it is found in considerable abundance, and has been known by the same name from ancient times. It occurs in different kinds of rock, but most frequently in old lavas and trap-rocks, and is found in almost all parts of the world where these exist, or where there are boulders derived from them. It is common in Scotland, and specimens of great beauty are brought from Iceland and the Farøe islands. It never occurs in crystals. It constitutes the whole or the principal part of many agates. It is generally translucent, sometimes semi-transparent, has not much luster, and is in color generally white or bluish white, sometimes reddish white, sometimes milk-white, less frequently gray, blue, green, yellow, brown, or even black. Its fracture is even, or very slightly conchoidal.—C. is much used in jewelry, for brooches, necklaces, and ornaments of all sorts, the largest pieces being sometimes made into little boxes, cups, etc. It was much used by the ancients, and many beautiful engraved specimens appear in antiquarian collections. Chalcedonies with disseminated spots of brown and red, were once very highly prized, and were called *stigmities* or *St. Stephen's-stones*. Petrified plants are sometimes found in C., in which they appear to have been encased whilst it was in course of formation. Specimens of C. are sometimes found enclosing a little water in the interior, which gives them a very beautiful appearance; but the water easily escapes, to prevent which, rings or other ornaments made of such stones are kept in distilled water, when not worn. The ancients set a very high value on these *enhyarites* (Gr. *en*, in, and *hydor*, water). The Vincentin was celebrated for producing them.

CHALCEDONYX (or, erroneously, *calcedonyx*), a name given to agates formed of cacholong, or a white opaque chalcedony, alternating with a grayish translucent chalcedony.

CHALCHIHUITL, a stone held in great repute by the ancient Mexicans, and still by the Indians of that country, who fashion it into ornaments and occasionally use it in trade. It is a turquoise found in the mountains not far from Santa Fé. The mines were exhausted before the coming of the Spaniards. The stone was valued by the Mexicans more highly than gold.

CHAL'CIS, a genus of Saurian reptiles, the type of a family called *chalcidæ*, some of which are popularly termed snake-lizards, because of the resemblance to snakes in the elongated form of the body, the limbs being also remarkably small, so that this family forms one of the transition links between the Saurian and the Ophidian reptiles. The scales are rectangular, and arranged in transverse bands, without being imbricated or disposed like tiles. The *chalcidæ* are natives of warm climates, both in the old and new worlds.

The name C. has also been bestowed on a genus of the order *hymenoptera*, allied to the ichneumons, which has become the type of a tribe or family, containing a vast number of species—1500 being supposed to exist in Britain—all of them of small size, many very minute, many of them very brilliant in their colors, and the larvæ of all of them parasitic

in the larvæ or pupæ, some even in the eggs, of other insects. The chrysalis of a butterfly or moth often nourishes a great number of these parasites; and they become useful in preventing the excessive multiplication of species which destroy valuable plants.

CHALCIS, the capital t. of the island and government of Eubœa, Greece, situated on the Euripus, a strait separating the island from Bœotia, and which at this point is only 120 ft. wide. The Euripus is divided into two channels, of unequal breadth and depth, by a rock, which is surmounted by a castle, partly of Venetian and partly of Turkish construction. A stone bridge, of some 70 ft. in length, connects the rock with the Bœotian shore, while a wooden and movable bridge, of about 35 ft., unites it with Chalcis. C. is a place of very great antiquity, having been founded, as tradition asserts, before the Trojan war, by an Ionian colony from Athens. Its rise was rapid. It sent out numerous colonies, and was the center of the trade of the western Mediterranean. Governed at first by an aristocracy, it fell into the hands of the Athenians, who in 506 B.C. divided the lands of C. amongst some of their own number. It subsequently fell under the power of the Macedonians and Romans, and was at this time a place of great military importance, nearly 9 m. in circumference, and had many fine temples, theaters, and other public buildings. Aristotle died at Chalcis. In the middle ages, it was prosperous under the Venetians, who held it for nearly three centuries, until its conquest by the Turks in 1470. The lion of St. Mark is, or was until within recent years, still to be seen over the gateway between the bridge and the citadel. Not many ancient remains now exist at Chalcis. The streets are narrow, but the houses, many of which owe their origin to the Venetians, are substantial and spacious. Pop. '70, 6,447.

CHALCOGRAPHY, a pedantic term used to signify engraving on copper, compounded of the Greek words *chalkos*, brass or copper, and *grapho*, I write. The term is inaccurate when applied, as it often is, to engraving on other metals, such as steel and zinc. For zinc-engraving the still more objectionable word *zincography* has been invented.

CHALDÆA. See BABYLON, BABYLONIA.

CHALDÆAN CHRISTIANS, a branch of Nestorians who acknowledge the pope of Rome. They use the eastern rite, and are under the patriarch of Babylon. They are supposed to number about 70,000.

CHALDEE. See ARAMÆA.

CHALDER, an old Scotch dry measure, containing 16 bolls. See BOLL.

CHALDRON (Lat. *caldarium*, a vessel for warm water), an old dry measure used in selling coal, and containing 36 heaped bushels. Coal is now sold by weight.

CHALEUR BAY, an inlet of the gulf of St. Lawrence, between Gaspé, a district of Lower Canada, and New Brunswick, having a depth of 90 m. from e. to w., and a width varying from 12 to 20. The Restigouche, which enters the gulf from New Brunswick at its very head, marks, at its mouth, the interprovincial boundary.

CHALEURS, BAY OF, a westward extension of the gulf of St. Lawrence, separating New Brunswick from Quebec. It is nearly 100 m. long, and varies in width from 10 to 22 miles. It is navigable in all parts, and is much resorted to for its mackerel fisheries.

CHALICE (Lat. *calix*, a cup). This ancient name for an ordinary drinking-cup has been retained for the vessels used for the wine in the holy sacrament. Chalices are commonly made of silver, but it was not unusual for them to be of gold, or gilt and jeweled. Chalices were also made of glass, crystal, and agate; but these substances have been abandoned, in consequence of their fragile nature. The C. is the attribute of St. John the evangelist.

CHALK, a soft earthy variety of limestone or carbonate of lime, forming great strata, and claiming the attention of the geologist even more than of the mineralogist. It is generally of a yellowish-white color, but sometimes snow-white. It is easily broken, and has an earthy fracture, is rough and very meager to the touch, and adheres slightly to the tongue. It generally contains a little silica, alumina, or magnesia, sometimes all of these. Although often very soft and earthy, it is sometimes so compact that it can be used as a building-stone; and it is used for this purpose either in a rough state, or sawn into blocks of proper shape and size. It is burned into quicklime, and nearly all the houses in London are cemented with mortar so procured. The siliceous particles being separated by pounding and diffusing in water, it becomes whiting, of which the domestic uses are familiar to every one. Carpenters and others use it for making marks, which are easily effaced: the *blackboard* and piece of C. are now common equally in the lecture-rooms of universities and in the humblest village-schools. C., perfectly purified, is mixed with vegetable coloring matters, such as turmeric, litmus, saffron, and sapphire, to form pastel colors; but vegetable colors which contain an acid are changed by it. See CRAYON. The *Vienna white* of artists is simply purified chalk. In a perfectly purified state, it is administered as a medicine, to correct acidity in the stomach. C. is also extensively used as a manure. See LIME, as a manure.

CHALK, BLACK, is a mineral quite different from common chalk, and apparently receives its name from resembling it in meagerness to the touch, in soiling the fingers,

and in being used for drawing, writing, etc. It is also called DRAWING-SLATE. It is of a slaty structure, of a bluish or grayish-black color, easily cut and broken, and makes a perfectly black mark on paper. It is used for drawing, and as a black color in painting. It becomes red by exposure to heat. It is essentially a kind of clay (q.v.), and derives its color from carbon, which it contains. It is found in primitive mountains, in Spain, France, Italy, etc., also in the coal formation in Scotland.—BRIANÇON CHALK and FRENCH CHALK are popular names for soapstone (q.v.).—RED CHALK is *ochery red clay-iron-ore*, consisting of clay and much peroxide of iron. It is of a brownish-red color, and a somewhat slaty structure, the cross fracture earthy. The coarser varieties are used chiefly by carpenters for making marks on wood; the finer, by painters. It occurs in thin beds in clay-slate and grauwacke-slate in some parts of Germany.

CHALK-BEDS. See CRETACEOUS GROUP.

CHALKING THE DOOR, a mode of warning tenants to remove from burghal tenements, long known and still in use in Scotland. The practice is thus described by Mr. Hunter in his valuable work on Landlord and Tenant: "A burgh-officer, in presence of witnesses, chalks the most patent door forty days before Whitsunday, which is held to be a legal warning. There is no execution at the parish church, but the officer makes out an execution of 'chalking,' in which his name must be inserted, and which must be subscribed by himself and two witnesses. This ceremony now proceeds simply on the verbal order of the proprietor, but anciently the interposition of a judge was requisite. In such a case, authority was given by one of the magistrates to the burgh-officer." That judicial authority is still assumed to lie at the root of the proceeding, is apparent from the fact that the execution bears that the warning has been executed in her majesty's name and authority, and that of the magistrates of the burgh. The officer ought to notify to the tenant the object of his visit, though it is not perhaps indispensable that he should do so. The execution of chalking is a warrant under which decree of removal will be pronounced by the burgh-court, in virtue of which the tenant may be ejected on the expiration of a charge of six days. See EJECTMENT.

CHALKLEY, THOMAS, 1675-1741; a Quaker preacher, native of London. He came to America in 1698, and traveled in Virginia, Maryland, and the New England colonies. Returning to England, he married, and soon afterwards came back and settled in Philadelphia. Again he crossed the sea and traveled in Holland and Germany; thence he went to the West Indies, where he died while engaged in missionary work. In his will he founded the library of the four monthly meetings of Friends in Philadelphia. The journal of his life and labors has been published.

CHALKY ISLAND, in New Zealand, near the s.w. extremity of Middle Island, about lat. 46° s., and lon. 166° 20' east. It takes its name from being composed of a mass of white limestone, and imparts the same to the adjacent bay of 16 m. in length, and also to one of the harbors of the inlet.

CHALLENGE. See DUEL.

CHALLENGE. See JURY.

CHALLONER, RICHARD, 1691-1781; the son of an English dissenter, but brought up among Roman Catholics, whose religion he embraced. He was ordained a priest at Douay, and made professor in the faculty. In 1730, he held the English mission in London, where he published several religious works. In 1758, he became vicar apostolic, residing generally in London; but during the "No Popery" riots of 1780, he retired into the country. He was the author of numerous controversial and devotional works, the most popular one being *The Garden of the Soul*, which has been frequently reprinted, and translated into various languages. He revised the Douay Bible (in English); and as an antidote to Foxe's well-known *Martyrology*, he wrote *Memoirs of Missionary Priests and Other Catholics of both Sexes, who suffered Death or Imprisonment in England on Account of their Religion*.

CHALMERS, ALEXANDER, 1759-1834; a Scotchman educated for a physician who gave up that calling for literature, writing for periodicals generally, and being for some time editor of the *Morning Herald*. Besides revised editions of standard authors, he published a *General Biographical Dictionary*, in 32 vols.; a *Glossary to Shakespeare*; and *British Essayists from the Tatler to the Guardian*, both inclusive.

CHALMERS, GEORGE, an eminent historical antiquary, was b. at Fochabers, Morayshire, Scotland, in 1742. Having attended King's college, Aberdeen, and afterwards studied law at Edinburgh, he went in 1763 to North America, where he practiced as a lawyer till the breaking out of the war of independence. Being a keen loyalist, he returned to Britain, where he was appointed clerk to the board of trade in 1786. The duties of this office he continued to discharge with diligence and ability till his death in 1825. Before his appointment, he had distinguished himself by various publications in political economy; and for some time after he devoted himself chiefly to editing the works of various authors and writing biographies. His great work is his *Caledonia; an Account, Historical and Topographical, of North Britain*; a production displaying profound research into the history of Scotland, and abounding in varied erudition. It was intended to be completed in 4 vols. 4to. The first volume, containing the historical

part, appeared in 1807; of the other three, which were destined to give an account of the several counties, the second, embracing Roxburghshire, Berwickshire, Haddingtonshire, Edinburghshire, Linlithgowshire, Peebleshire, and Selkirkshire, appeared in 1810; the third, containing the counties of Dumfries, Kirkcudbright, Wigton, Ayr, Lanark, Renfrew, and Dumbarton, appeared in 1824. A fourth volume is understood to have been left at his death, ready for the press.

Among his other publications are: *Political Annals of the United Colonies* (Lond. 1780); *On the Comparative Strength of Great Britain, during the present and the four preceding Reigns* (Lond. 1782, 1786, 1794, 1802, 1812); *A Collection of Treaties between Great Britain and other Powers* (2 vols, Lond. 1790); *Life of Daniel Defoe* (Lond. 1786); *Life of Thomas Ruddiman* (1794); *Life of Mary Queen of Scots* (Lond. 1818); editions of the works of Allan Ramsay (1800), and of sir David Lindsay (1806), with memoirs; also various pamphlets apologizing for those, himself included, who had believed in the authenticity of the Shakespeare manuscripts forged by Mr. Ireland.

CHALMERS, THOMAS, D.D., LL.D., was b. at Anstruther, in Fifeshire, 17th Mar., 1780, educated at the university of St. Andrews, and in his 19th year licensed to preach the gospel. In 1803, he was ordained minister of the parish of Kilmany, in Fifeshire, about 9 m. from St. Andrews. At this period his attention was entirely absorbed by mathematics and natural philosophy, to the neglect of the studies appertaining to his profession. To gratify his love of scientific pursuits, he even formed mathematical and chemistry classes in St. Andrews during the winter of 1803-04, and by his wonderful enthusiasm and lucidity of exposition excited intense interest, and obtained for himself a great reputation. In 1808, he published an *Inquiry into the Extent and Stability of National Resources*, which proved his capacity for dealing with questions of political economy. Shortly after this, certain domestic calamities, and a severe illness of his own, opened up the fountains of his soul, and rendered him keenly susceptible to religious impressions. Having to prepare an article on Christianity for Brewster's *Edinburgh Encyclopaedia*, he commenced an extensive study of the evidences, and rose from his investigations convinced that Christianity was a *fact*, and the Bible the veritable "word of God." Then the great genius of the man broke forth like sunshine. He grew earnest, eloquent, devout, and faithful to his pastoral duties. In July, 1815, he was translated to the Tron church and parish, Glasgow, where his magnificent oratory took the city by storm. His *Astronomical Discourses* were probably the most sublimely intellectual and imaginative that had ever been preached in a Scottish pulpit. They were published in 1817, and had a prodigious popularity. During the same year he visited London, where his preaching excited as great a sensation as at home. But C.'s energies could not be exhausted by mere oratory. Discovering that his parish was in a state of great ignorance and immorality, he began to devise a scheme for overtaking and checking the alarming evil. It seemed to him that the only means by which this could be accomplished was by "revivifying, remodeling, and extending the old parochial economy of Scotland," which had proved so fruitful of good in the rural parishes. In order to wrestle more closely with the ignorance and vice of Glasgow, C., in 1819, became minister of St. John's parish, "the population of which was made up principally of weavers, laborers, factory-workers, and other operatives." "Of its 2,000 families," says Dr. Hanna, "more than 800 had no connection with any Christian church, while the number of its uneducated children was countless." We have not space to narrate at length how vast and successful were the labors of Chalmers. It is sufficient to say, that in pursuance of his favorite plan, he broke up his parish into 25 districts, each of which he placed under separate management, and established two week-day schools, and between 40 and 50 local Sabbath-schools, for the instruction of the children of the "poorer and neglected classes," more than 1000 of whom attended. In a multitude of other ways he sought to elevate and purify the lives of his parishioners. While in Glasgow, C. had matured his opinions relative to the best method of providing for the poor. He disliked the English system of a "compulsory assessment," and preferred the old Scotch method of voluntary contributions at the church-door, administered by elders. The management of the poor in the parish of St. John's was intrusted to his care by the authorities, as an experiment, and in four years he reduced the pauper expenditures from £1400 to £280 per annum.

But such herculean toils began to undermine his constitution, and in 1823 he accepted the offer of the moral philosophy chair in St. Andrews, where he wrote his treatise on the *Use and Abuse of Literary and Ecclesiastical Endowments* (1827). In the following year he was transferred to the chair of theology in Edinburgh, and in 1832 published a work on political economy. In 1833 appeared his Bridgewater treatise, *On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man*. It was received with great favor, and obtained for the author many literary honors; the royal society of Edinburgh electing him a fellow, and the French institute a corresponding member, while the university of Oxford conferred on him the degree of D.C.L. In 1834, he was appointed convener of the church-extension committee; and after seven years of enthusiastic labor, announced that upwards of £300,000 had been collected from the nation, and 220 new churches built. Meanwhile, however, troubles were springing up in the bosom of the church itself. The evangelical party had become predominant in the gen-

eral assembly, and came forward as the vindicators of popular rights; the struggles in regard to patronage between them and the "moderate" or "Erastian" party became keener and more frequent, until the decision of the civil courts in the famous "Auchterarder and Strathbogie" cases brought matters to a crisis; and on the 18th of May, 1843, C., followed by 470 clergymen, left the church of his fathers, rather than sacrifice those principles which he believed essential to the purity, honor, and independence of the church. See articles **DISRUPTION** and **FREE CHURCH**. The rapid formation and organization of the Free church were greatly owing to his indefatigable exertions, in consequence of which he was elected principal of the Free church college, and spent the close of his life in the zealous performance of his learned duties, and in perfecting his *Institutes of Theology*. He died suddenly at Morningside, Edinburgh, May 30, 1847.

This is not the place for a criticism on the works of C., which extend to more than 30 volumes. It is sufficient to say, that they contain valuable and, in some cases, original contributions to the sciences of natural theology, Christian apologetics, and political economy; while on minor topics, such as the church-establishment question, they exhibit both novelty and ingenuity of argument. As an orator, C. was unique and unrivaled. We read of men, in the history of the Christian church, whom we can believe to have been as eloquent, impassioned, and earnest, but nowhere do we encounter a man in whom intellect, feeling, and imagination were so harmoniously combined—a nature so "nobly planned, to warn, to comfort, and command." Scotland never produced a greater or more lovable soul, one more gentle, guileless, genial-hearted, or yet more fervid, from the strength of a resolute and irresistible will, before whose impetuous difficulties were dashed aside as by a torrent. There have been some loftier and more purely original minds in Scotland than C.'s, but there has never been a truer one, nor a heart whose Christian faith and piety were more intense, sincere, and humane.

CHÂLON-SUR-SAÔNE, a t. of France, in the department of Saone-et-Loire, about 33 m. n. of Mâcon. It is situated on the right bank of the Saone, at the point where that river is joined by the Canal-du-Centre, which unites the Saone with the Loire; and secures C. an extensive traffic with the central districts of France, as well as with the Mediterranean and Atlantic. The town is generally well built, good quays line the river, along which also the finest houses extend. Vineyards, wood, meadows, and cultivated fields surround and add variety and beauty to the situation. Its manufactures include hats, hosiery, vinegar, oil, pottery, jewelry, and imitation pearls; and it has a large trade in the agricultural and other produce of the district. Steamboats navigate the Saone from C. downwards. Pop. '76, 20,571. C. occupies the site of the ancient *Cabillonum* or *Caballinum*.

CHÂLONS-SUR-MARNE, a t. of France, in the department of Marne, 107 m. e. of Paris by railway. It stands on the right bank of the river Marne, which is here crossed by a handsome stone bridge. C. is old; and the houses consist chiefly of timber, lath, and plaster. The situation, however, is agreeable, and the town contains some fine public buildings, the principal of which is the cathedral, in the sanctuary of which there is one of the finest grand altars in France. On the east side of the town there is the splendid *Promenade du Jard*, or park, which covers 19 acres. C. has manufactures of woolsens, cotton, leather, etc., and a considerable trade in grain, hemp, rape-seed oil, and Champagne wine. Pop. '76, 20,215. Previous to the union of Champagne with France in 1284, the population numbered about 60,000. In 1856, Napoleon III. formed the celebrated camp of C. to the n.e. of the town, which was occupied during the Franco-Prussian war by Canrobert, and afterwards by MacMahon. On the night of Aug. 21, 1870, MacMahon withdrew his troops; and next day the town was occupied by the Germans.

CHALOTAIS, LA, LOUIS RENÉ DE CARADEUC, 1701–85; procureur-general of the parliament of Brittany, where he was a decided opponent of Jesuits. Grimm asserts that Chalotais's reports led to the suppression of the Jesuits in France. Voltaire gave C. high praise for his essay on national education. Later in life he was subjected to long political persecution, but was finally found free of blame, and resumed his place in the parliament at Rennes.

CHALYBÆUS, a genus of birds very closely allied to the baritahs (q.v.), but having a rather thicker bill, and the nostrils pierced in a broad membranous space. The species are natives of New Guinea, and are birds of the most beautiful plumage, remarkable for the brilliancy of their metallic tints, and particularly for the resemblance to burnished steel, to which they owe their name (Gr. *chalyps*, *γβος*, steel). On this account, they are sometimes included under the name of birds of paradise; and the skin of *C. paradiseus*, deprived of its feet, is sold as that of a bird of paradise.

CHALYBÆUS, HEINRICH MORITZ, a German philosopher, was b. 3d July, 1796, at Pfaffroda, in Saxony, and educated at Leipsic. After spending some years in teaching, he was appointed in 1839 professor of philosophy in the university of Kiel, where he remained till his death in 1862. His chief works are the *Historische Entwicklung der speculativen Philosophie von Kant bis Hegel* (1836—English translations by Edersheim and Tulk); *System der speculativen Ethik* (1850); *Philosophie und Christenthum* (1853); and *Fundamental Philosophie* (1861).

CHALYBEATE WATERS are those which contain a considerable portion of iron in solution. They are of two kinds, *carbonated* and *sulphated*. The *carbonated C. W.* contain carbonate of iron (FeO, CO_2) dissolved in excess of carbonic acid, and may be recognized by forming an ochry deposit of red oxide of iron (Fe_2O_3) on the surface of the stones near the mouths of the springs, owing to the escape of the carbonic acid on exposure to the air. Islington Spa near London, Tunbridge Wells, and Oddy's Saline C. W. at Harrogate, are examples of this class. Where an excess of carbonic acid is present, communicating a sparkling aspect to the water and an acidulous taste, as at Pymont and other places, the term *acidulo-chalybeate* or *acidulo-ferruginous* is applied. The *sulphated C. W.* contain sulphate of iron (FeO, SO_3) dissolved in them, and examples of this class are afforded at the Isle of Wight (the Sand Rock spring), Vicars bridge, Moffat, etc. C. W. are characterized by a more or less inky or styptic taste; by becoming of a purplish black tint when infusion of galls or tea, and some varieties of wine, are added; and by giving a pale blue color on the addition of a few drops of ferrocyanide of potassium (yellow prussiate of potash). C. W. are of great service in cases of debility, and the *acidulo-carbonated* kind being lighter on the stomach, is generally preferred; but all C. W. are to be avoided in plethoric, febrile, and inflammatory conditions of the system.

CHAM, or **AMEDÉE DE NOE**, 1819-79; b. Paris; the son of a former peer of France: he was intended for the polytechnic school, but preferring painting he studied with Paul Delaroché, and afterwards with M. Charlet, where he developed a talent for the grotesque. Beginning in 1842, he contributed, chiefly to *Charivari* (the *Punch* of France), an immense number of caricatures, and some sketches, under the signature of "Cham." His political cartoons are singularly sharp and effective. He has also written many vaudevilles.

CHAMA, a genus of lamellibranchiate mollusks. The shell consists of two unequal valves, having two hinge-teeth in the one valve, and one in the other. The general form of the shell approaches to orbicular. The shell is generally thick, and is foliated with leaf-like projections, which arise in a somewhat regular manner from its surface; these and the colors of some of the species combining to make them very beautiful. The shells of the *chamæ* are often called *clams* or *clump* shells, a name which they share with some of the *pectens*, *spondyli*, etc. They are found only in the seas of warm climates, none further n. than the Mediterranean. The Linnæan genus *C.* contained many species now removed to other families, but the restricted genus *C.* is the type of a family *chamidæ*. Thirty fossil species have been referred to *C.*, 4 from the cretaceous period, and 26 from the tertiary.

CHAMADE'. See PARLEY.

CHAMÆROPS, a genus of palms, with fan-shaped leaves, less exclusively tropical than palms are in general, and of which one species, *C. humilis*, is the only palm truly indigenous to Europe. It extends as far n. as to the neighborhood of Nice. It is sometimes called the PALMETTO. The flowers are in spathes about 6 to 8 in. long; the fruit is a triple blackish spongy drupe, which is eaten, as are also the young shoots. This palm is so tolerant of a cold climate, that a specimen has lived in the open air in the botanic garden of Edinburgh for more than 50 years, with the protection of matting in very severe winters. In its native regions, the leaves are much used for thatching, and for making brooms, hats, chair-bottoms, etc. They abound in an excellent fiber, which the Arabs mix with camel's hair, and make into tent covers: cordage, and sometimes sail-cloth, are made of it in Spain; it is imported into France, and used for making carpets, under the name of *African hair*. The French in Algeria make paper and pasteboard of it; and it is supposed that it may prove a valuable commercial commodity, as a material for paper-making.—Other species of the genus abundant in India, China, etc., serve similar purposes, and deserve attention in connection with paper.—To this genus belongs also the West Indian palm, which yields the material for chip hats (see BRAZILIAN GRASS); and the palmetto (q.v.) of North America is by some botanists referred to it.

CHAMALARI, a peak of the Himalaya between Thibet and Botan, in lat. $28^{\circ} 4' \text{ n.}$, and long. 90° e. , said to have an elevation of 27,200 ft., or more than 5 m. and a furlong.

CHAMBA, a feudatory state of n. India, subordinate to the Punjab government, between 32° and $33^{\circ} 9' \text{ n.}$, and $75^{\circ} 54'$ and $76^{\circ} 30' \text{ east}$. A range of mountains separate *C.* from Kashmir. *C.* is about 65 by 50 m. in length and breadth; pop. 140,000. The agricultural products are wheat and millet, and among other productions are timber, nuts, wax, honey, lime, and slate.

CHAMBER, of a piece of artillery, or small arm, is a contracted part of the bore, at the breech end. The *C.* contains the charge of powder, but is too small to contain the shot or shell. Some of these cavities are spherical, some cylindrical, some conical with a hemispherical termination, and some pear-shaped. Carronades and shell guns are usually chambered. The charge just fits the *C.*, and the ball or shell comes in contact with it. Chambered guns are more slow to load and fire than those which are not chambered; and therefore the adoption of this form depends very much on the kind of service in which the weapon is to be employed. Its primary use is in kinds of ordnance in which the charge is small compared with the caliber, and in which, consequently,

there would be great loss of power unless the charge were confined within a comparatively limited space at the time of the explosion.

CHAMBER OF COMMERCE, a body of merchants and traders, associated for the purpose of promoting the interests of its own members, of the town or district to which the society belongs, and of the community generally, in so far as these have reference to trade and merchandise. Of the means by which these objects are sought to be accomplished, the following may be mentioned as the most prominent: 1. By representing and urging on the legislature the views of their members in mercantile affairs; 2. By aiding in the preparation of legislative measures having reference to trade, such, for example, as the bankrupt acts; 3. By collecting statistics bearing upon the staple trade of the district; 4. In some places, by acting as a sort of court of arbitration in mercantile questions; 5. By attaining by combination advantages in trade which might be beyond the reach of individual enterprise.

These institutions are of continental origin, and, like so many others which England has borrowed from that source, were first introduced into Scotland. The oldest C. of C. in France is that of Marseille, which dates from the end of the 14th or commencement of the 15th century. This chamber was invested with very remarkable powers. It shared in the municipal jurisdiction, and in the administration of justice in mercantile questions. It was several times suppressed and re-established, and it was not till 1650 that its powers were fixed, and that it received its ultimate organization. The second chamber in France was that of Dunkerque, which was established in 1700. The same year a council-general of commerce was instituted at Paris, which, in addition to six councilors of state, consisted of twelve merchants or traders, delegated by the principal commercial towns of the kingdom, an arrangement which led within the next few years to the formation of chambers of commerce everywhere in France. We thus find that the chamber at Lyon was instituted in 1702, those of Rouen and Toulouse in 1703, of Montpellier in 1704, of Bordeaux in 1705, etc. By an order of council of Aug. 30, 1702, a direct relation was established between these various chambers and the central council of commerce. These chambers were all suppressed by a decree of the national assembly in 1791, but they were re-established by a consular edict in 1802, which fixed the population of the towns in which they might be established, and the number of their members, who were to be chosen from amongst the merchants who had carried on trade in person for a period of not less than ten years. Sixty of the best known merchants, presided over by the prefect or the maire, were charged to elect the members of these new chambers. They then presented to the government two candidates for the office of member of the general council of commerce, instituted at Paris under the minister of the interior. This organization was again modified in 1832, and still later by the ordinances of Sept., 1851, and Aug., 1852, by which these bodies are now regulated. In accordance with that decree, the members of these bodies are now elected by the chief merchants of each town chosen for that purpose by the prefect. Their number cannot be less than 9, nor more than 21. They hold office for six years, one third of their number being renewed every two years, but the members resigning being re-eligible. The functions now assigned to these chambers in France are—to give to the government advice and information on industrial and commercial subjects; to suggest the means of increasing the industry and commerce of their respective districts, or of improving commercial legislation and taxation; to suggest the execution of works requisite for the public service, or which may tend to the increase of trade or commerce, such as the construction of harbors, the deepening of rivers, the formation of railways, and the like. On these and similar subjects, the advice of the chambers, when not volunteered, is demanded by the government. In most of the other countries of continental Europe there are similar institutions for the purpose of conveying information and advice to the central government, and making it acquainted with local feelings and interests in commercial matters.

The oldest C. of C. in Great Britain is believed to be that of Glasgow, which was instituted 1st Jan., 1783, and obtained a royal charter, which was registered at Edinburgh on the 31st of the same month. That of Edinburgh was instituted in 1785, and incorporated by royal charter in 1786. The Edinburgh C. of C. was the first public body which petitioned for the abolition of the corn laws, and the adoption of free-trade principles; and stood almost alone in the United Kingdom in advocating the Suez canal project. It also originated the movement that government should undertake the telegraph service in connection with the post-office. Six hundred of the bankers, merchants, and ship-owners of Edinburgh and Leith constitute the chamber. The Manchester chamber, since so famous for its exertions in the cause of free-trade, was not established till 1820, and for many years it continued to be the only institution of the kind in England. Its members number about 400. In Hull there has been a C. of C. since 1837, but those of Liverpool, Leeds, and Bradford, notwithstanding the great trading and manufacturing interests of these towns, were not established till 1850, in which year, strangely enough, a similar institution was established in s. Australia. The Liverpool C. of C. numbers nearly 600. The annual income of the Manchester chamber is upwards of £600, that of Liverpool about £800, contributed entirely by the subscriptions of members, amounting generally to £1 1s. a year. There are now

chambers of commerce in all the great mercantile towns of Great Britain and Ireland, and in 1860 there was established an "Association of Chambers of Commerce of the United Kingdom." In Canada, there is a Dominion board of trade, which consists of the chambers of commerce, or boards of trade, as they are indifferently called, of a dozen of the most important cities of the Dominion.

CHAMBER OF COMMERCE, *ante*. The Chamber of Commerce of New York city is the oldest existing institution of the kind in America, organized in 1768, and incorporated by royal charter Mar. 13, 1770, under the name of *The Corporation of the Chamber of Commerce of the City of New York in America*. When the state government was established the charter was renewed by the legislature. It was composed at first of 24 of the most prominent merchants of the city, who established an exchange which has been ever since kept up, though not recently under control of the body. The objects of the Chamber of Commerce are to encourage and promote commerce, support industry, adjust disputes relative to trade, and procure such laws and regulations as may be found necessary for the benefit of trade in general. The membership is about 800, including nearly all the leading merchants, financiers, and business men of the city. Several years ago a court of arbitration was established, by which differences between members are adjusted, and much litigation in courts avoided. Meetings are held once a month. In the rooms of the chamber is a vast collection of commercial and other statistics. Similar bodies exist in other large American cities.

CHAMBER-COUNSEL, a barrister or advocate who gives opinions in his own chambers, but does not, or rarely does, plead in court.

CHAMBERLAIN, Lord, or King's C., as he was formerly called, has been one of the principal officers of state from very early times, and for centuries he was an influential member of the government. He has the function of indorsing the king's answer on petitions presented to him, and very often of communicating his majesty's pleasure to parliament and to the council. He was always a member of the council himself, *ex officio*. Though he has long ceased to have any share in the responsibilities of government, the C. is still an officer of very high standing in the royal household. He has control over all the officers and servants of the royal chambers, except those of the bedchamber, over the establishment attached to the chapel royal, the physicians, surgeons, and apothecaries of the household. The C. has further the oversight of the queen's musicians, comedians, trumpeters, messengers, etc.; and all tradesmen and artificers in her service are appointed by him. When the office of keeper of the great wardrobe was abolished in 1782, the duties of providing the state-ropes of the royal family, the household, and officers of state, devolved on the lord chamberlain. All theaters in towns in which a royal palace is situated, require to be licensed by the Lord C., and no new play can be performed anywhere without his license. All persons desiring to be presented at levees or drawing-rooms, require to send their cards to the Lord C., and it is his duty to see that the persons thus applying are entitled by station and character to be presented to the queen. The C. also issues her majesty's invitations to balls, parties, etc. In accordance with ancient custom, the Lord C. is still a member of the privy council. His salary is £2,000 a year, but his tenure of office depends on that of the political party to which he belongs.

The Vice-chamberlain is the deputy and assistant of the Lord C., and in his absence exercises the full authority which belongs to his principal. His office existed in the time of Richard II. He is also dependent on the administration, and is usually a member of the privy council. His salary is £924 per annum.

CHAMBERLAIN, THE LORD GREAT, is a hereditary officer of great antiquity, and formerly of great importance. He has the government of the palace at Westminster, and, upon solemn occasions, the keys of Westminster hall and of the court of requests are delivered to him. At these times, the gentleman usher of the black rod, the yeoman usher, and the doorkeepers, are under his orders. At coronations, state-trials, banquets, and the like, the fitting-up of the hall devolves on him. When the queen goes to parliament, he delivers the sword of state to any member of the administration whom he chooses, to be borne before her majesty, he himself walking on her right hand. During the sitting of parliament, he has charge of the house of lords, and issues tickets of admission on the opening or prorogation of parliament. Some fees and perquisites belong to him. This office, conferred by Henry I. on Alberic de Vere, was inherited by female succession from the De Veres, earls of Oxford, by the Berties, and is now held conjointly by lady Willoughby de Eresby and the marquis of Cholmondeley, in right of their mothers, sisters and co-heirs of Robert, fourth duke of Ancaster. They discharge the duties alternately in each succeeding reign, a lady acting by deputy. Lord Aveland is at present deputy great chamberlain.

CHAMBERLAIN, JOSHUA L., LL.D., b. Me., 1828; a graduate of Bowdoin college. During the civil war he served with distinction, was six times wounded, and left the service with the rank of maj.gen. From 1866 to 1870, he was governor of Maine, and in 1871 was chosen president of Bowdoin college. When the democrats and fusionists under the lead of gov. Garcelon, in 1879-80 undertook to get possession of the state government, and there was some danger of civil war, C. was general-in-chief of the

militia of the state. He adhered to the regularly elected legislature, as sustained by the unanimous opinion of the supreme court, and by a quiet but firm hold of his lawful power, without any display of military force, prevented the intended violence and usurpation.

CHAMBERS, PRACTICE BEFORE A JUDGE OR VICE-CHANCELLOR AT. It is to applications to the court *in banc* alone that the name of motions is properly given. But there are certain matters of subordinate importance, regarding which applications are made to a single judge at chambers, who decides in a summary way on the pleadings.

CHAMBERS, a co. in e. Alabama, on the Georgia border, intersected by the Atlantic and West Point railroad. Before a division was made to form Lee co., the area was 775 sq. m.; pop. '70, 17,562—8,588 colored. It is partly bounded by the Chattahoochee river, and is intersected by the Tallapoosa. Productious, cotton, corn, wheat, and sweet potatoes. Co. seat, Lafayette.

CHAMBERS, a co. in s.e. Texas, on the gulf of Mexico, bounded on the w. by Galveston bay, and intersected by Trinity river; 900 sq. m.; pop. '70, 1503—453 colored. The surface is mainly prairie; productions, corn, cotton, and sweet potatoes. Co. seat, Wallisville.

CHAMBERS, EPHRAIM, the compiler of the first English encyclopædia. He was b. at Kendal in the latter part of the 17th c., and began life as an apprentice to a globe-maker in London, where he conceived the idea of his encyclopædia. The first edition of the work, in 2 vols. folio, appeared in 1728; ten years later, the 2d appeared; and in the year following, the 3d. The 4th was issued in 1741, a year after the editor's death. A 5th appeared in 1746, and a 6th, with new matter, in 1750. This work forms the basis of Dr. Rees's Cyclopædia in 45 quarto vols., and may be considered as the forerunner of the now countless publications of an encyclopædic character (see ENCYCLOPÆDIA).

CHAMBERS, GEORGE, 1803-40; an English painter. When a boy he followed the sea, where he made sketches of vessels, which so pleased his master that he canceled the boy's indentures. C. then apprenticed himself to an old woman who kept a paint-shop, and began house-painting. Finally he got employment as assistant in painting the panorama of London for the Colosseum, and then became scene-painter in a theater. His best works are naval battles, such as "The Bombardment of Algiers," and "The Capture of Porto Bello," both in the Greenwich hospital.

CHAMBERS, WILLIAM and ROBERT, the editors and publishers of this *Encyclopædia* and other works; b. at Peebles, W. in 1800, R. in 1802. Bearing up against the difficulties of his early life, W. C. began business as a bookseller in Edinburgh, 1819; afterwards adding printing to his business. Between 1825 and 1830, he wrote the *Gazetteer of Scotland*, 1 vol.; and the *Book of Scotland*, 1 vol. R. C. also began business as a bookseller in Edinburgh, and from 1823 to 1830 wrote successively the *Traditions of Edinburgh*, 2 vols.; *Popular Rhymes of Scotland*, 1 vol.; *Picture of Scotland*, 2 vols.; and *Histories of Rebellions in Scotland, and Life of James I.*, 5 vols. Next, he edited *Scottish Ballads and Songs*, 3 vols.; and *Biography of Distinguished Scotchmen*, 4 vols. His *Traditions of Edinburgh* procured him the friendship of sir Walter Scott, who contributed various memoranda for the work. W. C. projected *Chambers's Edinburgh Journal*, and that periodical was commenced on the 4th of Feb., 1832, about six weeks in advance of the *Penny Magazine*, and may be considered the pioneer of that class of cheap and popular periodicals of a wholesome kind now so generally diffused. The success of the *Journal* was materially promoted by the essays, moral and humorous, of R. C., who from the first was an able collaborateur. United from this period in the peculiar profession of writing, editing, printing, and publishing, W. and R. C. issued a series of works designed for popular instruction, including the *Journal* (now amounting, in its different series, to 65 vols.). Among these works are *Chambers's Information for the People*, 2 vols.; *Chambers's Educational Course*, 150 vols.; *Cyclopædia of English Literature*, 2 vols.; *Miscellany of Useful and Entertaining Tracts*, 20 vols.; *Papers for the People*, 12 vols.; and the present *Encyclopædia*, 10 vols. In conducting these laborious undertakings, they necessarily depended on a number of accomplished literary assistants. In 1849, W. C. acquired the estate of Glenormiston in Peeblesshire, and a few years afterwards he founded and endowed an *Institution* in his native town for purposes of social improvement (see PEEBLESHIRE). His later productions are—*Things as they are in America*, 1 vol. (the result of a visit to the United States in 1853); the *Youth's Companion, and Counselor*, 1 vol.; *History of Peeblesshire*, 1 vol. 8vo (1864); pamphlets on *Improved Dwellings and Co-operation among the Working Classes*; *Wintering at Mentone*, written from personal knowledge of the place during two successive visits; *France: its History and Revolutions*, 1 vol (1871); *Memoir of Robert Chambers, with Autobiographic Reminiscences*; and *Adie Gilroy*, a story. More lately, *Stories of Remarkable Persons, Stories of Old Families, and the Story of St. Giles'* (1879). Twice elected lord provost of Edinburgh, W. C. occupied that office for four years (1865-69), during which he promoted several important public acts, including one for the improvement of the older part of the city. R. C. latterly wrote a work on *Ancient Sea Margins*; after which appeared his *Domestic Annals of Scotland*, 3 vols. He also edited the *Life and Works of Robert Burns*, 4

vols. A collection of his historical and miscellaneous papers was issued under the title of *Select Writings of Robert Chambers*, 7 vols. His latest production was the *Book of Days*, a most elaborate and exhaustive work in two large volumes, the preparation of which so injured his health, that he relinquished all further literary exertion. In 1863, he received from the university of St. Andrews the honorary distinction of LL.D. R. C. died at St. Andrews, 17th Mar., 1871, leaving a high character for literary application, integrity, and geniality of disposition. In 1872, W. C. received the honorary distinction of LL.D. from the university of Edinburgh. Engaged in miscellaneous literary labor, he remains head of the firm of W. and R. C., which owns an extensive printing and publishing establishment in Edinburgh, and a publishing establishment in London. The whole of the works issued by W. and R. C. aim at popular instruction, free of all political or sectarian bias. Perhaps their greatest effort in these respects has been the present *Encyclopædia*.

CHAMBERSBURG, the seat of justice of Franklin co., Penn., on the Cumberland valley railroad, 52 m. s.w. of Harrisburg; pop. '70, 6,308. C. is in the midst of a populous and well-cultivated region, and has manufactories of cotton, wool, iron, paper, etc. The village is well built. A great part of it was burned July 30, 1864, by the confederates under Gen. Early. C. is the seat of Wilson college for young women.

CHAMBERTIN, a vineyard in the department of Cote d'Or, France, 6 m. s.s.w. of Dijon. It covers about 60 acres, and produces a red wine notable for excellence.

CHAMBERY, a t. of Savoy, of which it is the capital, beautifully situated in a rich vine-clad valley, between two ridges of hills, about 45 m. w.s.w. of Geneva. Though situated at an elevation of nearly 1000 ft. above the sea, the climate of C. is mild; the scenery around, with the river *Lysse* flowing through the valley, is exceedingly fine. The town itself, however, is dull and uninteresting. Some towers and other fragments of the old castle of the dukes of Savoy, which dates from the 13th c., still remain. C. has manufactories of silk-gauze, soap, leather, hats, lace, and a trade in silk, wine, etc. Pop. '76, 16,486. From the middle of the 16th c. to the peace of Utrecht, 1713, C. was under the dominion of France; and again from the revolution to the congress of Vienna, 1815, when it was restored to the house of Savoy; but in 1860, by the cession of Savoy, it has again come under the rule of France.

CHAMBLY, a s.w. co. in the province of Quebec, Canada, on the St. Lawrence, opposite Montreal; 190 sq. m.; pop. '71, 10,498. It is intersected by the Montreal and Richelieu rivers, and by the Grand Trunk and the Champlain and Montreal railroads, and the Chambly canal. Chief town, Chamblly.

CHAMBORD, a celebrated royal castle of France, in the department of Loir-et-Cher, situated in the midst of a vast walled park 21 m. in circumference, about 12 m. e. of Blois. Its foundation was laid in 1526, by Francis I., who employed 1800 men constantly in its erection until his death. The work was continued with less zeal by his successors, Henri II., Henri III., Charles IX.; and Louis XIV. and Louis XV. also made some additions to it. The building, which marks the transition between the fortified castle and Italian palace, is surmounted by a vast number of turrets, minarets, and cones; its most prominent features, however, being six enormous round towers, each 60 ft. in diameter. The double spiral staircase in the central tower is of great architectural interest, being so contrived that parties pass up and down without meeting each other. The castle has no less than 440 chambers. C. was the scene of the gallantries of Francis I. Here Henri II., Louis XIII., and Louis XIV. resided; and at one of the brilliant fêtes given at the castle by the latter, Molière performed, for the first time, his play of the *Bourgeois Gentilhomme*. Among the other occupants of C. were marshal Saxe, Stanislaus, king of Poland, and marshal Berthier, upon whom it was bestowed by Napoleon I. It was bought from Berthier's widow by a number of legitimists, and presented to the duc de Bordeaux, who is hence called comte de C. (q.v.).

CHAMBORD (HENRI CHARLES FERDINAND MARIE DIEUDONNÉ D'ARTOIS, DUC DE BORDEAUX), Comte de, the representative of the elder branch of the house of Bourbon, and of its claims to the French throne, was b. in Paris, Sept. 29, 1820. He is the grandson of Charles X., and the son of the duke of Berri who was murdered by Louvel, Feb. 14, 1820. The duke of Angoulême, Charles X.'s eldest son, being childless, the duke of Berri was heir-presumptive; and as, at his death, he left only a daughter, the joy was great when, seven months after, his widow gave birth to a prince, who received the title of duke of Bordeaux—that of comte de C., by which he has latterly been known, being derived from the castle of C. (q.v.), presented to him at his baptism. He was baptized, amid circumstances of great pomp, with water brought by M. de Châteaubriand from the river Jordan, and received the appellation of *l'enfant du miracle* ("the miraculous child"). When Charles X. abdicated the crown at the revolution in 1830, he did so in favor of his grandson, the duke of Bordeaux. The people, however, insisted on the "citizen king," and the elder Bourbons were banished. On the death of Charles X., the duke of Angoulême assumed the title of Louis XIX., and another party proclaimed the duke of Bordeaux king; but at last a reconciliation was brought about by prince Metternich. In 1839, the prince visited Italy, accompanied by his mother, and

was received by the petty courts with great distinction. After the death of the duke of Angoulême, in 1844, the heads of the different fractions of legitimists met to pay their united homage, and the duke of Bordeaux made a "pilgrimage to Belgrave square" to receive it. In 1846, he married the eldest daughter of the duke of Modena, who had never acknowledged the monarchy of July. After the revolution of 1848, many legitimists were returned to the national assembly. In 1850, the duke of Bordeaux, or count of C., as he styles himself, appeared at Wiesbaden, where a congress of his adherents assembled to consult as to their future policy. As the count of C. is without heirs, a union, or "fusion," as it is called, of the partisans of the elder Bourbons with the Orleanists was effected, but no attempt made to carry out the arrangement. After the capitulation of Paris in 1871, the count of C. returned to France, and, under the title of Henry V., issued a proclamation, in which he promised, if placed by the nation at the head of its affairs, to maintain the temporal power of the pope. Neither this nor subsequent manifestoes have induced the French people to accept of him as their king.

CHAMBORD, MARIE THÉRESE BÉATRICE GAËTANE, Countess de, Archduchess of Austria; b. July 14, 1817; wife of the Bourbon who calls himself Henry V of France, and eldest daughter of Francis IV., duke of Modena. Her sister was the wife of Don Juan de Bourbon, and mother of Don Carlos, duke of Madrid. She won great reputation and respect for her care of sick and wounded French soldiers during the German war.

CHAMBRE ARDENTE ("the fiery chamber"), a name given at different times in France to an extraordinary court of justice, probably on account of the severity of the punishments which it awarded, the most common being that of death by fire. In the year 1535, Francis I. established an inquisitorial tribunal, and a *chambre ardente*. Both were intended for the extirpation of heresy. The former, of which the pope was a corresponding member, searched out, by means of spies, cases of heresy, and instructed the processes; while the latter both pronounced and executed the final judgment. Under Henri II., the activity of the C. A. received a new impulse, the entrance of that monarch into Paris on the 4th July, 1549, being signalized by the burning of several heretics. But Francis himself, gallant and gay, as courtly history represents him, also seemed to relish a spectacle of this kind, for on various occasions he and his mistress presided at a burning. By and by, the C. A. relaxed in its penalties, and a cry was got up among the more bigoted Roman Catholics that it was conniving at heresy. This seems to have roused the "lurking devil" in its members, and, in order to wipe away the reproach, they commenced a series of unheard-of cruelties, which, along with other events, contributed to originate the religious war of 1560. In 1679, Louis XIV. employed it for a new and more praiseworthy purpose—viz., to investigate the numerous reports of poisoning cases which the trial of the marchioness Brinvilliers (q.v.) caused to be circulated. Many persons of the first rank, such as the *maréchal de Luxembourg*, and the princess Louise of Savoy, were examined on suspicion, but no one was executed except the pretended sorcerer, Voisin (1680), after whose time the C. A. ended its activity.

CHAMBRE INTROUVABLE (Fr. unfindable chamber; i.e., the chamber the like of which is not to be found again) was the name sarcastically given to that chamber of deputies in France which met after the second return of Louis XVIII. (July, 1815), and which, by its fanatical royalty, began to throw the country and society anew into commotion. The former chamber, which had shown much moderation, had been dissolved under the influence of the court party; and the ministry, led by Talleyrand, had done everything to procure for the ruling party at least a manageable chamber adapted for business. The number of the deputies was arbitrarily raised from 259 to 392; and to secure the victory of a complete restoration, all rushed forward who saw in the constitutional charter an encroachment on their privileges and pretensions. When it is considered, in addition, that the elections, at least in the departments of the south, took place under terror and the sanguinary outrages of a populace in a state of political and religious excitement, that the press was stifled, and the people deprived of all freedom of expression by the foreign armies, ultra-royalism could not fail to be completely triumphant. When the ministers saw this startling result, they did not venture to open the session; they resigned, and gave place to the Richelieu ministry. Then broke out the most frightful excesses in the southern provinces. At the elections in Nîmes (23d Aug.), more than 100 persons were killed by the royalist bands. At last, on 7th Oct., the king opened the chamber, on which he enjoined quietness and moderation; and it appeared as if it did take this advice to heart for an instant. But when, in one of the first sittings, Boyer d'Argenson asked for the intervention of the chamber in behalf of the Protestants, who were being slaughtered in the south by the ultra-royalist bands, the speaker was called to order, and the chamber from that time ceased to observe any bounds or moderation. The fanatical legislation of this chamber inspired the ministers, the king, and especially the emperor Alexander, with so much aversion and apprehension, and also met so decidedly with the disapprobation of all peaceful and sincere friends of the throne, that the news of its dissolution, on 5th April, 1816, was received with universal rejoicing. The electoral law of 5th Feb., 1817, prevented the return of a similar chamber; and it was not till by the modified electoral law of 1820 that ultra-royalism regained a predominating influence in parliament. It is said that Louis XVIII. first

used the epithet *chambre introuvable* in an ironical sense, and that the majority of the chamber took it seriously as a compliment.

CHAMBURE, AUGUSTE LPELLETIER DE, 1789-1832; a French soldier, whose daring at Dantzic in 1813, and in other places during Napoleon's wars, earned for him the name of "the devil." He was a prisoner for a time, but was released, and restored to military command in France. After Louis Philippe came to the throne, C. became one of the staff of Soult, minister of war.

CHAMELEON, a southern constellation within the antarctic polar circle, and containing nine stars.

CHAMELEON, *Chamaleo*, a genus of saurian reptiles, constituting a distinct family, of very peculiar form and structure, and on various accounts highly interesting. The body is much compressed; the dorsal line sharp, in some of the species rising into an elevated crest; the back of the head is also elevated into a sort of cone. The neck is very short, and does not admit of the head being turned, for which, however, compensation is found in the remarkable powers of motion possessed by the large prominent eyes, which move independently of one another, and are covered with a membrane pierced only with a small hole for the pupil to look through. There are no external ears. The skin is not covered with scales, but, like shagreen, rough with granules. The legs raise the body rather higher than in most of the saurians; the toes, both of the fore and hind feet, are divided into two sets, one directed forward, and the other backward, so that each foot has the power of grasping like a hand. The tail is long and prehensile. The lungs are very large, and are connected with air-cells that lie among the muscles and beneath the skin, so that the animal has a remarkable power of inflating itself with air. The tongue is remarkably extensible, and is the organ by which the animal seizes the insects which constitute its food, being darted at them with unerring aim, whilst a viscous saliva causes them to adhere to it, and they are carried with it into the mouth. Chamcleons are slow in their movements, except those of the eyes and tongue, and remain long fixed in one spot, awaiting the approach of insects, which they seize on their coming within reach. They all live among the branches of trees. Their power of fasting is great, and along with their gulping of air in respiration, and their habit of inflating themselves with air, gave rise to the fable, current among the ancients and until recent times, of their living on air. Their celebrated power of changing color is not equally fabulous, and perhaps it would be rash in the present state of knowledge on the subject to assert how far it has been exaggerated. It is probably in part under the control of volition, and may be used, as has been asserted, to render the animal less easy of observation, by assimilating it to the color of surrounding objects; it may depend in part on the action of light; it is certainly connected with the fear and other passions of the creature. Milne Edwards has discovered that it depends upon the presence of two differently colored layers of pigment in the skin.

Chameleons are natives of the warm parts of the old world, but are most abundant in Africa. One species is found in some parts of the s. of Europe, as near Cadiz. The whole number of known species is small.—When brought, as they frequently are, to Great Britain, they soon die, apparently from the coldness of the climate.

The fables which, in former times, were current regarding the C. were extremely numerous and ridiculous. It supplied not a few of those medicines to which absurd credulity ascribed the most marvelous powers.

CHAMFERING. In architecture, an angle which is slightly pared off, is said to be chamfered. The chamfer is sometimes made slightly concave, in which case it is called a *hollow chamfer*. Chamfers, in Gothic architecture, have frequently ornamental terminations of various kinds. The term C. is applied to wood-work as well as stone.

CHAMFORT, SÉBASTIEN ROCH-NICOLAS, 1741-94; one of the most remarkable and among the first of French Bohemians, or brilliant but thriftless authors, or wits. He was the illegitimate son of a strolling actress, and never knew his father. Starting in life with only the name "Nicolas," he found his way to Paris, got into the college des Grassins, worked hard, and won nine prizes out of ten in two years. Much disgusted with the Latin hexameters that crowned his college reputation, he considered the time wasted which he had spent over them, summarizing his opinion in the contemptuous epigram, "What I know I do not know; what I do not know I guess." He assumed the name of C., and began writing for the press for bread and renown. Being repelled alike by booksellers and editors, he took to writing sermons at a louis each for lazy or incompetent priests. Having successfully competed for one of the academy prizes, the salons of the upper world were opened to him, and he became fashionable. He went on with alternate success and failure, always poor, and living for the most part upon eleemosynary dinners and suppers, repaying countenance and sustenance with his always brilliant but cynical and sarcastic conversation. He was entertained at Sèvres for some years by Mme. Helvetius, and Chabanon gave him his pension of 1200 livres in the *Mercur de France*. C. also took two more academy prizes, won a hundred livres from Necker, and obtained an enormous reputation. He wrote little and talked much; his reputation increased, and finally, under the protection of the duchesse de Grammont, he went to court, where the prince de Condé made him his secretary. He was now

about 40 years old, and fast growing misanthropic. He resigned his secretaryship and retired into solitude at Auteuil, where he fell in love and married a lady attached to the household of the duchesse de Maine. She was a clever, amusing woman of the world; but in six months she left C. a widower. Then he traveled in Holland, where he lived awhile with M. de Narbonne. Then, returning to Paris, he received the chair in the academy left vacant by the death of Sainte Pelaye in 1781. He haunted the court and made himself loved in spite of his withering and uncontrollable irony; but in consequence of an unfortunate love affair he left the court and was received into the house of M. de Vaudrenil; about which time he made the acquaintance of Mirabeau, whom he assisted with orations, and whom he followed heart and soul into the storm and tumult of the revolution. He forgot his old friends; he frequented the clubs, and was for a time secretary of that of the Jacobins; he became a street orator; was among the first of the storming party to enter the Bastille; and worked for a royalist journal in which he depreciated kingships. With the fall of the Girondins his political life came to an end; but he could not restrain the tongue that had made him famous: he no more spared the convention than he had spared the court. This rashness was the cause of his arrest, and he was threatened with a second arrest, whereupon he attempted suicide with pistol and poignard; and, shockingly hacked and shattered, dictated to those who came to arrest him the well-known declaration: "I, Sebastien Roch-Nicolas Chamfort, declare that I would sooner suffer death as a free man than be conducted as a slave to prison." He did not die immediately, but lingered awhile in charge of a gendarme. To the abbé Sieyès he had given fortune in the title of a pamphlet, *What is the Third Estate? Everything. What has it? Nothing.* And to Sieyès also he spoke the famous sarcasm: "At last I am about to leave the world, where the heart must be broken or be changed to brass." As a writer, C. left little of value. It was as a conversationist, and especially for his epigrammatic wit and cynicism, that he won a world-wide fame.

CHAMIER, FREDERIC, an English novelist, was b. in London, 1796. He entered the navy as a midshipman in 1809, and distinguished himself in the American war. He left the service in 1833. The success of Marryat in depicting sea-life led C. to try the same field, in which he was not without success, though in invention and humor he falls short of his model. His best romances are—*Life of a Sailor* (3 vols., Lond. 1834); *Ben Brace* (3 vols., Lond. 1835); *The Arethusa* (3 vols., Lond. 1836); *Trevor Hastings* (3 vols., 1841); *Passion and Principle* (3 vols., 1843); *Tom Bowline* (3 vols., 1839); *Jack Adams* (3 vols., 1838), etc. All his novels have been translated into German. C. wrote a *Review of the French Revolution of 1848* (Lond. 1849), in which he gives a rather prejudiced view of some of the prominent actors. He died on the 1st of Nov., 1870.

CHAMISSO, ADELBERT VON, one of the most celebrated of German lyric poets, was b. in 1781, at the castle of Boncourt, in Champagne. His parents settling in Prussia in 1790, he became a page of the queen, and entered upon a military career. But when the campaign of 1806 broke out, he returned to France, for though no admirer of Napoleon, he was unwilling to fight against his native land. At this time, he was thrown into the circle of Madame de Staël at Coppet, and there began that study of natural philosophy which he afterwards pursued at Berlin. In 1814, count Rumjanzow, chancellor of the Russian empire, prepared an exploring expedition round the world at his own expense; C. accompanied it as naturalist. He embarked at Cronstadt under capt. Otto von Kotzebue, chief of the expedition, which, however, failed in its main object—that of discovering a north-east passage. Subsequently, he obtained a situation in the botanical garden of Berlin, was made a member of the academy of science; and after a happy domestic life, died there in 1838, universally loved and honored. He wrote several works on natural history, but his fame rests chiefly on his poetical productions. As early as 1804-1806, he, together with Varnhagen von Ense, published a *Musen Almanach*. In 1813, he wrote his original and amusing fiction called *Peter Schlemihl*, the story of the man who loses his shadow, which has been translated into almost all the languages of Europe. The character of his poetry is wild and gloomy, and he is fond of rugged and horrible subjects. In his political songs, he succeeds well in humor and irony; nor is he deficient in deep and genuine feeling. Indeed, several of his ballads and romances are masterpieces in their way. We may instance one of his longest poems, *Salas y Gomez*, written in terza rima, as a proof how peculiarly German the cast of C.'s mind was, despite his French origin. His collected works, in six volumes, appeared at Leipsic in 1836-39.

CHAMOIS, *Antelope rupicapra*, Ger. *gemse*, a species of antelope (q. v.) inhabiting the Alps and other high mountains of central and southern Europe, as the Pyrenees, the Carpathians, and the mountains of Greece; also those of some of the Mediterranean islands, Caucasus, Taurus, and other mountains of the w. of Asia. It is one of the antelopes sometimes designated *capriform* or goatlike, because of their departure from the typical or true antelope form, and approach to that of the goats. The C. is about the size of a large goat, but the neck is longer in proportion, and the body shorter; the horns seldom more than 6 or 7 in. long, black, rising nearly straight up from the forehead, and so bent back at the tip as to form a hook. The color is brown, deeper in winter than in summer; the tail is black; the head is of a pale-yellow color, with a dark-brown band along each cheek.

The usual summer resort of the C. is in the higher regions of the mountains which it

inhabits, not far from the snow-line, and it is often to be seen lying on the snow. In winter it descends to the higher forests. The aromatic and bitter plants of the mountain-pastures are its favorite food. It is—like the ruminants generally—very fond of salt; “and many stones are met with in the Alps, hollowed out by the continual licking of the C., on account of the saltpeter with which they abound.” It is gregarious: flocks of 100 are sometimes seen; but in the Swiss Alps, where the numbers have been much reduced by hunting, the flocks are generally very small, and often consist only of a few individuals. Old males often live solitarily. The C. produces one or two young at a birth, in the month of Mar. or April.

It is an animal of extraordinary agility, and flocks may often be observed sporting in a remarkable manner among the rocky heights. It can leap over ravines of 16 to 18 ft. wide; a wall of 14 ft. high presents no obstacle to it; and it passes readily up or down precipices which almost no other quadruped could attempt. It is said to descend obliquely almost perpendicular precipices of more than 20 ft., striking its feet once or twice against the rock, as if to stay and guide its descent, and alighting securely, often on a very narrow ridge of rock, with its hind feet first, and bringing the forefeet almost into contact with them.

The hunting of the C. is an occupation attended with great hardships and much danger, but of which, nevertheless, some of the Swiss peasants become passionately fond. The hunter sometimes goes out on the adventurous chase alone; but more frequently several go out together, dividing into parties; and whilst the flock of C. flee from those whose approach they first desery, an opportunity of using the rifle is obtained by their comrades. The scent of the C. is extremely keen; and when by this sense it is apprised of the approach of the hunter, it becomes alarmed and restless until it sees him, upon which it rushes hastily in an opposite direction, and so falls into the ambushade. When a flock of C. is feeding, one is always on the watch, and by a sort of whistle, announces apprehended danger.—The flesh of the C. is highly esteemed. Its skin is made into leather, and from it the original *shammy*, or *shammy* leather, so much prized for softness and warmth, was obtained, although the name has now become common also to leather prepared from the skins of other animals. See LEATHER.—When taken young, the C. is easily tamed.—The C. of the Persian mountains is smaller and of a paler color than the European variety, and its horns bend from the base.

CHAMOMILE, or **CAMOMILE**, *Anthemis*, a genus of plants of the natural order *compositæ*. sub-order *corymbifera*, distinguished by imbricated bracts, a scaly conical receptacle, a ray of one row of female florets, those of the disk hermaphrodite, the achenia obscurely four-cornered, and destitute of pappus. The species are annual and perennial herbaceous plants, chiefly natives of Europe and other temperate parts of the world. Several are found in Britain, amongst which is the COMMON C. (*A. nobilis*), the most important species of the genus, well known for its medicinal virtues, a perennial plant with a stem about a foot long, procumbent and much branched, each branch terminated by a flower (head of flowers) more than an inch broad, with yellow disk and white ray, the whole plant intensely bitter and highly aromatic. Its medicinal virtues are ascribed to the essential oil which it contains, *oil of chamomile*, which abounds most of all in the involucre. This oil is of a greenish-yellow color, and is used in the preparation of some medicines. The dried flowers are often administered in the form of an infusion, as a stimulant of the nerves of the abdomen, an alterative and antispasmodic; or are applied to the skin as an anodyne, and on account of their power of promoting absorption and suppuration. The infusion also acts as an emetic, and is often used to assist the action of other emetics. C. flowers find a place in the pharmacopœia, and are also amongst the most esteemed of domestic medicines, the plant being extensively cultivated for their sake, and very generally finding a place even in cottage-gardens. Yet they ought to be used with caution, as they have been known to produce congestion in the brain, and are very apt to aggravate any malady of this kind already existing. A double-flowering variety of C. is more generally cultivated than the single, to supply the C. flowers of the shops, the flowers being whiter and more bulky, but it is otherwise rather inferior. C. is easily propagated by parting the roots. It delights in a dry and rather poor soil.—The name WILD C. is given to a very similar plant, also a native of Britain (*matricaria chamomilla*), an annual belonging to a genus closely allied to *anthemis*. It may readily be distinguished by the want of scales on the receptacle. Its medicinal virtues resemble those of common C., and although now disused in Britain, it is in some parts of Europe preferred for internal use, because it is less bitter, less nauseous, and generally milder and more agreeable in its operation.—No small quantity of common C. is illegally used in the manufacture of beer in England, and is imported from Germany for this purpose. Yet this plant is so abundant in some parts of the s. of England as to form a principal part of the pasture in sheep-walks, and to fill the whole air with its scent. The other British species of C. (*anthemis*) are mere weeds; one of them, called stinking C. (*A. cotula*), is so acrid as to blister the fingers, if much handled. But the flowers of the OX-EYE C., or DYER'S C. (*A. tinctoria*), a native of many parts of the continent of Europe, yield a beautiful yellow dye, on account of which the plant is often cultivated.

CHAMOND, St., a t. of France, in the department of Loire, situated at the confluence of the Gier and the Ban, about 7 m. n.e. of St. Etienne, on the railway between that

place and Lyon. It is a flourishing well-built town, with extensive manufactures of ribbons and stay-laces. C. has also several silk-mills and numerous iron furnaces and foundries; and extensive coal-mines exist in the vicinity. Pop. '76, 14,420.

CHAMORERIL, a lake of Ladakh or Middle Thibet, in lat. $32^{\circ} 55'$ n., and long. $78^{\circ} 15'$ e. It lies at a height of 15,000 ft. above the sea, on the plateau between the upper waters of the Sutlej and of the Indus, girt by mountains which rise, at some points, 5,000 ft. above its own level. Though it is beyond the recognized limits of perpetual congelation, yet it freezes only in winter, and is hence supposed to be of great depth. Necessarily receiving much water from the surrounding mountains, it is without any visible outlet—evaporation alone, even at this elevation, appearing to maintain one uniform surface on a length of 15 m., and a width of 2½.

CHAMOUNI, or **CHAMONIX** (Lat. *Campus munitus*), is the name of a wild and romantic valley and village among the Alps in Savoy. It lies at a distance from all the high-roads, at an elevation of about 3,400 ft. above the level of the sea, and more than 2,000 ft. above that of the lake of Geneva. The valley is about 13 m. long, and about 2 broad, and is traversed by the Arve. It is bounded at the e. end by the Col de Balme, over which there is a mule-path to Martigny, in the upper valley of the Rhone, and from the other end issues the road to Geneva, which lies at a distance of $53\frac{1}{2}$ m. from Chamouni. On the n. side lies mont Breven and the chain of the Aiguilles Rouges, and on the s., the giant group of mont Blanc, from which enormous glaciers or rivers of ice slide down, even in summer, almost to the bottom of the valley. The chief of these glaciers are the Glacier des Bossons, des Bois, d'Argentière, and du Tour. By ascending to a point called Montanvert, we come upon the upper course of a glacier, where it expands into a great mountain-lake of ice called the Mer de Glace, in which there is a solitary rock or oasis called Le Jardin, about seven acres in extent, and covered with the most beautiful herbage. The excursion to the Jardin is one of the most striking excursions within the range of Chamouni. Until 1741, the valley was almost unknown; the region was considered a wilderness, and known by the name of Les Montagnes Maudites, or "accursed mountains." In the above year, it was visited by two Englishmen, Pocock and Wyndham, who ascended as far as Montanvert; and a granite block there still bears the name of the Englishmen's stone. It was only, however, in 1775, that the attention of travelers was effectually called to it by Saussure and Bourrit. The valley is rich in peculiar plants, and furnishes an aromatic and perfectly white honey. The village of C. owes its origin to the Benedictine convent founded between 1088 and 1099. The pop. of the village is about 2,400, who depend partly upon the strangers who visit the valley, and partly upon the pastures and upon hunting. There are several good hotels, and the best guides are to be found here for the neighboring Alps. It is from C. that mont Blanc is usually ascended.

CHAMPAC, *Michelia champaca*, an Indian tree, possessing great beauty both of foliage and flowers, and much venerated both by Brahmanists and Buddhists. Images of Buddha are made of its wood. Its flowers have a pale-yellow tint, and a sweet oppressive perfume, much celebrated in the poetry of the Hindus.

CHAMPAGNE, formerly a province of France, now forming the departments of Seine-et-Marne, Aube, Yonne, Haute-Saone, and Ardennes. The province was about 180 m. long by 150 broad, its surface presenting extensive plains with ranges of hills, especially in the north and east. Upon these hills is grown the famous Champagne wine.

In ancient times, C. was known as a part of Gallia, was subjugated by Cæsar, and afterwards was annexed to the kingdom established by the Franks. After the 11th c., it had its own dukes, who were vassals of the French kings. By the marriage of Philippe IV. with Joanna, heiress to the kingdom of Navarre, Champagne, and Brie, C., in 1284, came to the French crown, and was incorporated by Philippe VI., in 1328. During the campaign of 1792, the eastern part, and, in the campaign of 1814, the western part, of C. was the chief arena of warfare.

CHAMPAGNE, or **CHAMPAIGNE**, **PHILIPPE DE**, 1602-74; a painter of Brussels, born of a poor family. He was a pupil of Fouquier, and in 1621 was employed with Nicholas Poussin to paint in the Luxemburg palace. His best work is in Vincennes, and in the Carmelite church in Paris, where may be seen his celebrated crucifix. He became first painter to the queen of France, and rector of the Paris academy.

CHAMPAGNE WINE is the produce of vineyards in the above-mentioned province of Champagne. There are white and red champagnes; the white is either sparkling or still. Sparkling or effervescent (*mousseur*) C. is the result of a peculiar treatment during fermentation. In Dec., the wine is racked off, and fined with isinglass, and in Mar. it is bottled and tightly corked. The fermentation being incomplete when the wine is bottled, the carbonic acid gas generated in a confined space dissolves in the wine, and communicates the sparkling property to champagne. To clear the wine of sediment, the bottles are first placed in a sloping position with the necks downward, so that the sediment may be deposited in the necks of the bottles. When this sediment has been poured off, some portion of a *liqueur* (a solution of sugar-candy in cognac) is added to the wine, and every bottle is filled up with bright clarified wine, and securely

re-corked. The effervescence of the wine thus prepared bursts many bottles, in some cases 10 per cent; and in seasons of early and sudden heat, as many as 20 and 25 per cent have been burst. Wine-buyers estimate the value of wine according to the breakage, that which breaks most bottles being considered best. Still or non-effervescent C. is first raked off in the Mar. after the vintage. Creaming or slightly effervescent C. (*demi-mousseur*) has more alcohol, but less carbonic acid gas than sparkling champagne.

The best varieties of this wine are produced at Rheims and Epernay, and generally on a chalky soil. Among white Champagnes of the first class, the best are those of Sillery, which are of a fine amber hue, dry spirituous, and possessing a superior *bouquet*; those of Ay and Marcuil are less spirituous, but are sparkling, with a pleasant bouquet. Other white wines of first class are those of Hautvilliers, Dizy, Epernay, and Pierry.

In the first class of red C., or Montagne, we have the varieties of Verzy, Verzenay, Mailly, St. Basle, Bouzy, and Thierry; all having fine color, clearness, good body, sufficient spirit, and a pleasant *bouquet*. The trade in Champagne wines is chiefly carried on in Rheims, Aise, Epernay, and Chalons-sur-Marne. The cellars in which the vintages are stored are cut out of the calcareous rock. The fact that the sale of C. is very extensive and lucrative, has naturally given rise to adulterations. Sugar, and the juices of pears or gooseberries, or birch-juice, etc., have been used for making spurious Champagne. It may fairly be reckoned that not even a third part of the wine sold for C. in Paris is genuine. The greater part of it is readily manufactured by simply charging other light wines with carbonic acid gas. Recently, the German purveyors have succeeded in preparing light wines—such as Rhenish, Main, Neckar, Meissner, and Naumburg—so much like genuine C., as to deceive even the connoisseur. Altogether, it is estimated that the district produces 1,100,000 hectolitres (24,200,000 gallons) of genuine C., of which, however, the finest growths make but a small part.

CHAMPAIGN, a co. in e. Illinois, intersected by the Toledo, Wabash and Western, the Chicago branch of the Illinois Central, and the Illinois, Bloomington and Western railroads; 880 sq. m.; pop. '70, 32,737. The surface is level, and the chief productions are corn, broom-corn, oats potatoes, wheat, hay, cheese, butter, wool, and sorghum molasses. Co. seat, Urbana.

CHAMPAIGN, a co. in w. Ohio, intersected by Mad river, and by the Cincinnati, Sandusky and Cleveland, the Pittsburg, Cincinnati and St. Louis, and the Atlantic and Great Western railroads; 390 sq. m.; pop. '70, 24,188. The chief productions are corn, wheat, oats, potatoes, hay, butter, and wool. There are also a number of important manufactories. Co. seat, Urbana.

CHAMPAIGN, a city in Champaign co., Ill., on the Illinois Central and the Indianapolis, Bloomington and Western railroads, 128 m. s.s.w. of Chicago. It is the seat of the Illinois Industrial university. Champaign is a handsome and growing place, 2 m. from Urbana, the county seat, with which it is connected by horse railroad. Pop. '70, 4,625.

CHAMPARAN, a district in India, in the Behar province, under the jurisdiction of the lieutenant-governor of Bengal; 26° and 28° n. and 84° and 86° east. The district is a vast level except in the n. and n.w., where it is undulating and rugged as it nears the mountains of Nepal. The s. and w. portions are well cultivated, and have a dense population. The whole population in 1872 was 1,440,815, of whom 86 in a hundred were Hindus, 14 Mohammedans, 7 unspecified, and one in a hundred Christians. There are only two towns of consequence: Bettiah, pop. 19,708; and Motihari, the headquarters of the district, pop. 8,266. The principal crops are rice, corn, barley, sugar-cane, opium, and indigo; and the mineral products, gold, copper, and limestone. Indigo, saltpeter, and rope are the only manufactures.

CHAMPARTY, or CHAMPERTY (Fr., from Lat. *campi partitio*, a division of lands), an offense known to the law of England, which consists in a bargain between the plaintiff or defendant in a suit, and a third party, generally a lawyer, that the latter shall have part of the land, debt, or other thing sued for, in the event of success, and that in the meantime he shall carry on the suit at his own expense. This practice has been strictly forbidden by statute in England from very early times (3 Edward I. c. 25; 13 Edward I. c. 49; etc.); and in Scotland the rule of the civil law by which the *pactum de quotâ litis* (q.v.) was held to be a *pactum illicitum* (q.v.), and as such void, has all along been part of the common law. Such practices were also forbidden by statute to members of the college of justice (1594, c. 216). There is this difference between the laws of the two countries, however, that whereas in England the offense has always been punished criminally, in Scotland the only penalty which it entails beyond nullity of the bargain, is deprivation of office. In former times, the evil chiefly apprehended from C. probably was, that the honesty of judges might be tampered with by advocates who were generally their friends, and not unfrequently their very near relatives, if permitted to be personally interested in the issue of the causes in which they were professionally employed. In our own day, the chief danger consists in the encouragement which might thus be given to dishonest and oppressive litigation, and the facilities which would be afforded for nefarious transactions between the agents on the opposite sides. That practices closely analogous to C., though unnamed, are not unknown in the lower strata of the legal profession in all countries, is but too probable. The necessities of

trade have further introduced considerable equitable modifications into the law of C., which will be explained under CHOSE IN ACTION.

CHAMP DE MARS, originally CHAMP DE MAI, the title given to annual meetings of the Franks of Gaul in the 5th c. and later. They were national assemblies in which the chief men gathered to pay obeisance to their chief; or were special meetings called by the king, to deliberate upon important matters; or military reviews. One of the Carolingians changed the time of regular meeting from Mar. to May, whence the name. The Romans called them *plactia*.

CHAMP DE MARS, a great parallelogram in the environs of Paris, between the Seine and the Ecole Militaire, used especially for military purposes and drills. It is 1093 yards long and 537 wide, with four rows of trees on either side, flanked by ditches, and entered by five gates. It has been the site of many remarkable political and other demonstrations, from that against the legislative assembly in 1791, to the more peaceful universal expositions of 1867 and 1878.

CHAMPE, JOHN, 1752-98; a soldier in the revolutionary army, who was sent as a spy to New York with a view to carry off Arnold, who, after the discovery of his treason, had taken refuge in the British lines. C. discovered that Arnold was in the habit of walking in his garden at a late hour every night, and arranged to seize and hurry him to a boat and across the Hudson; but on the appointed night Arnold had changed his head-quarters and failed to appear. C. immediately escaped and rejoined the patriot army, but he was at once honorably discharged from service, lest if taken prisoner he should be summarily hanged as a spy.

CHAMPLEURY (real name JULES FLUERY), b. 1821. Beginning as a clerk with a Parisian book-publisher, he speedily acquired reputation by such books as *Confessions of Sylvius*; *Adventures of Mariette*; *Stories of Winter, Spring, and Autumn*; and a number of pantomimes. He is one of the founders of *L'Evenement* newspaper; and an author of *Les Oies du Noel* for Proudhon's *Voice of the People*. A satire on country life, *Les Bourgeois de Molinchart*, added to his fame. His works have been published with illustrations, including the *History of Ancient and Modern Caricature*.

CHAMPION (from a Gothic root signifying to contend, fight; Ang.-Sax. *camp*, fight). In the judicial combats of the middle ages, it was allowed to women, children, and aged persons, except in cases of high treason or of parricide, to appear in the lists by a representative. Such a hired combatant was called a champion. Those who followed this profession were generally of the lowest class, and were held disreputable; for besides the perils of the combat, they were liable to be executed as well as their clients. They were obliged to wear a peculiar dress of leather, and peculiar armor, which was also held disreputable. They were not allowed to fight on horseback, and appeared in the lists with their hair and nails cut short. Champions are mentioned as early as in the time of Charlemagne; and Otto I. employed them in deciding the succession to the empire. At a later period, in the age of chivalry, the word C. came to have a more dignified acceptation, and signified a knight who entered the lists on behalf of an injured lady, of a child, or of any one incapable of self-defense. In England, the crown even had its C., who, mounted on horseback and armed to the teeth, challenged, at every coronation at Westminster, all who should deny the king to be the lawful sovereign of the three realms. This practice is understood to have been first introduced under Richard II., and it continues to make a part of the ceremonial of an English coronation to this day. The name of C. was also given to the knight who, during a tournament, had charge to see that no injury or insult should be offered to the assembled ladies.

CHAMPION HILLS, in Hinds co., Miss., where, May 16, 1863, a confederate force under gen. Pemberton had a short fight with gen. Grant's forces, then marching upon Vicksburg. The confederates were beaten and forced to retreat to Big Black river.

CHAMPLAIN, LAKE, separating the states of New York and Vermont, and penetrating, at its n. end, about 6 m. into Lower Canada. It empties itself into the St. Lawrence, about 45 m. below Montreal, by the Sorel or Richelieu. It is navigable throughout for vessels of about 100 tons, having its communications improved by one canal on its own river, and by another to the Hudson. It stretches in lat. from 43° 30' to 45° 6' n., and in long. from 73° to 73° 30' w.; its extreme breadth, however, never exceeding 15 miles. Its principal towns are Whitehall at the s., Plattsburg on the w., and Burlington on the east. Both lake C., and its tributary, lake George, have been prominent in the history of the country—during the rivalry of France and England before the conquest of 1759-60; during the revolutionary struggle of 1775-82; and lastly, during the war of 1812-14, between Great Britain and the United States.

CHAMPLAIN, LAKE (*ante*), discovered by Samuel Champlain in 1609, the year in which Henry Hudson discovered New York bay and the North river. The possession of this lake was a matter of importance in the war between the United States and Great Britain in 1812-15. In Aug., 1814, an English army of 12,000, led by sir George Prevost, passed up the w. side of the lake to Plattsburg, accompanied by a squadron of 16 vessels, 95 guns, and 1,000 men. The Americans had a hastily constructed fleet in Plattsburg, comprising 14 vessels, 86 guns, and 850 men. A fierce engagement took

place Sept. 11, in the beginning of which the English had the advantage, but the victory was with the Americans. The British land forces abandoned the design of invasion, and under cover of darkness and a storm hastily retraced their steps toward Canada, abandoning their sick and wounded, and a part of their baggage. There are in the lake about 50 islands, the largest of which are North and South Hero, and Isle La Motte. The lake is noted for its magnificent scenery, and is a favorite resort for summer tourists.

CHAMPLAIN, a co. in the province of Quebec, Canada, bordering on the n. w. bank of the St. Lawrence, about midway between Montreal and Quebec; 229 sq. m.; pop. '71, 8,167. It is intersected by the St. Maurice and other rivers. The soil is fertile, and there is abundance of good timber. Besides ordinary agricultural crops, tobacco and maple sugar are raised. Chief town, Batiscan.

CHAMPLAIN, a township in Clinton co., N. Y., on the Canada border, forming the extreme n. e. point of the state. It has a village of the same name; pop. of township, '75, 5,306. The village is on the Ogdensburg and Lake Champlain railroad, 114 m. e. of Ogdensburg.

CHAMPLAIN, SAMUEL DE, 1567-1635; the son of a sea captain, and when young in the army of Henry IV. of France. He accompanied the Spanish fleet to the West Indies, and on his return wrote an account of the voyage. In 1603, he was sent to Canada by De Chaste, on whom the king had bestowed some of the new territory. From 1604 to 1607, he was engaged in exploring the coasts and seeking a desirable place for a settlement. The next year he made a third voyage, and began a settlement at Quebec. After many misfortunes and struggles the settlement became prosperous. In 1629, it was captured by some English adventurers, and C. was taken to London, but was set at liberty in 1632. The next year he returned to Canada, and died there. C. was in fact the governor of the settlement from its commencement until his death.

CHAMPLIN, JAMES TIFT, D.D., b. Conn., 1811; a graduate of Brown university, and tutor therein; from 1838-41 pastor of a Baptist church in Portland, Me.; 1841-57, professor of ancient languages in Waterville college, and from 1857-72, president of of the same institution, now known as Colby university. He has published a number college text-books.

CHAMPNEY, BENJAMIN, b. N. H., 1817; an artist noted for landscape painting of Alpine and White mountain scenery. In early life he was a lithographer in Boston.

CHAMPNEY, JAMES WELLS, b. Mass., 1843; learned the business of wood engraving, taught drawing, and studied painting in Europe. He served as a volunteer in the civil war.

CHAMPOLLION, JEAN FRANÇOIS, an illustrious name in modern Egyptian archæology, was b. Dec. 23, 1790, at Elgeac, in the department of Lot, France. In 1801, he was introduced to Baron Fourier, secretary to the *Institut d'Égypte*, who initiated him into the science of Egyptian antiquities. In 1807, C. went to Paris, in order to pursue, with more advantage, his oriental studies; and, in 1809, was appointed professor of history in the lyceum of Grenoble. In 1811, he published his work, *L'Égypte sous les Pharaons*, intended as the forerunner of a more elaborate work on Egypt, of which only the geographical section appeared, in 1814. In his endeavor to decipher the Rosetta stone, C. labored under the error of supposing that in this inscription the hieroglyphics were wholly ideographic, and the demotic and hieratic characters wholly phonetic. Afterwards, he was led to believe that the hieratic characters were of the same nature as the hieroglyphic, and this conviction he expressed in a communication made to the *Académie des Inscriptions*, in Aug., 1821. In the same year he published his essay, *Sur l'Écriture Hiératique des Anciens Égyptiens* (Grenoble), a work which is now scarce. In this essay he continued to assert the common ideographic nature of both hieroglyphic and hieratic characters. Meanwhile C. had been made acquainted with the conclusions of the acute mathematician, Dr. Thomas Young (q. v.), respecting the phonetic use of hieroglyphic signs. Without doubt, it was this important discovery, of which Dr. Young, however, made no great use, that set C. on the right track of investigation, and led to those brilliant results which were regarded by Niebuhr as constituting the greatest discovery of the century. By a comparison of the name of Ptolemy on the Rosetta stone with that of Cleopatra on the Philensian obelisk, he was enabled to lay the foundation of an alphabet, which he continued to elaborate until it now forms the basis of modern Egyptian archæology. His first decisive discoveries were made known in his celebrated *Lettre à Mons. Dacier* (Par. 1822), which was followed by the *Précis du Système Hiéroglyphique* (Paris, 1824; second ed. 1828); but his principal work, the *Grammaire Égyptienne*, was posthumously published in 1836.

In 1824, appeared his *Panthéon Égyptien*; and, in 1825, his celebrated letters to the duc de Blacas, in which he explains the names and titles of many of the Pharaohs, written on the monuments in Drovetti's Egyptian collection at Turin, and attempts to class them into dynasties. His theory of *interpretation* was much controverted at first, but its importance was recognized by such distinguished scholars as Rosellini, Bunsen, sir William Gell, and others.

In 1828, he was appointed by Charles X. to accompany a scientific expedition to

Egypt, of which the results were given by Rosellini in the *Monumens de l'Égypte et de la Nubie* (Par. 1835-45). On his return to Paris, 1830, C. was made a member of the *Académie des Inscriptions*, etc.; and, in the following year, was appointed to the new chair of Egyptian antiquities in the college of France; but soon after the commencement of his intended course of lectures, in May, 1831, he fell ill, and died, Mar. 4, 1832. According to Silvestre de Sacy, "few men, since the birth of letters, have rendered to erudition services equal to those which have consecrated to immortality the name of Champollion."

CHAMPOLLION-FIGEAC, JEAN JACQUES, a distinguished French archæologist, was b. 1778, at Figeac, in the department of Lot. After holding in Grenoble the offices of librarian and professor of Greek literature, he was appointed, in 1828, conservator of MSS. in the imperial library in Paris; but, after the Feb. revolution, was deposed from office by Carnot. In 1849, he was appointed, by Louis Napoleon, librarian of the palace of Fontainebleau. Besides the *Antiquités de Grenoble* (1807), his chief works include the *Annales des Lagides* and *Égypte Ancienne* (forming a part of *L'Univers Pittoresque*); *Les Tournois du Roi René*, a splendid work, with lithographs by Motte, and several publications of old French documents. After the death of his younger and more celebrated brother, C. was employed in editing the MSS. left by that distinguished scholar, and has given an account of them in the *Notice sur les Manuscrits Autographes de Champollion le Jeune* (Par. 1842). He died May, 1867.

His son, AIMÉ CHAMPOLLION-FIGEAC, follows the same path of historical antiquarianism, and has published several interesting and useful works.

CHANAK'-KALESSI' (Turkish, "Pot Castle"), a t. of Anatolia, deriving its name from its manufactures of crockery, is situated on the Dardanelles, about 28 m. s.w. of Gallipoli. Its castle is the most important on the Dardanelles, which name is sometimes given to the town itself. Pop. some 3,000 or 4,000.

CHANCE, in its original and strict meaning, may be defined as that which determines the course of events, in the absence of law, ordinary causation, or providence. Strictly speaking, it is an idea which few would now be disposed to admit as corresponding to anything which really exists; the religious mind excluding it as inconsistent with the belief in the divine government, and the philosophical mind rejecting it as inconsistent with a recognition of universal laws of causation. As a word, however, it has always been, and always will be popularly accepted; and its use is correct so far as we overlook, or choose for the moment to throw out of view, the more universal connection of events, and regard them as their emergence, on a superficial view, appears to be determined. The idea of C., as referring to some' apparently capricious or at least inexplicable cause of an event, distinguishes it from the word probability, or the degree with which the expectation of an event approves itself to a particular mind, the first expressing what metaphysicians would call an objective, and the second a subjective idea. * It is clear that C., being only legitimate as an expression in popular parlance—or if admitted as a term in philosophy, one that would at once lead into the most inextricable problems—is a term which is much too indefinite to admit of any kind of measurement; while what we call probability, or the degree with which an expectation approves itself, owing to certain data presented to the mind, does, as we shall hereafter see, admit of a kind of measurement which leads to very important consequences. For these reasons, the consideration of what is sometimes called the *doctrine of chances*, but what is more properly the *theory of probabilities*, will be found under the head of PROBABILITY.

CHANCEL (Lat. *cancellus*, a screen). The C., choir, or eastern part of a church, was often separated from the nave by a screen of lattice-work, so as to prevent general access thereto, though not to interrupt either sight or sound. As it was in this part of the C. that the service was always performed previous to the reformation, the clergy were held to have a special right to it, in return for which its repairs in general still fall on the impropriator, rector, or vicar, and not on the parish. The chief pew in the C. belongs to the rector or impropriator, but the disposal of the seats in the church, with this exception, belongs to the ordinary, or, practically, to the churchwardens, to whom the authority of the ordinary is delegated. No monument, moreover, can be set up without the ordinary's consent. The term C. is usually confined to parish churches which have no aisles around the choir, or chapels behind it or around it; and in this case the C. and the choir have the same signification. But in larger churches there are sometimes chancels at the ends of the side aisles, and this whether the choir has the character of a choir in the larger sense, or of a chancel. See CHURCH.

CHANCELLOR (Lat. *cancellarius*). It is said that the chief notary or scribe of the Roman emperor was called C., either because he was intrusted with the power of obliterating, *cancelling*, or *crossing out* (*cancellare*, to make lattice-work) such expressions in the edicts of the prince as seemed to him to be at variance with the laws, or otherwise croneous; or because he sat *intra cancellos*, within the lattice-work or railings (*cancelli*) which were erected to protect the emperor from the crowding of the people when he sat in judgment. Neither the title nor the office of C. is at all peculiar to England. The C. of France (chancelier de France), from a very early time, was an officer of state of great power and dignity, under whom several other officers, bearing also the title of C., were employed in the administration of justice and in the defense of the public

order. The C. of France was the constitutional interpreter of the will of the sovereign; his functions being, on the whole, analogous to those exercised by the C. of England. As an instance in the change of the value of money, not more remarkable than many which could be cited in our own country, it may be mentioned that, in 1290, the salary of this high official was six sous a day, with the privilege, to him and his, of eating at the court. When he was at Paris, and ate at his own lodgings, he had 20 sous a day. The office was abolished at the revolution; and though it was restored by the Bourbons, and even under the first Napoleon the higher-sounding title of arch-chancellor was revived, many of the functions of the old C. were transferred to the minister of justice, and have ever since been held by him.

In most of the other countries of Europe there are officers of state who bear this, or analogous titles, though their powers and duties are very various. The chief functionary in the Austrian empire has often been termed C.; and on the reconstitution of the German empire, prince Bismarck was made "C. of the empire" (*Reichskanzler*). Besides these state-chancellors, there were officers in many other capacities to whom the title was given. Every bishop has his 'C. in the church of Rome, and there are still law chancellors of cathedrals, dioceses, universities, etc.

CHANCELLOR (*ante*). The constitutions of some of the United States create this officer and define his power by legislative statute. In New York, the officer was recognized with others of colonial (English) appointment in the first and second constitutions, but in the constitution of 1846 the court of chancery was abolished, and the C. passed out of office. The tendency of late years is to merge the courts of chancery into the superior law courts. Separate chancery or equity courts exist in only a few states; in others the courts of law sit also as courts of equity; in some equity relief is administered under the forms of the common law; and in others still the distinction between law and equity has been formally abolished. The federal courts exercise equity jurisdiction whether the state courts in the district are courts of equity or not.

CHANCELLOR, LORD. It is usually said that the existence of the office in England, as in the other states of Europe, is to be ascribed to the influence which the constitution of the Roman empire had on the constitutions of the modern nations. This influence was exercised in no small measure through the medium of the church, the profession of the law being generally exercised by ecclesiastics; and it is for this reason, probably, that the bishop and the king are furnished with officers bearing the same title, and exercising analogous functions. The C. is always the confidential adviser of the sovereign in state affairs. It is for this reason that he has been called the keeper of his conscience, and that in England it is to him that the duty was intrusted of presiding over a court which acted on what were called—by way of contradistinction—equitable considerations. It is in this latter prerogative that the chief distinction exists between the C. and all other judges; for, whilst they are held by the letter of the law, he was at one time supposed to act rather *juxta bonum et equum*. In certain more special points of view, there is a similarity between the functions of the chancellors in different states. "In all of them he seems to have had the supervision of all charters, letters, and such other public instruments of the crown as were authenticated in the most solemn manner; and therefore, when seals came into use, he had always the custody of the sovereign's great seal."—Stephen's *Commentaries*, vol. iii. p. 398. It is from this last-mentioned circumstance that the office of C., or keeper (q. v.), which, by 5 Elizabeth, c. 18, is declared to be exactly the same, is created without writ or patent, by the mere delivery of the great seal, and that the C., if a baron, takes precedence of every temporal lord not a member of the royal family, and of all bishops except the archbishop of Canterbury. The C. is a privy-councillor by his office, a member of the cabinet, and prolocutor, or speaker of the house of lords, by prescription. Though the form in which his tenure of office is terminated, is by the resumption of the great seal by the sovereign, the C. practically resigns office with the party to which he is attached. He has the appointment of all justices of the peace throughout the kingdom, but this privilege he exercises generally on the recommendation of the lord-lieutenants. But the most important, and, as it now seems, somewhat anomalous branch of his patronage, arises out of his having been originally an ecclesiastic. Though the last bishop who held the office was John Williams, archbishop of York, who was lord keeper from July 10, 1621, to Nov. 1, 1625, the C. still continues to be patron of all the crown livings of the value of £20 per annum, or under (though in 1863 about 300 were sold to augment the incomes of those sold and those retained), and visitor of all hospitals and colleges of the king's foundation. As representing the paternal character of the sovereign, again, the C. is the general guardian of all infants, idiots, and lunatics, and has the supervision of all charitable uses in the kingdom. As regards his judicial patronage, the arrangement is, that the C. appoints in general all the judges of the superior courts, except the two chief-justices, who are nominated by the prime-minister of the day. Of inferior appointments, the latter also has reserved to him the commissioners of bankruptcy and the judges of the county courts. All these functions the C. performs in addition to his extensive duties as the supreme judge of the court of chancery, both as an ordinary court of common law and of record, and as an extraordinary court of equity. Much inconvenience had arisen from the accumulation of duties in the single

person of this high dignitary, and various expedients had been devised for lessening the evil. Vice-chancellors had been appointed, and the duties of the master of the rolls had been extended. In 1875, a considerable change was made by consolidating all the vice-chancellors' courts into one division, called the chancery division of the high court. And the C.'s duties in the house of lords as the highest appeal court were lightened in 1876. The proposal of a minister of justice has, however, not yet found favor. The salary of the C. is £10,000 a year, and he has an annuity of £5,000 on his retirement from office. The style of the C., since the union with Scotland, has been lord high chancellor of Great Britain; but he has scarcely any jurisdiction in Scotland, and in Ireland there is a separate C., having powers in most respects the same as those of the C. of Great Britain. To slay the C. is treason under 25 Edward III. c. 2.

CHANCELLOR OF A CATHEDRAL is an officer who superintends the arrangements for the celebration of the religious services. His office is quite distinct from that of the

CHANCELLOR OF A DIOCESE, who, as vicar-general to the bishop, is an ecclesiastical judge, appointed to assist the bishop in questions of ecclesiastical law, and hold his courts for him. By 37 Henry VIII. c. 17, it is provided that the C. of a diocese may be a layman, whether married or single, provided he be doctor of the civil law, lawfully create and made in some university. By the canons of 1603, he must be a bachelor of law, at the least, or a master of arts. There are certain cases, however, in which the bishop must sit in person. In case of complaint against a clerk in holy orders, for any ecclesiastical offense against the church discipline act (3 and 4 Vict. c. 86), the bishop is to hear the cause, assisted by three assessors; of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one; and a serjeant-at-law, or advocate who has practiced 5 years in the court of the archbishop of the province, or barrister of 7 years' standing, another.

CHANCELLOR OF THE EXCHEQUER. See EXCHEQUER.

CHANCELLOR OF SCOTLAND. Previous to the union of the two kingdoms in 1707, when the office was abolished, the C. of S. performed functions in many respects analogous to those which belong to the lord high chancellor of Great Britain. He presided in parliament, and was the head of all the courts of judicature; he was the chief counselor of the king, and keeper of the great seal. From the fact of the distinction between law and equity in the English sense never having been recognized in Scotland, the C. had no judicial functions separate from those of the ordinary courts of law, but he had the principal direction of the chancery, the constitution of which is described below. In early times, the C. of S., as of England, was very frequently an ecclesiastic; but the first, Constantine, earl of Fife, in the reign of Alexander I., and the last, the earl of Seafield, who held the office at the union, were both laymen; and many other nobles, earls of Argyle, Angus, Huntly, etc., appear in the lists given in Crawford's *Officers of State*, and Chalmers's *Caledonia*. On the abolition of the office, a keeper of the great seal was appointed, who acts merely ministerially in affixing it to the writs which pass under it. See GREAT SEAL.

CHANCELLORSVILLE, BATTLE OF, in Spottsylvania co., Va., between the union army under Gen. Hooker and the confederate forces under Gen. Lee, May 2, 1863. Hooker had succeeded Burnside in command of the army of the Potomac, and after nearly three months' work brought it into a state of efficiency. He had 132,000 men, 13,000 of whom were cavalry. This army, in seven corps, lay on the Rappahannock opposite to Fredericksburg. On the heights on the other (right) bank the confederate army was strongly intrenched; it numbered 62,000 men, of whom about 3,000 were cavalry. Hooker resolved to turn the confederate left flank, first sending nearly all his cavalry to destroy communication with Richmond. April 27th, Hooker sent 36,000 men up the left bank of the river beyond the confederate line, and they crossed safely. The objective point was C. a solitary brick dwelling-house in a wide and barren region. Before sunset, on the 30th, 48,000 union soldiers had reached the place. Another considerable union force had crossed the Rappahannock below Fredericksburg, and were making demonstrations in the confederate front. Lee appears to have been unaware of these movements until the evening of the 30th. At midnight his men were in motion, and before noon of May 1st he was in line of battle in Hooker's front. At daybreak "Stonewall" Jackson, with 30,000 confederates, moved behind the shelter of a dense forest (the "Wilderness"), and at 3 p.m., after a march of 15 m., fell upon the union army while the men were preparing their dinner, with arms stacked and their intrenchments unguarded. The union forces fled without making a stand, and pushed towards C. There they were with difficulty brought to a stand. Jackson, who had pursued them closely, rode out to reconnoiter, when he was fired on by his own men who mistook his escort for a union company. He died the next day. Thus far the greatest damage suffered by the federals was the temporary disorganization of Howard's corps, which was the weakest corps in the field; and this was more than supplied by the arrival during the night of a large corps from Washington. On the morning of May 3d (Sunday), Hooker was still on the defensive. The confederates began the attack, and it was hotly continued until 10 o'clock, both sides suffering severely. While Sickles was bearing the brunt of Stuart's attack, the ammunition

failed, and Sickles sent for aid. At the moment the message came to Hooker, he was struck by a spent ball and fell insensible to the ground; so there was no one to send aid to Sickles, and he was obliged to fall back. The weight of some half-dozen assaults fell upon his division, until he was overpowered and his lines destroyed. The day passed in desultory fighting and strategic movements, in which, on the union side, there was much indecision and loss of opportunity. During Monday night Hooker resolved to abandon his position, and threw up intrenchments to cover his bridges. A storm came on Tuesday afternoon, but during the night the union forces crossed the river, and the battle was over. The losses, as set forth in official reports, were: on the union side, 17,000, of whom 12,000 were killed and wounded and 500 missing; on the side of the confederates about 13,000, of whom 10,300 were killed and wounded and 2,700 missing.

CHANCELLOR OF A UNIVERSITY. The highest honorary office connected with a university is generally that of chancellor. See **UNIVERSITY**.

CHANCE-MEDLEY, and **CHAUD-MEDLEY**, or **MELLÉ** (Fr. *chaud*, hot; and *mélée*, a fray), as it is called in Scotland, are French expressions borrowed by our law. Though often spoken of as synonymous, they are, in reality, distinct in meaning—the one signifying a casual affray; the other, an affray in the heat of blood or passion. Both are in this country, and in most others, recognized as pleas in mitigation of the offense of *homicide* (q.v.). See also **SANCTUARY**.

CHANCERY (Lat. *cancellaria*). As the Roman emperors, and after them the various sovereigns who divided the vast inheritance of the empire, had each a chancellor (q.v.), so in every European kingdom there was an establishment called a *C.*, where these officers performed their functions. If we imagine a large chamber divided by lattice-work (*cancelli*), the outer half devoted to the people, the inner occupied by the chancellor and his subordinates, engaged in framing edicts, letters of nobility, and the like, and engrossing them on parchment, and sealing them with the king's own seal in proof of their authenticity, and then handing them through the railings to the people without, we shall have a pretty good conception of the *C.* in its earliest form.

In France, as there were subordinate chancellors attached to the parliaments of the respective provinces, so there were subordinate chanceries; but the grand *C.* of France, which followed the person of the king, was alone, in strictness, entitled to the name.

The apostolic *C.* at Rome, in which, in addition to the documents pertaining to his temporal sovereignty, the bulls and briefs of the pope are authenticated, is presided over by a cardinal, with the title of vice-chancellor.

CHANCERY, or **CHANCELLARY**, of Scotland, is a public office in the general register house at Edinburgh, managed by the director of *C.* and his deputies, in which all charters, patents of dignities, gifts of offices, remissions, legitimations, presentations, commissions, briefs, retours, and other writs appointed to pass the great and quarter seals are recorded. See **GREAT SEAL**.

CHANCERY, COURT OF, in England. Besides the functions pertaining to the chancellor in other countries, the chancellor of England had early assigned to him the office of a judge; and the English *C.* consequently became a court of law, the peculiar character of which will be rendered intelligible by the following considerations: In assigning judicial functions to the chancellor's department, it was not intended that it should interfere with that other department of government which has everywhere been distinguished both from the legislative and the executive—viz., the judicial. But in all departments, according to the imperial theory from which the idea of the *C.* at least was derived, the sovereign was supreme, and to his will, or to his sense of justice, there was consequently an appeal in judicial, as in other matters. His chancellor, however, was his adviser in all matters whatsoever; and thus, though not a judge in the stricter sense, it is manifest that his counsel, in judicial matters of the highest importance, would constantly be called in. But further, the king governed by laws, even before he was governed by them; and for the sake of order and his own convenience, he would naturally add to or supplement the law which he had established, only where it could be shown to him that it did not meet the substantial justice of the particular case. He would consequently be a judge, not of the interpretation or application of the law, which he would leave to his ordinary judges, but of its adequacy to circumstances which had changed, or had not been anticipated; and when he interfered, it would be to some extent in the character of a legislator, as well as of a judge. The king would thus be a judge in equity, in the popular and intelligible sense of that word; and acting in this capacity himself, it would be in this capacity that he would call in the aid of his chancellor. It is not mysterious, then, how in early times the court of *C.* came to be a court of equity; and the chief difficulty regarding its origin seems to attach to the other of the two great departments into which it is divided, and in which it exercises jurisdiction as a court of common law. But as the free constitution of England developed itself, it soon became apparent that equity, in the old despotic or patriarchal sense—in which it was not so much the administration as the making or modifying of law—was consistent with its principles, whether it proceeded from a judge or from the monarch himself. The popular sense of equity was consequently abandoned; and a technical sense, unknown to the jurisprudence of every other nation, was given to it.

The proceedings of the court of C. "on its equity side," which had hitherto been a mere supplement to law, came now to be hedged in by rules and precedents as closely as those of any court of common law. What henceforth continued to be the distinction in principle between law and equity, or between the functions of the courts of common law and the court of C., or even of the two great departments of this court itself, it is perhaps impossible to state. The arbitrary line which has been drawn between the class of cases assigned to the one set of courts and to the other, will be considered under EQUITY.

The judicial duties of the chancellor have long been shared by the master of the rolls, an officer of high rank, who was originally appointed only for the superintendence of the writs and records appertaining to the common law departments of the court, but who was accustomed also to sit as a separate though subordinate judge on the equity side. The disputes which had arisen regarding his powers were set at rest by 3 Geo. II. c. 30, which declares that all orders made by him, except such as by the course of the court are appropriated to the great seal alone, shall be valid, subject nevertheless to be discharged or altered by the lord chancellor, and so as that they shall not be enrolled till they are signed by his lordship. By 3 and 4 Will. IV. c. 94, the master's powers are further increased, and he may now hear motions, pleas, and demurrers, as well as causes generally. The salary of the master of the rolls (q.v.) is £6,000 a year. The vast increase of business, and the still greater increase of arrears, during the previous half-century, rendered it necessary, in 1813 (53 Geo. III. c. 24), to appoint another assistant to the chancellor, under the title of the vice-chancellor of England; and in 1841, when the equity business of the exchequer was transferred to the C., two more vice-chancellors were added. Each of these judges sits separately from the lord chancellor, and their functions extend to both departments of the court. Their salaries are £5,000 a year. Another important addition (14 and 15 Vict. c. 83) was that of the lords justices of the court of appeal for all courts. This court consisted of the lord chancellor, together with these judges; but the lords justices, when sitting without the chancellor, possess the same jurisdiction which belongs to him, and their existence does not prejudice his right to sit alone. The lords justices possess the same authority in matters of lunacy as the chancellor; and they, sitting together, constitute, without the chancellor, the court of appeal in bankruptcy. An appeal, which may also be entertained by the lord chancellor sitting alone, lies to this court from all the separate courts of the chancery division; and from this appellate jurisdiction there is an appeal in turn to the house of lords. The lords justices may also take up original causes, though these, in practice, are mainly confined to the divisional courts of the high court. Till recently, certain parts of the equitable jurisdiction of the court of C. were confided to the masters in ordinary (see MASTERS IN CHANCERY) and the accountant general. The office of the masters has been abolished, but that of the accountant continues to be one of the most important connected with the court. Besides these more important officers, the court of C. has always had a large body of subordinates, registrars, taxing-masters, and a staff of record and writ clerks attached to it.

The subdivision of courts into those of equity and common law had long been found mischievous, inasmuch as it in some cases doubled the expense to the suitor, by sending him from one court to another for instalments of the justice which he sought. For many years this anomalous arrangement had been given up as indefensible; and bills from time to time were introduced into parliament, in order to rearrange the courts, so as to administer entire justice in every case. Great changes were necessary in this department of the law, and the only question was at last reduced to the best mode of settling the details of the high court of justice, which was to supersede the previously existing courts. For the changes ultimately carried through under the judicature acts of 1873-76, and the constitution of the new high court of justice, see COMMON LAWS. The C. court is now the chancery division of the reconstituted high court.

In various colonies of the British empire, local courts have been established in imitation of the high court of C., an institution which, from its cumbrous, anomalous, and unscientific character, scarcely merited imitation; but in America, though the distinction between law and equity was at first adopted and long adhered to with the tenacity with which Englishmen cling to their native customs, it has been abolished in the state of New York, and law and equity there, as elsewhere in the world, now constitute one system, administered in one series of tribunals of original and appellate jurisdiction. On the continent, the English court of C. has always been a subject of ridicule; and a recent French writer, in speaking of it, says, "Nothing ever comes to an end in it; and the unhappy man who has a process there, can be sure of but one thing—viz., that whether he gains it or loses it, his ruin is certain." The acts by which evils which were inseparable from the constitution of the court of C.—and which spring from the distinction between law and equity, on which its very existence depended—had been mitigated, were the following: 15 and 16 Vict. cc. 80, 86, and 87, 21 and 22 Vict. c. 27, 23 and 24 Vict. cc. 38, 128, 25 and 26 Vict. c. 2.

CHANCERY, COURT OF (*ante*), in this country exists only in a few of the states; some never established the court at all, and a number which inherited it from English colonial times or established it in their first constitutions have abolished it and given the equity duties to the courts of law. According to latest authority, the court of chan-

cery exists in Alabama, Delaware, Florida, Mississippi, New Jersey, Tennessee, and Vermont; but in most of these states the court of chancery is held by a justice of the supreme court.

CHANCRE. See SYPHILIS.

CHANDAH, a t. of India, on the s. w. frontier of the territory of Nagpore, on the left bank of the river Eraee, near its junction with the Wurda, 90 m. s. of the town of Nagpore. Its walls, built of cut stone, and surrounded by a high parapet, are 6 m. round, from 15 to 20 ft. high, and flanked with round towers large enough for the heaviest guns. Within the place, and almost equidistant from the n. and s. faces, is a citadel; the rest of the interior consists of straggling streets, detached houses, and plantations. It is well supplied with water. In 1818, C. was taken by the British. Pop. 16,233. C. is capital of a British administrative district having an area of 9,700 sq. m., and a pop. of 534,431.

CHANDÂL'A, the lowest of the impure classes in Hindu caste. Besides the four pure classes there are various mixed and more or less impure classes, some of which, the C. for instance, are so vile that their shadow is pollution, and no true Hindu will take shelter under the same roof or tree with them.

CHANDELEUR ISLANDS, in the gulf of Mexico, between the mainland of Mississippi and the mouth of the river. There is a light on the n. end of the most northerly island, in 30° 8' n., and 88° 52' west.

CHANDERNAGORE, a French city, with a scanty territory of about 2000 acres, on the right or w. bank of the Hoogly, 21 m. above Calcutta by railway, on the opposite shore, in lat. 22° 50' n., and long. 88° 23' east. The population, estimated at about 30,000, consists of a few Europeans and Eurasians, the great bulk being natives of unmixed blood. Independently of political considerations, the place has, through the gradual silting up of the river, lost some of its commercial advantages. Within 100 years back, ships of the line ascended to C.; now, however, vessels even of far inferior burden seldom get above Diamond Harbor, which is nearly 50 m. further down. C. was established in 1676, and for awhile rivaled Calcutta. It was captured by Clive in 1757, but finally restored to the French in 1816.

CHANDHAIREE, or CHANDERI, a t. of Gwalior, India, in a hilly and jungly district, near a tributary of the Jumna. It is at present much decayed, on account of Mahratta oppression, the scourge of war, and the decay of its manufactures, which are undersold by the cheaper fabrics of Britain; but the extent and architectural excellence of its ruins indicate its splendor and importance in former times, when it is said to have contained 14,000 stone houses, 384 markets, 360 caravanserais, and 12,000 mosques. The fort of C., formerly deemed impregnable, consists of a strong rampart of sandstone, flanked by circular towers, and is situated on a high hill. Among other remains of former greatness, is a pass cut through a solid rock 100 ft. high. During the native wars, being a place of importance, C. was frequently besieged. Under Mahratta sway, it became a haunt of freebooters, very troublesome to the native districts under British rule or protection; and on the conclusion of the treaty of 1844, it was, among other lands, assigned for the maintenance of the increased Gwalior contingent, commanded by British officers.

CHANDLER, CHARLES FREDERICK, PH.D., LL.D., b. Mass., 1836; educated at Harvard, Berlin, and Gottingen. In 1857, he had charge of the chemical department of Union college, and in 1864, was made professor of chemistry in the school of mines of Columbia college. In 1858, he held the chair of chemistry in the New York college of pharmacy. He is a member of the chemical societies of Berlin, Paris, and London. In 1870, with his brother he established *The American Chemist*. Recently he has been the chief officer of the board of health of New York city, and has paid much attention to sanitary reforms. He is the author of many important scientific papers, the greater number of which can be found in his magazine.

CHANDLER, DR. RICHARD, a scholar and antiquary of considerable eminence of the last century, was b. at Elson, in Hampshire, in 1738, and educated at Oxford. He first became known as the editor of the magnificent work, *Marmora Oxoniensia*, published by the Oxford university in 1763. He afterwards traveled through Greece and Asia Minor, with Revett, an architect, and Pars, a painter, at the instance of the then flourishing Dilettanti society, with a view to collect information regarding the former state of these countries, and to procure exact descriptions of the ruins. The result of their united labors appeared in 1769, in 2 vols., entitled *Ionian Antiquities*. C. also published a valuable account of the ancient inscriptions of Asia Minor and Greece; and his account of his travels in these countries, issued in 1765-76, is still a standard work. He also published a *History of Troy*. He died in Feb., 1810.

CHANDLER, SAMUEL, D.D., 1693-1766; a dissenting minister of Berkshire, England, the son of an eminent non-conformist divine. He studied at Gloucester and Leyden, and held life-long friendship with bishop Butler and archbishop Secker. He was a fellow of the royal and antiquarian societies, and received offers of high preferment in the established church, but these he positively refused and remained until his death a Presby-

terian minister. He was forty years pastor of the meeting house in the Old Jewry. He left many sermons, commentaries, and other works pertaining to religious and church matters.

CHANDLER, ZACHARIAH, b. N. H., 1813; d. Chicago, 1879. He was educated in a common school and seminary. At the age of 22, he went to Michigan and settled in Detroit, where he became a wealthy and prosperous merchant. He was an early and active member of the whig party, and in 1851 was elected mayor of the city. The next year he was nominated for governor, but was defeated. When the republican party was organized, he took an active part, and was by it chosen U. S. senator in 1856. In the senate he was a firm opponent of all schemes for the extension of slavery, and stood side by side with Benjamin Wade of Ohio, and others who resisted the arrogant tone of the extreme pro-slavery senators. When the civil war broke out, Chandler was one of the foremost in favor of a vigorous prosecution, and had little respect for those whom he denounced as traitors. In 1865, he was defeated for senator, but was at once appointed secretary of the interior, where his business talent soon became manifest in the improved administration of the department. In 1868, and again in 1876, he was chairman of the republican national committee, having the general management of the party canvass. The day before he died he made a powerful speech to a great mass-meeting.

CHANDLER SCIENTIFIC DEPARTMENT. See DARTMOUTH COLLEGE.

CHANDORE', a t. and fort in the district of Nassiek (q. v.), presidency of Bombay, its lat. and long. being 20° 20' n. and 74° 14' east. C. is a flourishing place, with a pop. of (1872) 5,662. The fort, which commands an important pass on the route between Candeish and Bombay, is situated on the summit of a hill naturally inaccessible everywhere but at the gateway. It surrendered to the British in 1804; and being subsequently restored to Holkar, was finally ceded by him in 1818.

CHANDOS CLAUSE. During the discussion of the clauses of the reform bill (q. v.) in 1831, the marquis of Chandos (tory), afterwards duke of Buckingham, proposed the insertion of a clause giving the county franchise to *tenants at will* occupying lands for which they paid an annual rent of £50. This was opposed by the ministers on the ground that the class proposed to be enfranchised would be subject to the coercion of the landowners, who would thus virtually determine the elections. The amendment, however, was supported by many of the radicals, who at that time regarded any extension of the suffrage as a boon, and was carried by a majority of 84. The clause was incorporated in the bill of the following year, and was finally carried by a majority of 272 to 32. The result proved a material accession to the conservative element in counties. Under the reform act of 1867, occupants of lands of a rateable value of £12 are entitled to the county franchise.

CHANDPOOR', a t. of British India, in the n. w. provinces, district of Bijnour, about 930 miles n. w. of Calcutta, and 80 n. e. of Delhi. It is of considerable size, and has a p. (1872) of 12,033.

CHANFRON. See CHARGER.

CHANGARNIER, NICOLAS ANNE THÉODULE, a French general, was born at Autun in 1873—and received his education at the military school of Saint-Cyr. In 1830, he went as lieut. to Algeria, where he distinguished himself, and rose to the rank of gen. of division. After the proclamation of the republic in 1848, he was appointed governor-general of Algeria, in the room of Cavaignac; but being chosen a member of the national assembly, he returned to Paris, when he was appointed commander-in-chief of the garrisons of Paris and of the national guard. He held this double office till the middle of May, 1849, and again for some time after the insurrectionary movement of June of that year. C. was a member of the legislative assembly, where he held a sort of neutral position between the orleanists and legitimists and opposed to the bonapartists. At the *coup d'état* in December, 1851, after being imprisoned in Ham, he went into exile till the Franco-Prussian war, when he offered his services to Napoleon III. He was in Metz with Bazaine; and, on its capitulation, retired to Brussels. He returned to France in 1871, entered the assembly, and assisted M. Thiers in reorganizing the army. He died in February 1877.

CHANG-CHOW-FOO, a city of China, and capital of a department of the same name, in the province of Fuh-keen, in 24° 31' n. lat., and 1° 24' long. e. of Peking.

CHANG-CHOW-FOO, or CHAOU-CHOW, a city of China, and capital of a department of the same name, in the province of Keang-su, in 31° 50' n. lat., and 3° 24' long. e. of Peking.

CHANGELING. It was at one time a common superstition, that infants were taken from their cradles by fairies, who left instead their own weakly and starveling elves. The children so left were called *changelings*, and were known by their peevishness, and their backwardness in walking and speaking. As it was supposed that the fairies had no power to change children that had been christened, infants were carefully watched until such time as that ceremony had been performed. This superstition is alluded to

by Shakespeare; Spenser, and other poets; and it has not yet quite died out of some of the rural districts in Britain.

CHANG-SHA-FOO, a city of China, capital of the province of Hoo-nan, in 28° 20' n. lat.

CHANK-SHELL, the popular name of the shell of several species of *turbinella*, a genus of gasteropodous mollusks of the group *siphonostomata* (q.v.), natives of the East Indian seas. These shells are obtained chiefly on the coasts of the s. of India and Ceylon, and form a considerable article of trade to Calcutta. They are much used as ornaments by Hindu women, the arms and legs being encircled with them; and many of them are buried with the bodies of opulent persons. Those which are thrown up on the beach, after the death of the mollusk, and have become whitened, are little valued, but fresh shells readily find purchasers. The commercial returns show an exportation of chank-shells from Madras amounting to 2,460,727 in one year, 1853-54, the value of which was about £10,000. The quantity ordinarily exported is smaller. A chank-shell opening to the right is rare, and is highly prized in Calcutta, so that a price of £50, or even £100, is sometimes paid for one.

CHANNEL, ENGLISH—the *mare Britannicum* of the ancients—is that arm of the Atlantic ocean which divides England from France, gradually narrowing to the strait of Dover. It is often called simply the channel; and the fleet stationed in it for the protection of the English coast, the channel fleet. The greatest river which falls into it is the Seine. It forms bays both on the English and on the French coast; but the larger ones are those on the French coast, whilst the best harbors are on the English.

CHANNEL ISLANDS, a group of islands belonging to Great Britain, lying off the n.w. coast of France, between Normandy and Brittany. They are about 120 m. s.w. of Southampton, and the nearest distance from the French coast is about 10 miles. The C. I. are the only parts of the dukedom of Normandy now belonging to the English crown, to which they have been attached since the conquest. King John, about the year 1200, lost all Normandy, except these isles. The chief islands of the group are Jersey, Guernsey, Alderney, and Sark. The area of the whole is 112 sq.m., and the pop. in 1871 was 90,596. They are more particularly described under JERSEY.

CHANNING, EDWARD TYRREL, LL.D., 1790-1856; brother of William Ellery Channing, D.D.; a lawyer of Boston who devoted his attention chiefly to literature. In 1817 to 19, he edited the *North American Review*, and was a regular contributor to it through a large part of his life. He was professor of rhetoric and oratory in Harvard college until 1851. A volume of his lectures has been published.

CHANNING, WALTER, 1786-1876; a physician, native of Rhode Island, brother of William Ellery Channing, D.D. He studied medicine in Boston and Philadelphia, and in Edinburgh and London. In 1815, he was professor of obstetrics and medical jurisprudence in Harvard, resigning in 1854. He was also for 20 years physician of the Massachusetts general hospital. Among his writings are *Etherization in Childbirth; A Physician's Vacation, or a Summer in Europe; Professional Reminiscences of Foreign Travel; Old and New; Reformation of Medical Science*; and a volume of poems.

CHANNING, WILLIAM ELLERY, D.D., a celebrated Unitarian preacher and author, was b. 7th April, 1780, at Newport, R. I., in the United States, entered Harvard university at the age of 14, and took his degree in 1798. In 1803, he was ordained minister of a church in Boston. During the earlier years of his ministry, his theological peculiarities had little prominence in his discourses, and in consequence he stood upon friendly terms with his brethren in more orthodox churches. In 1819, however, he preached a sermon at the ordination of the Rev. Jared Sparks, in which he advocated the Unitarian doctrine with so much zeal and ability, that he was termed the "apostle of Unitarianism." This involved him in controversy, a thing which he naturally loathed. Nevertheless, to the end of his life, he preserved a devoutly Christian heart, shrinking from the delicate instinct of a pious nature from everything cold, one-sided, and dogmatic, whether Unitarian or Trinitarian. As late as 1841, he wrote, "I am little of a Unitarian, have little sympathy with the system of Priestley and Belsham, and stand aloof from all but those who strive and pray for clearer light." It 1821, he received the title of D.D. from Harvard university, on account of the high talent he had exhibited in his tractate on the Evidences of Christianity, his Address on War, and his Sermons. In 1822, he visited Europe, and made the acquaintance of several great English authors, such as Wordsworth and Coleridge, both of whom were strongly impressed in his favor. Coleridge said of him: "He has the love of wisdom and the wisdom of love." In 1823, he published an *Essay on National Literature*; in 1826, *Remarks on the Character and Writings of John Milton*; in 1829, the *Character and Writings of Fénelon*; in 1835, a work in opposition to *Negro Slavery*; and in 1838, an essay on *Self-Culture*. Besides these, he wrote a variety of other essays and treatises, all characterized by vigor, eloquence, pure taste, and a lofty tone of moral earnestness. He died Oct. 2, 1842, at Bennington, Vt. An interesting memoir of him has been published by his nephew William Henry Channing (3 vols., London, 1848).

CHANNING, WILLIAM ELLERY, b. Mass., 1818, a son of Dr. Walter Channing. He studied in Harvard, but did not graduate. In 1839, he went to Illinois, and

in 1840 to Cincinnati, where he was for a time connected with the *Gazette*. In 1844-45, he was one of the editorial corps of the *New York Tribune*; visited Europe soon afterward, and in 1855 became one of the editors of the *Mercury* of New Bedford. He has published three volumes of verse, and, in prose, *Conversations in Rome* and *Thoreau, the Poet-Naturalist*.

CHANNING, WILLIAM HENRY, b. Mass., 1810; nephew of William Ellery Channing, D.D. He graduated at Harvard in 1829, at Cambridge divinity school in 1833, and was ordained in charge of a Unitarian church at Cincinnati in 1835. After filling several pastorates in this country he succeeded James Martineau as minister of the Hope street Unitarian chapel, Liverpool, England. On the commencement of the rebellion he returned and took charge of the Unitarian church in Washington. He was one of the early supporters of the socialistic movement in this country, was editor of *The Present* and *The Harbinger*, and in 1848 presided over a socialistic association in Boston. He has been a prolific writer, contributing to the *North American Review*, *The Dial*, *The Christian Examiner*, and other serials. Among his larger works are a translation of Jouffroy's *Ethics*; *Memoir of William Ellery Channing*; *Memoirs of the Rev. James H. Perkins*; *Memoirs of Margaret Fuller Ossoli*; and a work on *The Christian Church and Social Reform*.

CHANT (see AMBROSIAN CHANT, and GREGORIAN CHANT, *ante*), a modification between singing and recitative especially used for litanies and psalms in the Roman Catholic and Protestant Episcopal service. The chant is the ancient style of church-song, certainly as old as Christianity, which seems to have inherited it from the Jewish church. St. Paul exhorts believers to sing (to chant) psalms and hymns and spiritual songs; and Pliny the younger mentions the early morning assembling of Christians to chant hymns to Christ. As rhymed and metrical hymns, now so common, were the product of a later art, so the tunes accompanying them are modern as compared with chants.

CHANTAL, JEANNE FRANÇOISE FRÉMIOT, 1571-1641; a daughter of the president of the parliament of Dijon. Her husband was killed in hunting, whereupon she took the vows of celibacy, and devoted herself to the education of her children and the care of the sick and poor. She was, under the direction of St. François de Sales, the founder of the order of the visitation at Annecy. She was canonized in 1767. One of her sons was the father of Madame de Sevigné.

CHANTILLY, a village in Fairfax co., Va., 20 m. w. of Washington, where, Sept. 1, 1862, a battle occurred between the right of the union army under Pope and the confederates under Jackson. The battle continued, in spite of a severe thunder-storm, until dark, but without important results. The unionists suffered the loss of two generals killed, Philip Kearny and Isaac I. Stevens.

CHANTILLY, a t. of France, in the department of Oise, about 23 m. n.e. of Paris. Being one of the most beautiful places in the vicinity of the metropolis, it attracts thence immense numbers of visitors. Apart from its natural beauty, it is interesting as the place where the great Condé spent the latter years of his life in the society of such men as Boileau, Racine, and Bossuet. The magnificent château in which he resided was pulled down at the revolution of 1793; but a lesser château, one of the finest specimens of the renaissance in France, still remains. The park and grounds are very charming. C. is also noted for its extensive manufacture of the *blonde lace*. Pop. (1876) 3,476.

CHANTREY, Sir FRANCIS, an eminent English sculptor, was b. at Jordanthorpe, in Derbyshire, on 7th April, 1781, not 1782, as has been generally said. His father, who was a carpenter, and rented a small farm, died when C. was only 12 years of age, leaving his mother in narrow circumstances. It is said that she gave him "as liberal an education as her limited means would admit;" but much cannot be meant by the phrase, if it be true, as asserted by Holland in his *Memorials*, that his attendance at the little lane-school was very irregular, and that "for a while he certainly drove an ass daily, with milk-barrels, between Norton and Sheffield." C.'s mother married a second time, and the boy was, in 1797, apprenticed for 7 years to a carver and gilder in Sheffield called Ramsay. It was in this humble department that C. acquired the rudiments of his future art. It was during this period that his first attempts at modeling in clay were made, and that by the help of casts taken from the faces of his fellow-apprentices and his own, he began the work of portraiture, in which his great eminence ultimately consisted. C.'s apprenticeship was canceled two years before its expiry; but his subsequent career is not very accurately known. It is certain that he visited both London and Dublin in 1802, probably in the capacity of a journeyman carver and gilder; and in that year he seems to have received instruction as a pupil of the royal academy. It was probably then that he commenced seriously to prepare himself for the work of his future life. In the earlier part of his career as an artist, C. is said to have been under great obligations to Nollekens, who had the shrewdness to see, and the generosity to see without envy, his great promise in the branch in which he himself was eminent. In 1816, C. was elected an associate, and in 1818 a member of the royal academy; and in 1819 he visited Italy for the first time. Like the lives of many other eminent men, that of C. presents few claims on our interest after his early struggles were ended. As an ideal

artist, he never attained a high rank, and, in comparison with Flaxman, he possessed little reputation in this country and none abroad. But he executed, with much truth to nature, as it presented itself to his eye, an endless variety and almost countless number of works of individual portraiture, so that there is scarcely any town of importance in Great Britain which cannot show specimens of his skill. As a result of his diligence in this department of art, C. accumulated a very considerable fortune, the greater part of which, after providing for his widow, he bequeathed for artistic purposes. In this respect, he formed a remarkable contrast to Flaxman, whose modest savings were sworn under £4,000; whilst Nollekens, whose name is almost forgotten, realized the enormous sum of £150,000, it is even said £200,000. C. died childless on the 25th Nov., 1841, and was buried in a tomb prepared by himself at Norton. Lady C. died in Jan., 1875, and the interest of her husband's gift to the royal academy, amounting to about £3,000 a year, is now at the disposal of the council, for the "promotion of British art."

CHANTRY (Fr. *chantererie*, from *chanter*, to sing). The term C. is applied alike to endowments or benefices, to provide for the chanting of masses, and to the chapels in which the chanting takes place. These endowments were commonly made in the form of testamentary bequests, the object being to insure the erection of a chapel near or over the spot where the testator was buried, and to remunerate the priests for saying masses in it for the benefit of his soul, or of the souls of others named in his will. Many such chantry chapels are still to be seen in English parish churches; but they were more common in abbeys and monastic establishments, in which it was considered a privilege to be buried, and where some such offering to the brotherhood was, in a measure, the price of sepulture. These chapels, which have generally the tomb of the founder in the middle of them, are separated from the aisles or nave of the church by open screen-work, a circumstance which has sometimes led to their being called *chancels* (q.v.). Sometimes, again, they are separate erections, projecting from the church externally; but in cathedrals and the larger churches they are generally constructed within the church, often between the piers. Many chantries are lavishly enriched with sculpture and tracery of all descriptions, and some of them are adorned with gilding and painting.

CHANZY, ANTOINE EUGÈNE ALFRED, b. 1823; a French gen. who first served as an apprentice in the navy. In 1843, he graduated from the Paris military school as sub-lieut. of zouaves. He served in Algeria, Italy, and Syria, and again in Algeria. In 1868, he became gen. of brigade, and early in the Franco-Prussian war he rose to commander-in-chief of the second army of the Loire. During the supremacy of the commune, he narrowly escaped death. In 1872, he was elected to the national assembly, where he acted with the left-center party. In Dec., 1875, he was chosen senator for life, and in 1878 received the grand cross of the legion of honor.

CHAOS signified, in the ancient cosmogonies, that vacant infinite space out of which sprang all things that exist. Some poets make it the single original source of all; others mention along with it Gæa, Tartaros, and Eros. By some also only the rough outlines of heaven and earth were supposed to have proceeded from C., while the organization and perfecting of all things was the work of Eros. Still later cosmogonists, such as Ovid, represent it as that confused, shapeless mass out of which the universe was formed into a *kosmos*, or harmonious order. Hesiod makes C. the mother of Erebus and Nox.

CHAOS or **BIRD ISLANDS**, is the name given to several rocky islets situated at the entrance of Algoa bay, South Africa, about 35 m. e. of Port Elizabeth. It was on one of these islands that Bartholomew Diaz, the navigator, died in 1500.

CHAOU-CHOW-FOO, a city of China, and capital of a department of the same name, in the province of Kwang-tung, in 23° 36' 6" n. lat., and 0° 46' 40" long. w. of Peking.

CHAOU-KING-FOO, a city and capital of a department of the same name, in the province of Kwang-tung, 50 m. w. of Canton, in 23° 4' 43" n. lat., and 4° 24' 30" long. w. of Peking.

CHAPALA, the largest lake in Mexico, containing about 1300 sq. miles. It is about lat. 20° 20' n., and ranges in w. long. from 102° to 103° 25'. It is merely an expansion of the Rio Grande de Lerma, which enters the Pacific at San Blax. C. lies on the table-land of Anahuac, and has many islands.

CHAP BOOKS, the name given to a variety of old and scarce tracts of a homely kind, which at one time formed the only popular literature. In the trade of the bookseller, they are distinguishable from the ordinary products of the press by their inferior paper and typography, and are reputed to have been sold by chapmen (see **CHAPMAN**) or peddlers; hence their designation. The older C. B. issued in the early part of the 17th c. are printed in black letter, and are in the form of small volumes. Those of a later date are in the type now in use, but are equally plain in appearance. Of either variety, they were mostly printed in London; many being without dates. They were of a miscellaneous kind, including theological tracts, lives of heroes, martyrs, and wonderful personages, interpretations of dreams, fortune-telling, prognostications of the weather, stories of giants, ghosts, hobgoblins, and witches, histories in verse, and songs and ballads. See *Notices of Fugitive Tracts and Chap Books*, also *Descriptive Notices of Popular*

English Histories; both by J. O. Halliwell, printed for the Percy society. An inferior class of tracts succeeded these books for the common people, and are best known as *Penny Chap Books*. For the most part they consisted of a single sheet, duodecimo, or 24 pages. Besides the title, the first page usually contained a coarse wood-cut embellishment. The paper was of the coarsest kind adapted for printing, and the price, as the name imports, was a penny each. The subjects besides being of a similar nature to the above, included stories of roguery and broad humor. These penny C. B. were issued by an obscure class of publishers in London and several English provincial towns, of which we might particularize Newcastle-on-Tyne. They were also issued from the presses of Edinburgh, Glasgow, Falkirk, and Paisley. It is a curious fact, that nearly all the penny C. B. of this very homely kind which were latterly popular, were written by Dougald Graham, who, previous to his death in 1779, filled the office of bellman or town-crier of Glasgow. The most reputable production of this humble genius was a *History of the Rebellion* in a Hudibrastic meter, which was a great favorite with sir Walter Scott, and is now scarce; see *Chambers's Journal*, first series, vol. x. p. 84; also the *Paisley Magazine* (1829), an extinct publication of great rarity, in which is given a biographic sketch of Dougald Graham, with a list of his productions. In some parts of Scotland and the n. of England, Graham's penny C. B. are still seen on stalls at markets; but the general advances in taste, along with the diffusion of an improved literature, have displaced them in almost all other quarters. Collections of the older C. B. are now found only in the libraries of bibliomaniaes, by whom they have been picked up at extravagant prices from dealers in second-hand books. In various continental countries, there are numerous varieties of C. B. at exceedingly small prices. The French government being desirous to substitute a wholesome class of tracts of this kind for what are generally objectionable on the score of taste and morality, have latterly, through commissioners, taken some steps on the subject. See *Histoire des Livres Populaires, ou de la Littérature du Colportage*, by M. Nizard. w. c.

CHAPEL (Fr. *chapelle*), a word derived from *capa*, which originally signified a case, or chest in which were contained the relics of a saint, and afterwards the place where the chest was kept. The term now signifies a building erected for the purposes of public worship, but not possessing the full privileges and characteristics of a church. In this sense, all places of worship erected by dissenters are now called chapels in England, and the term is also applied to supplementary places of worship, even though in connection with the established church—such as parochial chapels, chapels of ease, free chapels, and the like. In former times, it was applied either to a domestic oratory, or to a place of worship erected by a private individual, or a body corporate. In the latter sense we speak of chapels in universities and colleges. But its earliest signification was that of a separate erection, either within or attached to a large church or cathedral, separately dedicated, and devoted to special services. See **CHANTRY**. Chapels had no burying-ground attached to them, and the sacrament of baptism was not usually administered in them.

CHAPEL HILL, a village in Orange co., N. C., 28 m. n. w. of Raleigh; pop. about 3,000. It is the seat of the university of North Carolina.

CHAPELLE, LA, the name of several places in France, the most important of which forms a northern suburb of Paris. Chemicals, salt, starch, liquors, etc., are manufactured.

CHAPELLE DE FER. See **HELMET**.

CHAPERON, a hood or cap worn by knights of the garter. Such a hood was at one time in general use, but was lately appropriated to doctors and licentiates in colleges. A person who acts as a guide and protector to a lady at public places, is called a C., probably from this particular piece of dress having been used on such occasions. The name was also applied to devices which were placed on the heads of horses at pompous funerals.

CHAPIN, AARON LUCIUS, D.D., b. Conn., 1817; a graduate of Yale, and Union (N. Y.) theological seminary. In 1838, he was a professor in the New York institution for the deaf and dumb. In 1844, he became pastor of the First Presbyterian church in Milwaukee, Wis.; and in 1850, was chosen first president of Beloit college, an office which he still holds. He was for some years one of the editors of the *Congregational Review*.

CHAPIN, EDWIN HUBBELL, D.D., b. in Washington co., N. Y., 1814; educated at a seminary in Bennington, Vt., and commenced preaching in Richmond, Va., to a congregation of Unitarians and Universalists. In 1846, he went to Massachusetts, and in 1848, to New York, where he became minister of the Fourth Universalist church. He has ever since remained over this congregation, which, from a small beginning in the lower part of the city, has grown to rank among the largest, occupying a prominent church edifice in Fifth avenue, known as the Church of the Divine Paternity. Besides his regular sermons he has delivered a great number of lectures, and has published several volumes, among which are *Duties of Young Men*; *Duties of Young Women*; *Characters in the Gospels*; *Communion Hours*; *Discourses on the Lord's Prayer*; *Crown of Thorns*;

The Beatitudes; Moral Aspects of City Life; True Manliness; and Discourses on the Book of Proverbs; besides sermons.

CHAPLAIN was originally the title of the ecclesiastic who accompanied an army, and carried the relics of the patron saint. See **CHAPEL**. It has now come to signify a clergyman not having charge of a parish, but employed to officiate at court, in the household of a nobleman, or in an army, garrison, ship, etc. Such officials began early to be appointed in the palace of the Byzantine emperors. The practice afterwards extended to the western empire, and to the courts of petty princes and even of knights, and continued to subsist after the reformation. Forty-eight clergymen of the church of England hold office as chaplains of the queen in England, four of whom are in attendance each month. Six clergymen of the church of Scotland have a similar title in Scotland; but their only duty is to conduct prayer at the elections of Scottish representative peers. A statute of Henry VIII. limits the right of nominating private chaplains in England: thus, an archbishop may have eight, a duke six, a baron three; and chaplains so appointed have certain privileges, and may hold two benefices with cure of souls.

An **ARMY CHAPLAIN** is a clergyman whose services are retained especially by the government for the soldiery of the army. There have been such chaplains for many generations, and the office was at one time regarded as a salable perquisite; but the system was reorganized and improved in 1796. In recent years, Roman Catholic and Presbyterian chaplains have also been appointed, a practice which indicates the progress of toleration. The chaplains belong, not to *regiments*, but to the staff of the army, so as to be generally available. At home, they are attached to the military stations; but in the field they are located at headquarters, at the hospitals, and with the divisions. The officers at the stations usually arrange for the men to attend divine service at the nearest parish church; but this still leaves the chaplains many duties to fulfill. Where, as sometimes happens, there is no regular church or chapel near at hand, the C. reads and preaches to as many men as can conveniently group themselves around him at one time, and thus serves many different congregations at different times of the Sunday. He visits the sick at the hospitals, and examines and encourages the regimental schools. Among the wooden huts at Aldershot camp, a church has been built, which is rendered available for chaplains of different religious denominations in succession.

When the system of army-chaplains was remodeled in 1796, a *chaplain-general* was appointed; this office was abolished by the duke of Wellington soon after the termination of the great war, but revived by Mr. Sidney Herbert in 1846. The C.-gen., who receives £1000 per annum, has duties partaking somewhat of those of an archdeacon. He assists the war office in selecting chaplains, and in regulating the religious matters of the army, so far as church of England matters are concerned. His office forms one of the 8 departments under the new organization of the war office. There are 78 chaplains on the staff, besides officiating clergymen (not belonging to the army), and chapel-clerks. The commissioned chaplains receive from 10s. to 22s. 6d. per day, besides allowances; and there are always some on half-pay; while the officiating clergymen receive head-money for the troops attending their ministrations. The whole expenditure for chaplains, and other charges connected with divine service, figures in the army estimates at near £50,000 annually.

NAVY CHAPLAIN. Every ship in commission, down to, and including fifth-rates, has a chaplain. The navy estimates provide for above 80 commissioned chaplains, at stipends varying from £219 to £401 per annum. The chaplains perform divine service at stated times on shipboard, visit the sick sailors, and assist in maintaining moral discipline among the crews.

CHAPLAIN (*ante*), in the United States officially known only as the chaplain of the senate and of the house of representatives, and in the army and the navy. In some of the states there are chaplains for one or both of the legislative bodies. In the army there are both post and regimental chaplains; and there is usually a chaplain in every regiment of militia, though they are not always ordained clergymen. In the navy there are a certain number of chaplains, according to the number of vessels in commission. It is usual, also, to appoint chaplains to state prisons, to reformatory institutions, and to asylums. Where there are radical differences of religious belief to any considerable extent, as in the institutions of New York city, chaplains of Protestant, Roman Catholic, and Jewish faith are employed or permitted to officiate.

CHAPLET, a garland or head-band of leaves and flowers. In heraldry, a C. is always composed of four roses, the other parts being leaves.

CHAPLIN, JEREMIAH, D.D., 1776-1841; a native of Massachusetts, graduated at Brown university, and for some years a tutor there. He was for 16 years pastor of a Baptist church in Danvers, Mass., and from 1820-32 president of Waterville college.

CHAPMAN, a trader, but popularly applied in a more limited sense to a dealer in small articles, who travels as a peddler or attends markets. C. is from *chap*, equivalent to *cheap*, a word which in its origin signified a market or place for trading; hence *Cheapside, Eastcheap*. See **CHAP BOOKS**.

CHAPMAN, GEORGE, dramatist and translator, was b. in 1557, educated at Cambridge and Oxford, and was the cotemporary and friend of Spenser, Jonson, and Shake-

speare. His first play, entitled *The Blind Beggar of Alexandria*, was printed in 1598. Up to 1620, he supplied the theater with tragedies and comedies, and some of these, after the fashion of the time, were written in conjunction with other dramatists. As a writer for the stage, C. does not rank high. Despite many nervous passages, his plays want the irradiation of a constant genius, and his characters are unnatural. His translation of Homer is the most vigorous that has yet been executed in England, and in reading it, many have felt with Keats—

Like some watcher of the skies
When a new planet swims into his ken.

C. seems to have led a long, temperate, and happy life, unblasted by poetic fire. He died in 1634. Swinburne, the poet, published an edition of C.'s works, with a critical introduction, in 1875.

CHAPMAN, JAMES, A. M., D. D., b. N. H., 1830; graduated at Waterville college, and in 1855 became a Methodist minister. He has occupied pulpits in several New England towns, in Boston, and in Brooklyn, N. Y.

CHAPMAN, JOHN GADSBY, b. Va., early in this century. He studied art in Rome, and returned to New York, where he had a studio, but not long afterwards went back to Rome, where he now resides. Among his paintings are "The Baptism of Pocahontas" (for the capitol in Washington); "An Etruscan Girl"; "The Israelites Spoiling the Egyptians;" "The First Italian Milestone;" "A Donkey's Head;" and "The Last Arrow."

CHAPPE, CLAUDE, 1763-1805; an engineer, and the inventor of the first working telegraph of any importance. His invention consisted of an upright post, on the top of which was fixed a transverse bar, and at the ends of the bar two smaller arms movable on pivots. The position of the bars represented letters or words; and by means of such machines placed at remote but easily visible points, messages were conveyed fifty leagues in a quarter of an hour. Until almost the period of electric telegraphy, the machine was used especially for noting the arrival of ships. C. was so much annoyed by charges that he had copied his invention from others, that he committed suicide.

CHAPPED HANDS AND CHILBLAINS, a lesser and a greater form of disease of the skin, produced by undue exposure to extremes of cold and heat, and affecting chiefly the most exposed joints, the skin over which swells and cracks, with itching, pain, and heat; in the most severe cases there is ulceration, which is difficult to heal in proportion to the length of time the disease has been neglected. Chilblains may generally be avoided if the hands are washed always with tepid water, and not habitually exposed to great cold, or when cold, to the heat of a fire. When formed, they may be treated with oxide of zinc ointment; or with a dilute solution of borax in glycerine and water; or with glycerine alone, slightly diluted with water; the hands being in any case habitually covered with woolen gloves in cold weather.

CHAPSAL, CHARLES PIERRE, 1787-1858; a French grammarian, joint author (with François Joseph Noel) of the *Nouvelle Grammaire Française, avec Exercices*, one of the most widely adopted of all grammars of that language. The proceeds of the book gave him a fortune, much of which was given to charities, among which was one bequest of 80,000 francs to the teachers in the environs of Paris.

CHAPTAL, JEAN ANTOINE, 1756-1822, count of Chanteloup, a French chemist and statesman. He was professor of chemistry at Montpellier, where he taught the doctrines of Lavoisier instead of those of Stahl. By the death of an uncle, C. acquired capital, which he employed in manufacturing mineral acids, alum, white lead, soda, and other chemical wares. After the revolution of Nov. 9, 1799, he was made a counselor of state by Napoleon, and succeeded Lucien Bonaparte as minister of the interior, in which capacity he established a school of arts, and a society of industries. He also reorganized the hospitals, introduced the metrical system of weights and measures, and otherwise greatly encouraged arts and sciences. On Napoleon's return from Elba, C. was made director-general of commerce and manufactures, and minister of state. The downfall of the empire sent C. to private life, but he kept his interest in science, and in 1816 was named member of the academy.

CHAPTER-HOUSE (Fr. *chapitre*), the building in which the monks and canons of monastic establishments, and the dean and prebendaries of cathedral and collegiate churches, meet for the management of the affairs of their order or society. See CATHEDRAL. Chapter-houses frequently exhibit the most elaborate architectural adornment, as, for example, those at York, Southwell, and Wells. The original stained-glass windows remain at York, and are of exquisite beauty. On the walls of that at Westminster, the original painting has been discovered. Chapter-houses are of various forms: those at York and Westminster are octagonal; those at Oxford, Exeter, Canterbury, Gloucester, etc., are parallelograms; Lichfield is an oblong octagon; Lincoln, a decagon; and Worcester, a circle. They are always contiguous to the church, and are generally placed to the west of the transepts. They generally either open into the church, or are entered by a passage. Chapter-houses were often used as places of sepulture, and have sometimes crypts under them; as at Wells and Westminster.

CHAPU, a maritime t. in the province of Che-keang, China, 50 m. n.w. of Chinhai, in one of the richest districts in the country. It is the port of Hang-Chow, with which it has canal communication, and it was formerly the only Chinese port trading with Japan. It is about 5 m. in circuit, exclusive of the suburbs. It was attacked and much injured by the British, who captured it in 1842, but it was immediately abandoned by them.

CHAPULTEPEC, a fortress on a mound of rock about 200 ft. high, 2 m. s.w. of the city of Mexico. In the war with the United States this fortress, one of the chief defenses of the city of Mexico, was taken (Sept. 12, 1847) by gen. Scott, and the city itself was captured the next day.

CHARACEÆ, aquatic plants, forming, according to some botanists, a distinct natural order of acotyledonous plants; according to others, a sub-order of *algæ*. Their stems are tubular, consisting either of a single tube, or of parallel tubes, a central one with smaller ones applied to its surface; they are either pellucid or incrustated with carbonate of lime, which is not to be regarded as a mere accidental incrustation, but belongs to their proper structure; and they have whorls of symmetrical tubular branches. They grow in stagnant waters, both fresh and salt, are always submersed, and often completely conceal muddy bottoms. A number of species are natives of Britain, all belonging to the genus *chara*. The organs of reproduction are of two kinds—lateral *globules*, and axillary *nucules*. These organs have caused no little difficulty to botanists; the nature and use of the globules in particular being by no means well understood. The simple cellular structure of the C., apart from all consideration of their reproductive organs, associates them with the lower algae, rather than with phanerogamous plants. None of them is of any known use. It was in the C. that the beautiful phenomena of *cyclosis* (q.v.) were first observed. Sir David Brewster discovered that each of the minute calcareous particles incrusting the C. possesses double refraction, and has regular neutral and depolarizing axes.

Fossil Characeæ.—The calcareous incrustation which covers the organs of reproduction, as well as the stems of some C., has, from its power of resisting decomposition, caused the abundant preservation of this order in the tertiary fresh-water strata. The nucules originally described under the name of *gyrogonites*, and supposed to be foraminiferous shells, have been noticed by E. Forbes in strata as old as the middle Purbeck beds. No remains of these have been observed in newer deposits, until we find them in the tertiaries. The nucules, associated with *lymnæa* and *planorbis*, are very abundant in the cocene Bembridge beds (q.v.).

CHARACINIDÆ. See SALMONIDÆ.

CHARACTER (Gr. *charasso* or *charatto*, which signifies to scrape, cut, or engrave) means what is engraven on an object, either physically by the action of another external object or objects, or morally by the passions, the affections, by good or evil fortune, and by what we designate generally as "circumstances." In art, the expression of C., either in animate or inanimate objects, is, after correct delineation, the most important matter to be attended to. Though, properly speaking, all distinguishing marks are included under it, it is more generally used to designate those which mark individual from individual, than species from species, or genus from genus.

CHARACTERISTIC. See LOGARITHMS.

CHARACTER TO SERVANT. The master is under no legal obligation, either in England or in Scotland, to give a character to his servant, however long, faithfully, or efficiently he may have served him; the duty of bearing testimony in his favor being one which, however binding in morality, it has not been found convenient to enforce by positive law; but, if given, the character must be strictly true, or, at all events, in accordance with the master's belief, otherwise he may be exposed to an action of damages, either by the servant whom he has calumniated, or by a subsequent employer whom he has deceived. If true, however, the fact of its being prejudicial will expose the master to no risk. In order to justify the giving of a bad character, however, it must, in general, be asked for by the servant, as the master is not entitled needlessly to publish the servant's defects. In that case, it will lie with the servant to prove its falsehood, not with the master to prove its truth. The case of the servant being known by the master to have committed a felony while in his service, is, however, an exception to this rule, as, in a case so extreme, the master is at liberty to warn others against taking him into their employment. Even though strictly true, the character, if prejudicial, must not be more so than the circumstances render necessary. Acts of petty dishonesty, such as are too common amongst servants, will not warrant the master in branding him as a thief. The safe course, in such a case, is to state the offense, and not to describe it by a general epithet, which may convey an erroneous impression of its magnitude.

It is probable that, partly from thoughtless good-nature, and partly from a selfish desire to get rid of a bad servant in the most comfortable manner, false characters are given in favor of servants very much more frequently than to their prejudice. It is desirable that masters and mistresses should have in view that they may render themselves liable in reparation of any damage which can be shown to be the direct result of

thus inflicting on a stranger a wrong which is unquestionably within the reach of the law.

By 32 George III. c. 56, personating a master, and thus giving a false character to a servant, or asserting in writing that a servant has been hired for a period of time, or in a station, etc., contrary to truth; and any person offering himself as a servant, pretending to have served where he has not served, or producing a false certificate, or altering a certificate, or pretending not to have been in any former service, etc., are offenses at common law, punishable on conviction before two justices with a fine of £20. This statute does not extend to Scotland.

CHARADE, or "syllable-puzzle" as the Germans call it, is an amusement which consists in dividing a word of one or more syllables into its component syllables, or into its component letters, predicating something of each; and then, having reunited the whole, and predicated something of that also, the reader or listener is asked to guess the word. As a specimen of the C. depending upon syllables, we adduce the following:

"My first is plowed for various reasons, and grain is frequently buried in it to little purpose. My second is neither riches nor honors, yet the former would generally be given for it, and the latter are often tasteless without it. My whole applies equally to spring, summer, autumn, and winter; and both fish and flesh, praise and censure, mirth and melancholy, are the better for being in it. Ans. Sea-son."

As a specimen of the second class of charades, we take the following happy example from the French:

"Quatre membres font tout mon bien,
Mon dernier vaut mon tout, et mon tout ne vaut rien."

The word is *zero*. It is composed of four letters, of which the last—viz., *o*, is equal to *zero*; the whole, zero itself, being equal to nothing.

But besides charades of this nature, there is another kind rather popular at evening-parties—the *acted C.*: the character of which is entirely dramatic. Half a dozen or so of the company retire to a private apartment, and there agree to select a certain word, as the subject of the C.; let us suppose **INNKEEPER**. The next thing done is to take the first syllable, **INN**, and arrange a little scene and dialogue, each member taking a certain part. This being accomplished, the amateur actors return to the drawing-room, and commence their performance, the rest of the company constituting the spectators. Care is taken to mention conspicuously, and yet not obtrusively, in the course of the dialogue, the word **INN**, which is the subject of the scene. On its conclusion, they again retire, and devise a new series of incidents for the word **KEEPER**, generally something in connection with a menagerie or a madhouse. This being also represented, they retire for a third time, to contrive the final scene, into which both words, or rather the whole word, **Innkeeper**, must be dexterously introduced at an odd moment when the spectators are thought to be off the scent. The company are then asked to guess the word. In order to the effective performance of a C. of this sort, the actors must possess a good share of inventiveness, self-possession, and ready talk, as the greater portion of the dialogue has to be extemporized.

CHARADRI'ADÆ, a large family of birds, of the order *grallatores*, and tribe *pressirostres*, chiefly abounding in the temperate parts of the old world, and generally frequenting sandy unsheltered shores and open moors and downs. They have a short bill, generally soft at the base, hard and often a little inflated towards the tip; long and powerful wings; long legs; and short toes, generally only three in number, and all directed forward, but sometimes they have also a very small hinder toe. They run with great swiftness; they generally congregate in flocks, at least during certain parts of the year; many of them are nocturnal in their habits; many are migratory. The plovers (*chaardrius*) have given their name to the family, which includes also lapwings, pratincoles, oyster-catchers, turnstones, sanderlings, etc.

CHARBAR, or **CHOUBAR BAY**, a harbor in the Indian ocean on the coast of Beloochistan; 25° 16' n., 60° 35' east. The town of Charbar at the entrance is garrisoned by the sultan of Oman. Near by are the ruins of the early Portuguese settlement of Tees.

CHARBON ROUGE, or **RED CHARCOAL**, is a variety of charcoal obtained by subjecting wood to the action of heated air from furnaces, or of steam, which has been raised to a temperature of 572° F. Air-dried wood, by the ordinary process of charring, yields at the best 21 to 26 per cent of black charcoal; but when acted on by heated air or steam, as mentioned above, 36 or 42 per cent of C. R. is obtained. It is now prepared largely in France and Belgium, and is used in stoves for heating, and in the preparation of gunpowder. It has a dark-red color, and consists of about 75 per cent pure carbon, and 25 per cent hydrogen and oxygen.

CHARCAS. See **CHUQUISACA**, *ante*.

CHARCOAL is a popular term applied to charred wood, or coal produced by charring wood. There are several other varieties of C., however, for which see **CARBON**, **ANIMAL CHARCOAL**, **WOOD CHARCOAL**, **COKE**, **BLACK-LEAD**, etc.

CHARCOAL BLACKS are made both from animal and vegetable substances—e.g., burnt ivory, bones, vine-twigs, peach-stones, nut and other shells, the smoke of rosin

condensed, etc. Those which are derived from vegetable substances, when mixed with white, are usually of a blue tint. See LAMP-BLACK.

CHARDIN, Sir JOHN, 1643-1713; a native of Paris, the son of a jeweler, and bred to the same business; but preferring adventure he traveled in Persia and India in 1665-69. Two years later he made a second and more extended journey of four years. In 1681, he settled in London, and was knighted by Charles II. In 1686, he published a portion of the *Travels of Sir John Chardin into Persia and the East Indies*, etc. The complete account of his travels, however, did not appear until 1711.

CHARENTE, a considerable river in the w. of France, rises in the department of Haute-Vienne, about 14 m. n.w. of Chalus. It first flows n.w. to Civray, where it turns southward into the department of Charente to Angoulême, thence it flows westward past Châteauneuf, Jarnac, and Cognac, and entering Charente-Inférieure, it runs n.w. past Saintes, and falls into the Atlantic below Rochefort, and opposite the islands Oléron and Aix. This river gives its name to two departments, both remarkable for the productiveness of their vineyards; but the wines are mostly used in the preparation of brandy and liquors.

CHARENTE, a department of France, formed chiefly out of the old province of Angoumois, and situated in lat. 45° 10' to 46° 8' n., and long. 0° 50' e. to 0° 30' west. Area, about 2,200 sq. miles. Pop. '76, 373,950. It is generally hilly, and is watered by the river Charente, above noticed, and its tributaries, the Tardouère and the Bandiat, with the rivers Vienne and Dronne. The highest chain of hills in the n. of C. is a continuation of the heights of Limousin, forming the watershed towards the Loire. Remains of marine productions show that the basin of the C. was once filled by the ocean. The soil is mostly limestone, here and there interrupted by banks of clay and gravel. Only a portion of the arrondissement Confolens has a rich vegetable clay-mold. The clay-soil is cool and moist, while the limestone district is dry and hot. The hills are in many places clad with chestnut forests. The climate is generally mild and healthy. The wines grown are spirituous and fiery in flavor, and are chiefly used in the manufacture of Cognac, which forms the most important of the exports. Truffles grow abundantly in several parts. Industry is in rather a backward condition. C. is divided into the five arrondissements of Angoulême, Cognac, Ruffec, Barbezieux, and Confolens.

CHARENTE-INFÉRIEURE, a maritime department of France, which includes the former province of Angoumois, with the greater part of Saintonge, and a small portion of Poitou. It lies in lat. 45° 5' to 46° 19' n. and long. 0° 7' e. to 1° 13' west. The bay of Biscay washes its western boundary—the coast-line, which is very broken, measuring about 100 miles. Area, 2,740 sq. miles. Pop. '76, 465,628. It is watered on its boundaries by the Sèvre-Niortaise and the Gironde, and in the center by the navigable Charente and the coast-stream Sendre. The surface is level; and the soil—near the coast, intersected by ridges of rock and sand-banks, and protected from the sea by dikes—is mostly chalky and sandy, but very fertile, producing hemp, flax, saffron, and wine in great quantities. The commerce, facilitated by the structure of the coast, and by canals in the interior, is considerable, consisting chiefly of brandy and sea-salt, which is found in the department in great abundance. The oyster and pilchard fisheries are important. The chief harbors are those of Rochefort and La Rochelle, the latter of which is the chief town. C. is divided into the six arrondissements of La Rochelle, Rochefort, Marennes, Saintes, Jonzac, and St. Jean-d'Angely.

CHARENTON-LE-PONT, a t. of France, in the department of Seine, situated on the right bank of the Marne, 5 m. s.e. of Paris. The bridge over the river, which is important from a military point of view, being considered one of the keys of the capital, and which has frequently been the scene of conflicts, is defended by two forts, forming a part of the fortifications of Paris. At the other side of the river is the national lunatic asylum, formerly called Charenton St. Maurice, and now St. Maurice simply. Pop. '76, 8,744.

CHA'RES, 4th c. B.C., an Athenian general who relieved the Philasians from the siege of the Argives and Arcadians; fought against Oropus; lost the island of Corcyra to Athens; commanded jointly with Chalcas in the social war, and made a successful attack upon Chios, in which Chalcas was killed; led an expedition against and captured Sestos; commanded in Thrace, where his main business was private plundering; and in 338 was one of the Athenian commanders in the battle of Chæronea.

CHA'RES, a Grecian artist in bronze, a native on Lindus, and the designer of the colossus of Rhodes, lived in the 3d c. B.C. He was a pupil of Lysippus.

CHARGE. In the law of Scotland, a C. is a command to perform an act, conveyed in the letters of the sovereign. The same term is applied to a messenger's copy for service, requiring the person to obey the order contained in the letters—e.g., a C. on letters of horning, or a C. against a superior.

CHARGE, in heraldry. The figures represented on a shield are called charges, and a shield with figures upon it is said to be charged (Fr. *chargé*). The charges in a shield ought to be few in number, and strongly marked, both as regards their character and

the mode of their representation. The family shield, belonging to the head of the house, almost always is simpler, i. e., has fewer charges, than the shields of collaterals, or even of junior members.

CHARGE, in military warfare, is a sudden and impetuous attack on the enemy, by horse or foot, or both. Its object usually is to drive the enemy from a particular position; but if made with a much stronger force, it may result in his actual destruction.

CHARGE, in military pyrotechny, is sufficient combustible material for one firing or discharge. It is applicable to all kinds of firings, fireworks, and explosions; but the name is generally given to the quantity of gunpowder requisite for firing off a gun, etc. In cannon, this varies greatly, from $\frac{1}{2}$ to $\frac{1}{8}$ of the weight of the shot; some of the rifled ordnance now coming into use are remarkable for the smallness of the C. with which they are fired. The quota of C. will be mentioned in connection with the various kinds of fire-arms described in the *Encyclopædia*. In breaching a wall, a greater C. is necessary than in attacking a ship or a column of troops, even with the same kind of gun and projectile.

CHARGER is a name sometimes given to a war-horse, accustomed to the din of battles, and reliable under circumstances of confusion and danger. In the middle ages, when armor was used, and gunpowder unknown, the military horses were *barbed* or *barded* when ridden by men-at-arms—that is, they were nearly covered with armor. The face, the head, and the ears were covered with a mask called a *chanfron*, to prevent fright when charging the enemy; and an iron spike projected from the middle of the forehead. The neck was defended by small plates called *crinières*; the breast by a *poitrinal*; and the buttocks and haunches by *croupières*. These various pieces of armor were mostly made of metal, but sometimes of tough leather. The horse was occasionally covered with chain-mail; and in other instances with a *gambeson* of stuffed and quilted cloth. The man-at-arms generally rode another horse when not charging, to relieve the C. from his great burden. The *barbed* or *bardé* horse received its name from an old French word implying covered, clothed, or armed. A war-horse is still called a C., though not armed as in ancient times.

CHARGÉS D'AFFAIRES are fourth-class diplomatic agents, accredited, not to the sovereign, but to the department for foreign affairs; they also hold their credentials only from the minister, and are sometimes only empowered by an ambassador to act in his absence.

CHARIOT, in ancient times, was a kind of carriage used either for pleasure or in war. According to the Greeks, it was invented by Minerva; while Virgil ascribes the honor to Erichthonius, a mythical king of Athens, who is said to have appeared at the Panathænic festival founded by him, in a car drawn by four horses. The ancient C. had only two wheels, which revolved upon the axle, as in modern carriages. The pole was fixed at its lower extremity to the axle, and at the other end was attached to the yoke, either by a pin or by ropes. The Greeks and Romans seem never to have used more than one pole, but the Lydians had carriages with two or three. In general, the C. was drawn by two horses. Such was the Roman *biga* (q. v.), but we also read of a *triga*, or three-horse C., and a *quadriga*, or four-horse one. The last was that in which the Roman generals rode during their triumphal entrance into the city, and was often adorned with splendid art. The war-chariot held two persons—the soldier himself and the driver, the latter of whom usually occupied the front; but the chariots used by the Romans in their public games held only the charioteer.

The oldest war-chariots of which we read are those of Pharaoh (Exodus xiv. 7). All the eastern nations used them, while we learn from Cæsar (*De Bell. Gall.*, v. 19) that the Britons also were familiar with their use.

CHARISTICARIES, officers (in Greek ecclesiastical history) who had full power over the revenues of hospitals and monasteries.

CHARITABLE USES AND LAW OF CHARITIES. The law of England has always anxiously, though too often ineffectually, sought to provide for the preservation and proper application of the public and private endowments in that country for charitable purposes. The preceding efforts of the legislature in this direction may now be said to have been superseded by the charitable trusts acts (16 and 17 Vict. c. 137, 18 and 19 Vict. c. 124, 23 and 24 Vict. c. 136, and 32 and 33 Vict. c. 110). See **CHARITY COMMISSIONERS**. As these statutes now contain a species of code of charity-law, it will here only be necessary to mention certain general principles which govern the law of England in its relation to charities. The courts of equity are those which in general take cognizance of all charitable uses, or trusts of a public description. Under the authority of these tribunals—or in cases in which the annual income does not exceed £50, in accordance with the act just quoted, under that of the county courts of the district—trustees may be called to account for the funds committed to their charge, or new trustees may be appointed, improvident alienations may be rescinded, schemes for carrying the donor's object into effect may be judicially considered and adopted, and every species of relief afforded which such institutions require. Where the management of the charity has been confided by the donor to governors and other functionaries, the law

will not interfere with their proceedings unless they can be shown to be squandering the revenues or otherwise abusing the trust. Where the crown is founder, the lord chancellor is visitor, but in his personal character only, and not as judge of the court of chancery. As regards the nature of the trusts to which the equitable jurisdiction of the chancery extends, it is necessary to remark that the word *charitable* here includes institutions for the advancement of learning, science, and art, and, indeed, for all useful public purposes, as well as for the support of the poor. It also comprises all donations for pious and religious objects, under which are included all those which tend to the benefit of the church of England, or of any body of dissenters sanctioned by law. Roman Catholics were admitted into this category by 2 and 3 Will. c. 115, and Jews by 9 and 10 Vict. c. 59, s. 2. The charity or other benevolent purpose, however, must be public; "for if a sum of money be bequeathed, with direction to apply it to such purposes of benevolence and liberality as the executor shall approve," or even "in private charity," the law will take no notice of such a trust.

Legacies to pious or charitable uses are not by the law of England entitled to a preference, though such was the doctrine of the civilians; but where a deficiency of assets arises, they are abated in proportion with the others.

CHARITON, a co. in n. central Missouri, lying n. and e. of the Missouri and w. of Grand river, and intersected by the North Missouri railroad; 740 sq. m.; pop. '70, 19,136—2,800 colored. The surface is rolling prairie and forest, with fertile soil. Coal and limestone are found. Chief productions; wheat, oats, corn, hay, tobacco, and butter. Co. seat, Keytesville.

CHARITON, or **GRAND CHARITON**, a river rising in s. central Iowa, and flowing s.e. into Missouri, thence s. joining the Missouri river in Charitou co.; 250 m. long, and navigable about 50 miles.

CHARITY, SISTERS OF. See **SISTERS OF CHARITY.**

CHARITY COMMISSIONERS. A body of commissioners was created in 1853, by the charitable trusts act, 16 and 17 Vict. c. 137 (see **CHARITABLE USES**), with power to inquire into all charities in England and Wales, with reference to their nature, objects, and administration, and the amount and condition of the property belonging to them. The commissioners have power to call for the production of accounts and documents from trustees, and to appoint inspectors to visit and report on their management. The statute does not extend to Scotland or Ireland, to the English universities, or to the city of London. An annual report of their proceedings must be laid before parliament by the commissioners.

CHARIVARI is a French term used to designate a wild tumult and uproar, produced by the beating of pans, kettles, and dishes, mingled with whistling, bawling, groans, and hisses, and got up for the purpose of expressing a general dislike to the person against whom it is directed. The etymology of C. is obscure; the Germans translate it by *Katzenmusik*, the English of which is *cat-erwauling*. In France, during the middle ages, a C. was generally raised against persons contracting second nuptials, in which case the widow was specially assailed. On these occasions, the participants in it, who were masked, accompanied their hubbub by the singing of satirical and indecent verses, and would not cease till the wedding couple had purchased their peace by ransom. C. answers to the English concert upon "marrow-bones and cleavers," with which it was customary to attack a married couple who lived in notorious discord. It was also got up against an unequal match, such as where there was great disparity in age between the bride and bridegroom.

Similar customs seem to have existed under different names in all parts of Europe, and sometimes they were of such a licentious and violent character as to require military interference to put them down. Even as early as the 14th c., the church found itself forced to threaten punishment, and even excommunication, against those who participated in them. In more recent times, the C. has taken a purely political coloring; as, for example, during the restoration in France, at which time, however, the popular voice began to seek vent by casting its satirical darts against public men through the press. The papers published for this purpose were called C., the most famous among which is the *Charivari*, which was established in Paris, Dec. 2, 1832, corresponding to the English publication, *Punch* (q.v.).

CHARKOV. See **KHARKOV.**

CHARLATAN, a mountebank, quack-doctor, or empiric, and hence any one who makes loud pretensions to knowledge or skill that he does not possess. The word seems to be derived from the Ital. *ciarlare*, to babble or talk, the chief art of the C. consisting in talk. Charlatanism abounds in all departments of life, and manifests itself in various ways according to the subject and character of the person. It changes also in form with the spirit of the time. The medical C. no longer appears on a stage in the guise of Dr. Ironbeard, but as a fine-dressed gentleman, receiving grateful acknowledgments through the newspapers, and publishing popular medical books, with the address of the author, and recommendations to apply to him. It has not unfrequently happened, however, that extraordinary men who were so far before their age as not to be understood by it, such as Paracelsus, have passed for charlatans until more justly esti-

mated by later times. Several books have been written on the charlatanism of scholars. J. B. Mencke's satire, *De Charlataneria Eruditorum* (Leip. 1715), is a classical work, which has been continued by Büschel in his book, *Ueber die Charlatanerie der Gelehrten seit Mencke*.

CHARLEMAGNE, i. e., Charles the great, king of the Franks (768–814 A. D.), and Roman emperor (800–814 A. D.), was b. on 2d April, 742, probably at Aix-la-Chapelle, and was the son of Pepin the short, the first Carolingian (q. v.) king of the Franks, and grandson of Charles Martel (q. v.). On Pepin's death in 768, he and his brother Carloman jointly succeeded to the throne. By Carloman's death, and the exclusion of both his sons from the throne, C. became sole king. In 772, it was resolved in the diet at Worms to make war against the Saxons, for the security of the frontiers, which they continually threatened, and for the extension of the Christian religion. C. advanced as far as the Weser in 772, securing his conquests by castles and garrisons. Pope Adrian I. now called him to his aid against Desiderius, king of the Lombards. C. had married the daughter of Desiderius, and had sent her back to her father because she bore him no children, and married Hildegarde, daughter of the Swabian duke, Godfrey. Desiderius had sought revenge by urging the pope to crown the sons of Carloman, and on the pope's refusal, had laid waste the papal territory. C. crossed the Alps from Geneva, with two armies, by the great St. Bernard and mont Cenis, in 773, and overthrew the kingdom of the Lombards in 774. The Lombard dukes acknowledged him as their king, and he secured the pope's favor by confirming the gift which Pepin had made to the papal see, of the exarchate of Ravenna. In 775, he was again employed in the most northerly part of his dominions, reducing the Saxons to subjection; in 776, he suppressed an insurrection in Italy; in 777, he so completed his victory over the Saxons, that their nobles generally acknowledged him as their sovereign in an assembly at Paderborn. Being now invited to interpose in the wars of the Arabs and Moors in Spain, he hastened to that country in 778, and added to his dominions the regions between the Pyrenees and the Ebro. From Spain he was summoned in haste by a new insurrection of part of the Saxons, who had advanced almost to Cologne, but whom he drove back to the Elbe. In 781, he went to Italy, where the pope crowned his second son, Pepin, king of Italy, and his third son, Louis, an infant of three years old, king of Aquitaine. The Saxons once more rising in arms, defeated and destroyed a Frankish army on the Stüntel in 782, which C., after a new victory, fearfully revenged by causing no fewer than 4,500 prisoners to be executed as rebels in one day. A more general rising of the Saxons followed, but in 783–85, the Frankish monarch succeeded in reducing them completely to subjection, and in persuading their principal chiefs to submit to baptism, and to become his faithful vassals. Subsequent insurrections and wars in Germany, between this year and 800, resulted in victories over the Bulgarians and Huns, and in the further consolidation and extension of his empire, the eastern boundary of which now reached to the Raab.

In 800, C. undertook an Italian campaign, which was attended with the most important consequences. Its immediate purpose was to support pope Leo III. against the rebellious Romans. When C., on Christmas day, 800, was worshipping in St. Peter's church, the pope unexpectedly, as it appeared, set a crown upon his head, and, amidst the acclamations of the people, saluted him as Carolus Augustus, emperor of the Romans. Although this added nothing directly to his power, yet it greatly confirmed and increased the respect entertained for him, such was still the luster of a title with which were associated recollections of all the greatness of the Roman empire. A scheme for the union of the newly revived western empire with the empire of the east, by C.'s marriage with Irene (q. v.), the Byzantine empress, failed by reason of Irene's overthrow. After this, C. still extended and confirmed his conquests both in Spain and in Germany. He labored to bring the Saxons to a general reception of Christianity, and founded bishoprics for this purpose. To the end of his reign, he was incessantly engaged in wars, and insurrections were always apt to break out in the frontier parts of his dominions; which he endeavored to secure, however, not only by military power and arrangements, but by improvements in political and social institutions. His views were liberal and enlightened to a degree rare for many subsequent ages. Whilst he made the power of the central government to be felt to the utmost extremities of his empire, he recognized in his subjects civil rights, and a limitation of monarchic power by their assemblies. He zealously endeavored to promote education, agriculture, arts, manufactures, and commerce. He projected great national works, one of which was a canal to connect the Rhine and the Danube; but he deemed nothing beneath his attention which concerned the interests of his empire or of his subjects. He required his subjects to plant certain kinds of fruit-trees, the cultivation of which was thus extended northward in Europe. His own domains were an example of superior cultivation. He had a school in his palace for the sons of his servants. He built sumptuous palaces, particularly at his favorite residences, Aix-la-Chapelle and Ingelheim—for he had no fixed capital—and many churches. Learned men were encouraged to come to his court. He himself possessed an amount of learning unusual in his age; he could speak Latin and read Greek. He attempted to draw up a grammar of his own language. C. was of more than ordinary stature, and of a noble and commanding appearance. He was fond

of manly exercises, particularly of hunting. He was too amorous, but in eating and drinking he was very moderate. His fame spread to all parts of the world: in 768, Harun-al-Raschid sent ambassadors to salute him. He enjoyed good health till shortly before his death, 28th Jan., 814. He was buried at Aix-la-Chapelle (q.v.), in a church which he had built there. He was succeeded by his son Louis, styled Louis le Débonnaire, the only one of his sons who survived him; but the greatness of his dynasty terminated with his own life. C. is styled Charles I. in the enumeration both of the French kings and of the German or Roman emperors. Besides his *capitularies* (q.v.), there are extant letters and Latin poems ascribed to him. His life was written by his secretary, Eginhard.

CHARLEMONT. See GIVET, *ante*.

CHARLEROI, a Belgian t. and fortress in the province of Hainaut, stands on the Sambre, between Mons and Namur, on the line of the Brussels and Namur railway. The pop. is (1873) 12,150, who carry on considerable manufactures in hardware, glass, woolen-yarn, etc. The district is rich in coal, and the number of smelting-furnaces and nail-factories in the neighborhood is very great. The ironworks of Couillet, which yield a third of all the cast-iron produced in Belgium, lie within a mile or two of the town. C. possesses considerable historical and political interest as a fortress. The fortifications were begun by the Spaniards in 1666, but falling into the hands of the French next year, they were completed by Vauban. After six exchanges of masters between the French and Spaniards, the peace of Aix-la-Chapelle, 1748, left C. in the possession of Austria. In 1794, after a protracted and desperate resistance, it was surrendered to the French by capitulation, when the fortifications were demolished. The importance of the place in a strategic point of view having become apparent during the campaign of 1815, the fortifications have been since restored.

CHARLES, a co. in s.w. Maryland, between the Potomac and Pawtucket rivers; 450 sq. m.; pop. '70, 15,738—9,318 colored. Surface uneven, with forests of locust, oak, ash, chestnut, and cedar. Tobacco is the main production. Co. seat, Port Tobacco.

CHARLES I., King of England, Scotland, and Ireland (1625—49), was b. at Dunfermline, 19th Nov., 1600, and was the second son of James I. of England (VI. of Scotland). On the death of his elder brother, Henry, in 1612, he became prince of Wales, and heir-apparent to his father's throne; to which he succeeded in 1625, but found both in England and Scotland a contest in progress between king and people. He had inherited from his father the most extreme notions of kingly prerogative, and he mistook the general movement in the public mind for an agitation amongst a few disaffected persons. He had deeply imbibed his father's notion, that an Episcopal church was the most consistent with the proper authority of kings; and he adopted severe and persecuting measures against the Puritans in England and the Presbyterians in Scotland. He married a Roman Catholic, Maria Henrietta of France, a marriage most displeasing to the nation; and even so far despised public opinion as to make his father's favorite, the duke of Buckingham, his prime minister and chief adviser. The English parliament, which he assembled in 1625, was resolved upon the vindication of the national liberties, and was therefore very sparing in its grants of subsidies, while that of 1626, instead of freely granting supplies, resolved upon the impeachment of Buckingham; whereupon the king threw into prison two of the boldest members, Elliot and Digges; dissolved parliament; and, to procure money, had recourse to the arbitrary measures of forced loans, and a tax upon the seaports (*ship-money*), imposed by the mere exercise of royal authority. By all this, public feeling was more and more embittered. In 1628, C. found it necessary again to summon a parliament; and the parliament, very resolute to maintain the liberties of the nation, presented the petition known in history as the *Petition of Right* (q.v.). C. temporized, conceded, and finally, although the assassination of Buckingham had removed one cause of strife, assumed a threatening tone, and dissolved the parliament, 10th Mar., 1629. He even caused some of the leading members of the house of commons to be imprisoned. He now governed for 11 years without a parliament, having Laud (q.v.) and Strafford (q.v.) for his chief advisers, and obtaining for his edicts the semblance of a legal sanction by means of the star chamber (q.v.). All this while, the storm was gathering, the love of liberty increased, and republican principles were developed and extended. The policy which C. adopted was that of more severe repression. At length, in 1638, Scotland assumed an attitude of determined resistance to the imposition of a liturgy and of Episcopal church-government. The national covenant (q.v.) was subscribed, Presbyterianism was completely restored; and in 1639, the king having assembled an army for the purpose of reducing Scotland to subjection, the Scottish covenanters also took up arms, and advanced to the English border, many of the English regarding their approach with joy. Civil war was, however, prevented for the time, by concessions on the part of the king. Unable to do without supplies any longer, C. summoned an English parliament in 1640, which, instead of listening to his demands, began to draw up a statement of public grievances. C. soon dissolved the parliament, and assembled an army to resist the Scots, who had again taken up arms and entered England; but his army was defeated by them at Newburn-upon-Tyne, and they advanced southward, with the sympathy and good wishes of no small part of the king's English subjects. Much against his will, C. was now compelled again to call a parlia-

ment, whose memorable sittings began on 3d Nov., 1640. Both houses were resolute in their opposition to his despotism. They began by the impeachment of the ministers and high officers of state, and declared the decrees of the star chamber and court of high commission to be null and void. They passed a bill in favor of triennial parliaments; and the king, in trepidation, gave it his assent. He also consented, although against his own convictions, to the execution of Strafford; and even gave his assent to an act which provided that the present parliament should not be dissolved, prorogued, or adjourned, without its own consent. Hoping to win the favor of the Scots, he now visited Scotland; but whilst he was there, a rebellion broke out in Ireland, accompanied with a fearful massacre of Protestants. The prospect of a peaceful accommodation was now almost destroyed; the English parliament enlarged its demands; the king, after seeming to yield, took the extraordinary step of suddenly, on 4th Jan., 1642, appearing in the house of commons, accusing five members—Pym, Hampden, Hollis, Hazlerig, and Stroud—of high treason, and demanding that they should be delivered up to him. Both houses of parliament espoused their cause, and the city of London showed a determination to defend them by arms. C. left London with his family, and the parliament declared the kingdom in danger. Civil war began; the royalists had at first the advantage, but the national feeling was with the parliament. Negotiations were from time to time opened or renewed, but always in vain. After the battle of Naseby, on 15th June, 1645, in which his army was almost annihilated by the parliamentary troops under Fairfax and Cromwell, C. was compelled to seek refuge in the Scottish camp. Negotiations still proving fruitless, he was delivered up to the English parliamentary army. Negotiations were still attempted with C. in his captivity; but resulted in nothing. Finally, C. fled, was taken, refused the ultimatum of the army, and so enraged Cromwell and the Independents, that parliament was obliged to pass an act declaring all negotiation with the king to be treason. The Presbyterians of England and the Scots, who were always haunted by the idea that there was something sacred and inviolable in monarchy, thought to rescue the king from the hands of the Independents, but were defeated, and all the Presbyterians were forcibly expelled from the English house of commons, which now consisting only of about 60 members—the *Rump parliament*—appointed a court composed of persons from the army, the house of commons, and the city of London, to try the king. The court was opened with great solemnity in Westminster hall on 20th Jan., 1649. About 70 members took part in its proceedings. On the 27th of Jan., C. was condemned to death as a tyrant, murderer, and enemy of the nation. The Scots protested, the royal family entreated, and the court of France and states-general of the Netherlands interceded, but in vain. On 30th Jan., 1649, he was beheaded in front of the palace of Whitehall. In his last hours he showed great calmness and presence of mind. In his private character, C. was a man of cultivated mind, kind, and of irreproachable life; but in political affairs he was unscrupulous, and had recourse to dissimulation and falsehood for the accomplishment of his purposes. In the estimation of many who do not condemn it on moral grounds, his execution was a great political blunder. From the restoration of Charles II., the 30th of Jan. was observed in the church of England with special religious services, as the day of *king Charles the martyr*. This commemoration, offensive to great part of the community, and of the members of the established church itself, was abolished by act of parliament in 1859.

CHARLES II., King of England, Scotland, and Ireland (1649–85), the eldest son of Charles I., was b. 29th May, 1630, and went with his mother to France during the civil war. He was at the Hague at the time of his father's execution, and immediately assumed the title of king. He meditated an expedition to Ireland for the assertion of his claims, when the Scots offered him their crown in 1650, and proceeding to Scotland, he was crowned at Scone in the beginning of 1651. The limitations, however, under which he received the crown, were disagreeable to him, and he hated the restraint put upon his inclinations by the Presbyterian clergy. After the defeat of the Scots at Dunbar, he put himself at the head of their army, in hope of rousing the royalists of England to his support; but was completely defeated by Cromwell, at Worcester, on 3d Sept., 1651. He made his escape, amidst many dangers, to France, where his situation was by no means agreeable, and from which he went to Cologne, and afterwards to the Netherlands. After Cromwell's death, the desire of the English for a settled government leading to the restoration of the house of Stuart, he landed at Dover, on 26th May, 1660, was received with acclamation by the people, and ascended the throne almost untrammelled by a single condition. He was surrounded by men of extreme party-feeling, among whom the most influential was the chancellor, Clarendon (q.v.). The persons immediately concerned in the death of Charles I. were brought to the scaffold; Episcopacy was restored; and the Presbyterians and other non-conformists, both in England and Scotland, were subjected to great hardship and persecution. The king was extravagant, and soon found himself in want of money: he married the princess Catharine of Portugal, for the sake of her large dowry; he shamefully sold Dunkirk and Mardyke to the French; and for a pecuniary consideration, agreed to make war against the united provinces, although such a war was contrary to all the feelings of the English people and the interests of English commerce. The Dutch fleet, under De Ruyter,

entered the Thames, and C. was compelled to make an ignominious peace. After the fall of Clarendon, the ministry known as the Cabal (q.v.) ministry came into power—a ministry hateful to the country, composed of unprincipled men, and bent upon the restoration of popery and absolute monarchy. C. sought to conciliate the people by the *triple alliance*, in May, 1668, with Sweden and the states-general; but the French court soon found means to persuade him again to make war against the united provinces. He basely accepted pecuniary gifts and a pension from the French government; and, as even this, with all that he could get from his parliament, was insufficient for his expenses, he had recourse to illegal means of raising money. The story of the *popish plot* (q.v.) against the life of the king caused prodigious excitement amongst the people, and lord Stafford and many other persons were most unjustly brought to the scaffold. The parliament of 1679, very much against the will of the court, enacted the celebrated *habeas corpus act* (q.v.): and a bill was under consideration for the exclusion of the king's brother, the duke of York, from the throne, on account of his avowal of the Roman Catholic religion. The king, at this period of his reign, had, however, completely crushed the Presbyterians of Scotland, and was more absolute than any of his predecessors had been on either of the British thrones. Most arbitrary measures were adopted. The city of London was deprived of its privileges, because of the election of a sheriff disagreeable to the court. The *Rye-house plot* (q.v.), a widely-extended conspiracy, and in which the king's natural son, the duke of Monmouth (q.v.), was concerned, was discovered in 1683, and cost the lives of a number of persons, amongst whom were lord Russell and Algernon Sidney. C., however, appears to have recognized the necessity of a more liberal policy, when he was unexpectedly carried off by death, on 6th Feb., 1685. In his dying hours, he called in the assistance of a Roman Catholic priest, although he had not previously avowed his attachment to that religion. His reign was full of events dishonorable to his country, and of which he himself was generally the cause. His life was most dissolute; his adulteries, and the profligacy of his court, scarcely paralleled in British history. He had an affability, however, which won for him a certain sort of popularity.

CHARLES I., THE BALD, 823-77; King of France and emperor of the Romans, son of Louis le Debonnaire by his second wife, Judith. The father, in order to furnish C. a kingdom, took away portions of the territory of the other sons, and war among them followed, which ended in leaving C. in possession of a large kingdom in the w. part of the empire. When Louis died, C. undertook to succeed him as the emperor, and made an alliance with his brother Louis, the German. In 841, C. defeated his rival and eldest brother, Lothaire. In 843, the treaty of Verdun confirmed C. in possession of the kingdom, which comprised all France west of the Meuse, Saone, and Rhone, and Spain from the Ebro to the Pyrenees. But the government of C. was weak; the Norsemen pillaged the country almost without resistance; and finally the people, in despair of relief, called in the aid of his brother Louis, who drove C. from the country for a time. But C. had the church on his side, being entirely under control of the bishops, and in 875 he was crowned emperor by the pope. Louis was too strong for him, however, and he never to any great extent recovered his power. He died in 877, near mont Cenis, while on his way against the Saracens at the request of the pope.

CHARLES II., THE FAT, 832-88; King of the Franks and emperor of the Romans, third son of Louis the German. From his father, C. inherited Swabia; in 880, the death of his brother Carloman of Bavaria made him king of Italy; in 881, he was crowned emperor; the death of Louis of Saxony in 882, also a brother, brought him all Germany; and that of Carloman, the French king, in 885, left him all France; and so by no effort of his own, but by natural causes solely, C. became sovereign of all the dominions of Charlemagne. But he was a weak, gluttonous creature, more intent upon the pleasures of the table than upon matters of state. The Norsemen sailed up the Seine and laid siege to Paris, and C., instead of making even an attempt at resistance, bought them off with 700 pounds of silver and a free passage to the upper Seine and Burgundy, where they might ravage at will. In 887, C. was deposed by his people, and died the next year in a cloister.

CHARLES III., THE SIMPLE, 879-929; King of France; posthumous son of Louis the stammerer. By the death of his rival, Charles the fat, in 898, he obtained possession of the whole kingdom. The most conspicuous act of his reign was the cession to the harassing Norsemen of the territory afterwards known as Normandy, on condition that the heathen should be baptized, that Rollo (Hrolf Ganger, or Ralph the walker, a Danish pirate chief, and the ancestor of William the conqueror, of England) should marry Charles's sister, and become a duke and vassal of the crown. In 922, the barons rebelled against Charles, and elected Robert, brother of the previous king, in his place; but Robert was killed by Charles's own hand in the battle of Soissons, though that did not secure to him the victory. The barons then chose for king Raoul, duke of Burgundy. After many failures, misfortunes, and a long imprisonment, Charles died at Peronne.

CHARLES IV., THE FAIR, 1294-1388; King of France and Navarre; third son of Philip the fair, succeeded his brother Philip V., in 1322. The chief purposes of his policy were to free the country from the Lombards, and from the exactions of the barons

and the judges. He also did something towards improving the condition of the Jews, and assisted his sister Isabella in her contest with her husband, Edward II. of England. In 1325, being supported by the pope, Charles made an unsuccessful effort to attain the imperial crown.

CHARLES V., surnamed **THE WISE**, King of France (1364-80), was the son of king John, and was b. on 21st Jan., 1337. His father being made prisoner by the English at the battle of Poitiers, on 19th Sept., 1356, he assumed the regency. The most significant events which occurred under his rule, were the vigorous efforts of the *bourgeoisie* to deliver themselves from the tyranny of the nobles and the court, and the peasant war called the *Jacquerie* (q.v.). His father dying, 8th April, 1364, C. ascended the throne, and by his cautious policy rescued the kingdom from some of its troubles, and re-established the power of the crown, which had been much shaken. War with England raged for a number of years, but with results highly favorable to C., who stripped his enemies of all their conquests in France, except a few fortified places. He died 16th Sept., 1380. C. was fond of books and the company of learned men, but was not above the natural weakness of kings for outward pomp and magnificence.

CHARLES VI., King of France (1380-1422), b. at Paris, 3d Dec., 1368, was the son and successor of Charles V. He was only 13 years of age when his father died. For several years, his uncle, the duke of Anjou, acted as regent. In 1388, C. took the reins of government into his own hand, but during his life-time was so often afflicted with insanity, that party strife raged without much check. The two great families whose influence divided the nation, were those of Orleans and Burgundy. It was the Orleans party which called in the assistance of the English, and brought about the battle of Agincourt, so disastrous to the French nation. Subsequently the Burgundians allied themselves to the English, who laid waste the whole of northern France. In the midst of these calamities, C. died, 21st Oct., 1422.

CHARLES VII., King of France (1422-61), the son and successor of Charles VI., was b. on 22d Feb., 1403. On his father's death he was at the head of an army, with which he held possession of the southern provinces of the kingdom; Paris and the north being in the hands of the English, who proclaimed Henry VI. of England king of France, and appointed the duke of Bedford regent. For some time the events of war were unfavorable to C., who was compelled, in 1424, to evacuate Champagne, and, in 1425, Maine. In 1426, the count Dunois gained the first victory over the English at Montargis; but in the year following they besieged Orleans, a place of great importance to C., as securing a connection with the north, and he was roused to fresh energy. At this time, also, Joan of Arc (q.v.), the maid of Orleans, by her wonderful courage and confidence of a heavenly mission, roused the fervor both of nobles and people. The siege of Orleans was raised in May, 1429; the English retired disheartened, and gradually lost their acquisitions in France. A treaty between the French king and the duke of Burgundy greatly advanced the French cause. In 1436, C. entered Paris; and during the further progress of the war, the English lost all their strongholds except Calais. In 1452, they were finally defeated at Castillon. After he was established on his throne, C. devoted himself to the reorganization of the government, in which everything had fallen into confusion, but showed a strong anxiety to frame it according to a scheme of perfect despotism, and for this purpose to provide himself with a powerful and well-disciplined standing army, which caused some discontentment among the nobles of his kingdom. His government, however, was mild, and under it France recovered in some measure from the effects of the terrible calamities which it had endured. His last years were embittered by the conduct of his son, the dauphin, afterwards Louis XI.; and his apprehension that his son would poison him was so strong, that his consequent abstinence from food is supposed to have hastened his death, which took place at Melun on 22d July, 1461.

CHARLES VIII., king of France (1483-98), was b. at Amboise on 30th June, 1470, and succeeded to the throne on the death of his father, Louis XI. For some time the government was carried on under the regency of his sister, Anne of Beaujeu. When C. attained his 21st year, he took the royal power into his own hand, and soon developed a bold and ambitious spirit. The most important incident of his career was his conquest of Naples in 1495, to the throne of which he believed he had a claim. The Italian princes and other European potentates were alarmed by his success. A league was hastily formed between the pope, the emperor of Germany, Ferdinand of Spain, the republic of Venice, and Sforza, duke of Milan, to oppose his return to France. C., however, gallantly broke through the allied forces near Piacenza, and effected a retreat to his own country. It was with difficulty he was hindered by his councilors from resuming his warlike designs on Italy. C. is also said to have meditated the expulsion of the Turks from Europe, and making himself emperor of Constantinople; having received from Andreas Palæologus, the grandson of the last Grecian emperor, a transference of his claims to the Byzantine throne. He died 7th April, 1498.

CHARLES IX., king of France (1560-74), the second son of Henry II. and of Catharine de' Medici (q.v.), was b. at St. Germain-en-Laye on 27th June, 1550, and on 5th Dec., 1560, succeeded to the throne on the death of his brother, Francis II. His char-

acter was a compound of passion, acuteness, heartlessness, and cunning, Although only 24 years of age when he died, so well had his detestable mother trained him to a love of perfidy and cruelty, that he found time, with her assistance and that of the Guises, to perpetrate an act so hideously diabolical, that all civilized Europe still shudders at the recollection. The massacre of St. Bartholomew's (q.v.), 24th Aug., 1572, was the culmination of a series of treacheries towards the Huguenots, which disgraced his reign. The result was, that civil war broke out anew, and assumed a very threatening character, as political malcontents associated themselves with the Protestants. C. died May 30, 1574.

CHARLES X., king of France (1824-30), third son of the dauphin Louis, and grandson of Louis XV., was b. at Versailles, 9th Oct., 1757. He received the title of count d'Artois, and in 1773 married Maria Theresa of Savoy. After the events of 14th July, 1789, he and the prince of Condé took the lead of the emigration. In 1796, he sailed from England with a squadron under commodore Warren, on an expedition to the western coasts of France, whereupon twenty departments rose in insurrection; but he had not courage to land and place himself at the head of the insurgents, whom he basely left to the vengeance of the republicans. Detested now by the royalists of France, and despised by the British, he lived in obscurity until the allies entered Paris in 1814, when he appeared in France as lieutenant-general of the kingdom, and issued a proclamation announcing the end of despotism, of conscriptions, and of oppressive taxes. After the second restoration, he took little open part in politics, but lived surrounded with priests, Jesuits, and nobles of the old school; and in this circle originated the tyrannical and unconstitutional measures to which even Louis XVIII. made considerable opposition, but which at this time disgraced the government of France. The death of Louis, on 16th Sept., 1824, brought C. to the throne. He took the oath of adherence to the charter, but soon displayed his intention of restoring as much as possible the absolutism of the old French monarchy. Popular discontent rapidly increased. A royal speech, of a threatening character, on 2d Mar., 1830, was followed by an address of remonstrance, signed by 221 deputies, upon which the king dissolved the chambers. The deputies who signed the address were all re-elected, but the court taking fresh courage from the success of the expedition to Algiers, the celebrated ordinances of 25th July were signed by the king, putting an end to the freedom of the press, already largely curtailed, appointing a new mode of election, and dissolving the recently elected chamber. The capital took up arms, the guards refused to act, and the king soon found himself compelled to flee. As a last resource, he abdicated the throne, on 2d Aug., 1830, in favor of his grandson, Henry, duke of Bordeaux, the dauphin also consenting to this act. But it was too late; the revolution was accomplished, and Louis Philippe, duke of Orleans, was chosen king of the French. C. made his escape to England, resided for some time at Holyrood, and afterwards at Prague. He took no part in the political intrigues and attempts of the duchess de Berri. He died of cholera at Görz, on 6th Nov., 1836. His only surviving descendant, in the male line, is his grandson, the count of Chambord (q.v.).

CHARLES IV., German emperor (1346-78), was b. at Prague in 1316, and was the son of king John of Bohemia, of the house of Luxembourg, who fell in the battle of Crecy. At the instigation of pope Clement VI., to whom he had previously taken an oath of humiliating submission at Avignon, he was elected emperor by a portion of the electors on 11th July, 1346, although Louis IV. then actually filled the imperial throne. But even after the death of Louis, it was not without difficulty that he obtained secure possession of it. He was crowned king of Italy at Milan in 1354, and emperor at Rome in 1355. In 1356, he issued the golden bull (q.v.), the fundamental law concerning the election of German emperors; in defiance of the very letter of which he afterwards, by large bribes, secured for his own son, Wenceslaus, the succession to the empire. He died at Prague, 29th Nov., 1378. C. was an artful politician, but destitute of true greatness. He sought the support of the clergy by undue concessions, sold rights and privileges in Italy and other parts of the empire for money, and cared chiefly for the prosperity of his hereditary kingdom of Bohemia.

CHARLES V., German emperor, was b. at Ghent on 24th Feb., 1500. He was the eldest son of Philip, archduke of Austria, and of Joanna, the daughter of Ferdinand and Isabella of Spain. Philip's parents were the emperor Maximilian and Maria, daughter and heiress of Charles the bold, duke of Burgundy. On the death of his grandfather, Ferdinand, in 1516, C. took possession of the throne of Spain by the title of Charles I., his mother Joanna being of disordered intellect and incapable of reigning. He was not, however, very favorably received by the Spanish nobles, who were doubtful of his right, and jealous of the followers whom he brought from the Low Countries, where he had been educated. All the abilities of his famous minister Ximenes (q.v.) were requisite to prevent an open revolt. On the death of Maximilian in 1519, C. was elected German emperor from amongst a number of competitors, chiefly through the influence of the elector Frederic of Saxony. In his earlier years he had been frivolous and dissolute, but he now became mindful of the duties and dignity of his high position. On 22d Oct., 1520, he was crowned at Aix-la-Chapelle, and received from the pope the title of Roman emperor. He ascended the imperial throne at a

time when Germany was in a state of unprecedented agitation concerning the doctrines proclaimed by Luther. To restore tranquillity, a great diet was held at Worms in 1521, Luther's declaration of his principles before which forms a well-known and important passage in the history of the reformation. In 1522, he reduced to subjection the towns of Castile, which had leagued themselves together for the maintenance of their ancient liberties. He was likewise successful in his war against the Turks under Solymán the great. C. was involved also in a struggle of long duration with France, in which, after many alternations of fortune, his armies at last drove the French from the greater part of their conquests in Italy; and Francis I. of France fell into his hands as a prisoner, after a battle by which the siege of Pavia was raised on 24th Feb., 1525.

The pope, however, began to grow alarmed at his victories, and therefore allied himself with France and the principal Italian states, and released the king of France from the obligations under which he had come by his treaty with Charles. It was the pope's object to exclude C. from all dominion in Italy; but the emperor's forces under Charles of Bourbon, the former constable of France, took Rome itself by storm, plundered it, and made the pope prisoner. C. pretended great regret for this, went into mourning with all his court, and caused prayers to be said for the pope's liberation, whilst by his own directions the pope was kept for seven months a captive. Peace was concluded in 1529, on terms most favorable for the emperor. He now thought to put an end to the religious differences in Germany, and to repel the Turks, who had overrun Hungary and laid siege to Vienna. But the diet at Augsburg in 1530, proved how vain was the hope of restoring the former state of things in Germany; and the emperor refusing to recognize the confession of the Protestants, they refused to help him against the Turks. In 1531, the Protestant princes formed the league of Smalcald (q.v.), and allied themselves with France and England for their own protection. This, and the continued assaults of the Turks, compelled the emperor to yield in some measure to the demands of the Protestants. In 1535, C. undertook an expedition from Spain against the pirate Barbarossa, who had established himself in Tunis, and whose vessels did prodigious injury to the commerce of Spain and Italy. In this expedition he was completely successful, and set free no fewer than 22,000 Christians, who had been held as slaves. War again broke out with France; an armistice for ten years was concluded in 1538; and C. even visited Paris, where he was magnificently entertained. But the war broke out afresh in 1542, and terminated in favor of the emperor; who also triumphed in the battle of Mühlberg, 25th April, 1547, over the Protestant princes of Germany, and deprived the elector John Frederic of Saxony of his territories. But he showed so plainly his intention of converting the German empire into a hereditary possession of his family, that new opposition arose, and C. was compelled to flee before the arms of duke Maurice of Saxony and the Protestants, and in 1552 to promise them the peaceful exercise of their religion, which was confirmed by the diet at Augsburg in 1555. Henry II. of France also took from C. some parts of Lorraine. His health failing, C. now declared, in an assembly of the states of Louvaine, his resolution to seek repose, and devote the remainder of his days to God. He resigned the government of his dominions to his son, for whom, however, he vainly sought to secure the imperial throne; and having relinquished to him the crown of Spain on 15th Jan., 1556, he retired to the monastery of Yuste, in Estremadura, where he spent two years partly in mechanical amusements, partly in religious exercises, which are said to have assumed a character of the most gloomy asceticism, and died on 21st Sept., 1558. By his wife Isabella, daughter of king Emmanuel of Portugal, he had one son, his successor, Philip II. of Spain, and two daughters. His brother Ferdinand succeeded him in the empire.

CHARLES VI., German emperor, 1711–40, the last of the proper male line of the house of Hapsburg, was the second son of the emperor Leopold I., and b. 1685. His father intended for him the crown of Spain; but Charles II. of Spain, yielding to French intrigues, assigned it by testament to Philip of Anjou, whereupon arose the great war of the Spanish succession—Britain and Holland taking part with the emperor against France, for the maintenance of the balance of power in Europe. C. was acknowledged by the allies as Charles III. of Spain, but had not succeeded in obtaining permanent possession of the kingdom, when the death of his brother, the emperor Joseph I., recalled him to Germany in 1711; and as he now became emperor of Germany, Britain and Holland concluded the peace of Utrecht with France in 1713. C. continued the war for some time longer; but was at last obliged to give up his claim to Spain, being confirmed, however, in possession of the Spanish Netherlands and of the Spanish possessions in Italy. Success attended his arms in a war against the Turks, and in a war with Spain, which arose out of the project, of the Spanish minister Alborni, and in which the *quadruple alliance* was formed—France, Britain, and Holland joining the emperor against Spain. But C., having lost his only son, and being very anxious to secure the throne to his own descendants, named his daughter, Maria Theresa (q.v.), as his heiress, by a *pragmatic sanction* (q.v.), to which he had much difficulty in obtaining the consent of some of the German states and some foreign powers; and to accomplish this object he gave up Tuscany, Parma, and Piacenza, and afterwards Naples, Sicily, Lorraine, and some parts of Milan. Meanwhile, he was unsuccessful in wars

with France and Spain, and with the Turks, who compelled him, in 1739, to resign his former conquests. He died 20th Oct., 1740. He was of a mild and benevolent disposition, but full of superstition and of prejudices in favor of feudalism and ecclesiastical domination.

CHARLES VII., German emperor (1742-45), was b. at Brussels in 1697, and was the son of Maximilian Emmanuel, elector of Bavaria, and for some time governor of the Spanish Netherlands. After the conquest of the Bavarian territories, and the pronouncement of the ban of the empire against his father by the emperor Joseph I., he was for some time the emperor's prisoner; but after the decease of Joseph, he married his youngest daughter; and having, in 1726, succeeded his father as elector of Bavaria, refused his consent to the pragmatic sanction (see preceding article); and on the death of Charles VI. in 1740, advanced a claim to the Austrian dominions in right of his wife, and upon the further ground of a testament of Ferdinand I. Success at first attended his arms; he was acknowledged as archduke of Austria, and then as king of Bohemia, upon which he was also, in 1742, elected emperor. But the tide of fortune now turned against him. The Hungarians rose in favor of Maria Theresa, and he was driven from Austria and from Bohemia, and for a time even from his Bavarian capital, Munich. Disease and calamities combined to cause his death, 20th Jan., 1745, shortly before which he said, "Misfortune will never leave me till I leave it."

CHARLES, Count of Anjou and Provence, King of Naples and Sicily, about 1220-85. He was the ninth son of Louis VIII. of France, and wedded Beatrice, heiress of Provence, after scattering his rivals by the aid of an army furnished by his brother, Louis IX. His next adventure was on a crusade to the Holy Land in company with his brother, when both were taken prisoners. Returning to Provence, Charles resumed his authority, and began to cherish high ambitions. He first assisted Margaret of Flanders, in a plan to set aside the children of her husband by a former wife, for the aggrandizement of her own offspring, for which Charles was to receive the province of Hainault; but Louis interfered and Charles was compelled to relinquish Hainault for a sum of money. About this time the pope, Urban IV., requested Charles to assume the crown of the Two Sicilies, to assist in the overthrow of the bastard Manfred, the Ghibelline king; and in 1265, Charles was crowned at Rome; a crusade was preached against Manfred, who was taken and killed; Conradin, the legitimate heir, was also betrayed, captured, and murdered; a like fate was dealt out to many Italian nobles; estates were confiscated to reward the French mercenaries; and they established over Sicily an arbitrary and brutal rule. Charles aimed at becoming the head of the eastern empire. With this intent he accompanied his brother on another crusade; but the venture failed in consequence of a great storm and the breaking out of the plague. Charles also incurred the enmity of the pope, Nicholas II., by refusing to accept the hand of his niece for Charles's grandson: so Nicholas went over to the Ghibellines, and took from Charles his titles. But Nicholas died in 1280, and Charles procured the election of a Frenchman, Martin IV., to the chair of St. Peter, in return for which Charles was made senator of Rome, and his rival, the emperor Michael Palæologus, was excommunicated. Another expedition was ready for the east, when news was brought of the rebellion, afterwards known as the Sicilian Vespers (see *ante*); the people of Sicily had risen against their conquerors, and on Easter Monday, 1282, nearly exterminated the French in all Sicily. Charles at once sent his fleet against Messina, refusing all offers of capitulation; but the city held out until assistance came from Don Pedro of Aragon, and Charles's fleet was burned. Despairing of other means of success, Charles challenged Don Pedro to single combat; the latter accepted, but only Charles appeared in the list. Soon afterwards Charles's son was defeated and taken prisoner; and in 1285, Charles himself fell ill and died at Poggia.

CHARLES III., OF DURAZZO, 1345-87; King of Naples and Hungary. His father, who had rebelled against the queen, Joanna I. of Naples, died in prison; and the queen adopted the son, but afterwards displaced him in favor of Louis of Anjou, the father of Charles V. of France. Charles made an alliance with the king of Hungary, and set out to invade Naples. At Rome he was crowned king by the pope; thence he went to Naples, captured the queen, and had her assassinated. Three years later he was invited to accept the crown of Hungary by the nobles, who were dissatisfied with the rule of queen Elizabeth, and was crowned on the last day of the year 1386. Five weeks afterwards Elizabeth caused him to be murdered in her own presence. As he and his kingdom of Naples were under papal interdict, his body remained unburied for five years.

CHARLES I., b. 1839; Prince of Roumania, second son of prince Charles Anthony of Hohenzollern. In 1866, Charles was elected president of Roumania by an almost unanimous vote. He found the country in a wretched condition, the treasury empty, education unprovided for, and the people divided into warring political factions. By energy and good statesmanship he greatly improved matters, and when the Russo-Turkish war began he seized the occasion to proclaim Roumania's entire independence of Turkey, and such a declaration was officially made by the chambers. In 1869, Charles married princess Elizabeth of Wied.

CHARLES II., 1661-1700; King of Spain; son of Philip IV. He was but four years old when his father died, the regency being in the hands of the queen, Anna Maria of Austria. During her rule, Spain was much weakened by an unsuccessful war with France and by the loss of Sicily. In 1675, Charles assumed the government, taking for his chief adviser Don John, an illegitimate son of the late king. By marrying Louise of Orleans, a niece of Louis XIV., Charles maintained harmony with France for several years. After her death, Charles married a sister of the emperor, Leopold I., and in 1694 he joined Leopold in a war against France. The war was speedily concluded by the peace of Ryswick, 1697, and as Charles was childless there was a long negotiation concerning the succession, ended through the influence of the pope, who secured the crown for the grandson of Louis XIV., Philip Bourbon, who ruled Spain as Philip V.

CHARLES III., 1716-88; King of Spain, second son of Philip V., and great-grandson of Louis XIV. of France. Parma, Piacenza, and Tuscany having fallen to Spain, Charles, at the age of 15, was furnished with an army and given rule over those countries. At 18 he conquered the Two Sicilies, and the emperor was obliged to acknowledge him as king. On the death of his brother, Charles succeeded to the Spanish throne, in 1759. He was a man of ability and liberal ideas, and made many reforms, especially in financial administration. The Jesuits were banished, and an unsuccessful effort was made to bring the inquisition under the control of the civil power. He endeavored to put a stop to brigandage and to Algerine piracy; and interested himself in the development of commerce, and arts and sciences. In 1763, he ceded Florida to England in exchange for Cuba, and some years later he joined France in sending assistance to the American colonies, then engaged in the war for independence. At the close of the war, Florida was again given to Spain. He made an unsuccessful attempt to rescue Gibraltar from the English. Charles died in Madrid after a reign of 29 years.

CHARLES IV., 1748-1819; King of Spain, son and successor of Charles III. When very young, Charles married his cousin, Maria Louise of Parma, who soon acquired great influence over him. The government was conducted chiefly by Manuel Godoy, a handsome guardsman who gained the friendship of both the queen and her husband, and was made duke of Alcudia, and minister of foreign affairs. Godoy concluded peace with the French republic in 1795, after an unsuccessful attempt on the part of the king to assist his relative, Louis XVI. Soon after this peace an offensive and defensive alliance was made with France, and Spain speedily became involved in war with Portugal and also with England, the main event of which was the destruction of the Spanish fleet by Nelson at Trafalgar in 1805. In 1807, Charles made with Napoleon a secret treaty according to which Portugal was to be seized by the French and Spanish, and the greater part to be divided between Godoy and the queen of Etruria, and Charles was to assume the title of emperor of America; at the same time, 16,000 Spanish troops were to be sent to the assistance of the French in Denmark. While this was going on, Napoleon was intriguing with Don Ferdinand, the heir to the throne, who was soon after discovered in a plot to assassinate his father. Though pardoned, Ferdinand continued to do all that he could to arouse ill feeling against the court, and in 1808, Charles was so alarmed at disturbances in Madrid, that he abdicated in Ferdinand's favor. Charles declared immediately that this act was not voluntary; but the matter was decided by a meeting with Napoleon at Bayonne, urged by Godoy, who was moved by fear of Ferdinand, and also by the queen. Charles surrendered the crown to Napoleon (who gave him a pension of six millions of francs, and the castle and grounds of Chambord), refusing again to assume authority, although he might have done so, his son being very unpopular.

CHARLES IX., 1550-1611; king of Sweden, the fourth son of Gustavus Vasa. The Swedish crown belonged to Charles's nephew, Sigismund, king of Poland; but as he was a Roman Catholic, Charles was appointed to direct the government till Sigismund signed a decree establishing the Lutheran religion in Sweden. After many attempts at accommodation, Sigismund was formally deposed in 1604, and Charles was elected king. He had wars with Poland, Russia, and Denmark, and when 60 years old he challenged the king of Denmark to single combat, but the Dane did not respond. Charles founded the university of Gothenburg, and made a new code of laws. He wrote a rhymed chronicle of the war with Poland.

CHARLES X., or CHARLES-GUSTAVUS, king of Sweden, was b. at Nyköping, 8th Nov., 1622. After studying at the university of Upsala, he traveled through France, Germany, and Switzerland, joined the army of Torstensohn (q.v.) in 1642, fought at the battles of Yan'kovitz and Leipzig; and at the close of the war was the representative of queen Christina at the conferences which were held for giving effect to the treaty of Westphalia. On the abdication of Christina, Charles-Gustavus, who was the son of Gustavus Adolphus's eldest sister Catharine and John Casimir, the palatine of Zweybruck in Clerburg, succeeded as next heir, 17th June, 1654, to the throne of a kingdom which, after his accession, he discovered to be in an almost bankrupt condition. There was a debt of 10,000,000, while the revenue did not amount to 800,000 crowns, out of which one fourth was granted as a pension to the ex-queen, whose carelessness and extravagance had brought about this deplorable state of matters, and who, in the words of the aged chancellor Oxenstierna, "had cost Sweden dearer than ever an enemy did."

She had taken away everything belonging to the royal residences which was portable; and C. was forced at first to borrow even a set of kitchen utensils. C. was the second of the three great warrior-monarchs of Sweden, but unlike his uncle, who could plead religious grounds, and his grandson, who was at first forced to fight for self preservation, C. seemed to make war principally for war's sake. First, he attacked Poland in July, 1655, because the Polish monarchs had not resigned their claim to the Swedish throne; captured in the same year Warsaw, Cracow, Thorn, Elbing, Posen, and Kaliez; and drove the king to take shelter in Silesia; he then assailed the Danes, who had declared war against him, crossed the belts on the ice, and speedily made himself master of all the continental possessions of Denmark. Next marching from isle to isle over the frozen sea, he ultimately, by menacing Copenhagen, compelled the treaty of Roskild (7th Mar., 1658), which gave to Sweden, Holland, Scania, Bleckingen, Bornholm, and the other Danish possessions beyond the sound, and emancipated Sweden from the sound dues. Charles, however, still cherished enmity against the Danes; and after fruitlessly proposing to the Dutch and English, a partition of Denmark, he invaded Zealand, and attacked Copenhagen in 1659. The capital, however, defended itself valiantly, aided by succor from the Prussians and Dutch; and the Swedish monarch was compelled to abandon the siege. Soon after, while laboring to effect a complete reconciliation with Poland in order to be free to attack the Danes in Norway, he died suddenly at Gothenburg, Feb. 23, 1660.

CHARLES XI., one of the ablest kings of Sweden, was the son of king Charles (X.) Gustavus, and was b. Nov. 24, 1655. While he was little more than four years old at his father's death, the government was committed to his mother Hedwig as regent, and a council. The peace of Oliva (May 3, 1660) with Poland, by which Sweden obtained Esthonia, part of Livonia, and Oesel, and the Polish monarch renounced all pretensions to the Swedish crown; and that of Copenhagen (June 6, 1660), generally confirmatory of the treaty of Roskild with Denmark, were the first important acts of the government. A treaty with Russia on the basis of the *status quo* followed in 1661; and from this period till 1672, the kingdom was free from foreign wars. In Dec., 1672, C. (whose education had been so ill attended to that he had reached manhood before he could read) took the reins of government, and by the allurements of France, was induced to make war on Brandenburg. This unprovoked attack was disastrous to the Swedes, for they suffered a severe defeat from the elector at Fehrbellin (1675); and though C. revenged himself by defeating the Danes (who were allied with Prussia) at Halmstadt, Lemd, and Landskrona, his fleet was defeated by the Dutch near Oeland, and again by the Danes at Bleking and Kiöge; and many of Sweden's recent acquisitions were wrested from her. These, however, were restored by the peace of Saint-Germain-en-Laye (17th Sept., 1679), which closed this needless and unfortunate contest. In 1680, a struggle commenced between the crown, supported by the burghers and peasants, on one hand, and the nobles on the other; and a considerable diminution of the power of the nobles was the consequence. The resumption of all the crown lands which had been alienated since 1609, was a fatal blow to the preponderating power of the nobles; and by a voluntary declaration of the states, Dec. 9, 1682, the king was invested with absolute authority. This voluntary erection of a despotism by the people, a thing of rare occurrence in the world's history, is yet more extraordinary at the close of the 17th c.; and it speaks highly for C. that he never employed his unlimited authority otherwise than for the best interests of his kingdom. By a judicious administration of the revenues, he was enabled to extinguish the public debt (1686), reorganize the fleet and army, and by 1693 to dispense with the calling up of extraordinary subsidies. Though absolute, he never imposed a tax but with consent of the states; and he every year published a detailed account of revenue and expenditure. In 1693, he was formally declared absolute by an act of the diet. The foreign policy of the country was also conducted in a manner equally satisfactory and effective. Deux-Ponts fell to him as heir to his cousin Friedrich-Ludwig, the last palatine, in 1681; the attempts of the Danes upon Holstein were rigorously repressed, and many small outlying territories were brought under his sway. His anxiety for his subjects' welfare was particularly shown by commercial and maritime regulations superior to any that then existed in Europe; and by his numerous journeys to all parts of his dominions to examine for himself into the remote details of the administration. A codification of the laws was commenced but was unfinished at his death, which took place at Stockholm, 15th April, 1697.

CHARLES XII., king of Sweden (1697-1718), was the son of Charles XI., and was b. at Stockholm on the 27th June, 1682. On the death of his father in 1697, he ascended the throne, and notwithstanding his youth, the states declared him of age to assume the reins of government. The neighboring powers thought this a favorable time to humble Sweden, then the great power of the n.; and Frederick IV. of Denmark, Augustus II. of Poland, and the czar Peter I. concluded a league for this object. The Danes began by invading the territory of the duke of Holstein Gottorp, who had married C.'s eldest sister, and who applied to him for assistance. The young king immediately resolved on the most active measures, and approached Copenhagen with such a force as presently compelled the Danes to make peace. C. now hastened to meet the Russians; and although they lay in an intrenched camp beneath the walls of Narva, 50,000 strong, he

stormed their camp on 30th Nov., 1700, with 8,000 Swedes, and defeated them with great slaughter. He next dethroned Augustus II., and procured the election of Stanislaus Leszczyński as king of Poland. Augustus supposed himself safe at least in Saxony, his hereditary dominion, but was followed thither, and humbling terms of peace were dictated at Altranstädt in 1706. C. obtained from the emperor liberty of conscience for the Protestants of Silesia. Leaving Saxony with an army of 43,000 men in Sept., 1707, he proposed to advance direct upon Moscow; but at Smolensk he was induced, by the representations of the Cossack *hetman*, Mazeppa, to change his plan and proceed to the Ukraine, in hope of being joined by the Cossacks. In this hope, however, he was disappointed, and after enduring many hardships, he was defeated by the Russians at Pultowa, on the 27th June, 1709, and fled to Bender in the Turkish dominions.

Augustus II. now revoked the treaty of Altranstädt, and the czar and the king of Denmark assailed the Swedish territories. But the regency in Stockholm adopted measures of effective and successful resistance, and C. prevailed with the porte to declare war against Russia, in which Peter seemed at first likely to have suffered a severe defeat. But Russian agents succeeded in inspiring the Turks with suspicions concerning the ultimate designs of C., who was conveyed to Adrianople, but after some time escaped, and made his way through Hungary and Germany, pressing on by day and night with extraordinary speed till he reached Stralsund, where he was received with great joy, on 11th (22d) Nov., 1714. He was soon, however, deprived of Stralsund by the allied Danes, Saxons, Prussians, and Russians. After he had adopted measures for the security of the Swedish coasts, his passion for war led him to attack Norway. Success appeared again to attend his arms, when, in the siege of Friedrichshald, on 30th Nov., 1718, he was killed by a musket-bullet. On his death, Sweden—exhausted by his wars—ceased to be numbered among the great powers. He was a man capable of comprehensive designs, and of great energy in prosecuting them. His abilities appeared not merely in military affairs, but in his schemes for the promotion of trade and manufactures. His self-willed obstinacy, however, amounted almost to insanity; in fact, he has been termed “a brilliant madman.” His habits were exceedingly simple; in eating and drinking, he was abstemious; and in the camp, he sought no luxuries beyond the fare of the common soldier.

CHARLES XIII., king of Sweden (1809–1818), b. Oct. 7, 1748, was the second son of king Adolphus Frederick, and of the sister of Frederick the great of Prussia. He was trained for naval command, and was long the high admiral of Sweden, in which capacity he distinguished himself by a great victory over the Russians in the gulf of Finland in 1788, and by bringing back his fleet safe to Carlscrona in the most perilous season of the year. He was on several very important occasions called to an active part in political affairs—in the revolution of 1772, when he was made governor-general of Stockholm and duke of Södermanland; after the assassination of his brother Gustavus III. in 1792, when he was placed at the head of the regency; and after the revolution of 1809, when he became administrator of the kingdom, and subsequently king. The Swedish monarchy now became limited instead of despotic. Having no child, C. concurred with the states of the kingdom in choosing as his successor the French general, Bernadotte, who became crown-prince of Sweden, and ascended the throne on the death of C., Feb. 5, 1818. The prudence of the king and crown-prince secured the union of Norway with Sweden in 1814, as a compensation for Finland.

CHARLES XIV., king of Sweden and Norway (1818–1844), originally JEAN BAPTISTE JULES BERNADOTTE, was b. at Pau, in the s. of France, Jan. 26, 1764. He was the son of a lawyer. He entered the French army as a common soldier; became an ardent partisan of the revolution; greatly distinguished himself in the wars of Napoleon, and soon attained the highest military rank. But he was distrusted by Bonaparte, whose ambitious schemes he took no part in promoting; and Napoleon having taken offense at his conduct after the battle of Wagram, Bernadotte left the army in disgust, and returned to Paris. He was afterwards sent by the ministerial council to oppose the British, who had landed at Walcheren, but the breach between the emperor and him grew wider. In 1810, he was elected crown-prince, and heir to the throne of Sweden. Almost the only condition imposed on him was that of joining the Protestant church. He changed his name to Charles John; and the health of the Swedish king, Charles XIII., failing in the following year, the reins of government came almost entirely into his hands. He refused to comply with the demands of Napoleon, which were opposed to the interests of Sweden, particularly as to trade with Britain, and was soon involved in war with him. He commanded the army of the allies in the n. of Germany, and defeated Oudinot at Grossbeeren, and Ney at Dennewitz. He showed great reluctance, however, to join in the invasion of France, and was tardy in his progress southward.—He became king of Sweden on the death of Charles XIII., Feb. 5, 1818. He won for himself the character of a wise and good king. Education, agriculture, manufactures, commerce, and great public works, as well as the military strength of the kingdom, were promoted by his care. He died Mar. 8, 1844, and was succeeded by his son Oscar.

CHARLES XV., 1826–72; King of Sweden and Norway, succeeding his father, Oscar I., who was a son of Charles XIV. The rule of C. was liberal and popular. The most important event was the change (in 1866) in the constitution of the parliament,

which from that time has consisted not of four, but of two chambers, one elected by the provincial representatives and the other by the people. Charles's kindly nature was shown in his firm refusal to sanction capital punishment. He had a taste for literature and art, and published a volume of poems. In 1850, he married Louisa, daughter of the king of the Netherlands, by whom he had one daughter, who became the wife of prince Frederick of Denmark.

CHARLES, Archduke of Austria, third son of the emperor Leopold II., was b. at Florence, 5th Sept., 1771. Whilst yet a youth, he pursued military studies with much ardor; and after having greatly distinguished himself as a gen. in inferior commands, he was intrusted, in 1796, with the chief command of the Austrian army on the Rhine. He fought with great success against Moreau at Rastadt, defeated Jourdan in several battles, drove the French over the Rhine, and concluded his victories by taking Kehl in the winter. In 1799, he was again at the head of the army on the Rhine, was several times victorious over Jourdan, protected Suabia, and successfully opposed Massena. In 1800, bad health compelled him to retire from active service; but being appointed gov. gen. of Bohemia, he formed a new army there. After the battle of Hohenlinden, he was again called to the chief command, and succeeded in staying the rapid progress of Moreau, but almost immediately entered into an armistice with him, which was followed by the peace of Luneville. In 1805, he commanded the army opposed to Massena in Italy, and fought the hard battle of Caldiero; but upon bad tidings from Germany, retreated from the left bank of the Adige to Croatia. This retreat was one of his greatest military achievements. In 1809, he won the great battle of Aspern, which first showed to Europe that Napoleon was not invincible; but he did not promptly enough follow up his victory, and Napoleon, who hastened to reinforce his army, retrieved his fortunes at Wagram, and the archduke was now compelled to give way before the enemy, till he reached Znaim, where an armistice was concluded on 12th July. In the campaigns of 1813 and 1814 he had no part; and lived in retirement till his death, 30th April, 1847.

CHARLES, ELIZABETH RUNDLE, b. about 1826; the wife of Andrew P. Charles, of London. She has written *Chronicles of the Schonberg-Cotta Family*; *Diary of Mrs. Kitty Trevelyan*; and other popular works of fiction.

CHARLES, JACQUES ALEXANDRE CÉSAR, 1746–1823; a French physicist, noted for skill in experiments and public demonstrations. He made the first balloon to hold hydrogen gas, with which a successful ascent was made. He was the inventor of a number of optical instruments.

CHARLES ALBERT, King of Sardinia (1831–49), b. 2d Oct., 1798, was the son of the prince Charles Emmanuel of Savoy-Carignan, and in 1800, succeeded to his father's title and estates in France and Piedmont. In 1817, he married Maria Theresa, daughter of the archduke Ferdinand of Tuscany. When the revolutionary movement took place in Piedmont in 1821, he was made regent, upon the abdication of Victor Emmanuel, until Charles Felix, the brother of the late king, should arrive to assume the sovereignty. He displeased both the liberal party and their opponents, and Charles Felix disallowed all his acts, and for some time forbade his appearance at court. In 1829, he was appointed viceroy of Sardinia. On the death of Charles Felix, 27th April, 1831, he ascended the throne. The liberals had great expectations from him, but were for a long time disappointed; his government much resembled the other Jesuitic and despotic Italian governments, except that he sought to promote the interests of the country, and to restrict the influence of the clergy in political affairs. It was not till after the elevation of Pius IX. to the papedom, when a new impulse was given to the cause of reform, that the Sardinian government adopted the constitutional and liberal policy to which it has since adhered. C. A. entered warmly into the project of Italian unity, and evidently expected to place himself at the head of the whole movement and of the new kingdom of Italy. When the Lombards and Venetians rose against the Austrian government, he declared war against Austria, 23d Mar., 1848, and at first was exceedingly successful, but was insufficiently supported by the Lombards, and finally defeated by the Austrians; so that after the fatal battle of Novara, 23d Mar., 1849, he was obliged, for the preservation of the integrity of his kingdom, to resign the crown in favor of his son, Victor Emmanuel. He afterwards retired to Portugal, and died at Oporto on 28th July of the same year.

CHARLES AUGUSTUS, 1757–1828, grand duke of Saxe-Weimar. He assumed the government in his eighteenth year, and the next year entered the Prussian army, in which he remained until the defeat at Jena in 1806, when he became a member of the Rhenish confederacy and furnished aid to the French. In 1813, he joined in the coalition against Napoleon, and took command of an army of Saxons, Hessians, and Russians. He fought among the allies in 1815, and the congress of Vienna rewarded his services by enlarging his principality and making it a grand duchy. Charles was an intimate friend of Goethe, Wieland, and other men of letters.

CHARLES THE BOLD, duke of Burgundy (1467–77), son of Philip the good, of the house of Valois, and of Isabella of Portugal, was b. at Dijon on 10th Nov., 1435, and bore, during his father's life, the title of count of Charolais. He was of a fiery, ambitious, and violent

disposition. From an early period to the end of his life he was a declared enemy of Louis XI. of France, the nominal feudal superior of Burgundy. Louis having caused Philip to deliver up some towns on the Somme, C. left his father's court and formed an alliance with the duke of Bretagne and some of the great nobles of France for the maintenance of feudal rights against the crown. Their forces ravaged Picardy and Isle-de-France, they threatened Paris, and defeated the king at Monthéry. The result was a treaty by which the count of Charolais obtained the towns on the Somme and the counties of Bologne, Guines, and Ponthieu for himself. In 1467, he succeeded his father as duke of Burgundy. Richer and more powerful than any prince of that time, he conceived the design of restoring the old kingdom of Burgundy, and for this purpose of conquering Lorraine, Provence, Dauphiny, and Switzerland. Whilst he was making preparations for war, Louis invited him to a conference; he hesitated, and Louis by his agents stirred up the citizens of Liege to revolt. Meanwhile C. consented to the conference, and the news coming of what had taken place at Liege, he seized the king, and if he had not been withheld by his counselor Comines, would have put him to death. He compelled Louis, however, to accompany him to Liege, and apparently to sanction the cruelties which he inflicted on the citizens. War raged between them afterwards with but little intermission till 1475. In Sept. of that year, C. found himself at leisure to attempt the prosecution of his favorite scheme of conquest, and soon made himself master of Lorraine. In the following year he invaded Switzerland, stormed Grandson, and hanged and drowned the garrison; but was soon after terribly defeated by the Swiss near that place, and lost his baggage and much treasure. Three months after, he appeared again in Switzerland with a new army of 60,000 men, and laid siege to Morat, where he sustained, on June 22, 1476, another and more terrible defeat. After this he sank into despondency, and let his nails and beard grow. But the news that the young duke René of Lorraine was attempting to recover his territories, roused him, and he laid siege to Nancy. His army was small; Italian auxiliaries, whom he had hired, went over to the enemy; and in the battle which he too rashly fought, he lost his life, Jan. 5, 1477. His daughter and heiress, Maria, married the emperor Maximilian I. With his life ended the long successful resistance of the great French vassals to the central power of the monarchy.

CHARLES CITY, a co. in s.e. Virginia, on the James and Chickahominy rivers; 184 sq.m.; pop. '70, 4,979—3,153 colored. Productions, corn, wheat, oats, etc. Co. seat, Charles City Court House.

CHARLES EMMA NÜEL I., duke of Savoy (1580—1630), called the great, was b. at the castle of Rivoli, 12th Jan., 1562, and succeeded his father Emmanuel Philibert in 1580. He married a daughter of Philip II. of Spain, and at first allied himself politically with Spain, and made war against France for the marquise of Saluzzo (or Saluces), which he obtained in 1601, upon the cession of some other territories to France. But he afterwards joined France and Venice to oppose the preponderant power of Spain in Italy; then allied himself with the house of Hapsburg, and set up a claim to Montferrat, but suffered, in consequence, the direst calamities, great part of his dominions being conquered by the French, and in their hands when he died, 26th July, 1630. He was a prince of vast ambition, and for whom no enterprise was too bold.

CHARLES, surnamed **MARTEL**—i.e., the hammer—was the son of Pepin of Heristal, mayor of the palace under the last Merovingian kings, and was b. about 690 A.D. After his father's death in 714, he was proclaimed mayor of the palace by the Austrasian party. King Chilperic and he now quarreled, and a civil war arose which ended in C. becoming undisputed mayor of the palace and ruler of the Franks. During the latter years of his life, he indeed allowed the nominal throne to remain occupied—the titular kings being mere puppets in his hands. He was much engaged in wars against the revolted Alemanni and Bavarians, the Saxons, etc., but his importance as a historic personage is chiefly due to his wars against the Saracens, who, having conquered Septimania from the western Goths in 720, advanced thence into Aquitaine, conquered Bordeaux, defeated the duke of Aquitaine, crossed the Garonne, advanced to the Loire, and threatened Tours. C. defeated them between Tours and Poitiers in 732 in a great battle, in which their leader, Abd-ur-Rahmán, fell, and a stop was put to their progress in Europe, which had filled all Christendom with alarm. He defeated them again in 738, when they had advanced in the Burgundian territories as far as Lyon; deprived them of Languedoc, which he added to the kingdom of the Franks; and left them nothing of their possessions n. of the Pyrenees beyond the river Aude. He died on the 22d Oct., 741, at Quiercy on the Oise, in the midst of his victories, his projects, and his greatness, leaving the government of the kingdom to be divided between his two sons—Carloman, and Pepin the short.

CHARLES MIX, a co. in s.e. Dakota, on the Missouri river; pop. '70, 152, of whom 117 were Indians. Co. seat, Greenwood.

CHARLES RIVER, a stream rising in central Massachusetts, and flowing easterly to Boston harbor. It affords valuable water-power in many places, and in its lower course its banks are lined with large and small manufacturing villages.

CHARLES'S WAIN, a common name for the constellation of Ursa Major (q. v.).

CHARLESTON, a co. in e. South Carolina, on the ocean, and including several islands; 1906 sq.m.; pop. '70, 88,363—60,603 colored. The Santee river is the n.e. border, and the Ashley, Edisto, and Cooper rivers intersect the county. The surface is low and level, and much of the soil is very rich, producing sea-island and short staple cotton, rice, corn, sweet potatoes, etc. The South Carolina, the Savannah and Charleston, and the North-eastern railroads intersect. Co. seat, Charleston.

CHARLESTON, a village in Coles co., Ill., on the St. Louis and Indianapolis railroad, 35 m. w. of Terre Haute, Ind. It is the county seat, and has a medical college, some manufactures, and the trade of a productive agricultural district. Pop. '70, 2,849.

CHARLESTON, the chief city of a district of its own name in South Carolina, and the commercial capital of the state, is situated in lat. 32° 46' n., and long. 79° 57' west. With straight and regular streets, it occupies the fork of the Cooper and the Ashley, which, as deep tideways of the respective widths of 1400 and 2,100 yards, here unite with their common estuary of 7 m. in length to form Charleston harbor. This haven is beset to seaward by a sand-bar, which has its uses, however, as a breakwater and a bulwark. The more practicable of its two passages—showing 16 ft. at ebb and 23 at flood—is commanded by fort Moultrie and fort Sumter. The city is built upon ground raised but a few feet above the water. In 1860, the pop. of C. was 40,522; (1870) 48,956; (1875) 56,540. The exports, which are always of much greater value than the imports, amounted in 1858 to \$16,924,436; in the year ending Mar. 31, 1875, \$19,532,393. Cotton and rice are the chief exports. In 1878, the taxable property of C. was worth \$26,591,778. The public debt was \$4,716,754. There are about 40 churches, the state medical college, a large orphan asylum, etc. C. was founded in 1672, receiving from France, about 1685, a considerable influx of Protestant refugees. It was prominent for zeal and gallantry in the revolutionary war. Up to the time of the civil war, the city was remarkable for its suburban character and verdant surroundings, and its inhabitants were mainly opulent planters, distinguished for hospitality and refinement. It was in C., however, that the first open movement was made in favor of secession; and the city and its inhabitants have changed since then. In 1860 and 1861, the harbor was the scene of several conflicts; and in 1863, fort Sumter was reduced to ruins. The harbor was blockaded in 1861, and several dismantled hulks of vessels were filled with stones and sunk, in order to prevent passage. In spite of these precautions, however, more British blockade-runners entered this than any other southern port. In Aug., 1863, the city was bombarded, and in Feb., 1865, was occupied by the United States troops.

CHARLESTON (*ante*), the chief city of South Carolina and capital of Charleston co., stands upon a peninsula formed by the confluence of the Ashley and Cooper rivers, in lat. 32° 45' n., long. 79° 57' w., 7 m. from the Atlantic ocean. The harbor, formed by the junction of the two rivers, and land-locked on three sides, with a depth of water of from 40 to 50 ft., is one of the best on the coast. It is defended at the mouth by four fortresses, fort Moultrie, fort Sumter, castle Pinckney, and fort Ripley. The entrance to the harbor, on account of shifting sand-bars and the uncertain depth of the water, would sometimes be difficult were it not for the floating lights and bell-boats provided by the government. The water on the bar is only 18 ft. deep, but the channel is being deepened by the government. The city covers an area of more than 5 sq. m., has nearly 10 m. of water front, and more than 50 m. of streets. The latter intersect each other mostly at right angles, and some of them are spacious. The houses, instead of being built in blocks, are generally separated from each other by gardens, shade trees, and shrubbery, giving the city a peculiarly picturesque appearance, while greatly increasing its area. Charleston was founded in 1680 by an English colony. Its growth at first was slow, but with the development of the cotton traffic its commercial importance was greatly increased. The pop. '60 was 48,409, of which nearly one-half were colored. The war of the rebellion, which begun here in the spring of 1861 in the compulsory evacuation of Fort Sumter by the U. S. garrison under command of gen. Robert Anderson, and a great fire which occurred a few months later, paralyzed the business and greatly diminished the population of the city. Commerce indeed, between 1860 and 1865, was utterly destroyed. The wharves decayed, the docks were filled up, and the railroads leading into the interior were torn up. It was not until more than a year after the peace that the city was again made a port of entry; but from that time industry and commerce revived and have since steadily increased. The census of 1870 showed a very slight increase of population in comparison with that of 1860, the proportion of colored persons to white being about the same, 22 to 26. The population by the census of 1880 was 49,999; 24,005 being white, and 25,994 being colored. A large wholesale trade is carried on with the interior, an extensive region of country drawing its supplies of merchandise from this source. The overland trade with St. Louis, Chicago, and other cities of the north-west in flour, bacon, grain, etc., is rapidly increasing. Rice, cotton, lumber, naval stores, and phosphate rock are the principal exports. In the extent of the cotton trade, Charleston ranks next to New York and New Orleans. The manufacture of fertilizers from marl and phosphate rock has been developed since 1868 and is very extensive. Early vegetables, grown in the suburbs, are exported in large quantities to New York, Boston, and other northern cities. The whole amount of coastwise imports is very large and constantly increasing. **Manu-**

factures of iron, wood, and phosphate, employ much capital, and afford occupation for upwards of 3,000 people. There are several large mills for removing the husk from rice and preparing it for market. A large portion of the rice raised in South Carolina and Georgia is cleaned at these mills. The valuation of property by the census of 1870 was over \$50,000,000. The state assessment for 1872 was less than this by \$10,000,000; the city assessment for 1873 was less by more than \$20,000,000. In 1870 the number of dwellings was 6,861; the number of families, 9,098; the number of persons engaged in mechanical occupations, 18,705. There are seven banks of discount, with a capital of more than \$3,000,000, and five savings banks, with deposits amounting to more than \$1,000,000. The public squares are few and small, the battery near the water's edge, being the principal public resort. There are 3 daily and 5 weekly newspapers, and about 40 churches, of which 11 are Episcopal, 8 Presbyterian, 5 Roman Catholic, 5 Methodist, 4 Baptist, 3 Lutheran, and 1 Unitarian. The most noted church edifice is St. Michael's (Episcopal), built in 1752. It has a fine chime of bells, and its tower can be seen far out at sea. St. Philip's is the oldest church organization, but its house of worship is not so old as that of St. Michael's. In the graveyard adjoining St. Philip's lie the remains of many noted persons, including Gadsden, Rutledge, Pinckney, and Calhoun. Magnolia cemetery, near the northern boundary of the city, contains many fine monuments. The principal benevolent institutions are the orphan house, with an endowment of \$190,000, and over 300 inmates; the Roman Catholic orphan asylum, with more than 100 inmates; the almshouse; the asylum for the aged and infirm; the city hospital; and an asylum for colored orphans, supported by the state. The principal public buildings are the U. S. arsenal and citadel, the market, city hall, court-house, orphan house, academy of music, custom-house, post-office, Charleston hotel, and Mills house. Three steam railroads have their center here, and there are horse railroads connecting the different parts of the city with each other. The streets are lighted with gas, and many of them are well paved. The schools of the city are under the control of commissioners elected by the people and a superintendent appointed by the commissioners. In 1872, there were 8 public schools (5 grammar and 3 primary); number of children of school age, 12,727, of whom 5,068 were enrolled; number of teachers 68, all but four of them males; total school expenditures over \$40,000 annually. There are also a considerable number of private schools. Charleston college, founded in 1871, in 1872 had 5 instructors, 50 students, and a library of 8,000 volumes. The state medical college, at the same date had 9 professors. The Charleston library, founded in 1748, has 14,000 volumes, and the apprentices' library is a valuable collection. Charleston was among the first of the principal places in the south to enlist in the revolutionary struggle of 1776. It was captured May 12, 1780, after a siege of six weeks, by 12,000 British regulars under sir Henry Clinton, and evacuated Dec. 14, 1782. It was the center of the nullification movement of 1830, which was put down by Andrew Jackson; and the war of the rebellion had its beginning here in the bombardment of Fort Sumter, which aroused the northern people to a stern resistance. The city remained in the possession of the confederates until the surrender of Columbia, the state capital, to Sherman, when it was evacuated by the confederate forces, and all the public buildings, stores, cotton warehouses, shipping, etc., were fired by order of gen. Hardee, the confederate commander. When the union forces took possession, Feb. 18, 1865, they did all that they could to rescue the city from destruction. During the war many buildings were destroyed, and the towers and steeples of the churches riddled with shot and shell.

CHARLESTON (Post office, **KANAWHA COURT-HOUSE**), the capital of West Virginia, on the Chesapeake and Ohio railroad and the Kanawha river, at the junction of Elk river; 130 m. s.w. of Wheeling; pop. '70, 3,162. The Kanawha is navigable to the Ohio. Charleston is in a region productive of timber, coal, iron, and salt, and is an important shipping point. The salt springs are just above the city on both sides of the river, and more salt is made here than in any other place in the country except Syracuse, N. Y. The state-house is the most conspicuous building. There are a Roman Catholic seminary, and several high schools. The seat of the state government was fixed here April 1, 1870.

CHARLESTOWN, a seaport of Massachusetts, in lat 42° 2' n., and long. 71° 3' w. It occupies a peninsula about 2 m. long, immediately to the n. of Boston, the capital of the state; of which, connected as the two are by bridges, it is virtually a suburb. Pop. in 1850, 17,126; in 1860, 25,063; in 1870, 28,323. In common with the rest of the neighborhood, the peninsula displays an unevenness of surface which renders the streets, otherwise handsome, somewhat irregular. Its most prominent height is Bunker's hill, celebrated as the first battle-field in the revolutionary war, and surmounted, in 1825-43, by a granite monument of 220 ft. in height. Besides a state-prison on a large scale, the city possesses one of the principal navy-yards of the general government. This establishment, covering 60 acres, contains a magnificent ropewalk 1300 ft. long, and a dry-dock of chiseled granite measuring 80 ft. in breadth by 30 in depth. C. was incorporated with Boston in 1874.

CHARLESTOWN (*ante*), now part of Boston, formerly a city of Middlesex co., Mass. It is situated on the northern bank of the Charles river, and is connected with Boston by two free bridges. The Mystic river, which unites with the Charles at this

point, forms the boundary on the e. and north. The pop. in 1873, when the city was annexed to Boston, was 28,373. From the territory of Charlestown, originally very large, several towns have been taken on its northern side. The surface of the remaining portion is very uneven, two eminences, Bunker and Breed's hills, rising near the center, and affording many fine building sites. On Bunker hill was fought a celebrated battle of the revolution, June 17, 1775, commemorated by a granite shaft erected on the summit and rising to the height of 220 feet. The corner-stone of this monument was laid in 1825 by gen. Lafayette, and the work was finished in 1843. The attempt of the Massachusetts committee of safety to fortify this eminence was the immediate occasion of the battle, in the course of which the town was burned by the British, being set on fire by shells from Copp's hill in Boston, and by men who were sent across the Charles for that purpose. C. is well built, having some fine streets and residences. It has an abundant supply of water from Mystic lake, excellent schools, 15 churches of various denominations, a public library of 15,000 volumes, a fund of \$23,000 for the benefit of the poor, and a home for aged and indigent women. The state prison was located here from 1805 to a very recent period, and the buildings used for that purpose are still standing. A navy-yard of the United States, covering more than 70 acres of ground and having all the appointments required for such an establishment, has existed here since 1798. C. is also a place of considerable business. It has manufactories of steam engines, boilers and machinery, of stone and brass-ware, gas fixtures, mechanics' tools, leather, draw-pipes, sugar, soap, etc.

CHARLESTOWN, the seat of justice of Jefferson co., W. Va., on a branch of the Baltimore and Ohio railroad, 10 m. s.w. from Harper's Ferry; pop. '70, 1593. It is in a fine agricultural district. It was in this village that John Brown was tried, condemned, and hanged Dec. 2, 1859.

CHARLET, NICOLAS TOUSSAINT, a French painter and engraver, b. in Paris, 1792, was for some years employed as a clerk in a government office, but lost his place at the restoration, 1815, on account of his Bonapartism, and in consequence betook himself to art. After studying awhile under Gros, he gradually formed for himself a style in which he had no rival. C. is the Béranger of caricature, but without the political bitterness and sarcasm sometimes found in the poet. His genial sketches of French life and manners were studied with equal admiration in the salons of the aristocracy and in the ateliers, barracks, taverns, etc., of the lower classes. C. was especially successful in his sketches of soldiers and children. His designs are free from exaggeration, while full of spirit, interest, and naïveté; and his titles or mottoes were often so witty and suggestive, that dramatic writers have founded pieces upon them. His sketches and lithographs are very numerous, and are widely distributed. Among his paintings, the most remarkable are—"An Episode in the Russian Campaign" (in the museum at Versailles); "Moreau's Crossing of the Rhine" (at Lyons); and a "Procession of the Wounded" (at Bordeaux). C. died in 1845.

CHARLEVILLE, a t. of France, in the department of Ardennes, about a mile from Mezières, with which it communicates by a suspension bridge over the Meuse. It is a thriving place, well built, with clean spacious streets. It has manufactories of hardware, leather, and beer, and the Meuse affords facilities for considerable trade in coal, iron, slate, wine, and rails. Pop. '76, 12,881.

CHARLEVOIX, a co. in n.w. Michigan, on lake Michigan and Green river; 500 sq.m.; pop. '70, 1724. Grand Traverse bay bounds the county on the w., and Little Traverse bay on the north. The chief business is agriculture. Co. seat, Charlevoix.

CHARLEVOIX, a co. in the province of Quebec, Canada, forming a triangle, one side of which runs 80 or 90 m. along the n.w. bank of the St. Lawrence, reaching nearly to the Saguenay river; 5,224 sq.m.; pop. '71, 15,611, of whom all but nine were Roman Catholics. The surface is mountainous, and not well adapted to agriculture. It is intersected by five or six rivers that fall into the St. Lawrence, and one that joins the Saguenay. Chief town, Baie St. Paul.

CHARLEVOIX, PIERRE FRANÇOIS XAVIER DE, 1682-1761; a French Jesuit who was sent as a teacher to Quebec in 1705. After about five years he returned to France, and became professor of belles-lettres. He returned to Canada in 1720, and journeyed up the St. Lawrence and the lakes and down the Illinois and Mississippi to New Orleans, and thence went to Paris. His principal work is a valuable *History of New France* (or Canada), which was not published in English until 1865. He also wrote a history of Christianity in Japan, and a history of Paraguay.

CHARLOCK. See **MUSTARD.**

CHARLOIS, a village of the Netherlands, situated on the Maas, about 2 m. s.s.w. of Rotterdam. It is memorable on account of a terrible accident which occurred here in 1512, when a religious procession crossing the ice in defiance of magisterial prohibition, 8,000 of them were precipitated into the Maas. Pop. 2,000.

CHARLOTTE, a co. in s. Virginia, on Staunton river; intersected by the Atlantic, Mississippi and Ohio, and Richmond, Danville and Piedmont railroads; 550 sq.m.; pop. '70, 14,513-9,613 colored. Surface hilly; productions, wheat, corn, oats, and tobacco. Co. seat, Marysville.

CHARLOTTE, a co. in s.w. New Brunswick, on the Maine border and the bay of Fundy; 1323 sq.m.; pop. '71, 25,882. The county is traversed by the New Brunswick and Canada, and the North American and European railroads. Ship-building and sea-fishing are the occupations of the greater portion of the inhabitants. Chief town, St. Andrews, at the mouth of St. Croix river.

CHARLOTTE, the seat of justice and an incorporated city of Eaton co., Mich., 20 m. s.w. of Lausing, on Grand River Valley division of the Michigan Central, at the crossing of the Peninsular railroad; pop. about 3,000. Lumber and agricultural products furnish the greater part of its trade.

CHARLOTTE, a city of North Carolina, the seat of justice of Mecklenburg co., on Sugar creek, and the Wilmington, Charlotte and Rutherford railroad, at the terminus of the North Carolina division of the Richmond and Danville, and the Charlotte, Columbia and Augusta railroads. The city is in the North Carolina gold region, and a mint was established in 1838, but closed in 1861 on account of the rebellion. Up to that date more than \$5,000,000 in gold had been deposited in the mint. There are several manufactories in the city. It was here that the "Mecklenburg Declaration of Independence" was adopted, May 31, 1775.

CHARLOTTE AMALIE, chief, or rather only, town of St. Thomas, one of the Virgin group of the Antilles, in lat. 18° 20' n., long. 64° 55' west. It contains 11,400 inhabitants, nearly three fourths of the entire population of the colony. It has a spacious harbor, which, besides being largely visited by European ships in general, is a principal station for the mail-packets between Southampton and the West Indies.

CHARLOTTE AUGUSTA, 1796-1817; daughter of George IV. and queen Caroline of England. She was well educated under the care of the bishop of Exeter and Lady Clifford. It was desired that she should wed the prince of Orange, but she loved and married prince Leopold of Saxe-Coburg, who, long after her death, became king of Belgium. She was married May 2, 1816; was delivered of a still-born child early in Nov. of the next year, and died, in consequence of malpractice, as was believed. Her officiating physician committed suicide. Her domestic life was most wretched, as her published letters show.

CHARLOTTE HARBOR, or **BOCA GRANDE**, an inlet in the gulf coast of Florida, 25 m. long, and 8 to 10 m. wide, with an entrance three fourths of a mile wide, and 30 to 40 ft. deep. There is a good harbor, sheltered from the sea by a number of islands. Wild fowl, fish, and oysters are plentiful.

CHARLOTENBURG, a t. of Prussia, in the province of Brandenburg, is situated on the Spree, 3 m. w. of Berlin, with which it is connected by a road leading through the *Thiergarten*, and affording a favorite promenade to the Berliners. C. contains a royal palace, with a fine garden and splendid orangery, and an interesting collection of antiquities and works of art. In a beautiful part of the park a mausoleum, designed by Schinkel, contains the remains of Frederick William III. and his wife, the queen Luise, with their statues by Rauch. C. has manufactures of cotton and hosiery. Pop. '71, 19,518; '75, 25,900.

CHARLOTTESVILLE, a village in Albemarle co., Va., 65 m. n.w. of Richmond, on the Orange, Alexandria and Manassas, and the Chesapeake and Ohio railroads. The place is the seat of the university of Virginia, founded by Thomas Jefferson; and Monticello, Jefferson's home, is but 3 m. distant. Pop. '70, 2,838.

CHARLOTTE TOWN, the capital of Prince Edward island, in the gulf of St. Lawrence, in lat. 46° 15' n., and long. 63° 7' west. The census of May, '71, states the pop. at 8,807. The port is the best in a colony which, in proportion to its size, is remarkable for its navigable facilities. The town stands on the s.e. coast at the bottom of Hillsborough bay, and at the confluence of three rivers, which each admit the largest vessels for several miles, so as to secure them from all weather. The harbor is rendered still more commodious through the strength of the tides, which enable ships to work out and in against the wind. C. T. has an iron foundry and a woolen factory, and is largely engaged in ship-building.

CHARLTON, a co. in s.e. Georgia, on the Florida border, including a portion of the great Okefenokee swamp; 1000 sq.m.; pop. '70, 1897—401 colored. Productions, rice, cotton, tar, and turpentine. Surface level and soil sandy. Co. seat, Trader's Hill.

CHARM (Lat. *carmen*, a song), properly, a form of words, generally in verse, supposed to possess some occult power of a hurtful, a healing, or a protective kind. Charms exert their influence either by being recited, or by being written and worn on the person; and, in this latter case, they may be classed with amulets (q.v.). The nature of this superstition will be more fully considered under INCANTATION; see also MAGIC.

CHARNEL-HOUSE (Fr. *charnier*; Lat. *caro*, flesh), a chamber situated in a churchyard or other burying-place, in which the bones of the dead which were thrown up by the grave-diggers were reverently deposited. The C. was generally vaulted in the roof, and was often a building complete in itself, having a chapel or chantry attached to it. In such cases, the charnel-vault was commonly a crypt under the chapel; and even in

churches, it was not uncommon for the vault or crypt to be employed as a chancel-house.

CHARNOCK, STEPHEN, D.D., 1628–80; an English non-conformist minister, educated at Cambridge. He began to preach in London, and went thence to Dublin, where he was successful. In 1660, he was silenced by the act of uniformity, and returned to London; he continued 15 years in and near that city, preaching, but without a settled congregation. Many of his sermons have been published, and his work on the *Attributes of God* is still highly valued. He was a vigorous and original, as well as judicious thinker; and as a writer he was vivid and clear.

CHARON, in classical mythology, the son of Erebus and Nox, is first mentioned by the later writers of Greece. His duty was to ferry the shades of the buried dead across the rivers of the under-world. For this service, he exacted an *obolus* from each, and in consequence, a coin of this kind was placed in the mouth of the dead. If this rite was neglected, C. refused to convey the unhappy shade across, and it was doomed to wander restlessly along the shores of Acheron. C. is generally represented as a gloomy old man, with a rough beard and wretched clothes. In the Etruscan monuments, he holds a hammer.

CHARON'DAS, a lawgiver of ancient Greece, by some supposed to have been a disciple of Pythagoras. It is related that he fell a sacrifice to one of his own laws, by which it was made a capital offense to appear armed in a public assembly. On returning from a military expedition he hastened to quell a tumult, having his sword at his side. Being reminded by a citizen of his law, he replied, "Then I will seal it with my blood," and immediately plunged his sword into his breast.

CHAROST, ARMAND JOSEPH DE BETHUNE, Duc de, 1810–65; a descendant of Sully, the famous marshal. C. took part in the revolution of 1830 as a republican, and in 1833 was made a lieutenant. Afterwards he served in Algeria, and after the revolution of 1848 he was appointed under secretary of state. He was one of the zealous republicans in the national assembly, and one of the victims of Dec. 2, 1851, being imprisoned at Ham, and afterwards exiled to Belgium. In 1854, Napoleon III. expelled him from France, and he went to Holland and afterwards to Switzerland. He wrote a history of the campaign of 1815, in which he severely criticised Napoleon's generalship, and a history of the war in Germany in 1813.

CHARR, *Salmo umbla*, a fish of the same genus with the salmon, occurring in the lakes of Britain and of the continent of Europe. It is abundant in the lakes of Cumberland and Westmoreland, and in some of those of Ireland, of the n. of Scotland, and of Orkney, but in the greater number of the Scottish lakes it is not found. It is the celebrated *ombre chevalier* of the lake of Geneva. It is sometimes found weighing more than 2 lbs., but is generally under 1 lb. in weight. It has only the anterior part of the *roemer* (the middle line of the palate) furnished with the teeth, agreeing in this with the salmon and bull-trout, and differing from the common trout, salmon-trout, etc. The form is elongated, the greatest depth of the fish about one fifth of the entire length; the fins are rather small; the tail deeply forked; the color of the back dark olive, the sides lighter and spotted with either red or white, according to the condition in which the fish is at the time, the belly also being sometimes deep orange, and sometimes of a pale color; these, and other accidental variations, causing the fish to receive different names, such as *case C.*, *red C.*, *gilt C.*, *silver C.*, and having led some naturalists to believe in the existence of different species. It is not yet quite certain whether the *torgoch* or *red-belly* of Wales (*salmo salvelinus* of some authors) ought to be regarded as distinct or as a mere accidental variety. Whilst it is the most delicious perhaps of the *salmonidæ*, the C. is also the most beautiful; its rich purple, rosy, and crimson tints and white spots rendering it indeed a brilliant and striking object. During summer, the C. haunts chiefly deep cool water, and is seldom seen at the surface till late in autumn. It feeds on insects and minute crustaceans. In the end of autumn or beginning of winter, it ascends rivers to spawn, always choosing those which have a rocky bottom. Whether in lake or stream, it is only to be found in clear waters. Unfortunately, the C. of the English lakes is taken in great numbers, by nets, at the mouths of streams, when about to ascend them in order to spawn, and when not in the best condition for the table.

On some lakes, vast quantities are then caught for the table, particularly for the purpose of potting. A C. is now and then taken with fly when the angler may be whipping a lake, which perhaps abounds with them, for trout; but this occurs but seldom. The C. will, too, occasionally take a minnow, if sunk deep and trailed slowly; but the sport it affords is of the most precarious nature. C. are fast diminishing in those of our English lakes which they still inhabit, owing to the wholesale and indiscriminate slaughter which occurs at the spawning season. A large kind of C., sometimes reaching 4 lbs. in weight, is found in some of the more northern Swedish lakes.

CHARRIÈRE, or **CHARRIÈRES**, ISABELLE AGNÈTE DE SAINT-HYACINTHE DE, 1740–1805; a native of Holland, daughter of a Dutch baron, and married to a Swiss, who had been her brother's teacher. In 1786. appeared her most important book, *Caliste*, or *Letters Written in Lausanne*. She traveled in France and England, and was

an intimate friend of Benjamin Constant. She was a brilliant and beautiful woman, but, owing to loss of her estate, the latter years of her life were spent in strict seclusion.

CHARRON, PIERRE, 1541–1603; a French philosopher, one of the 25 children of a bookseller of Paris. He studied law at Bruges, and began practice in Paris, but not having immediate success, he went into the church, and rose to eminence as a preacher. At Bordeaux he formed a short but famous and important friendship with Montaigne, who, on his death in 1592, requested C. to bear the arms of the Montaigne family. In 1594, C. published *Le Trois Verites*, in which he seeks to prove that there is a God and a true religion, and that the true religion is the Roman Catholic. This was followed by a book of sermons, and in 1601 came his most remarkable work, *De la Sagesse*, a complete popular system of moral philosophy. This work brought upon its author the most violent attacks, but a second edition was soon called for. This, after much opposition, began to appear in 1603, but only a few sheets had been printed when C. died suddenly in the street.

CHART, a marine or hydrographical map, exhibiting a portion of a sea or other water, with the islands, coasts of contiguous land, soundings, currents, etc. See **MAP**. In the English service, when coasts have been surveyed by the admiralty, charts are engraved, and are sold at various prices, from 3s. down to 6d. each. This price is below their cost, the object being to encourage their general use as much as possible. Men-of-war are supplied with copies of every available C. published, relating to the regions likely to be visited. There is a printed list for every station. At Gibraltar and the cape of Good Hope, there are depots of charts to supply ships whose destination undergoes a change. All the charts are brought home again, and none are reissued until revised and corrected. The navigating charts, showing the dangers of coasts, with sufficient clearness to enable mariners to avoid them, are generally on the scale of half an inch to a mile; those of larger size show all the intricacies of the coast. The merchant-service is supplied with charts by agents, who receive a stock from the admiralty, and keep them on sale. The preparation of charts is part of the duty of the hydrographical department of the admiralty. In the financial year 1879–1880, a sum of no less than £11,000 was provided for this branch, quite irrespective of the surveying that preceded the engraving of the charts, which always costs a much larger sum. In the five years ending with 1875, the admiralty sold 495,445 charts, besides supplying the queen's ships.

CHARTA, MAGNA. See **MAGNA CHARTA**.

CHARTE (Fr. a charter; Lat. *charta*, paper). In the sense in which we have adopted this word from the French, and in which it may be now said to form part of our language, it signifies a system of constitutional law, embodied in a single document. Whether any system of positive public law existed in ancient France is, in that country, a subject of keen dispute amongst constitutional antiquaries. If any such there was, there seems little doubt that it was the mere embodiment of traditions, and not the result of any single act of the national will. Whilst France was divided into provinces and communes, local liberties and privileges unquestionably existed; but where the nation constituted no single body, a constitutional charter was impossible. The first traces of such a C. appear in the 14th c.; and it is known in the history of the public law of France as the *grand charter*, or the charter of king John. Up to this time, the kings had called together only partial assemblies, but in 1355 deputies from the whole kingdom were assembled in the hall of the parliament of Paris. The nobility and clergy, secular and regular, were represented by 400 deputies, the commons or third estate by a like number. This body assumed to itself the initiative, and prepared a species of constitution, which was accepted by the king. The chief triumph of the third estate on this occasion consisted in carrying through the doctrine, that the decision of any two estates should be invalid without the concurrence of the third. The three orders, who seem to have composed but one assembly, then proceeded to impose a series of restrictions on the power of the monarch, which, confirmed by the dauphin two years later, formed the foundation for the liberties subsequently asserted at the revolution.

But the constitution to which the term C. is most frequently applied by the French and by us, is that in which Louis XVIII. solemnly acknowledged the rights of the nation on his restoration in 1814. This C. has ever since been considered the fundamental law of constitutional monarchy when that form of government has existed in France. In some of its provisions, however, and still more in the mode of its acceptance by the monarch, as "a voluntary and free act of our royal authority," and as a "concession made to," not a contract entered into with, his subjects, it was open to the misconstructions which eventually led to the revolution of 1830. The "charte" sworn to on the 29th Aug. of that year by king Louis Philippe modified this and some of the other provisions of that of 1814. On that occasion, the king explicitly recognized the sovereignty of the people. This document, which, with some modifications, remained in force till the revolution of 1848, is of so much importance, not only from its bearing on the past history, and possibly on the future destiny of France, but from the analogies which it presents to our own constitution, that we shall endeavor to present a condensed view of its leading provisions.

It consisted of 67 articles, divided into 7 heads. Of these, the 1st head, containing 11 articles, treated of the public rights of the French people. It provided for the equality of all Frenchmen—a doctrine which it inherited from the revolution, and which it unfortunately left to be understood in a sense inconsistent with monarchy, and indeed with any other form of government than pure democracy (see EQUALITY)—for their equal admissibility to all employments, civil and military, and for their freedom from arrest, otherwise than by legal process. It guaranteed the enjoyment of religious liberty, and the payment of the ministers of all Christian denominations—a privilege which in 1831 was extended even to Jews. The liberty of printing and publishing was insured, the censorship of the press and conscription were abolished, an amnesty for all political offenses was proclaimed, and the security of property guaranteed, except when its sacrifice should be requisite for the public good, in which case it was declared that the owner must be indemnified. The 2d head set forth the nature and limitations of the kingly power in 8 articles. The supreme executive power, the command of the army and navy, and the right of making war, and treaties of peace, alliance, and commerce, were reserved to the monarch. To him, also, it belonged to nominate to all offices of public administration, to make all necessary regulations for the execution of the laws, but in no case to suspend them or dispense with them. The high duties of legislation were shared between the king, the chamber of peers, and the chamber of deputies; it being provided that every law should be agreed to by a majority of each chamber, and sanctioned by the king. Any one of the three branches of the legislature might originate any bill, except a money-bill, which was reserved for the chamber of deputies, as for the house of commons in England. The 3d head contained ten articles regarding the chamber of peers, the nomination of whom was vested in the king (the princes of the blood being peers by right of birth). No limit was set to their number; but by the law of 9th Dec., 1831, incorporated in the C., it was declared that their dignity should be for life only. The chancellor of France was president. The chamber of peers assembled simultaneously with that of the deputies, and its sittings were public. The personal privileges of the peerage, as they exist in England, were introduced. The 4th head concerning the chamber of deputies contains 16 articles. It provides for the election of the deputies and the sittings of the chamber. The electoral qualification is declared to be the payment of 200 francs of direct taxes, whilst that of a deputy is the payment of 500. The voting is by ballot, both at elections and in the chambers. The number of deputies, which at first was 430, was afterwards raised to 459. Each deputy was elected for 5 years, and one half of those for each department were required to have their political domicile within it. The C. became a nullity by the revolution of Feb., 1848; and by the new constitution promulgated on the 4th of Nov. of that year, the monarchy of France was converted into a democracy. By chapter 4 of that document, the legislative power was vested in a single assembly of 950 members, including the representatives of Algeria and the other colonies. The property electoral qualification was abolished, and the age reduced for electors to 21, and for delegates to 25. The period of three years was fixed for the continuance of the national assembly. By chapter 5, the executive power was intrusted to a citizen, who was to bear the title of president. He was not to be less than 30 years of age, his tenure of office was to be 4 years, and he was not to be re-eligible until after an interval of 4 years. For an account of the subsequent changes by which these and the other arrangements adopted at the revolution of 1848 have since been superseded, see FRANCE.

CHARTER (Lat. *charta*; Gr. *chartes*, paper, or anything written upon, from *charasso*, to scratch or write). In its most general signification, C. is nearly synonymous with *deed* and *instrument*, and is applied to almost any formal writing, in evidence of a grant, contract, or other transaction between man and man. In private law, its most important use is in the alienation of real estates, the writing given to the new proprietor by the old, in proof of the transference title, being usually called a charter. In public law, the name is given to those formal deeds by which sovereigns guarantee the rights and privileges of their subjects, or by which a sovereign state guarantees those of a colony or other dependency. See CHARTE, MAGNA CHARTA. There is another sense of the term, in which it is in a measure intermediate between the two we have mentioned—viz., where we speak of the C. of a bank or other company or association. In this latter sense it signifies an instrument by which powers and privileges are conferred by the state on a select body of persons for a special object. See BANK, CORPORATION, JOINT-STOCK COMPANY, etc. The requisites of a C., when used in the first of these significations, according to the law of England, will be pointed out under DEED.

ROYAL CHARTERS, generally written in Latin, are of two kinds: I. Grants of lands, houses, honors, or liberties to persons who did not previously possess them; II. Charters confirming grants previously made, and therefore called "charters of confirmation." Confirmation charters are of three kinds: 1. Charters confirming previous grants, without reciting them; 2. Charters of simple confirmation, without addition of anything new; 3. Charters reciting previous charters and confirming them, with addition of something new. These last two classes of charters are called charters of "inspeximus," or "vidimus," from the word used by the granter in saying that he has seen the C. which he confirms. Royal charters generally contain seven clauses: 1. The "premises,"

i.e., the name and style of the grantor, the persons to whom the C. is addressed, the name and style of the grantee, the reason why the grant is made, and the description of the thing granted, 2. The "tenendum and habendum," i.e., the way in which the thing granted was to be held and had; 3. The "reddendo," the return of rent or service which was to be made to the grantor by the grantee; 4. The "quare volunus," or order that the grantee should have the thing granted, under certain penalties; 5. The "sealing" or "signature" clause, setting forth the seal, signature, or subscription by which the C. was authenticated; 6. The "hiis testibus," or testing-clause, enumerating the persons who were present as witnesses when the C. was granted; 7. The "date," setting forth the time when, and the place where, the C. was granted.

CHARTER, in the law of Scotland, is the written evidence of a grant of heritable property, under the conditions imposed by the feudal law—viz., that the grantee, or person obtaining, shall pay at stated periods a sum of money, or perform certain services to the grantor, or person conferring the property. A C. must be in the form of a written deed. The grantor of a C., in virtue of the power which he thus retains over the property and its proprietor, is called the superior; and the grantee, in consequence of the services which he undertakes to render, the vassal; whilst the stipulated sum to be paid or service to be rendered, is called the duty.

Charters are either blench or feu, from the nature of the service stipulated—*a me* or *de me*, from the kind of holding or relation between the grantor and grantee; and original or by progress, from being first, or renewed, grants of the subjects in question.

Blench and Feu Charters.—The duty which the superior required of his vassal in former times was almost always military service, and the vassal was then technically said "to hold ward"—to hold on condition of warding or defending his superior. But subsequent to the rebellion of 1745, in which the dangerous tendencies of the feudal relation were experienced, this holding was abolished (20 Geo. III. c. 50), and the only duties which it has since been lawful to insert in C. are *blench* and *feu* duties. The former is a merely nominal payment—a penny Scots, a red rose, or the like, *si petatur tantum* (should it be asked); the latter is a consideration of some real value. Original blench C. having lost all object, and having no other effect but that of subjecting superiors to considerable expense in keeping up their titles, have become rare in modern practice. The forms of charters varying according to the circumstances in which they are granted, and the relations established between the grantor and grantee, are of too technical a nature to admit of explanation in this work. They will be found very clearly and shortly stated in Bell's *Law Dictionary*, voce "Charter."

CHARTER-HOUSE (a corruption of *Chartreuse*, i.e., Carthusian) is a hospital, chapel, and school-house, in London, instituted in 1611 by sir Thomas of Sutton, Camps castle, in the co. of Cambridge. It had originally been a Carthusian monastery (founded in 1371 by a sir Walter Manny and the bishop of Sudbury), but on the dissolution of monastic establishments by Henry VIII., it was made a place of deposit for his nets and pavilions. After undergoing many alterations, and passing into the possession of various distinguished persons, it was finally purchased from lord Suffolk, for £13,000, by sir Thomas Sutton, who endowed it with the revenues of upwards of 20 manors, lordships, and other estates, in various parts of England. This "masterpiece of Protestant English charity," as old Fuller calls it, serves three uses—it is an asylum for poor brethren, an educational and a religious institution; hence Bacon terms it a "triple good." The *poor brethren* are 80 in number. None are admitted under 50 years of age, and only those who have been housekeepers are eligible. Each brother has a separate apartment, a share of attendance from domestics, an ample, though plain diet, and an allowance of about £26 a year for clothes and other matters, and four weeks' holiday every autumn. The brethren must be bachelors and members of the church of England. Among the poor brethren in by-gone years were Elkanah Settle, the antagonist of Dryden, John Bagford, the antiquary; Isaac de Groot, a descendant of Grotius; and Alexander Machean, who assisted Johnson in the preparation of his dictionary. The *scholars* are 44 in number, admissible between the ages of 10 and 14. They are understood to be "the sons of poor gentlemen to whom the charge of education is too onerous;" as in the case of the *poor brethren*, it is not always the proper parties who are chosen. There are exhibitions, scholarships, and medals competed for at certain times by the scholars. In addition to the scholars properly so called, i.e., such as receive a free board and education, a large number of youths are sent to the charter-house school because of its reputation. These either board with the masters, or simply attend during the day. The number of extra boarders is nearly double that of the scholars. The institution is under the direction of the queen, 15 governors, selected from great officers of the state, and master himself, whose salary from the foundation is £800 per annum. Among the eminent individuals educated in this establishment, are Dr. Barrow, Judge Blackstone, Addison, Steele, John Wesley, bishop Thirlwall, George Grote, W. M. Thackeray, and sir Charles Eastlake.

The charter-house, which is situated at the upper end of Aldersgate street, is a quaint old building, interesting, though not very beautiful. The chapel contains Sutton's tomb, which was opened in 1842, when the body of the founder was discovered in a coffin of lead adapted to the shape of the body, like an Egyptian mummy-case.

CHARTER OAK, a famous tree that stood in Hartford, Conn., until blown down by a storm, in Aug., 1856. Its name was given because when sir Edmund Andros, governor of New England and New York, came to Hartford in 1687, by the order of James II., to demand the colonial charter, that document was hidden in a hollow of the tree by capt. James Wadsworth, and thus preserved. Though some writers have cast doubt on this interesting tradition, it is generally accepted by historians.

CHARTER-PARTY (Fr. *chartre-partie*, so called from such documents being at one time divided—in Fr. *parti*—and one half given to each party concerned), the title given to a contract in which the owner, or master of a ship, with consent of the owner, lets the vessel, or a portion of her, to a second party, for the conveyance of goods from one port to another port; hence the vessel is said to be *chartered*. The document must be stamped. It must specify the voyage to be performed, and the terms on which the cargo is to be carried. On the part of the ship, it is covenanted that she shall be seaworthy; well-found in rigging, furniture, and provisions; and that the crew be suitable in number and competency; that she shall be ready to receive the cargo on a given day, wait its complete delivery for a certain period; and sail for the stipulated port when laden, if the weather for the time permits. The freighter's portion of the contract obliges him to load and unload at suitable periods, under specified penalties, and to pay the freight as agreed on. The master must not take on board any contraband goods, or otherwise render the vessel liable to seizure. The owner is not responsible for losses caused by war, fire, or shipwreck, unless arising from negligence of the master or crew.

CHARTIER, ALAIN, the most distinguished man of letters in France in the 15th c., supposed to have been born about 1380. After studying at the university of Paris, he is supposed to have entered the service of Charles VI., and after that to have followed the fortunes of Charles the dauphin, afterwards Charles VII. The lot of C. was cast in troubled times; he felt the agony of Agincourt, and saw the rise of the maid of Orleans. The story of the famous kiss bestowed by Margaret of Scotland, wife of that Louis the dauphin who was afterwards to be known as Louis XI., "on that precious mouth from which has issued so many witticisms and virtuous sentences." is interesting if only as a proof of the high degree of estimation in which the ugliest man of his day was held. His best works are said to be *Le Liere des Quatre Dames*, which was called forth by the battle of Agincourt, and *Le Quadrilogue-Invectif*, a patriotic dialogue.

CHARTISM, a movement in Great Britain for the extension of political power to the great body of the people, arising in a great measure out of wide-spread national distress and popular disappointment at the results of the reform bill. Prior to 1831, the middle classes had sought popular aid towards obtaining their own enfranchisement. The assistance was given, the people expecting to receive help in their turn. After the passing of the reform bill, agitation ceased for a time, and the members returned to parliament were indifferent, or opposed, to any further change in the political arrangements of the country. The middle classes were satisfied with their own success, and generally looked with small favor on projects for the further extension of political influence among the masses. A season of commercial depression set in about 1835, and failing harvests for several years terribly increased the sufferings of the people. Food became dear, wages fell, manufactories were closed, work became scarce. The people associated their sufferings with their want of direct influence upon the government, and agitation for an extended franchise began. In 1838, a committee of 6 members of parliament and 6 working-men prepared a bill, embodying their views as to what were just demands on the part of the people. This was the "people's charter." It claimed—1. The extension of the right of voting to every (male) native of the United Kingdom, and every naturalized foreigner resident in the kingdom for more than two years, who should be 21 years of age, of sound mind, and unconvicted of crime; 2. Equal electoral districts; 3. Vote by ballot; 4. Annual parliaments; 5. No property qualification for members; and 6. Payment of members of parliament for their services. This programme was received with enthusiasm. Immense meetings were held all over the country, many of them being attended by two or three hundred thousand people. Fiercy orators fanned the popular excitement, and under the guidance of the extreme party among their leaders, physical force was soon spoken of as the only means of obtaining justice. The more moderate and thoughtful of the chartists were overruled by the fanatical and turbulent spirits, and the people, already aroused by suffering, were easily wrought into frenzy by those who assumed the direction of their movements. In the autumn of 1838, torch-light meetings began to be held. The danger of these meetings was obvious, and they were at once proclaimed illegal. Some of the more prominent leaders were arrested, amid intense popular excitement, and subjected to various terms of imprisonment. A body calling itself the national convention, elected by the chartists throughout the kingdom, commenced sitting in Birmingham in May, 1839. It proposed to the people various means of coercing the legislature into submission: recommending, among other things, a run on the savings-banks for gold, abstinence from excisable articles, exclusive dealing, and in the last resort, universal cessation from labor. During its sittings, a collision took place with the military in Birmingham. Public meetings were forbidden, and alarming excesses were committed by the irritated mob. In June, 1839, a petition in favor of the charter was presented to the house of commons, signed by 1,280,000 per-

sons. The house refused to name a day for its consideration and the national convention retaliated by advising the people to cease from work throughout the country. Fortunately, this advice was not followed, but the disturbance in the public mind increased, and in Nov., an outbreak at Newport took place, which resulted in the death of 10 persons and the wounding of great numbers. For taking part in this wild insurrection, three of its leaders were sentenced to death, but their punishment was afterwards commuted to transportation. In 1842, great riots took place in the northern and midland districts, not directly caused by the chartists, but encouraged and aided by them after the disturbances began. In the same year, an attempt was made by Joseph Sturge to unite all friends of popular enfranchisement in a complete suffrage union, but he only succeeded in dividing their ranks. In 1848, the turmoil in France created great excitement in England, and much anxiety was felt lest an armed attempt should be made to subvert the institutions of the country. Two hundred thousand special constables were enrolled in London alone. There were several local outbreaks, and much real danger, but the attempts at disorder were efficiently met, and, as usual, the only result was the punishment of the more prominent men, and the postponement of the desired reforms.

Since 1848, C. has gradually died out. Its principles were not new. The duke of Richmond, in 1780, introduced a bill into the house of lords to give universal suffrage and annual parliaments. In the same year, Charles James Fox declared himself in favor of the identical six points which were afterwards included in the charter. And nearer our own time, earl Grey, Mr. Erskine, sir James Mackintosh, and many others, formed a "society of friends of the people," which aimed at obtaining a very large extension of the suffrage.

The great body of chartists were, however, not so much actuated by the weight of precedent or argument, as impelled by the pressure of actual want, and an indefinite feeling that the laws were somehow to blame for not providing them with the means of comfortable subsistence. But there were many among them who had studied the principles involved in their demands, and maintained them from an intelligent conviction of their truth. These men declared that all persons had an equal natural right to share in determining the laws under which they lived; and further, that as they were required to contribute to the taxation of the country, they were justly entitled to be heard as to the application of the public funds. Taxation and obedience being universal, representation ought to be so. This view being conceded, all the other points of the charter naturally followed, they being merely arrangements for securing the free action of the right contended for. Some of the chartist advocates went far beyond this. There were those among them whose aims included little less than the reorganization of society. One of the ablest advocates of the cause wrote in favor of nationalizing the land, and remodeling the currency; he also proposed a system of state loans for the assistance of laborers who desired to become capitalists, and national marts for the exchange of wealth on terms of equity and justice. Pressed a little further, these views would have developed into communism; but so far as we are aware, most chartists held so strongly the doctrine of *individual* rights, that they were not likely to subordinate *man* to *society*. See COMMUNISM, SOCIALISM. The object aimed at by the majority was merely the extension of the franchise to the masses, in the belief that they would use it wisely and honestly, and put an end to what they considered the selfish and interested rule of classes who had long monopolized the control of the state. The opponents of C. answered, that if the question was argued as one of right, it would go far beyond the conclusions which the chartists had reached. The *right* appertained to women as well as to men, and there was no just reason why sane persons under 21 should be deprived of it. It would also, they maintained, give all power to the most ignorant classes of the community, and thus subject intelligence to brute force. Government existed for the benefit of society, and ought, as far as possible, to depend on the wisdom, and not on the mere number of the people. Then if representation depended upon taxation, it should vary in proportion to the taxes paid. Finally, they denied that men *as such* had a right to vote; their right was to be well governed, and universal suffrage was more likely to destroy society than to confer happiness or insure justice.

The cause which put an end to C. as an organization was undoubtedly the improvement in the circumstances of the people which followed the repeal of the corn laws. Since then, the chief points of the charter have actually become law. A property qualification is no longer necessary in a representative; the reform acts of 1867-68 have virtually established manhood suffrage; and the act of 1872 gave vote by ballot. The efforts of the majority of those who live by manual labor are now directed towards securing, by trades-unions and other means, a larger share than formerly in the profits of industry.

CHARTRES, a city of France, in the department of Eure-et-Loir, 47 m. s.w. of Paris, is built partly at the base and partly on the declivity of a hill overlooking the river Eure, which is here divided into two channels, one flowing within, and the other without the ramparts, which are converted into agreeable promenades. C. consists of an upper and lower town, connected by streets almost inaccessible to carriages. The upper town has some good streets, but the lower is ill built. The houses are old, and many of them composed of wood, with their gables to the street. The cathedral, one of the largest and most imposing ecclesiastical structures in Europe, with its lofty spires, one of them tow-

ering to a height of more than 400 ft., crowns the top of the hill. It has no less than 130 painted-glass windows, the workmanship of which is unsurpassed, if indeed equaled elsewhere in France. The church of St. Pierre, and the obelisk to the memory of gen. Marceau, are also objects of interest. The weekly corn-market of C. is one of the largest in France, and is remarkable as being under a corporation of women, who contrive to get through all the business most satisfactorily in less than an hour. It has manufactures of woolen, hosiery, and leather. Pop. '76, 20,067.

C. is a very ancient city. Under the Roman rule it was called *Autricum*, and remains of Roman antiquity are still found.

CHARTRES, ROBERT PHILIPPE LOUIS EUGÈNE FERDINAND D'ORLEANS, Duc de, b. 1840; the youngest son of the late duke of Orleans, and grandson of Louis Philippe. His father died when he was but two years old, and when he was eight the revolution drove him into exile. He was cared for at Eisenach, in Germany, but soon afterwards joined his family, who were in England. In 1860, he traveled in the east, and in 1861 came to the United States with his elder brother, the count of Paris. Both of them served for a time in the war of the rebellion on gen. McClellan's staff; but they went to England in the summer of 1862. In June, 1863, Robert married his cousin François Marie Amelie d'Orleans, by whom he has five children. After the revolution of Sept., 1870, he returned *incognito* to France, and served in gen. Chanzy's army; and in 1871, after the repeal of the act banishing the Orleans family, he was appointed a maj. in the army and served in Algeria. He has published his travels, and his father's posthumous work on the campaigns of the French army in Africa in 1835 and 1839.

CHARTREUSE, LA GRANDE, a celebrated monastery in France, in the department of Isère, situated 13 m. n.e. of Grenoble, in the wild and romantic valley of the Guiers, nearly 4,000 ft. above the sea. It is surrounded by the mountain-forests of the Alps; and the route to it, through a mountain-gorge, down which a rapid river dashes far below the traveler, while above him rise precipitous and foliage-lined rocks, some hundreds of feet in height, is one of the most picturesque. The convent is a huge ungainly structure, dating mostly from the 17th c., earlier buildings having been destroyed several times by fire. The convent owes its origin to St. Bruno, who settled a little higher up the mountain in 1084, giving the name of the place, C., to his order. The monks had at one time considerable property, but they were despoiled at the revolution of 1789.

CHARTULARY (Lat. *chartularia*, *chartologia*) is, as its name implies, a collection of charters. So soon as any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, obvious considerations of convenience and safety would suggest the advantage of having them classified and copied into a book or roll. Such book or roll has generally received the name of a chartulary. Mabillon traces chartularies in France as far back as the 10th c., and some antiquaries think that chartularies were compiled even still earlier. But it was not until the 12th and 13th centuries that chartularies became common. They were kept not only by all kinds of religious and civil corporations, but even by private families. Many of them have been printed, and their contents generally are of the greatest value in all historical, archaeological, and genealogical inquiries.

CHARYBDIS. See SCYLLA AND CHARYBDIS.

CHASCHISH. See HEMP, INDIAN.

CHASE. When one vessel is pursuing another at sea, the pursued vessel is often called the *chase*, and the pursuer the *chaser*. The maneuver also gives name to certain guns on board ship: a *bow-chaser* being a gun pointing ahead, and a *stern-chaser* pointing astern.

CHASE, in a gun, is the name given to the greater portion of the length between the muzzle and the trunnions.

CHASE, a co. in e. central Kansas, on the Neosho river and its affluents, intersected by the Atchison, Topeka and Santa Fe railroad; 757 sq. m.; pop. '70, 1975. It is an agricultural region. Co. seat, Cottonwood Falls.

CHASE, IRAH, D.D.; 1793-1864; educated at Middlebury college and Andover theological seminary, and ordained in 1817. He labored for a time as a Baptist missionary in West Virginia, and in 1818 became professor in a theological school in Philadelphia. The school was transferred to Washington, and he remained in his professorship seven years. In 1825, he aided in establishing a theological school at Newton Center, Mass., in which he was a professor for nearly 20 years. In 1830, he assisted in founding the Baptist mission in France. Among his works are *The Life of John Bunyan*; *The Design of Baptism*; *The Work Claiming to be the Constitution of the Holy Apostles, revised from the Greek*; *Infant Baptism an Invention of Man*; and many sermons and essays.

CHASE, PHILANDER, D.D., 1775-1852; graduated at Dartmouth in 1795, and ordained to the ministry of the Episcopal church in 1798. He labored as a missionary in western New York, and in 1811 became rector of Christ church in Hartford, Conn. In 1817, he went to Ohio, where, two years afterward, he was chosen bishop. A few years later he laid the foundation of Kenyon college and Gambier theological seminary. In 1835, he became bishop of Illinois, where he was instrumental in founding Jubilee college. at

Robin's Nest, where he died. Among his works are *A Plea for the West; The Star in the West, or Kenyon College; Reminiscences*, etc.

CHASE, SALMON PORTLAND, 1808-73; b. N. H. He was the son of a farmer, and a nephew of bishop Chase, who supervised his earlier education. Graduating from Dartmouth college in 1826, he opened a school for boys at the national capital, and in 1830 was admitted to the bar, where almost his earliest work was the preparation of an edition of the statutes of Ohio with annotations, and a sketch of the history of the state. This assisted him in gaining practice, and in 1834 he was appointed solicitor in Cincinnati for the bank of the United States. His first effort in a cause touching slavery was in defense of a colored woman claimed as a fugitive. He maintained that the fugitive slave law of 1793 was void, because unwarranted by the federal constitution. In the same year he defended James G. Birney (subsequently the candidate of the abolitionists for president), who had been prosecuted under the state law for harboring a slave. In this case he argued that slavery was a local institution, and that as the slave had been brought into a free state by his master, he was in fact free. In 1846, in the Van Zandt case before the U. S. supreme court, he took the ground that under the ordinance of 1787 no fugitive from service could be reclaimed from Ohio unless he had escaped from one of the original states; that it was the understanding of the makers of the constitution that slavery was to be left to the disposal of the several states, without sanction or support from the federal government; and that the clause in the constitution relating to persons held to service was a compact between the states, conferring no power of legislation on congress, and was never intended to confer such power. In 1841, he was prominent in the organization of the liberty party of Ohio, which nominated him for governor. In the national liberty convention at Buffalo in 1843, and in subsequent conventions until the nomination (in 1848) of Martin Van Buren for president, C. was a leading member, and in most cases directed the proceedings. In Feb., 1849, he was chosen U. S. senator from Ohio, his vote coming from all the democrats and a few free-soil members. He acted generally with the democrats until the nomination (in 1852) of Pierce on a strongly pro-slavery platform, when he withdrew and undertook the formation of an independent democratic party. The debate on the Nebraska bill gave him an opportunity to oppose the famous compromise, to which he moved an amendment looking to the exclusion of slavery from all the territories; but it was not adopted. Through all the contest for the repeal of the Missouri compromise and the Kansas debate, he was foremost in opposition to slavery extension. In the mean time, he was heard on other important subjects. He favored internal improvements by the general government, and supported the free homestead movement, and cheap postage. In 1855, he was elected governor of Ohio by the votes of the opponents of the Nebraska bill, and he was re-elected in 1857. His name was before the first national convention of the republican party (1856) for president, but was withdrawn at his own request. He was named, also, in the convention that nominated Lincoln, but was not pressed. In 1861, he was appointed secretary of the treasury, and held the office until July 30, 1864, when he resigned. In this position the arduous duties of sustaining the national credit in the struggle with the rebellion devolved in a great degree upon him; and he proved equal to the occasion. The death of Roger B. Taney in Oct., 1864, made a vacancy in the chair of the chief justice of the U. S. supreme court, which was immediately filled by the appointment of C., in which capacity he presided at the trial on the impeachment of Andrew Johnson in Mar., 1868. About this time, his dissatisfaction with the course of the republican party became so decided as to throw his influence on the side of the democrats, at whose national convention, July, 1868, he was prominently, though unsuccessfully, urged as a presidential candidate. In 1870, he was stricken with paralysis, the effects of which lasted until his death.

CHASE, SAMUEL, 1741-1811; one of the signers of the declaration of American independence; son of an Episcopal clergyman, and a lawyer in Annapolis, Md. He was one of the earliest and strongest friends of colonial liberty; was a member of the continental congress for four years, and in 1776 went with Charles Carroll and others on the fruitless errand to induce the Canadians to join in the rebellion against English rule. He filled several judicial offices in Maryland, and in 1796 was appointed associate justice of the U. S. supreme court. In 1804, John Randolph brought about his impeachment for misdemeanor in the conduct of political trials, but he was found not guilty on trial by the U. S. senate. He remained on the supreme court bench until his death.

CHASIDIM ("Pietists"). This name anciently denoted a whole class of Jewish sects. After the Babylonish captivity, the Jews, with regard to their observance of the law of Moses, were divided into two classes—*Chasidim* and *Zadikim*. When the so-called great synagogue was commissioned by the Persian government to draw up a code of civil and religious laws for the emigrant Jews returning to settle in their native land, several innovations were made on the Mosaic law. Those who accepted these innovations were styled the C.; while those who rejected them were styled, or styled themselves, the *Zadikim*, or "upright," because they adhered strictly to the law given by Moses, without observing any of the additions made to it. The C. branched forth into several sects, all holding traditions in connection with the written law, which they believed to possess a divine sanction equally with that law. The Pharisees, so often mentioned in the New

Testament, formed an early sect among the C., while from the Zadikim sprang forth the Hellenistic Samaritans, Essenes, Sadducees, etc. Afterwards, the C., or Pharisees, split into Talmudists, Rabbinites, and Cabalists, some of whom underwent still further subdivision.—The modern C. are not, like those in the times of the Maccabees, marked by any peculiar spiritualistic tendency in religion, but rather by a strict observance of certain traditional forms, and a blind subservience to their teachers. Their doctrine was promulgated in the middle of the 18th c. by Israel of Podolia, called *Baal-Shem* ("lord of the name," so called because he professed to perform miracles by using the great cabalistic name of the supreme being). Though condemned by the orthodox rabbis, this new teacher had great success in Galicia, and when he died (1760) left 40,000 converts. They are now broken into several petty sects; their religion is utterly formal, and its ceremonies are coarse and noisy.

CHASING, the art of working raised or half-raised figures in gold, silver, bronze, or other metal. It was called *calatura* by the Romans; and the term is expressly limited by Quintilian to working in metal. The same art when exercised on wood, ivory, marble, precious stones, or glass, was called *sculptura*. See **CARVING**. Iron was sometimes, though rarely used, silver having been always the favorite metal for this purpose. Closely connected with, but still distinguished from C., is the art of stamping with the punch, which the Romans designated by *excudere*. The Greek *torentike* is usually supposed to correspond to C., but the point is by no means free from dispute. The art was known at a very early period, as may be inferred from the shield of Achilles, the ark of Cypselus, and other productions of the kind. Such portions of the colossal statues made by Phidias and Polycleetus, as were not of ivory, were produced by the toreutic art. The statue of Minerva was richly adorned in this manner. Besides Phidias and Polycleetus, Myron, Mys, and Mentor were celebrated toreutic artists in antiquity, and amongst many moderns the most famous is Benvenuto Cellini (q.v.).

CHASLES, MICHEL, b. 1793; a French mathematician, educated at the Paris polytechnic school. In 1841, he was appointed professor of geometry in that institution. Among numerous essays and books of his productions are: *Historical Views of the Origin and Development of Methods in Geometry*; *History of Arithmetic*; and *Treatise on Superior Geometry*. In 1851, he became a member of the academy, and in 1867, he reported to that body that he was in possession of 27,000 letters and documents of great antiquity and value, among them letters and papers believed to have been written by Dante, Petrarch, Rabelais, Julius Cæsar, Shakespeare, and other persons of renown. Only about 100 of these were genuine, though they completely imposed upon C. and other good judges. The forger, Irene Lucas, was imprisoned two years for forgery and fraud.

CHASLES, VICTOR EUPHÉMION PHILARÈTE, 1798–1873; a French writer who traveled in the United States about 1820–23. In 1837, he was director of the Mazarin library, and in 1841, professor of German language and literature in the college of France. He published in 20 vols. *Comparative Studies of Literature*; wrote tales and books of travel; and prepared editions of classic authors.

CHASSE, music composed in imitation of the chase, and performed chiefly by horns, occasionally combined with other wind instruments. Its movement is in $\frac{3}{4}$ time. The best specimens of this kind of music are an overture by Mehul, and a C. for the piano-forte by Kreutzer.

CHASSÉ, DAVID HENDRIK, BARON, was b. in Tiel, Mar. 18, 1765, began his military career when but ten years of age, became a lieut. in 1781, and capt. in 1787. After the revolution of that year, C., as siding with the humbled Dutch patriots, took French service; was appointed lieut.col. in 1793; and, two years later, found himself marching towards the Netherlands under the command of Pichegru. He afterwards fought with the French in Germany and Spain, gaining great distinction and the appellation of *Général Bayonnette*. As lieut.gen. of the Dutch forces in 1815, C. added to his laurels on the field of Waterloo. After the peace he was made governor of Antwerp in 1830, and bravely defended it against the united Belgians and French from Nov. 29 till Dec. 23, 1832, when he was forced to surrender. He died in May, 1849.

CHASSELOUP-LAUBAT, FRANÇOIS DE, MARQUIS, 1754–1833; a French military engineer who conducted the works at Maestricht in 1794, at Mentz in 1795, and in the Italian campaigns up to 1812; when he was appointed senator. Louis XVIII. made him a marquis.

CHASSELOUP-LAUBAT, JUSTIN NAPOLÉON SAMUEL PROSPER DE, MARQUIS, 1805–73; in 1837, a member of the French chamber of deputies and afterwards councilor of state. In 1849, he was again a member, and then and afterwards a supporter of Louis Napoleon, who made him minister of marine. He was for some years the president of the colonial board of Algeria. In 1869, he presided over the council of state until the accession of Ollivier's administration.

CHASSEPOT, a breech-loading rifle invented by Antoine Alphonse Chassepot, b. Mar. 4, 1833; he was attached, in 1858, to the government workshops of St. Thomas at Paris, of which he was made director in 1864; and was afterwards officially attached to the national manufactory of arms at Chatellerault, near Poitiers. He took out patents

for his invention, and the royalty has brought him a large income. He was decorated with the cross of the legion of honor in 1866. The first model of the C. was exhibited in 1863; but it was not introduced in the French army till after the Prussians had proved the efficiency of the needle-gun in the war of 1866 against Austria; it was used successfully in the Franco-German war of 1870. The C. is an improved needle-gun; the fulminate is in a paper wad which forms the rear of the cartridge envelope; the gas check is a cylindrical ring of vulcanized India rubber, which is pressed against the surface of the chamber when the explosion takes place; the cartridge envelope is of silk or linen, with a caliber of .433 inch. The gun has 4 grooves, and can be fired 12 times a minute at a range of 1200 yards. An improved form of the C. has been recently introduced in France, in which the metallic cartridge can be used.

CHASSEURS (Fr., hunters) is a name used for two important forces in the French army. The mounted C. (*chasseurs-à-cheval*) are a body of light cavalry, designed for service in advance or on the flanks of the army, and correspond most nearly to the light horse of the British service. The name is first used in this sense in 1741, and has been retained while the force it denotes has undergone many alterations in organization and equipment. In 1831, a body of cavalry was raised for service in Africa, mounted on Arab horses, and with a distinct uniform. These have since become famous as the *C. d'Afrique*. After the reorganization of the French army in 1873, the effective army contained 14 regiments (subsequently increased to 20) of *chasseurs-à-cheval*, besides 4 regiments of *C. d'Afrique*.—The infantry C. (*chasseurs-à-pied*) are a light infantry force in many regiments of corresponding with the cavalry C., and like them intended for detached service (like the rifle corps in the English army). The French are believed to have adopted the idea of such a force of sharpshooters from the *Jäger* (the German word corresponding to C. or *hunters*) in the German armies. First used in the thirty years' war, the *Jäger* derived their name from the fact that they were chiefly drafted from amongst mountaineers and inhabitants of forest regions. They have always been regarded as a valuable contingent in the Prussian and Austrian armies, or even constitute the entire force of light infantry. In the German army, there are 26 battalions (near 15,000 men) of this force; in the Austrian service, upwards of 20,000 officers and men. In France, the equipment of the C. differed little from that of the other infantry; it was not until the formation, in 1838, of the *C. de Vincennes*, that the experiment of a specially armed force of sharpshooters was fairly tried. The fame of the *C. de Vincennes* for rapidity and precision of movement, as well as for the accuracy of their fire, soon vindicated the importance of this branch of the infantry; and at present there are 30 battalions of *chasseurs-à-pied* in the French army.

CHASTELAIN, GEORGES, 1403-75; in the service of Philip the good of Burgundy, at whose request he compiled the *Grande Chronique*, or history. Of their work, which was to have filled six volumes, only two fragments of importance are known to exist—the first extending from 1419 to 1422; the second, with large breaks in the text, from 1461 to 1474.

CHASTELARD, PIERRE BOSCOBEL DE, 1540-63; a French poet, a scion of the house of Bayard. The name of Chastelard is romantically connected with that of Mary queen of Scots. He was a page in the house of marshal Danville, whom he accompanied in his journey to Scotland as escort of Mary in 1561. C. returned to Paris in the marshal's train, but left almost immediately for Scotland bearing letters of recommendation to Mary from Montmorency, and also the "regrets" addressed to the queen by Pierre Ronsard. C.'s master in the art of song. The enthusiastic page fell in love with the queen, who is said to have encouraged his passion. Copies of verses passed between them, and she lost no occasion of showing herself partial to his person and conversation. The young man hid under her bed, where he was found by the maids of honor; but Mary pardoned the offense, and the old familiarity between them was resumed. Again C. was so rash as to violate her privacy; but he was discovered, seized, sentenced, and hanged the next morning. He met his fate consistently, reading, on his way to the scaffold, Ronsard's "Hymn to Death;" and turning at the moment of doom towards Holyrood, addressing to his unseen mistress the famous farewell: "Adieu! thou so fair and so cruel; thou killest me, and yet I cannot cease to love thee!" Another story is that he simply ejaculated "Cruel queen!" emphasizing the words by a threatening gesture.

CHASTELER, JEAN GABRIEL JOSEPH ALBERT, Marquis de, 1763-1825. He was in the Austrian service as a general officer, and served in the war of the Bavarian succession, and in the war against the Turks. He defended Namur against the French, participated in the third partition of Poland, and was sent to Russia to engage the emperor Paul in a coalition against France. In 1799, he was in the Russo-Austrian army, and was seriously wounded before Tolona, Italy. He fought in the Tyrol against Napoleon, but was beaten by Lefebvre, May 13, 1809, and was compelled to fly to Hungary. When the Lombardo-Venetian kingdom was established, he was made governor of Venice.

CHASTELLUX, FRANÇOIS JEAN, Marquis de, 1734-88; a French soldier and author, distinguished in the seven years' war in Germany, and in the army of Rochambeau in

the American revolution, where he held the rank of maj.gen. His chief works are *De la Félicité Publique*; *Voyages in North America*; and a *Discourse on the Advantages Resulting to Europe from the Discovery of America*.

CHASTE-TREE. See VITEX.

CHASUBLE (Lat. *casula*, *casubula*, and *casibula*), the uppermost garment worn by priests in the Roman Catholic church, when robed for the celebration of the mass. It was called also "the vestment," and under that name seems occasionally to have been used in the English church after the reformation. Originally it covered the priest from head to foot, like a little house, whence some writers think it had its name of *casula*. In more recent times, at least, it was made of velvet. It was of an elliptical shape, like a *vesica piscis*, with a hole in the middle for the head; it had no sleeves. When put on, it showed two peaks, one hanging down before; another, on which a cross was embroidered, hanging down behind. According to Hildebert, the C. signified good works; according to Alcuin, charity; according to another writer, the unity of the faith. Durand makes one peak the symbol of love to God, the other peak the symbol of love to our neighbor. In France, the press or wardrobe in which chasubles were kept was called the *chasublier*.

CHAT, *Saxicola*, a genus of small birds of the very numerous family *sytiadæ* (q. v.), distinguished by a bill slightly depressed, and widened at the base. They have rather longer legs than most of the family. They are lively birds, flitting about with incessant and rapid motion in pursuit of the insects on which they chiefly feed. They are found in Europe, Asia, Africa, and New Holland. Three species are British—the stonechat, whinchat, and wheatear.—The yellow-breasted C. of the United States (*icteria polyglotta*) is a larger bird, and belongs to the family *turdidæ* or *merulidæ*.

CHÂTEAU, CHÂTEL, or CASTEL, from the Lat. *castellum*, a fort, enters as a component part into many names of places in France.

CHATEAUBRIAND, FRANÇOIS AUGUSTE, Viscomte de, one of the most distinguished of French authors, was b. Sept. 4, 1769, at St. Malo, in Bretagne, and received his early education in the college at Rennes. While traveling in North America in 1790, he accidentally read in an English newspaper the account of the flight and arrest of Louis XVI. He immediately returned to France, intending to fight against the republic; but being seriously wounded at the siege of Thionville, in Sept., 1792, he escaped to England, where he lived in such poverty that he was compelled to make translations for the book-sellers, and to give lessons in French. In 1797, he published his first political essay, *Sur les Révolutions Anciennes et Modernes, considérées dans leurs Rapports avec la Révolution Française* (2 vols., London), a republican and sceptical work, the outcome of hardship, poverty, and sorrow. His skepticism soon vanished, but republican impulses continued to flash out at intervals during the whole of his strangely-checked, inexplicable, and inconsistent career. In 1800, C. returned to Paris, and wrote for the *Mercur de France*. In this journal, he first printed his tale of *Atala* (1801), with a preface lauding the first consul, Bonaparte. Its success was remarkable, but nothing to the miraculous enthusiasm excited by his *Génie du Christianisme* (1802), a work exactly suited to the jaded skepticism of the age, and also in accordance with the policy of the first consul, who was then concluding the concordat with the pope, and wished to make the Roman Catholic priesthood subservient to his measures. Bonaparte, therefore, appointed C. secretary to the embassy in Rome, and, in 1803, sent him as ambassador to the little republic of Valais. On the execution of the duke d'Enghien, Mar. 21, 1804, C. resigned in disgust. In 1806, he commenced his pilgrimage to the Holy Land, visited Greece, Palestine, Alexandria, and Carthage, and returned through Spain to France in May, 1807. From this period to the fall of Napoleon, he lived privately, publishing only two works of any value—*Les Martyrs* and the *Itinéraire de Paris à Jérusalem*. In 1814, his eloquent brochure, *De Bonaparte et des Bourbons*, excited such attention, that Louis XVIII. declared it was worth an army of 100,000 men in favor of legitimacy.

After the battle of Waterloo, C. returned to Paris, where he was made peer and minister of state. Gradually his monarchical zeal subsided, and, in his address, *De la Monarchie selon la Charte*, delivered in the chamber of peers, he gave expression to such liberal tendencies as offended the king, who erased his name from the list of his counselors. Soon, however, he appeared again as an ultraroyalist; and at the baptism of the infant duke de Bordeaux, C. presented to the duchess of Berry a flask filled with water from the Jordan. In 1822, he was appointed ambassador-extraordinary to the British court, but was rather rudely dismissed from office in 1824.

In 1826, C. prepared the first edition of his collected works, for the copyright of which the publisher gave the large sum of 600,000 francs, of which C. returned 100,000. During the days of July, 1830, he was staying with his friend Mme. Récarnier at Dieppe; but as soon as he heard tidings of the revolution, he hastened to Paris. He refused to take the oath of fealty to Louis Philippe. This political crochetedness, which always rendered it impossible to know beforehand what course of conduct C. would adopt, is perhaps best explained by the following passage from his *De la Restauration et de la Monarchie Elective* (Paris, 1831): "I am a Bourbonist in honor, a monarchist on

grounds of rational conviction; but in natural character and disposition, I am still a republican." In 1832, he revised a new edition of his works, and, after visiting the court of the expelled Bourbons, devoted his attention to the preparation of his memoirs, intended to be published posthumously (*Mémoires d'outre Tombe*), though considerable extracts were printed during his lifetime. He also found leisure to write several other works. He died July 4, 1848.

C. wrote with warmth, energy, and a rich supply of imagery. Many of his descriptive passages are excellent, but his ideas want depth and coherency.—Marin, *Histoire de la Vie et des Ouvrages de M. de Chateaubriand* (2 vols., Paris, 1832).

CHATEAUDUN, a t. of France, in the department of Eure-et-Loir, is situated on the Loir, a tributary of the Loire, about 26 m. s.s.w. of Chartres. The streets are straight and well built, and an old castle, with an enormous tower, overlooks the town. C. has manufactures of blankets and leather. Pop. '76, 6,061.

CHÂTEAUGAY, a s.w. co. in the province of Quebec, Canada, on the St. Lawrence, drained by the Chateaugay, the Noiré, and other rivers; 250 sq.m.; pop. '71, 16,166. It is generally level, and the soil is fertile. Chief town, St. Martine.

CHÂTEAU-GONTIER, a t. of France, in the department of Mayenne, situated on the river of that name, here crossed by a stone bridge, 18 m. s.s.e. of Laval. C. has some good houses, but the streets are not well laid out. It has linen and woolen manufactures. Pop. '76, 7,218.

CHÂTEAUGUAY, SIEUR DE. See LE MOYNE.

CHÂTEAUNEUF DE RANDON, a village of France, in the department of Lozère, 12 m. n.e. of Mende. A pretty historical incident connected with the place, which was formerly fortified, makes it interesting. In 1380, the fortress, then held by the English, was besieged by the troops of Charles V., under the command of the gallant Du Guesclin. The English governor, sore pressed, promised to yield in fifteen days if no succor arrived. In the meantime, Du Guesclin died, and his successor was appointed, who, at the expiry of the fifteen days, summoned the governor to surrender. He refused to yield up the keys to any but Du Guesclin; and when informed of his death, marched out, and on bended knee laid the keys and his sword on the dead hero's bier. Pop. '72, 393.

CHÂTEAUROUX, a t. of France in the department of Indre, situated on a rising ground in the midst of an extensive plain, on the left bank of the river Indre, 166 m. s. of Paris by railway. The town, which was formerly dirty and ill built, has been greatly improved within the last quarter of a century. C. does not possess much interest for the traveler. It is a busy place, with extensive woolen factories, besides manufactures of cotton, hosiery, yarn, hats, paper, parchment, hardware, leather, etc. Some of the best iron in France is found in the vicinity. The town owes its origin to a castle built here in the 10th century. Pop. '76, 16,980.

CHÂTEAU-THIERRY, a t. in the department of Aisne, France, on the right bank of the Marne; pop. '72, 5,347. It has a commercial college, a public library, and manufactures of linen, cotton, leather, and earthenware. There is a marble statue of La Fontaine, the fabulist. The town takes its name from a castle said to have been built by Charles Martel for Thierry IV., the ruins of which are on an adjacent hill. The position of Château-Thierry has subjected it to many disasters. It was captured by the English in 1421, by Charles V. in 1545, by the Spanish in 1591; pillaged in the Fronde wars in 1652, and suffered severely in the Napoleonic campaign of 1814.

CHÂTEL, FERDINAND TOUSSAINT FRANÇOIS, Abbé, 1795-1857; ordained as a priest in 1818, serving as vicar to several French towns, and as chaplain in the army. In 1831, he founded a new sect in whose doctrines Christ was to be venerated only as a perfectly good man, and the confessional, fasting, and vows of chastity and celibacy were to be omitted. The authorities interfered in 1842 and closed his place of worship, but in 1848 he appeared again as an especial champion of women's rights. His public meetings were suppressed in 1850, and he passed his later years in the duties of a metropolitan postmaster.

CHÂTELET, the name of two old fortresses of Paris, believed by some to have been built in the time of Julius Cæsar. The grand C. was restored by Louis IX. and remodeled by other kings. It was demolished in 1802. It was the residence of counts of Paris, and became an important seat of the judiciary, as well as a prison. This fortress stood on the right bank of the Seine where is now the w. part of the place de Châtelet. The petit C. was on the other bank near the present place du Petit Pont. It was demolished in 1782. In earlier times it was one of the gates of the city.

CHÂTELET-LOMONT, GABRIELLE EMILIE, Marquise du, a very learned French woman, notorious for her intimacy with Voltaire, was born at Paris, 17th Dec., 1706. At an early period she displayed a great aptitude for the acquisition of knowledge. She studied Latin and Italian with her father, the baron de Breteuil, and subsequently betook herself with zeal to mathematics and the physical sciences. Distinguished alike for her beauty and talent, she soon found a host of suitors for her hand. Her choice fell on the marquis du Châtelet-Lomont, but her marriage did not hinder her from forming a *tendresse*

for Voltaire, who came to reside with her at Cirey, a château on the borders of Champagne and Lorraine, belonging to her husband. Here they studied, loved, quarreled, and loved again, for several years. In 1747, however, poor Madame C. became "not insensible to the brilliant qualities" of a certain M. Saint-Lambert, a capt. of the Lorraine guards; and the result was, that the philosopher had to make room for the soldier, and content himself for the future with being the "devoted and indulgent friend" of his former mistress. This new intimacy became fatal to Madame Châtelet. She died at Luneville, 10th Sept., 1749, a few days after having given birth to a child. Her first writing was a treatise on the philosophy of Leibnitz. She also translated the *Principia* of Newton into French, accompanying it with algebraic elucidations. It did not, however, appear till 1756, some years after her death. Her correspondence with Voltaire is interesting; but the fact that a woman so highly gifted as Madame C., and possessing so many amiable qualities, should never have dreamed that there was anything wrong in her *liaisons*, proves with terrible conclusiveness how corrupt was that philosophic society which, in the 18th c., professed to explode superstition and enlighten France and the world.

CHÂTELLERAULT, a t. of France, in the department of Vienne, situated on the river of that name, 18 m. n.e. of Poitiers. A handsome stone bridge, with a massive castellated gateway, built by Sully, at one end, connects it with a suburb on the other side of the river. C., which is an ill-built, mean-looking town, is one of the chief seats of the manufacture of cutlery in France, and since 1820 has had a national manufactory of swords and bayonets. Its river-port makes it the entrepôt for the produce of an extensive district. The duke of Hamilton derives his title of duke of Châtellerault from this place. Pop. '76, 15,244.

In a military point of view, the lines of detached forts connected with C. constitute a fortification of great strength; and the whole is regarded as a flank defense for London in the event of an invader seeking to march on the capital from the s. coast. The place is also defended by some strong forts on the Medway. In and near C. are fort Pitt, a military hospital and strong fort; barracks for infantry, marines, artillery, and engineers; a park of artillery; and magazines, store-houses, and depots on a large scale.

In a naval sense, C. is one of the principal royal ship-building establishments in the kingdom, and a visit to it never fails to impress the stranger with a sense of the naval power of England. The dock-yard is nearly 2 m. in length, containing several building-slips, and wet docks sufficiently capacious for the largest ships; and the whole is traversed in every direction by a tramway for locomotives, with a gauge of 18 inches. One peculiar establishment in this dock-yard is a metal mill, which supplies all the royal dock-yards with copper sheets, copper bolts, and other articles in copper and mixed metal. The saw-mills at C. are so extensive that it is said that, if fully employed, they could cup up timber enough for all the dock-yards. A duplicate of Brunel's block-making machinery is kept at C., ready to supplement the operations of that at Portsmouth. The dock-yard is under the control of a captain-superintendent and other officers, whose annual salaries vary from £700 to £200 each. Under them are clerks receiving from £450 to £80 each. The actual workmen, artisans, and laborers, vary in number according to the amount of ship-building and repairing going on. In the navy estimates provision is made for about 3,500 shipwrights, calkers, joiners, sawyers, millwrights, smiths, blockmakers, sailmakers, ropemakers, riggers, laborers, etc. The total outlay on the C. establishment in 1879-80 was £685,253.

CHATHAM, a co. in s.e. Georgia, on the ocean and the South Carolina border; 358 sq.m.; pop. '70, 41,297—24,518 colored. It is level and swampy, with fertile soil near the rivers. Rice, sweet potatoes, corn, and cotton are the chief productions. The Savannah, Alabama, and Gulf railroad intersects it. Co. seat, Savannah.

CHATHAM, a co. in central North Carolina, reached by the Chatham railroad, and drained by the Rocky, New Hope, Deep, and Haw rivers; 700 sq.m.; pop. '70, 19,723—6,830 colored. Chief productions, wheat, corn, oats, tobacco, butter, and coal. Co. seat, Pittsboro.

CHATHAM, a t. in Barnstable co., Mass., on the s.e. extremity of cape Cod, near the Cape Cod railroad; pop. '70, 2,411. Fishing is the business of the greater portion of the inhabitants. There are three important lighthouses in the township.

CHATHAM (Saxon, *Ceteham* or *Cattham*, understood to signify the "village of cottages"), a parliamentary borough, river-port, fortified town, and naval arsenal, in the co. of Kent, situated on the right bank of the Medway, at the upper part of its estuary, 30 m. e.s.e. of London. Much of C. is ill built and irregular. The High street is 1½ m. long, parallel to the river, and swarms with soldiers and Jews. The refuse timber of the dock-yard is much used in building the house-walls. C. owes its importance to its naval and military establishments situated at Brompton village (on a height half a mile n. of C.), and on the Medway estuary. The C. fortified lines are the frequent scenes of field-operations, imitation battles, and grand reviews. Pop. '71, 45,792. The borough, which sends one member to parliament, is governed by a head-constable under the magistrates of Rochester. The Romans seem to have once had a cemetery here.

Traces of Roman villas have been found, with Roman bricks, tiles, coins, and weapons. The dock-yard was founded by Elizabeth before the threatened invasion of the Spanish Armada. In 1662, it was removed to its present site. In 1667, the Dutch, under De Ruyter, sailed up the estuary of the Medway, and, in spite of the fire from the castle, destroyed much shipping and stores.

CHATHAM, a t. in Northumberland co., N. B., on the Miramichi river, near its entrance into Miramichi bay; pop. '71, 4,303. It has a Roman Catholic cathedral, a college, and a temperance hall. It is a port of entry, and has a large export trade in fish, lumber, etc.

CHATHAM, a t. in Kent co., Ontario province, Canada, on the Thomas river, 47 m. e. of Detroit, Mich.; reached by the Great Western railroad, and by steamboats from the lakes. It is in a rich agricultural district, and has a large trade in grain and lumber. Pop. '71, 5,873.

CHATHAM, WILLIAM PITT, Earl of, sometimes styled **PITT THE ELDER**, one of the greatest English orators and statesmen of the 18th c., was the son of a country gentleman, Robert Pitt of Boconnoc, in Cornwall; and was b. Nov. 15, 1708. After an education at Eton and Oxford, he traveled on the continent, and on his return obtained a cornetcy in the blues. In 1735, he entered parliament for Old Sarum—that synonym for electoral corruption—a borough then belonging to his family. He espoused the side of Frederick prince of Wales, then at deadly feud with the king, and offered a determined opposition to Walpole, who was at the head of affairs. He was deprived of his commission in consequence—an insult and injury which only increased the vehemence of his denunciations of the court and the government. His influence, both in and out of the house of commons, increased rapidly; and Walpole, being driven from power, the king, notwithstanding his hatred of Pitt, found it necessary to allow of his admission to a subordinate place in the broad bottom administration; subsequently he was appointed to the lucrative office of paymaster-general. The duchess of Marlborough, pleased with his patriotism and powers of oratory, left him £10,000; and later, sir William Pynsent, struck with similar admiration, left him his whole property. In 1755, when Henry Fox (afterwards lord Holland) was made secretary of state, finding himself opposed to the foreign policy of the new minister, Pitt resigned office as paymaster. In the following year, when the king, unwillingly acceding to popular demands, had to dismiss Fox, Pitt became nominally secretary of state, but was virtually premier. He immediately began to put into execution his own plan of carrying on the war with France. He raised the militia, and strengthened the naval power; but the king's old enmity, and German predilections, led him to oppose Pitt's policy, who thereupon resigned office in April, 1757, but was recalled in June, in obedience to the loud demands of the people.

Now firmly established in power, Pitt's war policy was characterized by unusual vigor and sagacity. Success returned to the British arms. French armies were beaten everywhere by Britain and her allies—in India, in Africa, in Canada, on the Rhine—and British fleets drove the few French ships they did not capture or destroy from almost every sea. But the prime mover of all these brilliant victories found himself compelled to resign (1761), when, on the accession of George III., and owing to the influence of lord Bute, it was attempted to introduce a vacillating policy into the government; his immediate cause of resignation being the refusal of the majority of the cabinet to declare war with Spain, which Pitt, foreseeing as imminent, wished to commence before the Spaniards were thoroughly prepared. As some recompense for his important services, Pitt received a pension of £3,000 a year; and his wife, sister of George Grenville, was created baroness Chatham. Until 1766, Pitt remained out of office, not offering a factious opposition to government, but employing all his eloquence to defeat some of its most obnoxious measures. In that year he received the royal commands to form a ministry. He undertook the task, choosing for himself—to the astonishment of the public, and the sacrifice, to a considerable extent, of his popularity—the almost sinecure office of privy seal, with a seat in the house of lords as viscount Pitt and earl of Chatham. Ill-health prevented C. from taking any active part in this ministry, of which he was nominally the head, and which was weak and embarrassed throughout, and he resigned in 1768, to hold office no more. He did not, however, cease to take an interest in public affairs. He spoke strongly against the arbitrary and harsh policy of government towards the American colonies, and warmly urged an amicable settlement of the differences. But when, America having entered into treaty with France, it was proposed by the duke of Richmond to remove the ministers, and make peace on any terms, C., though much debilitated, came down to the house of lords, and in a powerful address protested against the implied prostration of Britain before the throne of the Bourbons, and declared war, with whatever issue, preferable to the proposed terms of peace. This address secured a majority against the motion, and the war was continued. But it was the orator's last effort; for, exhausted by speaking, on rising again to reply to a query addressed to him by the duke of Richmond, his physical powers suddenly failed, he fell back into the arms of his friends, and was carried from the house. He died May 11, 1778. He was honored with a public funeral in Westminster abbey, where a statue was also erected to his memory at the public expense; and, in addition, government voted

£20,000 to pay his debts, and conferred a pension of £4,000 a year on his descendants. C.'s personal appearance was dignified and imposing, and added greatly to the attractions of his oratory, which was of the most powerful kind. His upright and irreproachable character demanded the admiration of his enemies; but his affectedness and haughtiness not unfrequently disgusted his friends, and pride rather than principle seems to have actuated his course at some important conjunctures of his life. He had, however, an intense love of country; the grand object of his ambition being to make his native land safe against all contingencies, and powerful among nations.

CHATHAM ISLANDS, a small group in the Pacific, lying about 400 m. due e. of the Canterbury settlement, on the Middle island of New Zealand, in lat. 43° 38' to 44° 40' s., long. 177° to 179° w., being thus almost precisely the antipodes of Toulouse, in France. They were discovered in 1791 by lieut. Broughton, both the cluster and its chief member taking the name of his ship. Chatham island is computed to contain 600,000 acres; a salt or brackish lake, however, of 20 m. in length, occupying the interior. The soil and climate of the archipelago, in general, are said to be good. Wheat yields abundantly; and the horses, cattle, and pigs which have been introduced thrive well. Timber of any size is unknown, so that the native canoe, instead of being cut out of a single tree, is merely wicker-work bound together by cordage of indigenous flax. The aborigines have two missions among them—one from Germany, and the other from New Zealand.

CHATI, a cat, *felis mitis*, smaller than the ocelot, and something like the leopard, a native of South America. It greatly annoys farmers by destroying fowls, birds, and smaller animals. Like all of the cat kind, it hunts mostly in the dark.

CHÂTILLON, a t. of France in the department of Cote d'Or, on the Seine, about 45 m. n.n.w. of Dijon. Pop. '76, 4,894. C. is chiefly famous on account of the congress of allied sovereigns held here in 1814, from Feb. 5 to Mar. 19, for the purpose of negotiation with Napoleon respecting conditions of peace. Several of the conditions proposed by the allies Napoleon could not bring himself to submit to, and the negotiations broke up, Mar. 19. On the 25th, when their armies were, in fact, marching on Paris, the allies from Vitry issued their declaration justifying a continuation of the war.

CHAT MOSS, a bog in Lancashire, the largest in England, about 7,000 acres in extent, and celebrated as having been the scene of the first great and successful efforts for the reclaiming of bogs, by Mr. Roscoe of Liverpool, in the end of the 18th and beginning of the 19th c., and of one of the great engineering triumphs of George Stephenson in the construction of the Liverpool and Manchester railway. It is situated between Liverpool and Manchester, at no great elevation above the sea. It is from 20 to 30 ft. in depth, and of such consistence that when an attempt was first made to survey it for the Liverpool and Manchester railway, the attempt was relinquished because of the impossibility of obtaining a sufficiently solid stand for the theodolite. Drains are filled up almost as fast as they are cut, by a pulpy stuff flowing into them, and affect only a few feet on either side. Great danger is experienced by any person stepping unwarily on the surface of the bog; and when he begins to sink, his struggles to extricate himself only cause him to sink faster and deeper. Mr. Roscoe's agricultural improvements were effected by numerous parallel drains in the parts on which he operated. The use of *pattens* by his workmen, and the adaptation of them to the feet of the horses employed, have been mentioned in the article **BOG**. The enlargement of the circle upon which a horse's foot rests from 5 in. diameter to 7, nearly doubles it, and consequently diminishes nearly by one half the pressure on each unit of surface. Mr. Stephenson, when he could find no one to countenance him in his views, calculated with confidence on the application of this principle to the railway, so that even the ponderous locomotive and train might be supported by a sufficient extension of the bearing surface; and thus he accomplished by spreading branches of trees and hedge-cuttings, and in the softest places rude hurdles interwoven with heather, on the natural surface of the ground, containing intertwined roots of heather and long grass; a thin layer of gravel being spread above all, on which the sleepers, chairs, and rails were laid in the usual manner. Drains were at the same time cut on both sides of the line, and in the central part of the moss a conduit was formed beneath the line of railway, of old tar-barrels placed end to end. Notwithstanding difficulties which every one but himself deemed insuperable, Mr. Stephenson constructed the portion of the line through C. M. at a smaller expense than any other part of the railway. There still is "a sort of springiness in the road over the moss, such as is felt when passing along a suspension-bridge;" and "those who looked along the moss as a train passed over it, said they could observe a waviness, such as precedes and follows a skater upon ice."

The complete reclaiming of C. M. for agricultural purposes can be only a question of time and expense. It seems capable of becoming one of the most productive tracts of land in England.

CHATOYANT, a term to denote the changeable internal light seen in some minerals, such as "cat's eye." (See **CAT'S EYE**, *ante*.)

CHÂTRE, L.A., a t. in the department of Indre, France, on the river Indre, 20 m. s.e. of Chateauroux; pop. '66, 5,167. There is a ruined castle, one of the towers of which is still used as a prison.

CHATSK, or **SCHAZK**, a t. of European Russia, government of Tambov, 175 m. s.e. of Moscow, on a small river of the same name. It is situated in the midst of a vast fertile plain, contains a number of churches, and has a trade in hardware, grain, and cattle. Pop. '67, 6,783.

CHATSWORTH, the magnificent mansion of the duke of Devonshire, and one of the most splendid private seats in England, is situated in Derbyshire on the Derwent, 12 m. n. by w. of Matlock. William the conqueror gave the domain to his natural son William Peveril. It was purchased by sir W. Cavendish in queen Elizabeth's time. Sir W., in 1570, began the old mansion, which was finished by his widow, afterwards countess of Shrewsbury. In this building Mary Queen of Scots was imprisoned for 13 years. The present edifice, called a palace from its grandeur, includes the old Ionic pile, 183 by 172 ft. built 1687-1706, by the first duke of Devonshire, after designs by Talman and Wren. The great stables were built about 1706, and the n. wing since 1720. The façade is 720 ft. long, or with the terraces, 1200 feet. The building is nearly a square, with an interior court. C. is famed for its pictures, sculptures, hangings, carvings, and bass-reliefs. There are some exquisite sculptures by Canova, Thorwaldsen, Chantrey, etc. The grounds around are 9 m. in circuit, including hill and dale, and fine prospects. They were laid out by Loudon and Paxton, and are celebrated for their trees, shrubs, rock-work, deer, and water-works—only surpassed by those at Versailles. The conservatory, unrivaled in Europe, covers nearly an acre, measures 300 by 145 ft., and 65 ft. high, has 70,000 sq. ft. of glass, and a carriage-road through it. Hobbes, the philosopher, lived long at Chatsworth.

CHATTAHOOCHEE, a river of the United States, rises on the eastern declivity of the Blue Ridge of the Alleghanies, in the n. of Georgia; traverses that state in a s.w. direction; becomes the boundary between it and Alabama; and finally, after receiving the Flint from the left, crosses Florida, under the name of Appalachicola, into the gulf of Mexico. With an entire course of 550 m., it is navigable upwards as far as Columbus, at a distance of 350 m. from the sea. It forms the principal outlet for the cotton crops of its basin.

CHATTAHOOCHEE, a co. in s.w. Georgia, on the Alabama border; 250 sq. m.; pop. '70, 6,059—3,405 colored. Agriculture is the chief business. Co. seat, Cusseta.

CHATTANOOGA, a city in Hamilton co., Tenn., on the Tennessee river, near the Alabama boundary; pop. '70, 6,093—2,221 colored. The river is navigable for steam-boats about eight months in the year, and by light-draught boats at all times. Four railroads center at Chattanooga, and afford easy communication in all directions. The city is one of the most important shipping points in that section of the country. The region is rich in coal and iron, and there is abundance of water-power. At this point, in Oct., 1863, occurred one of the most important conflicts of the war of the rebellion. After the retreat of Rosecrans from the field of Chickamauga, in Sept., the confederates under Bragg sent a cavalry force across the Tennessee above Chattanooga, and seized several points on the railroad in order to cut off his supplies. Shortly afterwards, Grant relieved Rosecrans and assumed command of the department of the Tennessee, Cumberland, and Ohio. Thomas was appointed commander of the department of the Cumberland, Sherman was assigned to the department of the Tennessee, and Hooker, with the 11th and 12th corps, which had been transferred from the army of the Potomac, was sent across the river to make a flank movement against Bragg, while a force under William F. Smith was thrown across the river at Brown's ferry, below Chattanooga, to seize the points of Lookout mountain that commanded the passage of the river. These measures, which were executed Oct. 27, 28, and 29, were successful in restoring the connection between the union army at Chattanooga and its depot of supplies. Sherman's army having arrived, the movement against the confederates was begun Nov. 23. Thomas's troops attacked and carried the enemy's first line of rifle-pits at 2 P.M., and held it during the night. The next day the attack was renewed along the whole line. Thomas strengthened himself in his advanced position, repelling every effort of the enemy to recover the lost ground. Sherman succeeded in carrying Missionary ridge, and Hooker, after partially carrying Lookout mountain, intrenched himself in a strong position, compelling the abandonment of the mountain by the enemy during the night. On the 25th the battle raged from dawn till dark. Missionary ridge, Lookout mountain-top, and all the rifle-pits in the valley, were carried by desperate fighting. The confederate army was routed, and pursued by Sherman and Hooker back to Georgia. The union loss was between 6,000 and 7,000 in killed, wounded, and missing. The confederate loss in killed and wounded is estimated at 2,500; in prisoners, 6,000. The effect of this battle was to cut off Bragg from communication with Longstreet, and to force the latter to abandon the siege of Knoxville and retreat into Virginia.

CHATTEL (Fr. *chatel*, old Fr. *chapel*, from Lat. *capitale*, corrupted into *capitale* and *cattalum*, meaning the capital or principal sum in a loan; hence goods in general, especially cattle, as distinguished from land), in the law of England, is a term used to designate any kind of property which, with reference either to the nature of the subject or the character of the interest possessed in it, is *not freehold*. Regarded from a positive

point of view, C. included not only all movable property, but all property which, though immovable, was not held on a feudal tenure. Any estate, then, or interest in lands and tenements not amounting to freehold, is a chattel. But as between property thus "savoring of reality" and mere personal movables—money, plate, cattle, and the like—there was a manifest distinction, chattels were, consequently, distinguished into *chattels-real* and *chattels-personal*. Both descriptions of C., in the eye of the ancient law of England, were regarded as inferior to freehold, and formed a subordinate class of property. As distinguished from estates of inheritance, or for life in things immovable, such estate is called *personal*, the others being *real* estate. Till the passing of 8 and 9 Vict. c. 106, livery of seizin was required to pass an estate of inheritance, or for life in corporal hereditaments of feu tenure, but such was no more required for the transfer of a C. real than of a C. personal. A C. *real* is also transmitted on the owner's death to his executor or administrator, like a C. personal, and does not descend to his heir like a freehold of inheritance. There is an exception to this rule, however, in the case of chattels which, owing to their intimate connection with property of a freehold nature, cannot be separated from it without injury. Such, for instance, are the muniments of title to an estate, growing grass, deer in a park, and actual fixtures, all of which go to the heir, and not the executor. The tenant of a C. real, like the tenant of a C. personal, is, moreover, said not to be *seized*, like the tenant of a freehold, but to be *possessed*. Lastly, there can be no estate tail in a C. real more than in a C. personal, except in the case in which either of them can be regarded as an heir-loom. Formerly, C. might be disposed of by will at an earlier age than real estates, but this was altered by 1 Vict. c. 26.

CHATTERER, a significant popular name, often applied to the birds of the family *ampelidæ*, a family of the order *insectivores* and tribe *dentirostres*, having a depressed bill like that of the fly-catchers (*muscipidæ*), but somewhat shorter and broader in proportion, and slightly arched. To this family belong the cotingas, wax-wings, piauhaus, caterpillar-hunters, etc. They are found chiefly in the warmer parts of the old world, although America also produces some. They inhabit low grounds or forests, feeding chiefly on insects and their larvæ. Some of them possess powers of song almost equal to those of the nightingale. Many of them are birds of gorgeous plumage.—Only one species is British, sometimes called simply the C., sometimes the Bohemian C., or wax-wing (q. v.).

CHATTERTON, THOMAS, an English poet, whose youth, genius, and tragical death have made him one of the wonders of English literature, was b. at Bristol, Nov. 20, 1752. His father, who had once been a chanter in the Bristol cathedral, and also master of a kind of free-school, died two or three months before the poet's birth. C. was educated at a parish-school, was considered a dull child, but, making acquaintance with a black-letter Bible which his mother often used, the dormant spirit flashed up. From early years he was fond of all kinds of antiquities; he clung around old walls like the ivy, and haunted twilight ruins like the bat. At the age of 14 he was apprenticed to Mr. Lambert, an attorney. His situation here was uncomfortable; he took his meals in the kitchen with the footboy, and, when refractory, was chastised with a ruler. In Oct., 1768, the new bridge at Bristol was opened, and C. sent to a newspaper an account, in antique phraseology and spelling, of the ceremonies attending the opening of the old one several centuries before—the whole purporting to be taken from an ancient MS. To a certain Bristol pewterer, Burgum by name, he presented himself, and astonished the craftsman by the sight of a parchment, in which his pedigree was traced back to the Norman conquest, adorned by many a splendid marriage, and many a knightly name. He also exhibited to his friends copies of old poems, which, he said, were composed by one Thomas Rowley, a monk of the 15th century. These matters made some stir in his native city, but not enough to satisfy C., who resolved to fly at higher game. Accordingly, Horace Walpole, at that time collecting additional materials for his *Anecdotes of Painting in England*, received from C. several pages of antique writing, accompanied by a short note. The pretended MS. gave biographical sketches of celebrated painters who had flourished in England several centuries ago, and of whose existence Walpole had never dreamed. Walpole, put off his guard, answered his unknown correspondent at once; expressed his delight at receiving the MS.; and desired, as a personal favor, that all the other antique writings, poems included, mentioned in the note, should be forwarded. C., highly elated, immediately sent accounts of a great many more painters and poets, and also gave some slight sketch of his personal history. On receipt of this second communication, Walpole suspected a trick. The poems he showed to Mason and Gray, who at once pronounced them forgeries; he then wrote C., expressing his suspicions as to the genuineness of the MS., and administering at the same time a great deal of excellent advice. C. replied, desiring that the MS. should be returned at once; but, by the time the letter reached London, Walpole was about to start for Paris, and it was allowed to remain unanswered. On Walpole's return some six weeks thereafter, a fierce note from C. awaited him, the contents of which must have brought the blood to his polished and urbane brow; indignant, he bundled up the MS., and returned it without a word of explanation.

From his earliest youth, C. had a ghastly familiarity with the idea of suicide. Among

his papers preserved in the British museum, is a last will and testament, "executed in the presence of Omniscience, the 14th of April, 1770," full of the wildest wit and profanity. Another document of similar purport, falling into the hands of his friends, led to his dismissal from Mr. Lambert's office. Released from what he considered the slavery of law, C.'s eyes turned to London, and in that city he arrived, carrying with him all his Rowley MS. and several modern poems, on Tuesday, the 24th April, 1770, and took up his abode with one Walmsley, a plasterer, in Shoreditch. No sooner had he settled there, than he began to work as with a hundred hands. During the last few months of his life, he poured forth squibs, satiric poems, political essays, burlettas, letters in the style of Junius, and meditated writing a history of England, to appear in parts. For a time, his prospects seemed golden enough. He obtained an introduction to lord mayor Beckford; he sent glowing letters home, accompanied by presents to his mother and sisters. Ultimately, he left the plasterer's in Shoreditch, and took lodgings in Brooke street, adjoining Holborn. Unhappily for C., editors of opposition papers were willing enough to insert and praise his articles, but were disinclined or unable to render an equivalent in cash. Possibly they conceived that a patriotism so ardent must be its own reward. The means of life were now fast failing. In desperation, he attempted to procure an appointment of surgeon's mate in a vessel going to Africa, but failed. This was the last drop that made the cup overflow. On Saturday, the 25th Aug., his landlady, alarmed that her lodger did not make his appearance, had the door of his room broken open; saw the floor littered with small pieces of paper, and C. "lying on the bed with his legs hanging over, quite dead." Just at this time, Dr. Fry of Oxford, who had seen or heard something of the Rowley poems, was on the eve of starting for Bristol to make inquiry into the matter. Sad enough to think on now: a little promptitude on the one hand, a little patience on the other, and the catastrophe might have been averted.

C. died before he reached his 18th year, and takes his place as the greatest prodigy in literature. Indeed, in our judgment of him, age cannot be taken into account. He never seems to have been young. His intellect was born fully matured. He was equally precocious in other respects. In his letters, he speaks of the relation of the sexes in the tone of a sated *roué*. He never seems to have felt the delicious shame and ingenuousness of youth; over his heart never was outspread "the bloom of young desire and purple light of love." The *Kew Gardens* is written in the style of Churchill, and it possesses all that master's vigor, and every now and then we come on a couplet turned with the felicity of Pope. His genius, however, is in its greatest perfection in the ancient poems. No poet, before or since, has written a tenderer strain than the lament in *Ælla*, or conceived a bolder image than the personification of freedom in the ode to liberty in his *Tragedy of Godwin*. C.'s life has been written by many hands, but the best and most sympathetic sketch of it is that given by prof. D. Masson of Edinburgh university in his collected essays.—See *The Poetical Works of Thomas Chatterton*, by the Rev. Walter Skeat, M.A. (1875).

CHATTOOGA, a co. in n.w. Georgia, on the Alabama border, intersected by the C. river; 360 sq.m.; pop. '70, 6,902—1503 colored. The surface is somewhat mountainous. Limestone, marble, lead, and iron are found; and wheat, corn, oats, and cotton are raised. Co. seat, Summerville.

CHAUCER, GEOFFREY, the father of English poetry, was b. most probably about 1340, though the traditional date is 1328. Recent researches have made it clear that C. was the son of John Chaucer, a London vintner. It has been said that he studied at Cambridge, and afterwards removed to Oxford. While at the university, he wrote *The Court of Love*, and *The Book of Troilus and Cresseide*. At one period he seems to have turned his attention to law, and to have become a member of the Inner Temple. About these matters his biographers, knowing little, have conjectured much. The only particular of C.'s youth of which an anxious posterity can be certified is, that he one day thrashed a Franciscan friar in Fleet street, and was fined two shillings for the exploit on the next. History has preserved this for us, but has forgotten all the rest of his early life, and the chronology of all his poems.

In 1359, C. assures us, on his own authority, that he served under Edward III. in his French campaign, and was therein made prisoner. The date of his return from captivity, and of his subsequent marriage, cannot now be ascertained. He espoused Philippa, youngest daughter of sir Payne Roet, whose estates lay in Hainault. His wife's sister, Katherine, ultimately became the wife of John of Gaunt, duke of Lancaster; and it may be presumed that the high connection thus established aided, in no inconsiderable degree, the poet's advancement in life. After his marriage, he began to mix in public affairs. He was sent on an embassy to Genoa in 1372, and, on that occasion, has been supposed by some to have had an interview with Petrarch, then residing at Padua, and to have heard from his lips the story of *Griselda*. On his return, he was appointed controller of the customs for wools, and in the same year the king granted him a pitcher of wine daily for life. In 1377, C. proceeded to Flanders in the retinue of sir Thomas Percy, afterwards earl of Worcester; and for several years thereafter he was employed assiduously in embassies and other business connected with the public service. In 1386, a commission was issued to inquire into alleged abuses in the department of

the customs, and C. was dismissed from his controllership in the Dec. of that year. On meeting this fact, one cannot help remembering that Edward made the writing out of the accounts in C.'s own hand the condition of his holding office. Had the great poet neglected his duties? It has been conjectured by some, that after his disgrace C. became embarrassed in circumstances, and apparently with reason, for about this time he canceled both his pensions, and consigned them to one John Scalby, "to whom they were probably sold under pressure of distress," says his latest biographer. In 1387, C. lost his wife. Where he spent his closing years, cannot now be ascertained. Godwin surmises that in his distress he retired to Woodstock, and composed there *The Canterbury Tales*. It seems, however, to be tolerably certain that during the last years of his life he was resident in London. There he died on the 25th Oct., 1400, aged 74, and was buried in Westminster abbey, the first of the long line of poets whose ashes make that pile so venerable.

C. was a worthy representative of the splendid 14th century. He was a master of the science, the theology, and the literature of his time. He had seen many men and cities, and had formed no inconsiderable unit in imposing ceremonies of state. His poems are numerous, and exhibit every variety of poetical excellence. His earlier performances, such as *The Flower and the Leaf*, *The Romaunt of the Rose*, are, after the French fashion then prevalent, gorgeous allegories full of queens and kings, bowers, beves of beautiful ladies, brave knights, and pious nightingales that sing the praises of God. They appeal potently enough to the eye, but they do not in the slightest degree touch the heart, or relate themselves to human concerns. Quite different *The Canterbury Tales*, so full of humor, pathos, and shrewd observation. In these tales, English life, as it then existed, is wonderfully reflected—when the king tilted in tournament, when the knight and the lady rode over the down with falcon on wrist, when pilgrimages bound for the tomb of St. Thomas passed on from village to village, when friars sitting in tavern over wine sang songs that formed a remarkable contrast with the services they so piously and sweetly intoned. All that stirring and gayly appareled time—so different from our own—is seen in C.'s work, as in some magic mirror; and in his case, as in every other, when the superficial tumults and noises that so stun the contemporary ear have faded away, leaving behind that which is elemental and eternal, the poet is found to be the truest historian. Among C.'s other writings may be mentioned, *The Book of the Duchess*; *The House of Fame*; and *The Legend of Good Women*. The genuineness of *The Court of Love* and of *The Flower and the Leaf* is denied by Mr. Furnivall, and by Mr. Skeat in his new edition of C. (4 vols., 1878).

CHAUCI, an important tribe of ancient Germany, who dwelt between the Elbe and the Ems. Tacitus records that they were conspicuous for their love of peace and justice, being powerful but not ambitious, ready to resist aggression, but never provoking war. They finally merged into the wider designation of Saxons.

CHAUDÉS-AIGUES, a t. of France, in the department of Cantal, about 12 m. s.s.w. of St. Flour. It is celebrated on account of its hot mineral springs, which have the property of discharging grease from sheep's wool, and vast numbers of fleeces are sent hither annually to be washed. The waters are also taken for rheumatism and cutaneous diseases. Pop. '72, 1100.

CHAUDET, ANTOINE DENIS, 1763–1810; a French artist, whose statue of *Œdipus*, finished in 1810, established for him a high reputation. He also excelled in designing and penciling; and illustrated the works of Racine for Didot. Among his statuary are "Paul and Virginia," "Sensibility," "Surprise," a silver statue of "Peace," and the "Napoleon" that crowned the Vendome column. His wife, Jeanne Elizabeth Gabion, was his pupil in painting, and produced many fine pictures.

CHAUDFONTAINE, a village charmingly situated in the valley of the Vesdre, a few miles from Liège, in Belgium, and celebrated for a hot spring which supplies water for hot-baths. There are hotels and lodging-houses for the accommodation of visitors. The place is a favorite resort of the Liégeois. There is here a station on the railway from Liège to Aix-la-Chapelle. Pop. '73, 1393.

CHAUDIÈRE, the name of a river and of a lake of Canada. The river joins the St. Lawrence from the s., about 7 m. above Quebec, forming the celebrated falls of its own name, about 2½ m. from its mouth. The lake—merely one of the many expansions of the Ottawa—has on its right the city of that name, the metropolis of the united colony.

CHAUFFEURS, or **GARROTTEURS**, outlaws during the French reign of terror who roamed over the country in organized bands, under the lead of Johann Buckler, or Schinderhannes. They garroted men and women, and roasted their feet to compel them to disclose treasure. In 1803, vigorous measures were taken which resulted in their suppression.

CHAULIAC, or **CHAULIEU**, GUI DE, a surgeon of France, of the 14th c., who was physician to three of the popes of Avignon. In his profession he was far in advance of the time, and his works are still regarded as important. He is credited with laying the foundation of the modern principles and practice of surgery. One of his works describes the plague or black death of 1348.

CHAUMETTE, PIERRE GASPARD, one of the most extravagant characters of the French revolution, was b., 1763, at Nevers, and made his first public appearance at the Cordeliers' club, where he was introduced by Camille Desmoulins. His "sans-culottism" gained for him such popularity, that he was appointed procurator of the community of Paris, in the place of Manuel. C. was very enthusiastic in favor of the "worship of reason." In his zeal, he rejected his own Christian name, Pierre, as having been sullied by saintly associations, and styled himself "Anaxagoras." The institution of the tribunal of the revolution, the decree for a revolutionary army, and the law against suspected aristocrats, were carried into effect by C. along with others. He also proposed that the whole French nation should be made to wear wooden shoes, and to subsist on potatoes; but this was too much even for the chimerical enthusiasm of his compatriots. His antics, however, in connection with the "worship of reason" excited the disgust of Robespierre, who devised measures for bringing the whole company of actors under Hébert to the scaffold. C. was arrested and imprisoned on a charge of having been implicated in a plot against the convention, and was executed, April 13, 1794.

CHAUMONOT, PIERRE MARIE JOSEPH, 1611-93; a French Jesuit missionary among the North American Indians. His work was chiefly among the Hurons of Canada, among whom he established missions and schools. He left a grammar of the Huron tongue. In 1658, he visited the Onondagas.

CHAUMONT, a t. of France, in the department of Haute-Marne, on an elevation between the rivers Marne and Suize, about 140 m. s. e. of Paris. It is generally well built, with clean, spacious streets, and fine promenades round the upper part of the town. There are considerable manufactures, including hosiery, cotton, yarn, gloves, etc. On the 1st of Mar., 1814, the allied powers here bound themselves by treaty against Napoleon, in the event of the negotiations at Chatillon ending unsatisfactorily. Pop. '76, 8,791.

CHAUNCEY, CHARLES, LL.D., 1777-1849; son of the Connecticut attorney-general; became a member of the Philadelphia bar, where he won high rank.

CHAUNCEY, or CHAUNCY, CHARLES, LL.D., 1747-1823; a native of Massachusetts, admitted to the bar in 1768, and settled in New Haven. He was attorney-general of the state, and in 1789, judge of the superior court.

CHAUNCEY, or CHAUNCY, ISAAC, 1772-1840; a capt. in the U. S. navy. He began sea-faring life in the mercantile service, in which he was conspicuous for enterprise and energy. In 1799, he entered the navy as a lieutenant, and in 1802 was made acting capt. commanding the *Chesapeake*, of 38 guns, the flag-ship of the squadron sent against Tripoli, serving with distinction in that brief war. In 1806, he was made capt., and in the war of 1812 had command on the great lakes. In 1813, he participated in the capture of York, now Toronto, and of fort George, driving the enemy from the whole of Niagara region. On one occasion he captured five British vessels, and a regiment of troops. In Aug., 1814, he blockaded a British fleet in Kingston harbor until the close of navigation. Before the lake opened again, peace was concluded. In later years he was in command of the navy-yard at Brooklyn, and of the squadron that conveyed an officer to make the treaty of peace with Algiers. At the time of his death he was president of the board of navy commissioners.

CHAUNCY, CHARLES, 1705-87; great-grandson of the president of Harvard, a graduate of that institution, and pastor of the First church in Boston in 1727. He published many works, among which were *Complete View of the Episcopacy*; *Seasonable Thoughts on the State of Religion in New England*; *Mystery Hid from Ages, or the Salvation of all Men*; and *The Benevolence of the Deity*. He officiated 60 years in one parish.

CHAUNCY, or CHAUNCEY, CHARLES, 1592-1672; a native of England, educated at Cambridge, where he became professor first of Greek and afterwards of Hebrew. His puritanism involved him in difficulties with the ecclesiastical authorities, and he was fined and imprisoned. In 1638, he emigrated to New England, and was for three years pastor at Plymouth, Mass., and afterwards at Scituate. There having been a change in ecclesiastical policy in England, he was about to return to his vicarage in Ware, when Henry Dunster, the first president of Harvard college, resigned, and the place was offered to Chauncy. He at once accepted (1654), and remained in office all his life. He left six sons, all of whom graduated at Harvard, and all became preachers.

CHAUNY, a t. of France in the department of Aisne, about 18 m. w. n. w. of Laon. It is built partly on the right bank of, and partly on an island in, the river Oise, which is here navigable. It is an old, rather uninteresting place, with manufactures of sackings, hosiery, chemicals, and leather, and an active trade. Pop. '76, 8,982.

CHAUSSES, in the armor of the middle ages, were defense-pieces for the legs. Some were made of padded and quilted cloth, with metal studs; some of chain-mail; some of riveted plates; and some of banded mail. It was not unusual to fasten them by lacing behind the leg.

CHAUTAUQUA, a co. in w. N. Y., having lake Erie on the n. and Pennsylvania on the s. and w.; drained by Conewango creek, and traversed by the Erie, the Lake Shore, the Atlantic and Great Western, and other railroads; 1000 sq. m.; pop. '75,

64,781. Among mineral productions are iron and marble; also there are sulphur springs, and natural gas, which has been successfully used in lighting houses. The surface is mostly level, and the soil fertile, producing wheat, oats, corn, barley, potatoes, hay, cheese, butter, wool, and maple sugar. Co. seat, Mayville.

CHAUTAUQUA LAKE, in Chautauqua co., N. Y., 730 ft. above the level of lake Erie and 1290 ft. above the ocean. It is 18 m. long and 1 to 3 wide, with a navigable outlet to Alleghany river.

CHAUVEAU, PIERRE J. O., b. Quebec, 1820. In 1844, he was chosen to the provincial legislature, became solicitor-general in 1851, and provincial secretary in 1853. In 1855, he was appointed superintendent of education for Lower Canada. On the organization of the confederation, he became first minister of the government of Quebec, and in 1873 was chosen speaker of the Canadian senate. He is the author of *Charles Guérin*, the first Canadian-French novel ever published.

CHAUVENET, WILLIAM, LL.D., 1819-70; b. Penn.; a graduate of Yale, and long connected with Alexander D. Bache in magnetic and meteorological observations at Girard college. In 1841, he was appointed professor of mathematics in the navy, and assisted in the establishment of the naval academy at Annapolis and of its observatory, of which he was made director. He was for a time professor of mathematics and astronomy in Washington university at St. Louis, Mo. Among his works are *Manual of Spherical and Practical Astronomy*; *The Binomial Theorem of Exponents and of Logarithms*; and *Plane and Spherical Trigonometry*.

CHAUVIN, ETIENNE, 1640-1725; a minister of the reformed religion, b. at Nîmes. At the revocation of the edict of Nantes, he went to Rotterdam, and in 1695, he was made professor of philosophy at Berlin. His principal work is a *Lexicon Rationale, sive Theaurus Philosophicus*. He also wrote *Theses de Cognitione Dei*, and started the *Nouveau Journal des Savants*.

CHAUVINISME. "Chauvin" was the name of the principal character in a French comedy, which was played with immense success at the time of the restoration. He represented a bragging veteran of the empire, who was continually talking of his achievements at Austerlitz and Jena, and his determination to take a brilliant revenge for Waterloo. Since then, a *chauviniste* has come to mean a man who has extravagant and narrow-minded notions of patriotism, and corresponding enmity towards foreign peoples.

CHAUX DE FONDS, a t. of Switzerland, in the canton of Neuchâtel, 9 m. n.w. of the city of that name. It is situated in a bleak valley, at an elevation of 3,070 ft. above the sea, and is scattered over a large area, almost every cottage being surrounded by a garden or croft. It is one of the chief seats of the manufacture of clocks and watches in the canton. The mechanists work chiefly at home, each devoting himself to a particular portion of machinery. This industry employs 12,000 hands. Pop. '71, 19,930.

CHAVES, a t. in Portugal, near the frontier, on a plain near the right branch of the Tamega, which is here crossed by an old Roman bridge of 18 arches; pop. 4,870, but formerly as many as 20,000. Its hot saline springs were known to the ancients. In one of its churches is the tomb of Alphonso I.

CHAYENPUR, a fortified t. of Nepaul, in the n. of India, about 120 m. to the e. of Khatmandu, the capital of the state, being in lat. 27° 20' n., and long. 87° 3' east. It is the chief town of a district which yields rice, wheat, cotton, ghee or butter, timber, spices, sugar, tobacco, and pearls.

CHAY ROOT, CHOYA, or SAYAN (*oldenlandia umbellata*), a perennial herbaceous plant of the natural order *cinchonaceæ*, said to be a native both of India and of Mexico. It is cultivated on the coast of Coromandel for the sake of its long, orange-colored roots, the bark of which affords a beautiful red dye. The quality of the bark is said to be improved by keeping it for some years. It is the coloring matter obtained from C. R. which is used to paint the red figures on chintz. C. R. is the Indian madder, and in it some tribes in Ceylon formerly paid their tribute.

CHAZELLES, JEAN MATHIEU DE, 1657-1710; a mathematician and engineer; b. at Lyons. He was for some time employed by Cassini in measuring an arc of the meridian, and finally became hydrographic professor for the galleys at Marseilles. In 1689, he set sail from Rochefort with 15 galleys, cruised as far as Torbay, in England, and took part in the descent upon Teignmouth. C. published many maps and charts in the *Neptune Français*, and traveled to Egypt, where he measured the pyramids. He was made a member of the academy in 1695.

CHAZY, a village and township in Clinton co., N. Y., on the w. shore of lake Champlain; the village on the Plattsburg and Montreal railroad; pop. of town, '75, 3,068. One of the mineral products of the township is the C. limestone, of the lower Silurian formation.

CHEADLE, a small but neat market-t. of England, in the moorland district of the n. part of the co. of Stafford, 14 m. n.e. of the town of Stafford, 3 m. from the Frog-hall station on the Churnet valley branch of the North Staffordshire railway, and 4 m. from the Blyth bridge station on the main line from Derby to Crewe. The town is

seated in a pleasant vale, surrounded by hills mostly planted with fir and other trees. The parish church (St. Giles) was a very ancient structure, but was rebuilt in 1837-38. A magnificent Roman Catholic church, erected at the sole expense of John, earl of Shrewsbury, was opened in 1846. There are several dissenting chapels, various schools, a mechanics' institute, a large tape manufactory, and also one for silk. There are copper and brass works a short distance from the town, and coal and limestone abound in the vicinity. Pop. '71, 2,929.

CHEATHAM, a co. in n.w. Tennessee, on Cumberland river; 350 sq.m.; pop. '70, 6,678—1470 colored. Chief productions, corn, oats, and tobacco. Co. seat, Ashland City.

CHEATING. In the technical language of the English law, C. means the offense of fraudulently obtaining the property of another by any deceitful or illegal practice short of felony, but in such a way as that the public interest may possibly be affected. In order to constitute C., the fraud must be of such a kind as that it could not be guarded against by common prudence. C., in this sense, is an offense at common law, and indictable, which is not the case with imposition in a private transaction. The law of Scotland has no such distinction. See WEIGHTS AND MEASURES, FALSE PRETENCES, CHARACTER TO SERVANT.

CHEATING (*ante*), defined in American law as "deceitful practices in defrauding or endeavoring to defraud another of his known right, by some willful device contrary to the plain rules of common honesty." Bouvier says: "In order to constitute a cheat or indictable fraud, there must be a prejudice received, or such injury must affect the public welfare, or have a tendency to do so." Courts have held that it is not indictable for a person to obtain goods by false verbal representations of his credit in society, and of his ability to pay for them; or to violate his contract, however fraudulently it may be broken; or fraudulently to deliver a less quantity than was contracted for and represented. To cheat one of his money or goods by false weights or measures has always been an indictable offense. The word "cheat" is not actionable unless spoken of a plaintiff in relation to his profession or business.

CHEAT RIVER, a stream in West Virginia, formed by brooks rising in the Alleghany mountains, flowing through a region rich in iron and coal, and joining the Monongahela in Fayette co. It furnishes abundant water-power, and is in some parts navigable for steam-boats.

CHEBOYGAN, a co. in n Michigan, forming, with Emmett co., the extreme northern portion of the peninsula; 500 sq.m.; pop. '70, 2,196. It contains a number of small lakes. Agriculture is the main business. Co. seat, Duncan.

CHECK, a variegated cloth, the pattern of which consists of rectangular spaces like a chess-board (Fr. *échec*, chess), in black and white, or of various colors.

CHECK is a money order on a banker or other party having funds of the drawer. It must bear a penny stamp, and is payable to bearer on demand. If not presented within a reasonable time the holder shall not claim against the drawer should the banker fail. The banker bears the risk of forgery, unless facilitated by carelessness in drawing. A C. is held as payment of a debt until dishonored on presentation; it is not payable after the drawer's death.

CROSSED CHECK is an ordinary C. with two transverse lines drawn across it, which has the effect of making it payable only through a banker. When a particular banker's name is written between the lines the C. is said to be *specifically* crossed, and is only payable by the banker whose name it bears. Wanting a particular name, it is said to be *generally* crossed, and is payable through any banker. An ordinary C. may be crossed either generally or specifically by the holder. Obliteration of the crossing or any alteration of a C., except as provided for by the crossed checks act (1876), is felony.

CHECKERBERRY. See GAULTHERIA, *ante*.

CHECKERS. See DRAUGHTS, *ante*.

CHECKY (Fr. *échiqueté*). In heraldry, when the field or any charge is composed of small squares of different tinctures, generally metal and color, it is said to be checky.

CHEDDAR, a village in Somersetshire, on the s. side of the Mendip hills, 2 m. s.e. of Axbridge, with a level country to the south. It lies at the entrance of a deep rocky gorge, nearly 1 m. long, overhung by stupendous mural limestone precipices, containing caverns—one being 300 ft. long—filled with fantastic stalactites and stalagmites. The celebrated C. cheeses are produced on the rich grass-farms around. The church is supposed to have been built about 1400, and has a sculptured stone pulpit. Pop. of parish '71, 2,200.

CHÉDOTELO, the pilot of the expedition sent from France in 1598 to the coasts of Nova Scotia, under command of the marquis de la Roche. Arriving at Au Sable island (90 m. s.e. of Nova Scotia, an uninhabited island 25 m. long by 1 to 1½ wide), 50 men were landed, and the ships departed for the mainland. But weather prevented a landing at the island on returning, and the men were left there seven years. In 1605, they were sent for, and 12 only were found alive.

CHEDU BA, an island off Aracan, in the bay of Bengal, stretching from lat. 18° 40' to 18° 56' n., and from long. 93° 31' to 93° 50' e. Its area is about 250 sq.m., and its pop. 9,000. Along with the adjacent mainland, it was ceded to the British at the close of the first Burmese war. The soil is fertile, yielding rice, tobacco, sugar, indigo, cotton, hemp, and large quantities of a vegetable oil, equally fitted for burning and for varnishing. The principal mineral is petroleum. The coast presents earthy cones, which emit mud and gas, and about 100 years ago a severe earthquake is believed to have extended the limits of the island.

CHEESE is the common form in which the caseine (q.v.) of milk is used in a separate state as an article of food. In new milk, the C. is present in a condition soluble in water, and is generally separated therefrom in a coagulated or clotted form, on the addition of a little rennet (q.v.). In the preparation of C., the milk is gently heated to a temperature of 110° to 112° F., and placed in a large wooden tub, where the rennet is added, and the operation of earning goes on. In about half an hour, the curd is sufficiently formed. The liquid whey being pressed out, the curd is chopped into small pieces of the size of a walnut with a knife, called a curd-cutter, salt is added, and the fragments of curd introduced into a cloth placed in a cheese-vat or chesart, which is a wooden tub of varying size and shape, perforated at the sides and bottom. The whole is then put under a cheese-press (q.v.), and subjected to great pressure, which consolidates the curd or caseine, and at the same time squeezes out the remaining portions of the whey. After two or three hours, the half-formed C. is turned and re-turned, each time being subjected to renewed pressure, till in about two days it is sufficiently compacted. It is then removed from the cheese-vat, and placed on a shelf in a dry, airy room, where, being repeatedly turned, it gradually dries, and gets aged or seasoned sufficiently for market in about six months.

There are many varieties of C., which partly owe their difference to the food of the cows, but in greater part to differences in the mode of treating the milk. *Skimmed-milk C.* is prepared from milk from which the cream has been removed, and a rich color is communicated by adding a little arnotto (q.v.) to the milk before coagulation. *Sweet-milk C.* is procured in a similar manner from the whole milk, and contains much of the butter along with the caseine. *Stilton C.* is made in Leicestershire, by adding the cream of the evening's milk to the new milk of next morning; and as there is always more trouble in expelling the whey from curd containing butter, there is a difficulty in preparing this variety of C., from its liability to fermentation and bursting. *Cheddar C.* is made in Somersetshire, from the whole milk, and the whey is several times skimmed off, heated, and added to the curd to scald it. *Cheshire* and *Double Gloucester* are made from the whole milk; *Single Gloucester*, from half new milk and half skimmed milk. *Gouda C.* is prepared in Holland from skimmed milk curdled by muriatic acid instead of rennet, and for this reason it is not infested with mites. Holland exports annually about thirty millions of pounds of C., the greater portion coming to England. *Suffolk C.* is made from skimmed milk. *Parmesan C.*, obtained from Parma, in Italy, is also made from skimmed milk, and owes its fine rich flavor to the superior herbage on the banks of the river Po. The cows are kept in the house nearly all the year round, and fed in summer with cut grass. Some of the cheeses are so large as to contain 180 lbs.; and the milk of 100 cows is required to produce one of this size. *Swiss C.* is flavored with herbs, and especially that of Gruyère, which is very pleasant to the taste. Gruyère cheeses weigh from 40 to 60 lbs. each, and are exported in large quantities.

Cream C. is prepared from cream curd which has been placed in a cloth, and allowed to drain without the assistance of pressure. Bath and York supply C. of this description. In the fabrication of C., minium or red-lead has occasionally been employed as a cheap coloring substance, and cases of poisoning have resulted therefrom. Carrots, saffron, and marigold flowers have also been used for imparting color as well as flavor.

Dunlop C., though nowhere so well made as in the parish at Ayrshire, from which it derives its name, is now manufactured in the dairy districts of Scotland generally. The cheeses are made of various sizes—from a quarter to half a hundredweight. Sometimes the entire milk is used, but generally the cream is removed from the evening's milking. Of late years, great improvement has taken place in the manufacture of C. in the Scottish dairy districts, Ayrshire, Lanarkshire, Wigton, and Kirkcudbright. Much of what is sold as cheddar (q.v.) C. is really made in Scotland. The annual Kilmarnock "cheese show" is one of the largest in the world, the value of the C. exhibited being often more than £20,000.

When sufficiently dry for use, C. still retains from 35 to 44 per cent water, and, besides the caseine, contains a greater or less proportion of oil or fat and saline matter—the latter mainly consisting of common salt, originally present in the milk, and added during the manufacture of the cheese. As an article of diet, C. is highly nutritious; but from its costive properties, it is mainly used as a condiment in small quantity after an ordinary meal, and is then serviceable in giving an impetus to the process of digestion. To serve the purpose of a digester, C. must be old and partially decayed, or moldy. It then acts as leaven, and causes chemical changes gradually to commence among the particles of food which has previously been eaten, and thus facilitates the dissolution which necessarily precedes digestion.

CHEESE PRESS.—The old method of compressing curd and expelling the whey from it is still employed in many places, the mere piling of weights on the cheese-rat. Sometimes the action of a screw is employed. Among improved dairy implements are now reckoned, however, many ingenious and elegant forms of C. press, generally depending on the action of a lever. They are much more convenient than the clumsy contrivance which they have superseded. Factories for the manufacture of C. have been established in the United States and Canada, by which C. is produced in immense quantities, and a factory on a similar principle has been lately established in Derbyshire. The C. made in the United States and Canada is now imported into Great Britain in immense quantities, and is steadily increasing in favor.

CHEESE (*anté*), manufactured in immense quantity in the eastern and northern United States, particularly in New York, Ohio, Illinois, Vermont, Massachusetts, Pennsylvania, Wisconsin, and Michigan. Of 163,000,000 lbs. returned as made in the census year of 1870, 101,000,000 lbs. were made in N. Y. State. Within recent years nearly all descriptions of foreign cheese are imitated in this country, and the most of the imitations are equal to the imported article. Many farmers have ceased to manufacture C. in their own dairies. The milk is taken to large factories, where it is weighed and emptied into a common receptacle. The processes following are directed by trained superintendents, and the average product is greatly improved. The farmers receive either payment for the milk as brought, or a share in the proceeds of the manufacture.

CHEESE-HOPPER, the larva of *piophilæ casei* or *tyrophaga casei*, a small dipterous (two-winged) fly, of the large family *muscides*, the same to which the house-fly, blow-fly, etc., belong. The perfect insect is about a line and a half in length, mostly of a shining black color; antennæ, forehead, and some parts of the legs rufous. It is a pest of dairies and store closets, laying its eggs in cracks or crevices of cheese, the destined food of its larvæ. To preserve cheeses from this pest, it is of advantage to brush or rub them frequently, and to remove all cracked or injured cheeses from large stores, besides keeping them dry and in a well-aired place. The same rules are applicable to their preservation from the other insect larvæ by which they are sometimes infested, of which the most notable are those of the bacon beetle (see *DERMETES*), and of another species of dipterous fly, *musca corvina*.

CHEESHAHTEAUMUCK, **CALEB**, an Indian, b. 1646; the only aboriginal graduate of Harvard college.

CHEETAH, **CHIT'TAH**, or **HUNTING LEOPARD**, *Felis jubata* or *Cynailurus jubatus*, 'an animal of the feline family, but differing from all the rest of that family in its longer and narrower feet and less retractile claws, which are also more blunt and less curved. With these peculiarities are associated a greater length of limbs than is usual in feline animals, adapting it to take its prey by running rather than by leaping, and an intelligent and tractable disposition, constituting an additional point of resemblance to dogs; with which, however, the form of the head and the internal anatomy have nothing in common, but are entirely feline. The C. is in size about equal to a leopard, but the body and limbs are longer. It is very widely distributed, being found in Senegal, s. Africa, Persia, India, Sumatra, etc. Its geographic range extends as far n. as the Caspian sea, and the steppes of the Kirghiz Tartars. The Asiatic species described as *felis venatica* appears to have been fully identified with *F. jubata*; and differences in the quantity of mane, and other unimportant particulars, may probably sometimes have resulted from domestication; for this animal has been long domesticated and employed in the chase, both in Persia, where it is called *youze*, and in India. Deer and antelopes are the game principally hunted with the C., and packs are kept by Indian princes. The head of the C. is kept covered with a leather hood till the game is discovered, when the hunting party, advancing cautiously to within 200 yards of it, the hood is taken off, and the C. stealthily creeps towards the herd, taking advantage of every bush and inequality for concealment, till, on their showing alarm, he is amongst them at a few bounds, and striking down his victim with a blow of his paw, instantly tears open its throat, and begins to suck the blood. It is then somewhat difficult to withdraw him from his prey, which is generally done by offering him meat. If unsuccessful, the C. does not attempt to follow the herd by running—nor does this animal seem to possess the power of maintaining speed through a lengthened chase—but slowly, and as if ashamed, creeps back to the hunters. The C. is not unfrequently to be seen in menageries in Britain. In a domesticated state, it is extremely fond of attention, and seems to repay kindness with affection. The skin is frequently imported from Africa.

CHEEVER, **EZEKIEL**, 1615–1708; b. in England; came to New England in 1637, and assisted in founding New Haven colony, in which he became prominent as a deacon, a minister, and especially as a teacher. He also taught in Ipswich, Charlestown, and Boston, being at the head of the famous Latin school in Boston for 38 years. He prepared the *Accidence*, a short Introduction to the Latin Tongue, and wrote *Scripture Prophecies Explained*, in three short Essays.

CHEEVER, **GEORGE BARRELL**, D.D., b. Me., 1807; a graduate of Bowdoin college and Andover theological seminary, and in 1832 ordained pastor of a Congregational church in Salem, Mass. He began at an early age to write for the press, contributing

prose and verse to the current magazines and quarterlies. The Unitarian controversy attracted his attention, and he wrote a defense of the orthodox system of Cudworth. Temperance also became a leading idea, and in 1835 he published in a Salem newspaper *Deacon Giles's Distillery*, a bitterly satirical allegory which had a wonderful popularity. The author was prosecuted, and sent to prison for a month. After some time passed in European travel he took charge of the Allen street Presbyterian church in New York city, and soon afterwards gave a series of lectures on the "Pilgrim's Progress" and on "Hierarchal Despotism." After another trip across the sea he became the leading editor of the *Evangelist*, a weekly religious journal in New York, for which he had been a correspondent. In 1864, he became pastor of the Church of the Puritans (Congregational) in New York city, retaining that office until 1868, when the church, whose ground-lease had expired and which was weakened by dissensions, disbanded. His ministry there was amid the fierce debate which preceded the war of the rebellion. Since that time he has not been in the active ministry, and has resided at Englewood, N. J. He has written many essays and books, among which are, *Studies in Poetry; Lectures on the Pilgrim's Progress; Wanderings of a Pilgrim; Windings of the River of the Water of Life; Voices of Nature; Powers of the World to Come; God against Slavery; and The Guilt of Slavery and Crime of Slave-holding.*

CHEEVER, HENRY THEODORE, b. Me., 1814; brother of George B.; a graduate of Bowdoin, and correspondent abroad of the *Evangelist* of New York. He was a Congregational minister in New York, New Jersey, and Connecticut, and secretary and agent of the church anti-slavery society from its beginning. He published several books of travel, memoirs, etc.

CHE-FOO, or **YEN-TAI**, a seaport t. of n. China, on the s. coast of the gulf of Pih-chih-ti, in the province of Shantung, 30 m. e. of Tang-chow-foo. It was a place of small consequence until, under the treaty of 1858, it was opened to foreign trade as the port of Tang-chow. There is now a custom-house, a British consulate, and a considerable foreign settlement. The imports are chiefly woolen and cotton goods, iron, and opium; the exports bean-cake, bean-oil, peas, raw silk, straw braid, dried fruit, etc. There is some trade with the Russians in Manchuria.

CHEHA'LIS, a co. in Washington territory, on the Pacific; 1600 sq.m.; pop. '70, 401. Gray's harbor, one of the few places of refuge from the ocean, is in this county. Co. seat, Montesano.

CHEILOANGIOS'COPY, a method of observing the circulation of the blood. Heretofore, with the exception of a single experiment the evidence of circulation in the human subject has been entirely circumstantial, derived from the facts of structure of the circulatory organs, and from the manner in which the blood flows from several arteries and veins. But by means of a simple arrangement, invented by Dr. C. Hüter, a German, it is now possible for one to witness the actual flow of blood in the blood-vessels of another person, and that with sufficient accuracy to detect any abnormality in the circulation, and so to obtain invaluable assistance in the diagnosis of disease. In Dr. Hüter's arrangement the patient's head is fixed in a frame, something like that used by photographers, on which is a contrivance for supporting a microscope and lamp. The lower lip is drawn out, and fixed, by means of clips, on the stage of the microscope, with its inner surface upward; a strong light is thrown on this surface by a condenser, and the microscope, provided with a low-power objective, is brought to bear upon the delicate net-work of vessels, which can be seen in the position indicated, even with the naked eye. The appearance presented is, at first, as if the vessels were filled with red injection. But by focussing a small superficial vessel, the observer is soon able to distinguish the movement of the blood-stream, rendered evident by the speck-like red corpuscles, the flow of which, in the corkscrew-like capillaries, is said by Hüter to be especially beautiful. The colorless corpuscles are distinguishable as minute white specks, occurring now and again in the course of the red stream. Beside the phenomena of the circulation, the cells of pavement-epithelium lining the lip, and their nuclei, can readily be distinguished, as well as the apertures of the mucous glands. Beside the normal circulation, various pathological conditions can be observed. By a pressure quite insufficient to cause pain, the phenomena of blood stagnation—the stoppage of the flow, and the gradual change in the color of the blood from bright red to purple—are seen. A momentary stoppage is also produced by touching the lip with ice, a more enduring stasis by certain reagents, such as glycerine or ammonia.

CHEIRAN THUS. See WALLFLOWER.

CHEIROL'EPIS, a genus of fossil ganoid fish, peculiar to the Devonian measures, in which eight species have been found. They had large heads, the spine continued in a rudimentary condition, and the body was completely covered with small lozenge-shaped ganoid scales. The first ray of each fin was converted into a strong spine, whose base was loosely imbedded in the flesh. The pectorals and ventrals were largely developed, while the dorsal was small, and situated behind the anal fin. The generic name, meaning "scaly-hand," was given in allusion to the large scaly pectorals.

CHEIR'OMANCY (Gr. *cheir*, the hand; *manteia*, prophecy), or **PALMISTRY**, a form of divination that professes to read the destiny of an individual by the lineaments of the

hand. In the middle ages, C. occupied the attention of Cardan, Paracelsus, and other eminent men, who elaborated it into a system. It is now, however, the exclusive property of the gypsies, who still find among maid-servants sufficient credulity to make its practice profitable.

CHEIR'OMYS. See AYE-AYE.

CHEIRONEC'TES, a genus of marsupial quadrupeds, differing from the opossums chiefly in having webbed-feet and aquatic habits. *C. palmatus* or *C. Yapock*, sometimes called the Yapock opossum, or simply the Yapock, from the South American river of that name, is common in many rivers of Brazil and Guiana. It has a soft woolly fur, the color of the upper parts of the body is gray, with large transverse patches of black, connected with a dorsal black line, the breast and belly white; the tail is long, very thick at the base, tapering to the tip, and, except at the base, covered with scales. The cheek-pouches are very large. Crustaceans are said to form the chief food of this animal, which is interesting as a sort of marsupial representative of the otter.

CHEIROP'TERA. See BAT.

CHEIROTHE'RIMUM, the name given by Dr. Kaup to the animal which produced the peculiar hand-like impressions (hence the name, "hand-beast") on the triassic rocks of this country and Germany. The remains of the animal having been found, and its structure made out, this name has given place to the more characteristic one of *labyrinthodon* (q.v.).

CHEKE, Sir JOHN, who deserves to be remembered as one of the revivers of classical literature in England during the 16th c., was born at Cambridge, June 16, 1514. Entering the university of Cambridge, he devoted himself assiduously to the study of Latin and Greek, particularly the latter language, then much neglected in England. He labored earnestly to advance the study of the Greek language and literature; and when the first professorship of Greek was founded in Cambridge by king Henry VIII., about 1540, C. was appointed professor. A new mode of pronouncing Greek which he introduced was assailed by bishop Gardiner, the chancellor of the university; but notwithstanding, C.'s system prevailed. C. was for a time preceptor of the prince, afterwards Edward VI., whose elevation to the throne secured him rank, wealth, and honor. But being a Protestant, he was stripped of everything when Mary came to the throne, although other lands were given to him on his returning to the Roman Catholic church, which he did to escape burning, the only alternative offered him by cardinal Pole. His recantation preyed on his mind so much, that he died in the course of the following year, Sept., 1557. He left several works in Latin, and a pamphlet in English; and among his MSS. was a translation of the gospel by Matthew, exemplifying a plan for reforming the English language by eradicating all words save those derived from Saxon roots.

CHE-KEANG, one of the eastern and maritime provinces of China, the smallest of the eighteen. Situated in the southern portion of the great plain, it is possessed of great fertility, and produces silk, tea, and rice in abundance. Its capital, Hangchow (q.v.), an important and populous city, is the metropolis of the silk districts. "Above is Paradise," say the Chinese; "below are Soo-chow and Hangchow." Both these places were taken by the Taeping rebels in 1860. Ning-po (q.v.) is the principal port of the province. Pop., according to the Chinese census of 1812, 26,256,784. Area, 39,150 sq. miles.

CHELIC'ERÆ, or antennal claws, modified antennæ, which, in some of the crustaceans, and in most of the arachnida, serve a purpose corresponding with that of the mandibles of insects in the cutting, tearing, or bruising of food. They move, however, up and down, in a direction contrary to that of the mandibles of insects.

CHEL'IFER, a genus of *arachnida* (q.v.) of the order *trachearia*, and of the family to which, from their resemblance to scorpions without tails, the name *pseudo-scorpions*, or false scorpions, has been given, the true scorpions belonging to the order *pulmonaria*. The genus C. consists of minute species in which this resemblance is very strong. The palpi are elongated and armed with pincers. The species live under the loose bark of trees, in chinks of old furniture, etc. One species, *C. caneroides*, about a line and a half in length, is frequently to be seen in old books, herbaria, etc., and is called the *book scorpion*; it is said to be useful as feeding on the insects which are most destructive to books and collections in natural history.

CHELM, or CHOLM, a t. of Russian Poland, in the government of the same name, 126 m. s.e. of Warsaw. It is the seat of a united Greek bishop, and has a theological seminary. The Poles were defeated here by the Russians, June 4, 1794. Pop., '67, 4,483.

CHELMSFORD, the co. t. of Essex, near the center of the co., at the confluence of the Chelmer and the Cann, 29 m. n.e. of London. The industry of C. is chiefly agricultural. The town is the seat of assizes and local courts, and has a grammar-school founded by Edward VI. Pop. '71, 9,318. On a small island called Mesopotamia, in the Chelmer, there has long been a ludicrous mock-election of a member of parliament during the county elections.

CHELMSFORD, FREDERICK THESIGER, Baron, b. London, 1794; a lawyer and judge; solicitor-general in 1844; and next year attorney-general, and again in the same office in 1852. In 1858, he was made lord chancellor, and received the title of lord C. He filled the same office in 1866.

CHELO NIA (Gr. *chelone*, a tortoise), an order of reptiles, corresponding in extent with the genus *testudo* of Linnæus, and of which the most obvious distinguishing character is the inclosure of the whole body in a protective covering connected with the skeleton, so that only the head, the tail, and the limbs are protruded; the limbs, four in number, and all formed on the same plan, are used by some as feet for walking on dry ground, by others as paddles for swimming. The bony covering consists of two principal parts, called the *carapace* and the *plastron*; the carapace serving as a buckler for the upper parts, and the plastron for the under parts of the body. The carapace is formed from the ribs, of which there are eight pair, and from the annular parts of the dorsal vertebrae, expanded into plates, which are joined to each other by dentilated sutures, so that the whole acquires great firmness, and the dorsal vertebrae are rendered immovable. The plastron is formed of pieces which represent the sternum or breast-bone, and which are ordinarily nine in number. So compact and strong is the case of some of the tortoises, that it will bear immense pressure without injury, the arched form of the carapace adding to its strength; whilst the creature, destitute of other means of defense, and incapable of flight, finds safety, at least in its mature state, from all enemies but man, by drawing its head, tail, and limbs within the protecting case, which in some, called box-tortoises, has certain plates movable, so as more completely to inclose them. The turtles and other aquatic chelonians cannot thus withdraw their head, tail, and limbs from danger, but the greater activity of their movements compensates for this.

The firmly fixed ribs not admitting of the movements by which respiration ordinarily takes place in other vertebrate animals, the C. gulp down air, which they inhale entirely through the nostrils; first filling the cavity of the mouth by elevating the hyoid bone, and then, by depressing it, forcing the air into the lungs, whilst the inner aperture of the nostrils is closed by the tongue. In other respects, as to aëration and circulation of blood, they resemble other reptiles.

The jaws are not furnished with teeth, but act in a manner more resembling that of the mandibles of birds, being like them hard, sharp, and horny. The food of the C. is various. Some of them, among which are all the land-tortoises, subsist exclusively on vegetable food; some of the aquatic C. pursue and eat other aquatic animals.

All the C. are strictly oviparous. Their eggs are hatched by the heat of the sun alone; they lay a great number at a time, which are covered with a calcareous shell, like those of birds. The eggs of fresh-water tortoises are in some places a lucrative article of commerce, from the quantity of oil which is obtained from them.

The C. are found only in the warmer parts of the world, but their numbers in some places are astonishingly great. None of them can properly be reckoned British, although stray turtles have, in a few instances, been found on the British shores. A few species occur in the southern parts of Europe, and some are found in the temperate parts of North America.

All the species are extremely tenacious of life; they are capable of extraordinary abstinence, and of living long after having sustained injuries which would have been immediately destructive to almost any other animal. They are also remarkable for their longevity.

The flesh of some kinds of turtle is well known as an excellent article of food. The eggs of some are equally an esteemed delicacy. Tortoise-shell (q. v.), and the oil already mentioned, are the only other valuable products of the order.

Further information concerning the C. will be found in particular articles devoted to some of the different genera and species. See also REPTILES.

Fossil Chelonia.—Foot-tracks on the triassic sandstone of Dumfriesshire were referred by their discoverer, Dr. Duncan, to tortoises. Similar tracks have been noticed in Devonian and oolite strata. Their vagueness, however, does not indicate with any certainty the animals which produced them. The first indisputable evidence of chelonian life occurs in the upper oolite, where the remains of several pond-tortoises and two or three turtles have been observed. In the newer deposits, they increase in number, so that between 70 and 80 species have been described from the tertiary strata. In the eocene deposits of the London clay, at the mouth of the Thames, there occur the remains of more species of true turtles than are now known to exist in the whole world. Some of these fossil C. were of a size proportioned to their colossal companions; as, for instance, the gigantic land tortoise (*colossochelys*) of the Sewalik hills, whose carapace was as much as 20 ft. in length.

CHELSEA, a city in Suffolk co., Mass.; pop. '70, 18,547; a suburb of Boston, with which it is connected by ferry, and horse and steam railroads. C. is separated from East Boston by C. creek, and from Charlestown by Mystic river, which is crossed by a bridge 3,300 ft. long. The principal public buildings, besides churches, are the city hall, the U. S. naval hospital, the marine hospital, odd fellows' and masonic halls, and Winnisimmet hall. C. is in the Boston customs district, and there are some manufactories in the city; but the business of many of the inhabitants is in Boston. It has the

usual civic government of mayor, aldermen, and common council; with police, fire, and water departments, board of education, etc. C. was settled in 1630 under the name of Winnisimmet, and was a part of Boston until 1738, when, with adjacent settlements, it was organized as the town of C. It was incorporated as a city in 1857.

CHELSEA, a suburb of London, in Middlesex, on the left bank of the Thames, $4\frac{1}{2}$ m. w.s.w. of St. Paul's. The river is here crossed by a fine iron bridge. Pop. '71, 258,050. Many of the nobility and gentry formerly resided at C., and some of its coffee-houses were much resorted to by pleasure-parties in the 17th and 18th centuries. C. has water-works to supply London, a chain-pier, and floor-cloth factories, besides a training-college for male and another for female teachers, and the Cremorne house gardens, now a place of public amusement.

CHELSEA HOSPITAL is an asylum for disabled or superannuated soldiers. The building was commenced in 1609, as a Protestant theological seminary, by Dr. Matthew Sutcliffe, dean of Exeter; and James I. gave it a charter in 1610, as *King James's college*. When Sutcliffe died in 1629, the building was less than half finished, and the students were only 15 in number. Shortly after this, the scheme was abandoned, and the building used for various purposes. It was then rebuilt, and made into an hospital for disabled soldiers by Charles II. By a warrant issued in 1684, one day's pay per year, and two in leap-years, were deducted from soldiers' pay, for supporting C. H. This deduction has long ceased; the hospital being maintained by parliamentary grant. The hospital has accommodation for about 600 persons besides officers. Attached to it are about 40 acres of land, used as public gardens and exercise ground. It is governed by a board of commissioners, comprising *ex officio* the lord president of the council, the first lord of the treasury, and the secretaries of state; but the more immediate management is in the hands of about 120 persons, of whom 20 are military officers, 20 civil officers, and the rest subordinates.

The establishment is maintained for the *in-pensioners* of the British army, who, in the army estimates for 1876-77, are set down at 538. These in-pensioners, besides board, lodging, clothing, washing, medical aid, etc., receive a small sum in money, varying from 5s. 3d. per week for a color-sergeant, down to 7d. per week for a private soldier. They are all dressed in uniform—red, with blue facings—and are treated as a garrison, in respect to guards, sentinels, etc. There is a certain degree of choice open to the men, as to whether they will be *in* or *out* pensioners. The out-pensioners, who are more than a hundredfold as numerous as the others, receive sums of money varying from 1½d. to 3s. 10d. per day for life, as a reward for past services. Vacancies in the hospital are filled up once a quarter; and every person admitted must give up his out-pension before he can become an in-pensioner. The cost of the hospital for 1876-77 was estimated at £28,916. This is exclusive of out-pension charges. Doubts have frequently been expressed as to the usefulness of this expenditure; it is exceptional in its character, and the arrangement to which it refers is not in much favor among the soldiery.

CHELTENHAM, a t., parliamentary borough, and fashionable watering-place, in the co. of Gloucester, 8 m. n.e. of Gloucester. It lies in a picturesque and healthy valley on the Chelt, a small stream which rises in the adjacent hills, and flows into the Severn. It is sheltered on the e. and s.e. by a semicircle of the Cotswolds. It owes its celebrity and rapid increase to its mineral springs, of which there are several varieties. The chief street is upwards of a mile long, right and left of which are spacious and elegant squares and crescents, and innumerable villas lately erected for the accommodation of the numerous visitors. Attached to the spas are handsome pump-rooms—with tasteful grounds, avenues, saloons—lodging-houses, and public promenades among the finest in England, besides many fine mansions in and around the town. It has 10 churches and a number of dissenting chapels. Of late years, C. has become famous for its public schools, the oldest of which is its endowed grammar-school, capable of educating 300 scholars; but the largest, and now the most celebrated, is its proprietary college, for the sons of gentlemen, a noble institution, educating, upon an average, 600 pupils. There are also a ladies' college, a junior proprietary school, and a number of private scholastic establishments. There are public assembly-rooms in the town; which is also much resorted to in winter for its hunting. It has two clubs, and five or six weekly newspapers. Pop. '71, 44,519. C. returns one member to parliament. Its affairs are managed by a board of elected commissioners. It has no manufactures of any importance. C. was only a village in 1716, when the first spring was discovered. It gradually increased till 1788, when the benefit received by George III. from its waters suddenly made it a resort of fashion.

CHEMIC, is the name given to BLEACHING POWDER by those engaged in chemical works.

CHEMICAL NOMENCLATURE AND NOTATION. (During the progress of the *Encyclopædia*, the nomenclature and notation of chemistry were greatly changed. What follows here is allowed to stand, as the old names and notation are still found in books in use, and are often used concurrently with the new.) In early times, chemical substances were named according to the fanciful theories of alchemy (q. v.). Thus the name *flowers*

of sulphur was applied to the sublimed sulphur, which grew or sprang like a flower from sulphur when heated; *spirit of salt*, to hydrochloric acid, the corrosive acid or spirit obtained from common salt; and a multitude of other names had a like fanciful origin. In 1787, Lavoisier founded the system of nomenclature which is followed still by chemists. At first, it was intended that the names of simple as well as compound substances should be regulated by system. Hence, such terms as oxygen (from *oxus*, acid, and *gennaos*, to produce), the *acid-producer*, given from the notion then held that no acid was without oxygen; and hydrogen (from *hydor*, water, and *gennaos*), the *water-producer*, from the supposition that hydrogen had more to do with the formation of water than any other element. The advance of chemistry, however, has so completely changed the opinion of chemists regarding the simpler bodies, that such names are now found to mislead; and thereafter, though such as had been given on this system were retained, their meaning has been discarded, and the systematized nomenclature restricted to compound substances. A remnant of the system, however, still subsists at the present time, in making the scientific names of all the metals end in *um*. In the non-metallic elements, a close analogy exists between chlorine, bromine, iodine, and fluorine; and to indicate this, the common termination *ine* has been given; and for a similar reason, carbon, silicon, and boron, end in *on*. As a general rule, however, the chemical name of an elementary substance does not convey any scientific meaning, and must be regarded as a simple mark or designation, analogous to the names of persons, which give no notion regarding their moral character or physical development. The ancient and more common metals retain their popular titles, such as gold, silver, and copper; but the more recently discovered metals have names given which end in *um*. The symbol of an element is obtained from the first letter of its Latin name, as O for oxygen; P_l for lead (Lat. *plumbum*). When the names of two or more elements commence with the same letter, a smaller letter or satellite is attached to one or more of these; such as S for sulphur, Se for selenium, and Si for silicon. For a complete table of the symbols of the elementary substances, see ATOMIC WEIGHTS.

The name of a compound substance generally indicates the elements of which it is composed. Thus the name oxide of iron indicates that the red powder (rust) is made up of oxygen and iron; the sulphuret of lead (*galena*), that it is composed of sulphur and lead. In all similar combinations—

Oxygen forms oxides.

Chlorine “ chlorides.

Bromine “ bromides.

Iodine “ iodides.

Fluorine “ fluorides.

Nitrogen “ nitrides.

Carbon “ carbides or carburets.

Sulphur “ sulphides or sulphurets.

Selenium “ selenides or seleniurets.

Phosphorus forms phosphides or phosphurets.

When two elements combine with each other in more than one proportion or equivalent (see ATOMIC THEORY and ATOMIC WEIGHTS), the names of the compound bodies are contrived so as to express this. The term *protoxide* is applied to a compound of one equivalent of oxygen with one equivalent of another element; *deutoxide* to a compound containing a larger proportion of oxygen than the protoxide; and *tritoxide* when the oxygen is still further increased. The term *binoxide* is used when oxygen is present in the proportion of two equivalents to one equivalent of the other element; and *teroxide* when the proportion is as three to one. A *suboxide* contains less than one equivalent of oxygen; and a *peroxide* is the highest oxide not possessing acid properties. The same prefixes are applied to the compounds of chlorine, sulphur, etc.

When one element combines with another to produce several compounds possessing acid properties, various terminations are employed to distinguish the compounds. Thus, oxygen combines with a number of the elements to produce with each a series of acid compounds, the more highly oxidized of which receive the termination *ic*, whilst those containing less oxygen end in *ous*. Thus, sulphuric acid contains three equivalents of oxygen to one equivalent of sulphur; and sulphurous acid, two equivalents of oxygen with one equivalent of sulphur. These terminations are qualified by the use of the prefixes *hypo* (under) and *hyper* (over). Thus, *hyposulphuric* acid is applied to a compound containing less oxygen than the sulphuric acid, and *hyposulphurous* to one with less oxygen than sulphurous acid.

When acids combine with bases or metallic oxides to form salts, they produce compounds, the names of which are influenced by the terminations of the acids. Thus, sulphuric acid and soda form the sulphate of soda; sulphurous acid and soda, the sulphite of soda; and hyposulphurous acid and soda, the hyposulphite of soda. In the same manner, nitric acid with potash forms the nitrate of potash, whilst nitrous acid and potash produce the nitrite of potash.

If a symbol be employed alone, it represents one equivalent of the element. Thus, O signifies one equivalent, or eight parts by weight, of oxygen; C, one equivalent, or six parts by weight, of carbon; H, one equivalent, or one part by weight, of hydrogen. The

combination of two elements is represented by placing the symbols for those elements side by side; thus, HO signifies one equivalent of hydrogen and one equivalent of oxygen in a state of chemical combination (viz., water); and NaCl is one equivalent of sodium (Lat. *natron*) united with one equivalent of chlorine (viz., common salt).

When two or more equivalents of one element unite with one or more equivalents of another element, the number of such equivalents is signified by a small figure being placed immediately after the symbol of the element so multiplied. Thus, H_2O represents one equivalent of hydrogen in combination with two equivalents of oxygen (peroxide of hydrogen); MnO_2 is one equivalent of manganese with two of oxygen (black oxide of manganese); Fe_2O_3 is two equivalents of iron with three equivalents of oxygen (rust); and Pb_3O_4 is three equivalents of lead with four equivalents of oxygen (red lead).

In expressing the formula of a compound substance, the symbol of the metal or its analogue is placed first in order, and is succeeded by the oxygen, chlorine, or similar element. Thus, the symbol for the chloride of mercury is always written HgCl , never ClHg . The same order is carried out in the construction of the formula of more complex substances; the metallic half is placed first. Thus, sulphate of iron—containing sulphuric acid and the oxide of iron—is always expressed as FeO, SO_3 , never SO_3, FeO . In other words, the symbols are written in the order in which the substances would be named in Latin.

In the construction of the formulas of complex substances, the comma (,) and plus sign (+) are often introduced; the former to separate the symbols of substances which are closely united together, and the latter to form a line of demarcation where the components are less intimately combined. Thus, $\text{FeO}, \text{SO}_3 + \text{KO}, \text{SO}_3$ represents the compound of the sulphate of iron with the sulphate of potash; $\text{KCl} + \text{PtCl}_2$ is the double chloride of potassium and platinum.

Large figures placed at the left hand of a formula multiply all the symbols till a comma or plus sign appears. Thus, 3SO_3 represents three equivalents of sulphuric acid; $3\text{PbO}, \bar{\text{A}}$ is three equivalents of oxide of lead, and one equivalent of acetic acid; and $\text{KO}, \text{SO}_3 + \text{Al}_2\text{O}_3, 3\text{SO}_3 + 24\text{HO}$ (alum) is one equivalent of the sulphate of potash, with one equivalent of the sulphate of alumina, and 24 equivalents of water. When a compound substance requires to be multiplied, it is inclosed within parentheses, and a large figure placed immediately before it; thus $3(\text{KO}, \text{C}_2\text{O}_3) + \text{Fe}_2\text{O}_3, 3\text{C}_2\text{O}_3 + 6\text{HO}$ represents three equivalents of oxalate of potash, one equivalent of oxalate of iron, and six equivalents of water.

In expressing the formulas of organic compounds, the symbols are written in the following order: CHNO . Thus, turpentine is C_8H_8 , alcohol is $\text{C}_4\text{H}_8\text{O}_2$, and morphia is $\text{C}_{17}\text{H}_{19}\text{NO}_5$.

Arbitrary symbols are occasionally used to represent important complex substances. Cyanogen is known as Cy ; the organic acids are recognized by their initial letter with the sign (—) drawn above, as $\bar{\text{T}}$ for tartaric acid, $\text{C}_4\text{H}_4\text{O}_{10}$; $\bar{\text{A}}$ for acetic acid, $\text{C}_2\text{H}_2\text{O}_3$; and $\bar{\text{O}}$ for oxalic acid, C_2O_3 ; while the alkaloids are represented by their initial letter or

letters with the sign (+) above; thus, $\overset{+}{\text{Sr}}$ for strychnine, $\text{C}_8\text{H}_{22}\text{N}_2\text{O}_4$; $\overset{+}{\text{M}}$ for morphia, $\text{C}_{17}\text{H}_{19}\text{NO}_5$; and $\overset{+}{\text{Q}}$ for quinine, $\text{C}_{20}\text{H}_{28}\text{N}_2\text{O}_4$.

Occasionally, in treatises on mineralogical chemistry, arbitrary modes of expressing the composition of minerals are resorted to, which it is not necessary here to explain.

CHEMICAL TOYS, which in the course of recent years have been brought prominently before the public, deserve a brief notice. "Pharaoh's serpents," which are described in the article **SULPHOCYANOGEN**, are highly poisonous, and during combustion evolve dangerous vapors. *Larmes du Diable*, or "crocodiles' tears," are formed of metallic sodium, burn with extreme violence if thrown into water, or even if moistened with water or heated, and scatter particles of caustic alkali, which may inflict serious burns. "Sunshine in winter evenings," "fiery swords," etc., are formed of magnesium, and, like the preceding, may cause serious burns. Pyroxylin, which is identical with gun-cotton, is the active agent in the various toys known as "will-o'-the-wisp paper," "parlor lightning," "fireflies," etc. The use of these toys in teaching rudimentary chemistry to children and young persons is quite incommensurate with their danger.

CHEMISTRY is that branch of natural science which takes cognizance of the changes that bodies undergo when they are influenced by affinity (q. v.). Changes that do not alter the nature and properties of substances—such as the falling of a body by gravity, or its expansion by heat—belongs to physics or natural philosophy. In chemical changes, again, the properties of the substances are permanently altered. Thus, when a piece of iron is left exposed to damp air, it is after a while converted into a reddish brittle substance (rust), owing to the union with it of the oxygen of the air. Chemistry, then, may be most simply defined as that branch of natural science which considers (1.) The combination of two or more substances to form a third body, with properties unlike either of its components; and (2.) The separation from a compound substance of the more simple bodies present in it: and considering that the steps of the combination and decomposition of substances can never be correctly understood without an intimate

knowledge of the properties of substances, it follows that the science of C. must likewise take into notice the description of all the simplest as well as the most complex bodies.

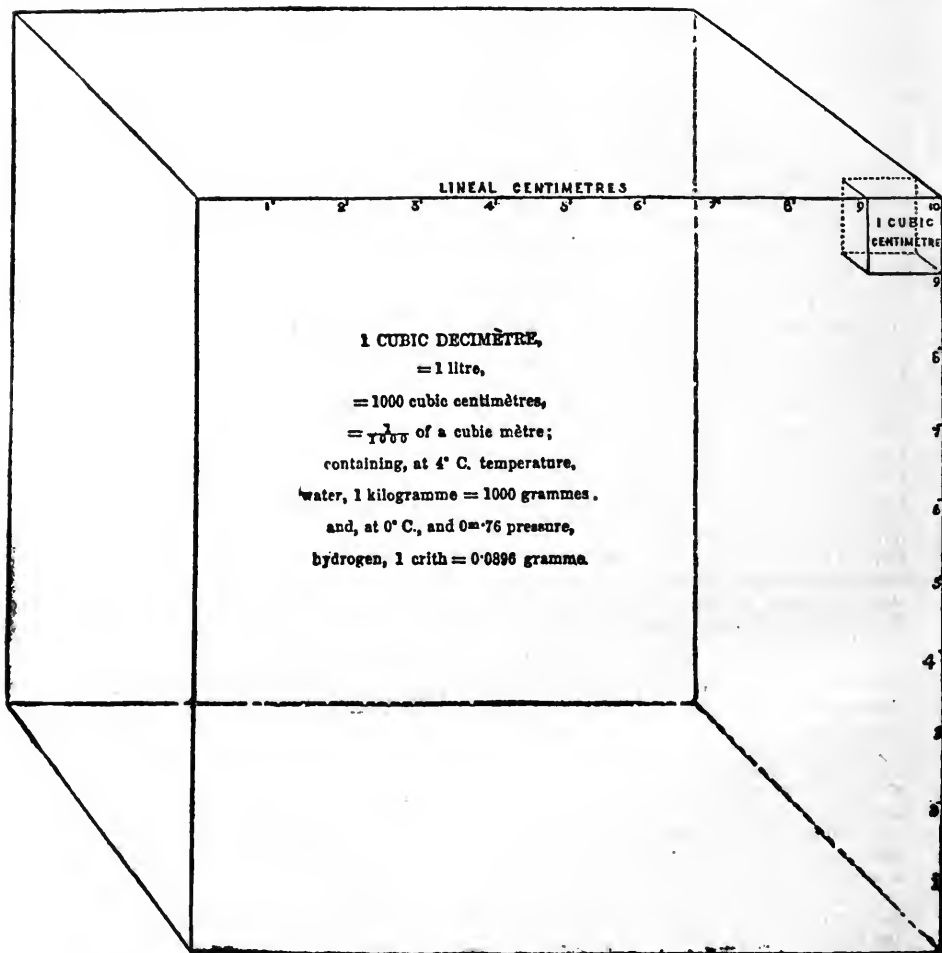

When the science of C. is considered as a whole, including the properties of all the elements or substances, and the combinations and changes which they can under all circumstances undergo, it is distinguished by the title of *pure, theoretical, or philosophical C.* Particular departments of C., where the science is confined to the examination of special objects, receive distinctive names; as *physical C.*, or *chemical physics*, which considers phenomena bordering on natural philosophy and C.; *mineralogical C.*, which takes cognizance of the composition of minerals; *physiological C.*, which includes the changes which food undergoes in its transit through the animal economy, and the transformations that take place in organic substances generally; *medical C.*, which considers the composition and compounding of medicines; *agricultural C.*, which relates to the composition of soils and manures, the ingredients in plants, and the best modes of supplying the food they require, etc. *Inorganic C.* takes cognizance of dead matter, and the changes it undergoes, whilst *organic C.* considers the substances obtained from plants and animals.

C. ranks as one of the arts as well as one of the sciences, and the division of *practical C.* comprehends the rules and processes which must be followed, and the mechanical means which must be resorted to, for the successful prosecution of the art. Practical C. is subdivided into *analytical C.* (q.v.), which is occupied with the separation of simple substances from more complex—as chlorine (Cl) and sodium (Na) from the chloride of sodium or common salt (NaCl)—and to the estimation of the quantities of the several ingredients; and *synthetical C.*, which has for its object the union of simpler bodies to form more complex—as hydrogen (H) and oxygen (O) to form water (HO). The art of *assaying* (q.v.) is a department of analytical chemistry. *Applied C.* includes the art of manufacturing the various substances employed in commerce and in domestic life, so far as chemical processes and application are required. It is subdivided into *technical C.*, which relates to everything connected with the arts and manufactures; and *pharmaceutical C.*, which takes cognizance of the substances used in medicine.

History.—The Egyptians appear to have possessed the greatest amount of chemical knowledge of all the nations of antiquity. They preserved dead bodies from decay (see MUMMY), fixed colors in silk by means of mordants, prepared many medicines and pigments, as also soap, beer, vinegar, metals and metallic alloys, common salt, vitriol, soda, sal-ammoniac, glass, enamel, tiles, and painted earthenware. The Chinese were very early acquainted with the processes for dyeing, and the preparation of metallic alloys, the fabrication of niter, sulphur, gunpowder, borax, alum, porcelain, verdigris, paper, etc. From the Egyptians, the Greeks and Romans derived what chemical knowledge they possessed; but they added little or nothing; and when the migration of the northern tribes, and overthrow of the Roman empire, took place, a stop was put for a time to the advancement of all science in Europe. The prosecution of chemical knowledge was taken up by the Arabs before the 8th c., and was carried on by them and by their European scholars, the alchemists, with the results described under ALCHEMY. The first germs of a real science of C. seem to appear about the end of the 17th and beginning of the 18th c., in the speculations of Becher (q.v.) and the phlogistic theory of Stahl (q.v.). After this, C. rapidly advanced. In 1718, Geoffrey brought out the first table of *affinities*; in 1732, Boerhaave published many original experiments on the chemical relations of heat and light; in 1724 Hales, and in 1756 Black, published researches on the air and æriform bodies, showing that the carbonic acid evolved during fermentation, respiration, and by the action of acids on chalk, was different from atmospheric air. In 1754–59, Margraff added to the then known earths—lime and silica—two others, alumina and magnesia; he also extracted sugar from plants. In 1770, Priestley began to announce his discoveries of oxygen, ammoniacal, hydrochloric, and sulphurous acid gases, etc. In 1773–86, Scheele contributed chlorine, hydrofluoric, prussic, tartaric, and gallic acids; also baryta, phosphoric acid from bones, etc., and gave the first hints regarding a new doctrine of combustion. About the same time Bergman and Cavendish enlarged our knowledge of the gases. Lavoisier, between 1770 and 1794, reorganized much of the then known C., and founded a system of C. which still remains as the skeleton of the science. Berthollet, in 1787, contributed much to the doctrine of affinity, and made researches in chlorine, etc. Fourcroy and Vauquelin advanced organic C.; Klaproth gave many contributions to mineral C. Richter devoted himself to the doctrine of combining proportion, which was afterwards perfected by Dalton, as noticed under atomic theory (q.v.). The discovery of galvanic electricity by Galvani, and its advancement by Volta, led sir Humphry Davy, and others, to important researches in the metals and gases. Gay-Lussac and Thenard advanced our knowledge regarding organic substances and the chemical relations of heat. Berzelius made laborious researches in mineral C., and gave an exactness to this department which is matter of astonishment to the chemists of the present day. He was also the author of the electro-chemical theory, which has been almost perfected by the labors of Faraday, De la Rive, Becquerel, etc. Organic C. has latterly advanced most rapidly under the researches of Liebig, Wohler, Mitscherlich, Mulder, Laurent, and others. See ATOM, ATOMIC THEORY, ATOMIC VOLUME, ATOMIC WEIGHTS, AFFINITY.

CHEMISTRY. It is impossible in this article to do more than briefly describe some of the most important of the numerous changes which have been introduced into the science of chemistry within the last few years.

1. The system of measuring temperature, lengths, weights, and volumes has been altered. The centigrade has completely superseded the Fahrenheit thermometric scale in all recent chemical works, and the French metric (which is a decimal) system has been adopted for all measurements and weights, inches and their fractions being replaced by 10ths or 100ths of a meter, and grains by grams. It has this advantage over all the other systems, of possessing one fundamental linear unit, from which all the ramifications of linear, superficial, or solid dimensions, and of weight are derived. See METER, LITER, GRAM, FRANC. This unit is the 10-millionth part of a quadrant of the meridian, or of the distance from the pole to the equator. It is only to measures of weight and capacity or volume that we need here refer. "Multiply," says Dr. Hof-

man in his energetic appeal in favor of the metric system, "the cubic meter by one million, and you have a fit measure in terms of which to express the *capacity* of the Atlantic, or its *cubical contents* of brine; *divide* the cubic meter by one million, and you arrive at the petty volume of the gambler's ordinary die."—*Modern Chemistry*, p. 124. This last-named volume, the millionth of a cubic meter, taken as so much distilled water at a temperature of 4° C. (its point of greatest density), furnishes the metrical *unit of weight* called the *gram*, which thus forms a link connecting weight with measure. Again, dividing the edge of a *meter cube*, which is a linear meter, into 10 parts, called *decimeters*, and cubing one of these parts, we obtain a unit of volume or capacity to which the term *liter* is applied. The various weights in use are all multiples or divisions by tens. Thus, 10 meters form a decameter, 100 a hectometer, and 1000 a kilo-

meter; while $\frac{1}{10}$ th of a meter is called a decimeter, $\frac{1}{100}$ th a centimeter, and $\frac{1}{1000}$ th a millimeter, the Greek prefixes in all cases denoting multiplication, and the Latin division. The reader will do well to recollect the following rough comparisons between the chief French and English measures chiefly used in chemistry, as otherwise he can form no conception of the length, size, or weight of the substances treated of. A meter = nearly 1.1 linear yard = 39.37 in.; a millimeter = 0.039, or nearly $\frac{1}{25}$ th of an in.; a centimeter = 0.39, or nearly $\frac{3}{8}$ th of an in.; and a decimeter = 3.94, or nearly 4 in.; a gram = 15.43 gr.; and a liter = rather more than 61 cubic in., or a pint and three-quarters. The accompanying figure represents a cubic decimeter. Two of the edges of the front side are divided, as may be seen, into 10 linear centimeters; and the space occupied by a cubic centimeter is shown on the upper right-hand corner of the tube. Now, a cubic decimeter is employed as a unit for measures both of weight and of volume, for in the former capacity it contains, at 4° C., 1 kilogram, or 1000 grams of distilled water, and in the latter it loses its name of kilogram and receives the appellation of *liter*, which corresponds to 1000 cubic centimeters, or $\frac{1}{1000}$ th of a cubic meter. Chemists have long felt the want of an appropriate *volume*, with its corresponding weight, to serve as standard units of measurement, and prof. Hofman has selected 1 cubic decimeter = 1 liter, as the most appropriate unit of volume, and the weight of this measure of pure hydrogen as the unit of weight, hydrogen being taken at 0° C. temperature, and 0^m76* pressure. To this standard *weight-unit*, which = 0.0896 of a gram, he assigns the name of *crith*, from the Greek *krithē*, a barley-corn, signifying figuratively a small weight; and the weight is now in universal acceptance amongst modern British chemists. There is probably no figure in chemical science more important than this one (0.0896 of a gram) to be remembered and kept ready for calculation; for it is the standard multiple or co-efficient by means of which the weight of 1 liter of any other gas, simple or compound, is computed. "For example, the relative volume-weight of chlorine being 35.5, that of oxygen 16, and that of nitrogen 14, the actual weights of 1 liter of each of these elementary gases at 0° C. and 0^m76 pressure, may be called respectively 35.5 *criths*, 16 *criths*, and 14 *criths*. So again with reference to the compound gases, the relative volume-weight of each is equal to half the weight of its product-volume. Hydrochloric acid (HCl), for example, consists of 1 volume of hydrogen + 1 volume of chlorine = 2 volumes, or by weight, 1 + 35.5 = 36.5 units; whence it follows that the relative value-weight of hydrochloric acid gas is $\frac{36.5}{2} = 18.25$ units; which last figure therefore expresses the number of *criths* which 1 liter of hydrochloric acid gas weighs at 0° C. and 0^m76 pressure, $18.25 \times 0.0896 = 1.6352$ as the actual weight in grams of hydrochloric acid gas. Again, as the product-volume of water gas (H₂O),† taken at the above temperature and pressure, contains 2 volumes of hydrogen + 1 volume of oxygen, and therefore weighs 2 + 16 = 18 units, the single volume of water-gas weighs $\frac{18}{2} = 9$ units, or substituting as before the concrete for the abstract value, 1 liter of water-gas weighs 9 *criths*; that is to say, 9×0.0896 gram = 0.8064 gram."—*Op. cit.* p. 131. In concluding this subject we will only further remark, that when a closely approximative result suffices, the *crith* may be estimated at 0.09 gram.

2. Such terms as *atomic weight*, *atom*, and *molecule* are now employed in a stricter sense than formerly. Every element has been held from the time of Dalton to have a number called its atomic weight. This number, according to Dr. Frankland, one of our most distinguished modern chemists, is made to represent, as far as possible: 1st, The smallest proportion by weight in which the element enters into or is expelled from a chemical compound—the smallest weight of hydrogen so entering or leaving a chemical compound being taken as unity. 2d, The weight of the element in the solid condition at any given temperature contains the same amount of heat as seven parts by weight of solid lithium at the same temperature. 3d, The weight of the element which, in the form of gas or vapor, occupies, under like conditions of temperature and pressure, the same volume as one part by weight of hydrogen."—*Lecture Notes for Chemical Students*, 1866, p. 2. Recent investigations have led chemists to assign to many of the elements double the atomic weights that were previously assigned to them.‡ Thus, taking as formerly the atomic weight of hydrogen as the unit, the atomic weight, or, as it is now often styled, the *atomic number* of oxygen is changed from 8 to 16, that of carbon from 6 to 12, that of sulphur from 16 to 32; and this doubling is by the latest writers extended to most of the elements except the halogens, nitrogen, phosphorus, boron, the metals of the alkalis, gold, and silver. The old atomic weights are still recognized as *combining* or equivalent numbers. The reason why this doubling of the number has been adopted will be presently given. The distinction between an *atom* and a *molecule* must be clearly recognized. "We may define an *atom* of an elementary body to be the smallest proportional weight thereof which is capable of existing

* It is almost unnecessary to notice that 0^m76 signifies 0.76 of a meter, or nearly 30 inches—the ordinary atmospheric pressure at the level of the sea, and at lat. 51 $\frac{1}{2}$ °.

† The reason why the formula H₂O, instead of HO, for water is used, will be presently explained.

‡ The article "Atomic Theory" in the body of the work has been rewritten in accordance with the new views.

in *chemical combination*; and we may define the *molecule* of an elementary body to be the smallest proportional weight thereof which is capable of existing in the *free or uncombined state*." This, which is Hofman's definition (*Modern Chemistry*, p. 157), is now generally accepted. Thus a molecule (or *elementary molecule*, as it is often termed) may consist either of an isolated atom, or of a group of atoms.

The bulk of a molecule, or the *molecular volume* of an element in the gaseous or vaporous state, is the same as the molecular volume of hydrogen at the same temperature and pressure, and in a large number of cases the *molecular weight* of an element is twice its atomic weight. Dr. Frankland gives the following list of the elements whose molecular volumes have as yet been determined: The molecules of mercury, cadmium, and zinc contain *one* atom, and are, termed *monatomic molecules*; those of hydrogen, oxygen, chlorine, bromine, iodine, fluorine, nitrogen, sulphur, and selenium contain *two* atoms, and are termed *diatomic molecules*; the molecules of oxygen, as ozone, contain three atoms, or are *triatomic*; while those of phosphorus and arsenic are *tetraatomic*, and those of sulphur under certain conditions are *heptatomic*. Thus an element, as in the cases of oxygen and sulphur, may, under different conditions, have two distinct molecular weights.

3. We shall now proceed to explain the reasons why many of the atomic weights have been doubled. "It is obvious," says Dr. Odling, in his elaborate article on "Atomic Weights" in Watts's *Dictionary of Chemistry*, vol. i. p. 456, "that the atomic weights of an element and of its combinations should be selected so as to express the entire series of combinations by the simplest series of formulæ; so as best to accord with the chemical properties and metamorphoses of the bodies; so as best to illustrate their analogies with other bodies; and so as to be in relation with their physical properties, such as their specific volumes, specific heats, isomorphism, etc." We shall endeavor to show how he applies these views to prove that, in the case of oxygen, 16 parts of that element, or the quantity thereof which unites with 2 atoms of hydrogen, is the smallest proportion of oxygen that can enter into a combination. "We find, in the first place," says Dr. Odling, "that the quantity of oxygen contained in the great majority of definite oxidized compounds must necessarily be represented by 16, or some multiple of 16 parts. Thus, the molecules of all hydrates, double oxides, acids, oxisalts, aldehydes, ketones, alcohols, oxacid-ethers, and a great number and variety of other compounds, doubtless forming together 99 per cent of all known compounds of oxygen, cannot be represented save with 16 parts, or some multiple of 16 parts of oxygen. For example, the molecules of *hydrate of potassium*,* *benzoic aldehyde*, *acetone*, *chloral*, *hypochlorite of sodium*,* etc., each contain 16 parts of oxygen. The molecules of *spinel*, *brown hematite*, *camphor*, *benzile*, *acetate of sodium*,* *benzoic acid*, etc., each contain twice 16 parts of oxygen. The molecules of *nitric acid*, *glycerin*, *chlorate of potassium*,* *salicylic acid*, *argite*, etc., each contain three times 16 parts of oxygen. We need not carry the quotation further, it being sufficient to remark that Dr. Odling gives similar lists of substances whose molecules each contain 4, 5, 6, 7, etc., times 16 parts of oxygen. Hence it follows that when two bodies only differ in composition by the different proportions of oxygen which they contain, that difference amounts to 16 parts, or some multiple of 16 parts of oxygen. This is well shown in the two following series of bodies given by Odling, in the former of which the symbols are arranged according to modern views:

KCl,	Chloride of potassium.	C ₂ H ₄ ,	Ethylene.
KClO ₂ ,	Hypochlorite of potash.	C ₂ H ₃ O ₂ ,	Aldehyde.
KClO ₃ ,	Chlorate of potash.	C ₂ H ₃ O ₄ ,	Acetic acid.
KClO ₄ ,	Chlorate of potash.	C ₂ H ₃ O ₆ ,	Glycolic acid.
KClO ₆ ,	Perchlorate of potash.	C ₂ H ₃ O ₈ ,	Glyoxylic acid.

It is obvious that in both these series each term differs from the preceding one simply by O₂, or 16 parts of oxygen. Again, the quantity of oxygen which can be liberated by any reaction, and which, either alone or in the form of water, can be added to or separated from a compound, must be 16, or some multiple of 16 parts. Thus, each molecule of nitrate of soda (NaO.NO₃), when decomposed by heat, yields nitrate of soda (NaO.NO₃) and O₂ (or 16 parts of oxygen); similarly, each molecule of permanganate of potash, when decomposed by sulphuric acid, yields manganese—alum, and O₄ (or twice 16 parts of oxygen); and each molecule of chlorate of potash (KO.ClO₃) is decomposed by heat into chloride of potassium (KCl) and O₆ (or three times 16 parts of oxygen). Again, water (and consequently its main constituent, oxygen) is always eliminated in double or some higher even atoms. Thus, formic acid (C₂H₂O₄) yields carbonic oxide (C₂O₂) and two atoms of water (H₂O₂); alcohol (C₂H₅O₂) yields olefiant gas (C₂H₄) and two atoms of water (H₂O₂); oxalate of ammonia (NH₄.C₂HO₄) yields cyanogen (C₂N) and four atoms of water (H₂O₄); and innumerable additional examples might be given. On these grounds (and many additional ones might be adduced if space permitted) it becomes obvious that if the vast majority of oxidized bodies were correctly formulated, they would be represented more simply

* In these cases, one of the new forms of nomenclature is introduced.

by the formulæ in which O = 16 than by the formulæ in which O = 8. Reasons of a similar nature have led to the duplication of the atomic weight of carbon, sulphur, and many of the other elements. There must obviously be some means of distinguishing when O indicates 8 or 16 parts of oxygen, C indicates 6 or 12 parts of carbon, etc. Various modes of distinction have been adopted by different chemists. In Watts's *Dictionary of Chemistry* (published between 1863 and 1868), the new atomic weights are represented by the same symbols which have hitherto been adopted for the old weights; while the latter (when they are occasionally introduced) are printed in italic capitals; thus water is represented by H_2O in the new and by HO in the old system, acetic acid by $C_2H_4O_2$ in the new and by $C_2H_2O_2$ in the old system, etc. A more common means of indicating when the value of the symbol of an element is doubled in value is by drawing a horizontal bar through it, a notation due to Berzelius; thus, \bar{C} , \bar{O} , \bar{S} represent respectively an atom of carbon, of oxygen, and of sulphur in the new system. This system is useful in forming, as it were, a bridge to facilitate the passage from the old to the new system, and will gradually disappear when all chemists recognize the doubled atomic weights. Naquet, Miller (in the 3d edition of his *Chemistry*, 1864), and others, adopt this *barred* system, and the latter frequently give the formulæ pertaining to both systems; for example, $Fe\bar{O}$, SO_3HO_3 , $6H\bar{O}$, or $Fe\bar{S}O_3$, $H_2\bar{O}$, $6H_2\bar{O}$, represents the composition of the crystallized sulphate of protoxide of iron often described as protosulphate of iron.—*Inorganic Chemistry*, 3d ed., p. 6. Some writers, as Frankland, in his *Lecture Notes for Chemical Students*, 1866, following the plan of Watts and the contributors to his dictionary, unreservedly adopt the doubled atomic weights, and represent them by the old formulæ; thus O, C, and S represent in these works precisely double the weight of oxygen, carbon, and sulphur that these capitals represent in the 1st and 2d editions of Miller's *Chemistry*, Fownes's *Manual of Chemistry*, and other standard works published a few years ago. It is now customary for the writers of chemical papers who object to the barred symbols as being unseemly, to insert at the commencement C = 6, \bar{O} = 8, or C = 12, O = 16, in order that the reader may be able to recognize which system is adopted.

Chemical Nomenclature is still in an unfinished state. The chemists of all countries are, with one notable exception, agreed as to the names and symbols which should represent the different elements. The French chemists persist in designating nitrogen by the name of *azote*, and of using Az instead of N for its symbol; and in Italy the term *azoto* is still employed, but as it is often coupled with the symbol N, it will probably soon be exchanged for the more general term nitrogen. When the elementary bodies unite together, they form a *binary compound*. The nomenclature of the binary compounds is in a transitional state. The compounds of sulphur with metals used to form *sulphurets*, latterly they have been termed *sulphides*, and now they are denominated after a third fashion; sulphuret of potassium (for example), after having been for some years sulphide of potassium, now being termed *potassic sulphide*. In order to obtain uniformity, the following rule is adopted by the representatives of the modern school. The names of binary compounds are formed from those of their constituents, the English or Latin name of the positive constituent with the terminal *ic* preceding that of the negative constituent, which is made to end in *ide*. Thus: potassium and sulphur form potassic sulphide; sodium and oxygen form sodic oxide (formerly soda or oxide of sodium); silver and chlorine form argentic chloride (formerly chloride of silver); lead and iodide form plumbic iodide (formerly iodide of lead); calcium and chlorine form calcic chloride (formerly chloride of calcium), etc. When the same elements form two compounds, the one which contains the smallest proportion of the negative element is distinguished by changing the terminal syllable of the name of its positive constituent into *ous*, while the terminal *ic* is retained for the compound containing the larger proportion of the negative element. Thus, 1 atom of iron and 1 atom of oxygen form *ferrous oxide* (the old protoxide of iron); 2 atoms of iron and 3 atoms of oxygen form *ferric oxide* (the old peroxide of iron). Sometimes the same elements form more than two compounds with one another, and then the prefixes *hypo* and *per* are employed. When a binary compound contains oxygen, and becomes an acid when made to unite with water, or becomes a salt when united to a base, it is termed an *anhydride* (q.v.) or *anhydrous acid*. Thus 1 atom of carbon and 2 atoms of oxygen form *carbonic anhydride*, formerly known as carbonic acid gas; 1 atom of sulphur and 3 atoms of hydrogen form *sulphuric anhydride*, etc. In a considerable number of cases, the trivial or common name has not been displaced by the new systematic name; thus water, ammonia, hydrochloric acid, phosphureted hydrogen, sulphureted hydrogen, etc., are not as yet replaced by hydric oxide, hydric nitride, hydric chloride, hydric phosphide, hydric sulphide, etc.; and soda and potash are still preferred by some chemists to sodic and potassic hydrates.

The term *acid* was originally applied only to substances which, like vinegar, possessed an acid taste; it is now made to include a large number of compounds which do not possess this property. The most general definition of acids is that of Gerhardt, which is adopted in Watts's *Dictionary of Chemistry*—namely, that "acids are salts of hydrogen." A more intelligible definition to ordinary readers is that which is adopted by Frankland, in which an acid is described "as a compound containing one or more atoms of hydrogen, which become displaced by a metal when the latter is presented to

the compound in the form of a hydrate." Thus, using the new nomenclature and atomic weights, nitric acid and sodic hydrate, yield sodic nitrate and water—

in which reaction the hydrogen of the nitric acid is displaced by the sodium of the sodic hydrate (or soda), and as only *one* atom of hydrogen is displaced, nitric acid is said to be *monobasic*. When an acid admits of the displacement of two atoms of hydrogen, it is termed *dibasic*—as tartaric, oxalic, and, according to recent views, sulphuric acid; and when three atoms can be replaced—as in the case of common phosphoric acid, H_3PO_4 , in which H_3 may be displaced by K_3 or Ag_3 , the acid is termed *tribasic*. The nomenclature of the compounds of acids with bases is still unfixed. The names of the alkali-metals (potassium, sodium, and lithium) and alkaline-earth metals (barium, calcium, etc.) are now commonly substituted for those of their oxides in the nomenclature of the corresponding oxygen salts—as, for example, *carbonate of sodium* and *sulphate of calcium* for carbonate of soda and sulphate of lime. The names of these bodies are thus brought into uniformity with those of the salts of iron, copper, etc. In Watts' *Dictionary* and Frankland's *Lecture Notes* such compounds are denominated *sodic carbonate*, *calcic sulphate*, *sodic nitrate*, etc.; and these terms will doubtless soon be generally adopted for the metallic salts of the oxygen-acids generally. The nomenclature of complex inorganic bodies is founded, for the most part, on the theory of types, the names of particular compounds being obtained from the name of the type by prefixing to it adjectives which express the nature of the element by which the hydrogen of the type is replaced and the number of atoms of it contained in one molecule of the compound. By way of illustration, we give a simple and a complicated example:

dichloro-dinitride. The nomenclature of organic compounds is founded on the same principles as that of inorganic bodies; but our limited space prevents our entering into this subject.

Chemical notation has been considerably altered by certain members of the recent chemical school; but on the whole, the modifications, since the time when the system of Berzelius was introduced into England in the third edition of Turner's *Elements of Chemistry*, are not numerous. The most important are the introduction of "general formulae" by Gerhardt, in which letters of variable value are used as coefficients instead of numbers, and Odling's method of denoting the atomicity of polyatomic elements and radicals by means of accents placed above the symbols, which are then called dashed symbols. See TRIADS. Chemists are still at variance as to whether, when two or more atoms are represented in a compound, the figure indicating the repetition should be above or below the symbol; whether, for example, water should be represented by H^2O or H_2O , and alcohol by $\text{C}^2\text{H}^6\text{O}$ or $\text{C}_2\text{H}_6\text{O}$. The *ordinary* or *dualistic* system, according to which the elements combine in couples to form compounds, which similarly unite by twos, led to the division of salts into two classes—viz., into salts composed of an oxygen acid and an oxygen base, which were hence called oxygen salts, as NaO, SO_3 , and KO, NO_6 , which in the old notation represent sulphate of soda and nitrate of potash; and binary or haloid salts, of which chloride of sodium, NaCl , is the type, which are formed by the union of the radical in hydrogen acids with some metal. Davy considered that the former class might be made similar to the latter by regarding them as composed of a metal and a compound radical having the same electro-negative chemical relations as the radicals in the hydrogen acids. According to this view, a radical, SO_4 , not yet isolated, combines with hydrogen to form sulphuric acid, and with a metal to form sulphates, sulphuric acid being represented by H_2SO_4 , and sulphate of lime by Ca_2SO_4 . In like manner, nitric acid and the nitrates were supposed to contain a radical, NO_6 . Against this view Gerhardt urges that we know nothing of the proximate constitution, but are merely acquainted with the ultimate composition of compounds. Hence we now no longer use a formula for sulphuric acid indicating its supposed constitution (HO, SO_3), but regarding it as a dibasic acid, express it, either as Miller does, by H_2SO_4 or by H_2SO_4 (where $\text{S} = 32$ and $\text{O} = 16$), or by $\text{SO}_4 \begin{Bmatrix} \text{O}_2 \\ \text{H}_2 \end{Bmatrix}$, if we adopt the type-notation; and we must not omit that Frankland, who may be regarded as the leading representative of the English school of modern chemistry, represents it by the formula SO_2Ho_2 , when Ho is the abbreviated formula for HO , and represents a compound radical, to which he gives the name of hydroxyle, and which is commonly known as binoxide of hydrogen, being expressed, according to the old system, by HO_2 . The following examples may enable the reader to pass from one system to another:

	Old System.	Barred System.	New Atomic Weights.	Frankland's Notation.
Sulphate of potassium.....	KO, SO_3	K_2SO_4	K_2SO_4	SO_2Ko
Sulphate of zinc.....	$\text{ZnO}, \text{SO}_3, 7\text{HO}$	$\text{ZnSO}_4, 7\text{H}_2\text{O}$	$\text{ZnSO}_4, 7\text{H}_2\text{O}$	$\text{SOHo}_2, \text{Zno}'', 6\text{OH}$
Nitric acid.....	HO, NO_5	HNO_3	HNO_3	NO_2Ho
Nitrate of sodium.....	NaO, NO_5	NaN_3	NaNO_3	NO_2NaO

The Ko, Zno", and Nao in Frankland's notation represent compound radicals, to which he has given the names potassoxyl, zincoxyl, and sodoxyl, and which are represented in the ordinary new notation by KO, ZnO₂, and NaO. These new names will probably soon get into general use in consequence of Frankland's great influence as the teacher of chemistry in the government school of mines, and at the royal institution.* We must refer to the article TRIADS for a description of what is meant by *atomicity*, or, as Hofmann terms it, *quantivalence*, and the reader will do well to study lectures 10 and 11 of his *Modern Chemistry*. In the article just mentioned, we have stated that the degree of atomicity of an element is indicated by the number of dashes with which it is furnished. In the so-called *graphic notation*, which, in the hands of Kekulé, Crum Brown, Naquet, Frankland, and others, has proved a most valuable aid in explanation of the constitution of chemical compounds, the degree of atomicity of an atom is thus expressed:

"No element," says Frankland, "either alone or in combination, can exist with any of its bonds disconnected; hence the molecules of all elements with an odd number of bonds are generally diatomic, and always polyatomic—i.e., they contain two or more atoms of the element united together. Thus:

	Symbols	Graphical
Hydrogen,	H ₂	
Chlorine,	Cl ₂	
Nitrogen,	N ₂	
Phosphorus,	P ₄	

An element with an even number of bonds can exist as a monatomic molecule, its own bonds satisfying each other. Thus:

	Symbols	Graphical
Mercury,	Hg ²	
Zinc,	Zn ²	

This graphic notation is most useful in fixing upon the mind the true meaning of symbolic formulæ, and in elucidating the internal arrangement of the very complex molecules which often occur in both mineral and organic compounds. It also affords an easy means of showing the causes of isomerism in organic bodies. The following example will suffice to illustrate our meaning. The simplest of the alcohol family, methylic alcohol, is derived from marsh-gas by the substitution of one atom of Frankland's hydroxyl, Ho or HO (O = 16), for one of hydrogen.

The classification of organic compounds has, during the last few years, been much improved. Until a comparatively few years ago, organic compounds were arranged, according to their most obvious properties, into acids, bases, fatty bodies, etc. Now

* Another peculiarity of Frankland's notation is the introduction of thick letters (Egyptian capitals). His formulæ are so written as to denote that the element represented by the first symbol of a formula, and printed in this type, is directly united by points of attachment or bonds with the other elements or compound radicals following the first symbol. Thus, to use his own illustration and notation, the formula SO_2Ho_2 (sulphuric acid) signifies that the hexad atom of sulphur is combined with the four bonds of the two atoms of oxygen, and also with the two bonds of the two atoms of hydroxyl. (By hexad we mean an atom with six bonds, one of which is subsequently figured in the text.)

the great majority of these compounds are arranged in series, of which each group differs from the preceding one by a fixed additional number of certain atoms. Thus (see Armstrong's *Organic Chemistry*, pp. 143, 144) twelve alcohols are represented by the general formula $C_nH_{2n+2}O$ (new notation), the first being represented by CH_4O , and the others differing from it by an additional number of multiples of CH_2 . Bodies of analogous properties thus united are termed *homologous*. Again, every compound in a homologous series yields other compounds differing in composition from that from which they are derived, but yet bearing a different relation to it. Thus, alcohol yields ether, aldehyde, and acetic acid, and these so-called *heterologous* bodies form collateral series. This mode of classification is daily extending. It includes the *organic radicals*, such as methyl, ethyl, allyl, phenyl, cyanogen, etc.; the *hydrides of the compound radicals*, such as methylic hydride or marsh-gas, benzol, cyanic hydride or hydrocyanic acid, etc.; the *alcohols*, which form one of the most important of the families of organic compounds, and which are considered in a special article in this ENCYCLOPÆDIA; the *aldehydes* and *ethers*, both of which are specially described; the *acids*, of which the monobasic acids alone include six series, amongst which are the acetic or fatty series, represented by the general formula $C_nH_{2n}O_2$, and containing 19 or 20 distinct acids, the oleic series, the lactic series, the benzoic or aromatic series, etc.—while the dibasic acids may be divided into four series, in which occur the succinic series, containing nine acids, most of which present several modifications, and the tartaric series; the *anhydrides* (q.v.), of which those belonging to the acetic acid group may be arranged in series; the *ketones* or *acetones*; the compounds of nitrogen containing the *amines*, *amides*, *imides*, etc.; and, in short, excepting the natural alkaloids, the protein-compounds and their derivatives, the uric acid group, pigments, etc., there are few organic compounds which will not soon find a definite place in a series.

In this article we have strictly confined our remarks to the subjects bearing on general, and for the most part on theoretical chemistry. We may, however, allude, in conclusion, to two subjects, which have undergone a great development during the last few years—viz., *volumetric analysis* and the *synthesis of organic bodies*, both of which are discussed in special articles.

The general tenor of this article shows that chemistry is at present in altogether a transitional state. As prof. Anderson of Glasgow observes in his address to the chemical section of the British association in Sept., 1867, the atomic theory, which, at the commencement of the present century, sufficed to explain all the facts of chemistry that were then known, is now quite inadequate to that end. At that time, chemists were acquainted with comparatively few compounds, and in these, oxygen was of such preponderating importance, that the science might have been almost termed "the chemistry of oxygen." Oxygen is now deposed from its high place, and is supplanted by carbon to such a degree, that one of the first living chemists has actually proposed for organic chemistry the name of "the science of the carbon compounds." Facts gradually accumulated in the course of time which did not admit of explanation on the Daltonian theory; and as their number increased, such terms as catalysis, allotropy, etc., were invented, under which such facts were grouped together as were supposed to depend on similar causes. Such grouping may have certain temporary advantages, provided it is understood that, to use prof. Anderson's words, it is "the grouping of ignorance."

It is indeed obvious that a true theory of chemistry must be a part of a general theory of dynamics, and that until we obtain some more distinct idea of how the atoms are grouped in the molecules of substances (see ATOMIC THEORY) than we at present possess, the link connecting theoretical chemistry and theoretical dynamics is wanting. The doctrine of *atomicity* evidently points to some general truth; it has been of great use in grouping together numerous facts, and in leading to investigations which have resulted in the discovery of many new facts and new generalizations, but we now want an explanation of this doctrine, and this chemistry does not appear to be able to give us. The want of a theoretical explanation does not, however, render a generalization valueless, and much progress has been made of late years in ascertaining the "chemical structure" of substances—that is, in obtaining graphic formulæ, which consistently represent all the reactions by which the substances are formed or transformed. Before discussing the subject of chemical structure, it will be well to consider somewhat more fully than has been done above, the reasons why certain numbers have been selected for the atomic weights of the elements rather than any multiples or submultiples of them (see ATOMIC WEIGHTS). It was pointed out by Dulong and Petit that a close relation exists between the specific heat of a solid elementary substance and its atomic weight. Thus, if we take the old system of *atomic weights* (q.v.), and multiply the specific heat of each solid element by its atomic weight, we find that the elements form three groups. In the first, the product of specific heat into atomic weight, or *atomic heat*, varies from 6 to 6.6. In the second it varies from 3 to 3.3. In the third group, containing the allied elements, carbon, boron, and silicon, no regularity can be traced. By far the greater number of solid elements belong to the first or second group. Now it is plain that the atomic heat of a member of the first group is approximately double that of a member of the second group. But as the atomic weights are to a certain extent arbitrary, we can make the atomic heats of the two groups agree by doubling the atomic weights of the members of the second group. This was first proposed by the eminent Italian chemist, Cannizzaro,

and has now been accepted by most chemists. These new atomic weights not only greatly simplify Dulong and Petit's law, but are also in harmony with many other facts, most of which were observed after the change had been made. Thus the formulæ of corrosive sublimate, bichloride of tin, and zinc methyl are, according to the old system, HgCl_2 ; SnCl_2 ; and ZnC_2H_5 and $\text{H} = 1$. According to the new system, they are HgCl_2 ; SnCl_4 ; and ZnC_2H_5 .

It will be at once observed that the second set of formulæ represent just twice the quantity represented by the first; now the second formulæ express the *molecular weights* of the substances according to Avogadro's law (see ATOMIC THEORY). Further, if we adopt the old atomic weights, we see no reason why oxide of lead should readily form basic salts, while oxide of silver does not. This peculiarity is to some extent explained by the new atomic weights; thus we have nitrate of silver—old formula AgNO_3 , new formula AgNO_2 ; nitrate of lead—old formula PbNO_3 , new formula $\text{Pb(NO}_2)_2$; basic nitrate of lead—old formula $\text{PbO}, \text{PbNO}_3$, new formula $\text{Pb}_2\text{O(NO}_2)_2$. The contrast will be better seen if we put the new formulæ into a graphic form.

We at once see the connection between the dyad character of lead ($-\text{Pb}-$), and the occurrence of basic salts.

Similarly we know that if we pass a current of chlorine gas into a cold solution of caustic potash, we obtain a *mixture* of chloride of potassium and hypochlorite of potash $-\text{Cl}_2 + 2\text{KHO} = \text{KCl} + \text{KClO} + \text{H}_2\text{O}$. But that if, instead of caustic potash, we take slaked lime, we obtain, not a *mixture*, but a single substance: $\text{Cl}_2 + \text{CaH}_2\text{O}_2 = \text{CaOCl}_2 + \text{H}_2\text{O}$. Putting the new symbols into a graphic form we have:

Where we see why we have a mixture in the first case, and a single substance in the second, the reason being that calcium being a dyad, one atom of it represents two atoms of potassium. Many other examples might be given, but these may suffice as an indication of the reasons which have induced chemists to prefer the atomic weights given in the second column in the table in the article ATOMIC WEIGHTS.

Assuming, then, these atomic weights, let us return to the subject of *Chemical Structure*. This may be defined in various ways, but most conveniently as the indication by a graphic formula, or something equivalent to it, of all the chemical changes by which the substance can be formed or decomposed. This will best be illustrated by means of a few examples, and we shall select these from among organic compounds, that is, compounds of carbon, because the structure of these compounds has been most fully investigated.

Acetic acid has (on the new system, which will be exclusively used in the remainder of this article) the formula $\text{C}_2\text{H}_4\text{O}_2$. If it is treated with caustic potash, it yields acetate of potash according to the equation $\text{C}_2\text{H}_4\text{O}_2 + \text{KHO} = \text{C}_2\text{H}_3\text{KO}_2 + \text{H}_2\text{O}$. Here one atom of hydrogen has been replaced by one atom of potassium, and we find that further treatment with caustic potash does not cause any further replacement of hydrogen by potassium. We may therefore write the formula of acetic acid thus: $\text{H}-(\text{C}_2\text{H}_3\text{O}_2)$, and this formula indicates the replaceability of one atom of hydrogen by metal, and explains (as far as such formulæ can explain anything) the occurrence of such compounds as acetate of lead $(\text{C}_2\text{H}_3\text{O}_2)-\text{Pb}-(\text{C}_2\text{H}_3\text{O}_2)$, and all the other acetates. The question now remains, what is the structure of the group $(\text{C}_2\text{H}_3\text{O}_2)$, which is united in acetic acid to hydrogen, and in the acetates to metal?

To answer it we must examine some other reactions of acetic acid. When treated with pentachloride of phosphorus, it loses an atom of oxygen, the place of which is taken by two atoms of chlorine—the pentachloride of phosphorus taking the oxygen in exchange for the chlorine; but instead of obtaining a compound $(\text{C}_2\text{H}_3\text{OCl}_2)$, we find that the result is expressed by the equation: $\text{C}_2\text{H}_4\text{O}_2 + \text{PCl}_5 = \text{C}_2\text{H}_3\text{OCl} + \text{HCl} + \text{POCl}_3$. We thence conclude that in acetic acid the atom of dyad oxygen removed in the action given above was united to an atom of hydrogen, and to the group $(\text{C}_2\text{H}_3\text{O})$, and represent the change thus:

the replacement of the dyad oxygen by two atoms of the monad chlorine necessitating the falling asunder of the compound. The reactions of chloride of acetyl (C_2H_3OCl) lead us to the further conclusion that the atom of hydrogen replaceable by metal is the atom not present in chloride of acetyl, so that the formula $(C_2H_3O)O-H$ is a fuller and more explanatory form of $(C_2H_3O_2)-H$. Again, if we heat acetate of potash with caustic potash, we have marsh gas (CH_4) given off, and the residue consists of carbonate of potash

and this decomposition can only be represented if we give acetic acid the formula

when we have

the dotted lines separating in the diagram the symbols of the parts of the molecules which change places.

We have considered only a few of the reactions of acetic acid, but the formula just given is equally consistent with all the others. It is therefore said to exhibit the *structure* of acetic acid. This word "structure" is perhaps a little misleading—we must recollect the precise sense in which it is used, as a concise representation of many reactions. It is conceivable that it may have some relation to the actual relative position of the atoms in a molecule of acetic acid, but we have not as yet any means of ascertaining whether this is so or not.

We may illustrate the meaning of chemical structure further by a somewhat more complex case. Asparagine, a colorless crystalline substance extracted from asparagus, and also from the blanched shoots of other plants, has the composition expressed by the formula $C_4H_8N_2O_3$. When treated with caustic potash it yields ammonia and a body called aspartate of potash—the potash salt of aspartic acid. The change is obviously

an exchange of $K-O-$ and $\begin{array}{c} H \\ | \\ N \\ | \\ H \end{array}$ —and may be thus indicated:

Aspartic acid is then $(C_4H_8NO_3)O-H$, and we have to study its decompositions in order to discover the structure of the group $(C_4H_8NO_3)$. Now, aspartic acid is attacked by nitrous acid, and the products are nitrogen gas, water, and malic acid, thus: $C_4H_7NO_4 + HNO_2 = C_4H_6O_6 + N_2 + H_2O$. Here we have the triad nitrogen of the aspartic acid replaced by the dyad O, and the monad group $O-H$ of the nitrous acid,

and this leads to the formula $\begin{array}{c} H \\ | \\ N \\ | \\ H \end{array} (C_4H_6O_5)O-H$ for aspartic acid. The equation above thus becomes:

When malic acid is treated with hydrobromic acid, we obtain water and bromo-succinic acid:

and we can prove that the group $H-O-$, here replaced by Br, is that one which in aspartic acid is represented by $\begin{array}{c} H \\ | \\ N \\ | \\ H \end{array}$. Bromo-succinic acid, when treated with nas-

cent hydrogen, has its bromine removed and hydrogen put in its place, thus yielding succinic acid ($C_4H_6O_4$). We shall most easily arrive at the structure of succinic acid by studying its synthesis.

Olefiant gas (C_2H_4) unites with bromine to form a liquid having the composition ($C_2H_4Br_2$), and (as can easily be proved by its relation to glycol and glycollic acid), a structure represented thus:

This bromide of ethylene, as it is called, when treated with cyanide of potassium, gives bromide of potassium, and a substance which may be called cyanide of ethylene—bromine and cyanogen changing places ($C_2H_4Br_2 + 2KCN = C_2H_4(CN)_2 + 2KBr$). As cyanide of potassium is $K-C\equiv N$, it follows that cyanide of ethylene is

nia is given off, and succinate of potash remains in solution. Here we have nitrogen uniting with hydrogen, while the place of the nitrogen is taken by that with which the hydrogen was united—viz., the dyad O, and the monad $-O-K$. We thus obtain the structural formula of succinic acid.

Here are obviously two hydrogen atoms having a different function from the rest—those, namely, which are replaceable by metal, and which, in the above formula, are represented as directly united to oxygen. That it is not one of these that is replaced by bromine follows from the fact that bromo-succinic acid has also two atoms of hydrogen replaceable by metals in exactly the same way as in succinic acid itself, and as the other four atoms of hydrogen do not differ in position in the diagram from one another, we have only one possible formula for bromo-succinic acid; and therefore, for malic acid:

and for aspartic acid:

We have, however, two possible structural formulæ for asparagine, as it is plain that the two groups $H-O-$ in aspartic acid are not similar to one another, and we have not as yet any means of deciding between them. The reader will see that they are different, and from the way in which structure has been proved, will also see that reactions may be obtained which would decide between the two.

It is not necessary to give any further examples of chemical structure—the two we have treated in some detail may suffice to show how the principle is applied, and what is the nature of the evidence in favor of particular structural formulæ.

CHEMISTS AND DRUGGISTS, LAWS RELATING TO. Under the head Apothecary (q.v.) will be found the distinction between that profession and the kindred one of pharmaceutical chemist. The pharmaceutical society of Great Britain, founded in 1841 for raising the standard of efficiency in the practice of dispensing and compounding drugs, was incorporated by royal charter in 1843. An act was passed in 1852 defining the qualifications of pharmaceutical chemists, and the society's powers for examining and granting qualifying certificates. The pharmacy act of 1868, referred to below, still further defines its duties and privileges. As in the case of medical practitioners, there is no penalty for mere practice; but the assumption of the specific title named in the act is punishable by fine. The legislature presumes that certificates obtained by examination are evidence of efficient education, but that the freedom of engaging in business ought not to be interfered with; and that the right of the subject to consult whom he chooses, or to buy drugs from whom he will, must be respected. This seems a sound view.

Serious mistakes, such as the substitution of one medicine for another, to the injury of the purchaser, are punishable by law, both in the unqualified and in the case of those qualified under the act. The public also derives great and increasing security in this and in all other departments of human enterprise, from the improving effect of free competition. The operation of the act was simply that of indicating to the public, by a name or title, a class of druggists possessing a higher education. In 1868 it was deemed necessary, owing to the frequent evils arising from the facility of obtaining poisons, to enact that no person should sell, or keep open shop for selling poisons, or assume or use the title of chemist or druggist or pharmacist, unless he be registered under the act 31 and 32 Vict. c. 121, amended by 32 and 33 Vict. c. 117, and conform to the regulations as to sale of poisons. All persons who in 1868 carried on the business of chemists and druggists, and their apprentices and assistants, were entitled to be registered. The register of chemists and druggists under this act now contains the names of all qualified persons in Great Britain.

CHEMITYPE is the name given by its inventor, C. Pül, a Dane, to the art of producing on a metal plate, by a chemical process, an engraving in relief. The outline of the process is this: On a polished plate of zinc an etching or an engraving is made in the usual way. The depressions of this design are then filled up with a melted metal—the nature of which is not revealed—and this superadded metal is then reduced to the exact level of the zinc, so that the design now appears as if inlaid. An acid is next applied to the surface, which attacks the zinc, without affecting the inlaid metal; and thus there results an exact copy in relief of the original intaglio engraving. In competition with wood-cuts, relief-lithographs, and copperplates, C. does not seem as yet to evince any great superiority; it fails especially in that character of strength and softness which wood-cuts express so well. The prints produced by this art look more like engravings than like wood-cuts. They have this advantage, however, that they give an exact copy of the original design made by the artists on the metal; whereas in wood-cutting the drawing made on the block may be impaired in its effect by the engraver. C. is particularly adapted for producing maps by the common printing-press. Pül practiced his invention at first on a small scale in Copenhagen, from 1843 to 1846, and then extensively in Leipsic. In 1850, he went to Vienna, where he was employed in the imperial printing establishment.

CHEMNITZ, a t. of Saxony, is situated at the base of the Erzgebirge, and at the confluence of the river Chemnitz with three other rivers, in lat. 50° 50' n., and long. 17° 55' east. It is the principal manufacturing town of Saxony—its industry consisting in weaving cottons, woollens, and silks, and in printing calicoes, chiefly for German consumption. Cotton stockings are a most extensive manufacture, and rival the British in quality and cheapness. The American markets are chiefly supplied from this place. It has several extensive machine factories, producing machinery for flax and wool spinning, weaving, and mining industry. Amongst the numerous educational institutes of C. are schools of weaving, mining, and tailoring. For four centuries C. was a free imperial city. Traces of its antiquity are seen in many of the buildings. Pop. '75, 85,334.

CHEMNITZ, MARTIN, next to Luther and Melancthon the most distinguished German Protestant theologian of the 16th c., was b. at Treuenbrietzen, in Brandenburg, 9th Nov., 1522; studied at Frankfurt and Wittenberg; and, in 1548, became rector of the cathedral-school of Königsberg. About 1550, he began to devote himself seriously to theology, and in 1553 went back to Wittenberg, where he delivered prelections on Melancthon's *Loci Communes*, from which sprang his own *Loci Theologici*, which, for method and learning, excels all similar books of the same age. In 1554, he was made a preacher in Brunswick, where he wrote his *Repetitio Sanae Doctrinae de Vera Presentia Corporis et Sanguinis Domini in Cæna Sacra* (Leip. 1561), in which he defended Luther's view of the Lord's Supper against that of the Swiss reformers; the *Theologia Jesuitarum Præcipua Capita* (Leip. 1562); and the *Examen Concilii Tridentini* (Leip. 1565), a work in which he has argued with remarkable acuteness and learning against the dogmas of the church of Rome. His *Corpus Doctrinae Prutenicae* (1566), written in conjunction with Mörlin, became a standard work of divinity among the Prussian Protestants. But his greatest ecclesiastical achievement was inducing the Saxon and Suabian churches to adopt as their confession of faith the *Concordienformel*, and thus extending and consolidating the creed of Luther. He died at Brunswick, 8th April, 1586.

CHEMNITZIA, a genus of gasteropodous mollusca. It has a slender, elongated, many-whorled shell; the whorls striated; a simple semi-oval aperture; and a horny operculum. There are many recent species scattered all over the world. The discriminating characters of the fossil species being taken from the form of the shell, it is more than probable that the remains of very different animals are classed under this generic name. No less than 180 species have been described, occurring throughout all the divisions of the fossiliferous strata from the lower Silurian upwards.

CHEMOSH, the national deity of the Moabites and the Amorites. Solomon introduced the worship of C. into Jerusalem, but Josiah put a stop to it. Scholars are not

agreed as to descriptions either of the deity or the worship. Jerome identifies C. with Baal-Peor; others with Baal-Zebub; Genesius with Mars, or some god of war; some with Saturn, as the star of ill-omen; C. having, according to Jewish legend, been worshipped in the form of a black stone; and Maimonides says his worshippers went bareheaded, and used no garments sewn by the needle. Hackmann makes the name equivalent to "royal deity," and, apparently, children were sacrificed to him.

CHEMUNG', a co. in s. New York, on the Pennsylvania border, intersected by Tioga river, and traversed by the New York and Erie and the Northern Central railroads, and the canal from Seneca lake to Elmira; 513 sq. m.; pop. '75, 41,769. The surface is partly level and partly hilly; soil fertile. The chief productions are wheat, corn, oats, buckwheat, potatoes, hay, butter, wool, honey, and tobacco. There are in the county several carriage and wagon manufactories, flour-mills, saw-mills, tanneries, etc. Co. seat, Elmira.

CHENAB', the largest, according to general opinion, of the five rivers which give name to the Punjab. Like most of the principal streams of India, it rises to the n. of the Himalayas, making its way through the Ritanka pass at the height of 13,000 ft. above the sea, and having its source about lat. 32° 48' n., and long. 77° 27' east. After a descent of 300 m., the C. reaches the level country. At the close of a course of the same length, it receives, on its right, the Jhelum in lat. 31° 12' n., and long. 72° 12' e.; 50 m. further down, it is joined, on its left, by the Ravee; and 110 m. lower, it absorbs, through the Ghara, on its left, the mingled waters of the Beas and the Sutlej. Lastly, at a distance of 60 m., the accumulated floods, under the designation of Punjnud, lose themselves in the Indus in lat. 28° 55' n., and long. 70° 28' e.—being still 470 m. from the ocean.

CHENAN'GO, a co. in s. New York, on a branch of the Susquehanna, and the Chenango and Unadilla rivers, intersected by the Chenango canal, and the Albany and Susquehanna, the New York Midland, and a branch of the Delaware and Lackawanna railroads; 624 sq. m.; pop. '75, 39,879. It has an elevated, hilly, and broken surface, with fruitful soil, producing corn, wheat, oats, potatoes, hay, cheese, butter, wool, maple sugar, and hops. There are in the county more than 40 cheese factories, and several flour-mills, tanneries, furniture and carriage manufactories. Co. seat, Norwich.

CHENAN'GO RIVER, a stream in central New York, rising in Oneida co., and flowing, with a length of about 90 m., through Madison and Chenango counties to the Susquehanna, near the Pennsylvania boundary.

CHENDAREE, or **CHUNDEREE**. See **CHANDHAIREE**, *ante*.

CHENEY, CHARLES EDWARD, D.D., b. 1836; a graduate of Hobart college and a student in the Virginia theological seminary (Episcopal). He had pastoral charge in Rochester and Havana, N. Y., and in Chicago, Ill. In Dec., 1873, having left the Protestant Episcopal church, he was chosen assistant bishop, and afterwards bishop, of the Reformed Episcopal church, then newly organized. He is a vigorous thinker and an able organizer; he is still rector of Christ church, Chicago.

CHÉNIER, ANDRÉ-MARIE DE, 1762-94; a French poet, b. in Constantinople. He undertook military life, but resigned his commission after six months' trial, and returned to Paris, where he wrote idyllic poems, such as *Le Mendicant*; *L'aveugle*; and *Le Jeune Malade*. Overwork made a journey for health necessary, and he traveled in Switzerland, Italy, and the Grecian islands. Returning to Paris in 1786, he recommenced study and work, and produced the *Elegies*; *Art d'aimer*; *L'Invention*; *Hermès*; *Susanne*, and *La Liberté*. From 1787 to 1790, he resided in London as a secretary to the French embassy, but neither the position nor the people were congenial, and he returned to France, plunging at once into the revolution, then well under way, taking the moderate side. In 1791, he was defeated as a candidate for a seat in the national assembly, and the next year an invective against the Jacobins involved him in a quarrel with his brother Joseph, whom he was afterwards to defend against the attack of Burke. When the hopes of the monarchy were gone, he returned to literature, but the trial of the king brought him once more forward, and he took part in preparing the defense, and also drew up an appeal to the people. He was broken in health and spirits; Paris was dangerous; and he went to Versailles, where he wrote poems to "Fanny." At Passy, Jan. 6, 1794, he opposed the arrest of a lady in whose house he was living, an act which resulted in his own seizure and incarceration in St. Lazare. Here he wrote *La Jeune Captive* for the duchess of Fleury, and for the convention the furious iambs so often quoted. At the tribunal he appeared with 44 others, and 38, including himself, were condemned to execution. The next day, July 25, 1794, he, with the counts de Montalembert and de Crequi, was led to death. As he descended the steps of the conciergerie, he said to Roucher, "Je n'ai rien fait pour la postérité. Pourtant" (striking his forehead), "j'avais quelque chose là." Three days later, in the same place, Robespierre and his fellows were executed, and the "reign of terror" was at an end. C.'s poems, with the exception of two, remained unedited for a quarter of a century.

CHÉNIER, MARIE JOSEPH DE, 1764-1811; poet and dramatist, younger brother of André Chénier; b. in Constantinople, and educated at the college de Navarre. He also served a short time in the army, but left it for literary composition, producing, at the age

U. K. III.—48

of 20, *Azcimire*, a tragedy which was not very successful. His next work, however, *Charles XII.*, gave occasion for the commencement of Talma's renown, and gained great popularity. It still keeps the stage. Following these came *Henry VIII.* and *Culus*; in 1792, *Culus Græchus*, which was proscribed and burned because of the anti-anarchical phrase "The law, and not blood;" and the drama *Timoleon*, proscribed in 1793. The death of his brother on the scaffold took him away from play-writing, which he attempted again only once (in 1804), when he produced *Cyrus*, which was not a success. He was long a prominent member of the Jacobin club; a member of the convention, and also of the council of five hundred, over both of which he presided; he had a seat in the tribunate, and belonged to the committees of public instruction, of general security, and of public safety. In 1806-7, he delivered a course of lectures, on the language and literature of France from the earliest period; and in 1808, at Napoleon's request, he prepared his *Tableau Historique de l'Etat et du Progres de la Littérature Française*. He was the author of many hymns, songs, and odes, among them the famous *Chant du Depart*; odes on the death of Mirabeau, the oligarchy of Robespierre, etc.; tragedies that never reached the stage, and translations from the Greek, Latin, and German authors. As a satirist he was said to possess great merit.

CHENONCEAUX, CASTLE OF. See BLÉRÉ, *ante*.

CHENOPODIA CEE, or SALSOLA'CEE, a natural order of exogenous plants, consisting of herbaceous and half-shrubby plants, with leaves entire or divided, and destitute of stipules. The flowers are inconspicuous, hermaphrodite, or unisexual; the perianth deeply divided, persistent; the stamens inserted into its base, opposite to its segments, and equal to them in number, or fewer; the ovary single, free, or occasionally adhering to the tube of the perianth, with a single ovule attached to the base of the cavity; the style generally with 2 to 4 divisions. The fruit is membranous, inclosed in the perianth, which sometimes becomes fleshy. The seed has a curved or spiral embryo.—There are about 360 known species, most of which have a weed-like appearance, and grow in waste places. They are widely diffused over the world, but are particularly abundant in the northern parts of Europe and Asia. Beet and spinage are among the best known and most useful plants of the order. Many are occasionally used as pot-herbs, as some species of *chenopodium* and of orache. The fruit of strawberry blite (*blitum capitatum* and *B. virgatum*), a common weed in the s. of Europe, has some resemblance in appearance to a strawberry, from the coherence of the fleshy perianths of a whole spike or head of flowers, and a sweetish, insipid taste. The seed of quinoa (q.v.) is used for food as a kind of grain. Some of the C. are aromatic (see CHENOPODIUM). Some inhabit salt-marshes, and abound in soda, as the saltworts (q.v.).

CHENOPODIUM, a genus of plants of the natural order *chenopodiaceæ*, of which some of the native British species are well known by the name of GOOSEFOOT, as weeds growing in gardens, on heaps of rubbish, and in waste places. The species are mostly annuals, with entire or toothed leaves, which in some of them have a sort of mealy hoariness. They are mostly natives of Europe, and of the temperate parts of Asia; but some are natives of America, into which, however, some of the common European species have found their way, and are naturalized as weeds. The genus has hermaphrodite flowers, with perianth of five small green scales, five stamens, and solitary flat seeds. The leaves of many species are used as a substitute for spinage, particularly those of the GOOD HENRY, WILD SPINAGE, or ENGLISH MERCURY (*C. bonus Henricus*), a perennial plant, native of Britain and other parts of Europe, often found growing by waysides, with stem more than a foot high, powdered with minute transparent globules, and large, alternate, triangular, arrow-shaped, entire leaves. It is cultivated in some places, particularly in Lincolnshire, chiefly for the leaves, but the young shoots are also used as asparagus. *C. intermedium*, *C. album*, etc., annuals, common in waste places, are also excellent substitutes for spinage. *C. olidum* or *vulvaria* (STINKING GOOSEFOOT), an annual with an extremely nauseous odor, growing in waste places in Britain, etc., especially near the sea, is a popular medicine, in much repute as an antispasmodic and emmenagogue. *C. botrys*, a native of the s. of Europe, with pinnatifid leaves resembling those of the oak, and hence called JERUSALEM OAK, is in use as an expectorant and anthelmintic. It is not fetid like the species last named, but agreeably fragrant. *C. ambrosioides* has a strong aromatic odor, is used in Mexico instead of tea, and is much cultivated in France, an infusion of it being deemed useful in nervous disorders. *C. anthelminticum*, the WORMSEED of the United States, has a strong and somewhat aromatic odor, and a high reputation as a vermifuge. Its seeds are chiefly used, or the essential oil extracted from them, called *oil of wormseed*. More important than any of these species, as affording a principal article of food in the countries of which it is a native, is quinoa (q.v.).

CHEOPS, according to Herodotus, an Egyptian king, called Chombes by Diodorus, Soughis by Manetho, Saophis by Eratosthenes, and in Egyptian "Khufu." He was the second king of the fourth dynasty of Manetho, and the builder of the great pyramid at Ghizeh. His name was supposed to mean "wealthy," or "having much hair." He spent enormous sums on the pyramid (see PYRAMID, *ante*), and one improbable story is that he was compelled through want of money to sacrifice the honor of his daughter to insure its completion. He is also depicted as impious towards the gods, closing the

temples, and stopping the worship; but subsequently repenting, and writing a sacred book much esteemed by the Egyptians. The monumental information about C. does not confirm the Greek historians; on the contrary, it records the construction of temples in honor of the gods, the repair of the shrine, and the gift of various figures to the temple of Isis and Athor, close to his own pyramid, and his construction or repair of the temple of the same goddess Athor, the Egyptian Venus, at Denderah, or Tentyris. C. carried on war at the valley Magarah, in the peninsula of Sinai in Arabia; and a rock tablet represents him as having conquered the hostile tribes in the presence of the god Thoth, who had revealed to him the mines of the locality. His oppression had so afflicted Egypt, that charges of impiety had attached to his name; but the tombs of his children reveal no change in the established religion, and his pyramid differs from those of his predecessors and immediate successor only by its larger size and greater beauty. The date of C., according to Lepsius, is 3,095 to 3,032 B.C.; but great difference of opinion, amounting to nearly 2,000 years, exists as to the time of Menes, from whom the lists separate him by an interval of 898 years.

CHEPHREN, in the hieroglyphs "Khafra," called also Cephren, Chabrias, Souphis II., and Saophis II.; according to the legends, the son or brother of the Egyptian king Cheops. He built the second of the great pyramids at Ghizeh, near the sphynx and the great pyramid, and was said to have been tyrannical and hated, like his brother, so that his mummy was not buried in the sepulcher, but torn to pieces, and the sarcophagus emptied of its contents; but there is no more reason for believing in his impiety than in that of Cheops. His wife was a priestess of the god Thoth, and another prince of the family was a priest at Hermopolis. He also built the small temple behind the sphynx. It is probable that he lived 95 years, and his reign, according to Lepsius, was 3,032 to 2,966 B.C. A statue of him is in the Boulaq museum.

CHEPSTOW, a river-port in the s.e. of Monmouthshire, on the right bank of the Wye, $2\frac{1}{2}$ m. from its junction with the estuary of the Severn, and $14\frac{1}{2}$ m. e.n.e. of Newport. It lies between bold cliffs, on a slope rising from the river, in the midst of beautiful and grand scenery. There is a fine view from a rock called Wind-cliff, 970 ft. high, 3 m. and a half up the river. The streets are broad. There occurs the highest tide in Europe, rising suddenly, with a fierce current, often 50, and on rare occasions even 70 feet. Large vessels reach the town. One of the wells of the town ebbs and flows with the tide. Over the Wye is a railway bridge combining the suspension and tubular principles of construction. C. has a magnificent castle, built in the 11th c., and a fine Benedictine priory recently restored. It has few manufactures, but exports corn, cider, bark, iron, millstones, timber, and salmon. Pop. '71, 3,347. In 1875, 1013 vessels, of 31,586 tons, entered and cleared the port.

CHEQUE. See **CHECK**, *ante*.

CHER, a tributary on the left side of the river Loire, rising near Crocq, in the department of Creuse; flows first n. by Auzances, Evaux, Montluç, and St. Amand; then n.w. through the department of C. by Vierzon; then westward by Selles, Mont-richard, and Bléré, to the Loire, which it joins below Tours. Its whole length is about 200 m.; and it is navigable for the last 47 of its course.—**CHER**, the central department of France, to which the above river gives its name, is situated in lat. $46^{\circ} 25'$ to $47^{\circ} 39'$ n., and in long. $1^{\circ} 55'$ to $3^{\circ} 10'$ east. The surface is mostly level, traversed by well-wooded elevations, and produces corn, fruits, wine, hemp, flax, etc. The climate is mild and pleasant. Agriculture and pasturage of cattle are both capable of improvement. Area, upwards of 2,700 sq. miles. Pop. '76, 345,613. C. is divided into the three arrondissements—Bourges, St. Amand, and Sancerre. Bourges is the chief town.

CHERASCO, a t. in the province of Cuneo, n. Italy, situated on the Tanaro, 30 m. s.e. of Turin. It has manufactures of silk, and a pop. of (1871) 4,694. A peace was concluded here between Louis XIII. of France, and the duke of Savoy in 1631. On April 26, 1796, the place was taken by the French; and here, three days after, the "Armistice of Cherasco" was concluded between the Sardinian commissioners and Napoleon, by which the latter obtained the right of free passage for his troops through the Sardinian states; and the treaty that followed gave to the French republic Savoy, Nice, and the possessions of Piedmont to the westward of the Alps' highest ridge.

CHERBOURG, a fortified seaport t. and arsenal of France in the department of Manche, is situated at the head of a deep bay on the northern extremity of the peninsula of Cotentin, on the English channel, and opposite the w. coast of the isle of Wight, in lat. $49^{\circ} 40'$ n., and long. $1^{\circ} 35'$ west. Napoleon I. began to build the great defenses of this northern stronghold of France. His nephew, Napoleon III., developed his plans, but not with the original view of an invasion of England. Occupying a prominent position on the French coast, only some 60 m. removed from the s. shore of England, the harbor-works have been extended, strengthened, fortified, and provisioned with cannon—the dock-yards improved, and facilities of embarkation afforded, to a degree that, as it is unparalleled in ancient or modern times, not unnaturally excites the lively apprehension of Englishmen. A description of the stupendous breakwater of C., inclosing a space of nearly 2000 acres, will be found in the article **BREAKWATER**. In connection with its fortifications, this breakwater assumes an importance that attaches

to no other work of the kind in existence. At the apex of the angle formed by the meeting of the two branches of the breakwater or *digue*, there is a center fort or battery, measuring 509 ft. on the inner line of the parapet, which forms a flat semi-ellipse. The circular forts at the extremities of the breakwater are remarkably well placed for purposes of defense. Behind the center battery there is to be an elliptical tower, measuring 225 ft. on the major, and 123 ft. on the minor axis. Altogether there are six large batteries on the mole. The entrances to the harbor are round the ends of the mole; and the passages are further defended by the fortifications of the Ile Pélée, and by the batteries of La Roche Chavaignac and fort Querqueville. A series of coast redoubts, and the two large fortifications of Les Roches des Flamands and du Homet, are situated behind this outer zone of defense. "The arsenal," says Mr. W. H. Russell, who visited C. during the summer of 1860, "is inclosed by a continuous line of bastion and curtain of a very elevated profile, defended by outworks, wet and dry ditches, and by profuse batteries of the heaviest guns, either in casement or *en barbette*. Wherever you look, you fancy that on the spot you occupy are specially pointed dozens of the dull black eyes from their rigid lids of stone." Altogether, besides the batteries on the mole, C. is defended by 24 regular forts and redoubts. The town itself is commanded by La Roule (an exceedingly strong fort) and fort d'Octeville on the heights behind. The military port of C. consists of an outer harbor of 776 ft. in length by 663 ft. wide, its minimum depth being 58 ft., and the entrance to which is 206 ft. wide at its narrowest point. This harbor communicates by means of a lock with a floating basin, 957 ft. long by 712 wide. The outer harbor has four building-slips for 120-gun ships, besides some smaller slips, and a fine graving-dock. In Aug., 1858, an inner floating-harbor was inaugurated by the emperor of the French, in presence of the queen and many of the lords and commons of Great Britain. This harbor, entirely cut out of the solid rock, has a length of about 930 yards, and a breadth of 437 yards, and is surrounded by beautiful building-slips and capacious graving-docks. It is calculated that the roads of C. cannot, on account of the small depth of the greater portion, shelter more than 25 or 30 sail of the line, and about as many frigates, at one time. C. has a commercial port quite distinct from the other, situated on the s.e.; but it displays little activity, the principal exports being eggs, butter, and cattle. The town itself is insignificant, the streets being narrow and dirty; and there are no public buildings of note. There are some manufactures of hosiery, chemicals, lace, and leather, and sugar and salt refineries; but the industrial energies of the great bulk of the population are absorbed in the arsenal and dock-yards. C. is a very ancient place; in the 10th c. it was known under the name of *Carusborg*. In 1758, C. was taken by the English, who destroyed the naval and military works, and levied a contribution on the town. Pop., exclusive of naval and military forces (1876), 36,338.

CHERBULIEZ, ANTOINE ÉLISÉE, 1797-1869; a native of Switzerland, professor of political economy in Geneva and in the national polytechnic school in Zurich. He was a contributor to cyclopædias and periodicals, and author of *L'Utilitaire*, and *Preces de la Science économique*.

CHERBULIEZ, VICTOR, b. 1832; a Swiss author, the son of a Hebrew professor in Geneva. He has written many novels for the *Revue des Deux Mondes* (Paris), among them *Le Comte Kostia*; *Le Prince Vitale*; *Paule Mere*; *Le Roman d'une honnête Femme*; and *Le Idée de Jean Tetetrol*.

CHERIBON, or SHERIBON, a seaport t. of Java, situated on the n. coast, 125 m. e.s.e. of Batavia. It has a considerable trade in coffee, indigo, and teak-wood, and is the residence of a Dutch governor. Pop. 11,000.

CHERIMOYER, or CHIRIMOYA, *Anona cherimolia*, the most esteemed fruit of Brazil and Peru, now common and even naturalized in some parts of the East Indies, and other tropical countries of the old world. It is a fruit of most delicious flavor, is sometimes described as the finest of all fruits, and sometimes as inferior only to the mangosteen. It belongs to the same genus with the custard apple (q.v.). Both flowers and fruit emit a pleasant fragrance, but when the tree is covered with blossom, the odor is so strong as to be almost overpowering. The fruit varies from the size of an orange to 16 lbs. or upwards in weight. It is roundish, or heart-shaped. Externally, it is greenish, covered with small knobs and scales. The skin is rather thick and tough. Internally, the fruit is snow-white and juicy, and contains a number of small brown seeds. The eatable part is soft like a custard, and forms almost the entire mass of the fruit. The C. attains its highest excellence only in particular soils and situations, and some varieties are much finer than others. No tropical fruit seems better to deserve a higher degree of attention than it has yet received in our hot-houses.

CHERKASK'. See TCHERKASK.

CHEROKEE, a co. in n.e. Alabama, on the Georgia border, on the Coosa and Chattooga rivers, reached by the Selma, Rome, and Dalton railroad; 250 sq.m.; pop. '70, 11,132-1480 colored. The surface is mountainous, and in large part covered with forests of pine and oak. Productions mainly agricultural. Co. seat, Centre.

CHEROKEE, a co. in n. w. Georgia, on the Etowah river, which is navigable by steamboats; 620 sq. m.; pop. '70, 10,399—1281 colored. It has a rolling surface and fertile soil, yielding the usual agricultural crops. Co. seat, Canton.

CHEROKEE, a co. in n. w. Iowa, on Little Sioux and Maple rivers, traversed by the Dubuque and Sioux City railroad; 600 sq. m.; pop. '70, 1967. Agriculture is the chief business. Co. seat, Cherokee.

CHEROKEE, a co. in s. e. Kansas, bordering on Missouri and the Indian territory; 604 sq. m.; pop. '70, 11,038. It is an agricultural region, and is intersected by the Missouri, Fort Scott, and Gulf railroad. Co. seat, Columbus.

CHEROKEE, a co. in s. w. North Carolina, the extreme point of the state, adjoining Georgia and Tennessee; 650 sq. m.; pop. '70, 8,080. It has a mountainous forest-covered surface, and is little cultivated. Co. seat, Murphy.

CHEROKEE, a co. in e. Texas, between the Angelina and the Neches rivers, intersected by the International and Great Northern railroad; 1144 sq. m.; pop. '70, 11,079—3,283 colored. It is in an excellent agricultural region, consisting of alternating woodland and prairie. Co. seat, Rusk.

CHEROKEES, in their own tongue called Tsanaghee, a tribe of Indians of the United States, now settled in the Indian territory, where they occupy 5,960 sq. m. in the n. e., and 8,500 along the n. side. Their original home was in the country now forming portions of Florida, Georgia, Alabama, Mississippi, and Tennessee. They were then in two great divisions, the Ottare, or Otari, dwelling in the mountainous districts, and the Airate, or Erati, occupying the lower lands; and they were further divided into seven clans, each of which prohibited intermarriage between its own members. They adhered to the English in early colonial times, formally recognized the king in 1730, and in 1755 ceded territory and permitted the establishment of English forts. The tribe was considerably advanced in civilization when the war of the revolution began. They clung to the royalist side, and in consequence their country was laid waste by American forces. They were subjugated after a few years of intermittent war, during which they lost much territory, and, by the treaty of Hopewell, Nov. 28, 1785, they acknowledged the sovereignty of the United States, and were confirmed in the possession of their hunting grounds. Then began the ever-recurring story of white man's encroachment and red man's resistance, with the ultimate advantage on the side of the intruders. By treaties in 1791 and 1798, portions of their territory were surrendered, and many of their people emigrated beyond the Mississippi. In 1817, the C. on the Arkansas numbered 3,000. Those who remained in their old territory abandoned hunting, and the greater portion of them lived by agriculture. But the white men of Georgia, who coveted their lands, demanded the removal of the remaining C. notwithstanding the great services which they had rendered (1812-15) in the war with England; and though the Indians were entirely peaceable, generally industrious, and were fast becoming Christianized by the efforts of Moravian missionaries and those of the American board, the clamor for their removal prevailed, and in July, 1817, they were forced to exchange their eastern lands for territory w. of the Mississippi. The end was not effected, however, without much trouble and bloodshed. Georgia passed laws extending over the territory of the C., by which the Indians were practically outlawed, deprived of citizenship, and prohibited from being witnesses. They appealed to the U. S. supreme court, and that body—which long afterward decided that a negro had no rights that a white man was bound to respect—refused the Indians the right to bring an action; and finally the general government confessed its inability to fulfill its own treaty obligations. But this inability did not prevent the federal government (in 1835) from making a treaty with a small portion of the tribe for the removal of the whole of them, and three years later an armed force was sent into their country to compel the removal. At that time the whole number of Indians in their old homes was about 27,000. The Indians were themselves divided; one section, led by John Ross, at first opposed, but at last directed the removal. Within a few years, after much difficulty and not a few murders, their removal was effected. Since their occupation of a share of the Indian territory, the C. have greatly advanced in learning and in material prosperity. About 1821, a member of the tribe invented an alphabet, and books and newspapers have been printed in their own language for half a century. In the war of the rebellion, they at first favored the confederates, but the majority soon came over to the union side. Between the two armies, their territory suffered severely, and they were compelled to emancipate their slaves. The territory of the C. now amounts to about 5,000,000 acres, and they have, in the keeping of the United States, school and orphan funds to the amount of about \$1,600,000. They are governed by a national committee and council elected for two years, and a chief who is chosen for four years. In 1873, the C. numbered 17,217, and they had 63 schools with 1,884 pupils. They live in well-built villages, and are peaceable and industrious. Tahlequah is their chief town.

CHERRY, *Cerasus*, a genus or sub-genus of plants, of which the best known yields one of our most esteemed stone-fruits. This is usually regarded as a sub-genus of *prunus* (see PLUM), but is erected by some botanists into a distinct genus on very slender grounds, the most obvious distinction between the species of *cerasus* and the true species

of *prunus* being that, in the former, the young leaves are conduplicate, or folded up, and in the latter they are convolute, or rolled together. Two species are pretty generally regarded as the parents of the garden cherries usually cultivated, *prunus* or *cerasus avium*, and *P. cerasus* or *C. vulgaris*—the former having the underside of the leaves hairy and a small austere fruit; the latter having smooth shining leaves and a more juicy fruit. *C. avium* attains a height of 40 to 50 feet. *C. vulgaris* is a smaller tree. Both have white flowers in clusters or nearly sessile umbels, and both are generally regarded as natives of Britain, and of the middle and s. of Europe. In a wild state, they are usually called *GEAN* (*guigne*), and *C. avium* is frequently planted—not only because it is exceedingly ornamental when in flower, but also as a timber-tree, being of rapid growth, with firm, strong, close-grained wood, suitable for the purposes of cabinet-makers, turners, and musical-instrument makers. But according to some botanists, there is only one species, of which these are varieties; and according to others, *C. vulgaris* is a native of Syria and other parts of western Asia, and is only naturalized in Europe, having been first brought to Italy by Lucullus, after his victory over Mithridates (74 B. C.), from Kerasunt, on the coast of the Black sea, from whence it derives its name. The cultivated varieties of the *C.* are very numerous, and differ very considerably in size, color, and flavor. The fruit of the *C.* supplies the inhabitants of some parts of France with a principal article of food, especially the wood-cutters and charcoal-burners of the forests; and among their modes of preparing it is that of making it a principal ingredient in soups. It ripens in Norway and East Bothnia as far n. as lat. 63°. In some parts of Germany, the public roads are lined for many miles together with avenues of *C.* trees. Besides its use for the dessert and for preserves, the *C.* is extensively used for making liquors. See KIRSCHWASSER and MARASCHINO. Varieties of *C.* with double flowers, and with pendulous branches, are frequently planted for ornament in shrubberies, and few trees or shrubs are more beautiful. The *all-saints C.* produces flowers almost all summer, and even in autumn. Its fruit is small and rather acid.—The other species of *C.* are numerous. Some species are low, or even prostrate shrubs, as *C.* or *P. chama-cerasus*, the *GROUND C.* of the s. of Europe and of Siberia; and *C.* or *P. pumila*, the *SAND C.* of North America.—The genus or sub-genus *cerasus* contains also the different kinds of bird *C.* (q. v.) and choke *C.* (q. v.), including the American *WILD C.*, famous for its medicinal bark; the *MAHALEB* (*C.* or *P. mahaleb*) of the s. of Europe, and the *CAPOLLIN* (*C.* or *P. capollin*) of Mexico and Peru—the first famous for the fragrance of its flowers, and the second for the fragrance of its fruit; and the *Cherry-laurel* (q. v.).

CHERRY-LAUREL, or **LAUREL-CHERRY**, a name given to those species of *prunus* or *cerasus* (see **CHERRY**) which have evergreen leaves. They are also often called **LAUREL**. They have small flowers in long racemes, and small fruit; the fruit of a nauseous taste; and most parts of the plant, but particularly the leaves and kernels, remarkably abounding in hydrocyanic (prussic) acid, and therefore very poisonous.—The **COMMON CHERRY-LAUREL**, sometimes called the **BAY-LAUREL** or **LAUREL-BAY**, very often spoken of simply as the **LAUREL** or **COMMON LAUREL** (*prunus* or *cerasus lauro-cerasus*), is a shrub, sometimes of very large size, with ovato-lanceolate, convex, smooth, remotely serrated, shining, yellowish green leaves, and erect racemes of flowers. It is originally from Asia, but is now naturalized throughout the s. of Europe, and is one of the most common ornamental shrubs in Britain, where it suffers only from such severe frosts as are of rare occurrence. It is propagated by seeds, layers, and cuttings. Its leaves resemble bitter almonds in smell and taste, and contain in great abundance the same essential oil (see **ALMONDS**, **VOLATILE OIL OF**), rich in hydrocyanic acid. From these leaves, by maceration in water for 24 hours, and subsequent distillation, is obtained the *laurel-water* (q. v.), or *cherry-laurel water*, sometimes employed in medicine as a substitute for hydrocyanic acid, and which formerly was so much used as a poison. The leaves are sometimes employed also for flavoring puddings, sauces, etc., and are safer for such purposes than oil of bitter almonds, but ought to be used with caution.—Another species, also very common as an ornamental shrub in Britain, but not quite so hardy as the common cherry-laurel, is the **PORTUGAL LAUREL** (*prunus* or *cerasus Lusitanica*), a native of Portugal, a large shrub—sometimes a tree—with dark-green leaves and lateral racemes. It does not grow so well under the shade of trees as the common cherry-laurel. From the dissimilarity of form and color of their leaves, these species present a pleasant appearance when mixed, as they usually are, in the shrubbery.

CHERRY VALLEY, a village in Otsego co., N. Y., 68 m. w. of Albany, reached by way of the Albany and Susquehanna railroad; pop. of township, '75, 2,240. The village was the scene of a massacre of Americans, Oct. 11, 1778, by Indians and Tories under direction of British officers; 16 soldiers of the revolutionary army and 32 inhabitants, nearly all women and children, were killed, and all others carried into captivity. Every house in the settlement was burned.

CHERSIPIHIRON, an architect of Crete, who, with his son Metagenes, built or began to build the great temple of Artemis at Ephesus, commenced about 600 B. C. The columns were erected about 40 years later. It was completed 220 years after its commencement, and a few years afterwards was destroyed by fire on the night in which Alexander the great was born. This temple was considered to be one of the seven wonders of the world.

CHERSO, an island of Illyria, belonging to Austria, in the Adriatic, 12 m. s.s.w. of Fiume. A bridge unites it with the adjoining isle of Lossini. It has an area of about 105 sq. m., with a pop. (1869) 14,000. Its surface is generally hilly and rugged, with forests in the north. The chief town is Cherso, at the head of a bay on the w. side. Pop. '69, 7,590.

CHERSON. See **KHERSON**.

CHERSONESUS, the ancient name of several peninsulas and promontories in Europe, the most important of which are the Crimea (q. v.), *C. Taurica*; Gallipoli (q. v.), *C. Thracia*; and Jutland (q. v.), *C. Cimbrica*.

CHERT, or **HORNSTONE**, a variety of quartz, always massive, and having a kind of granular appearance and structure. It is common in the mountain limestone, oolite, and greensand formations; sometimes forms rocks; and often contains petrifications. It passes into common quartz and chalcedony, also into flint and flinty slate. Its colors are gray, white, red, yellow, green, or brown. The name C. is sometimes limited to the finer varieties, and the coarser are called hornstone.—The name C. is very commonly given to the silicious concretions which occur as nodules and layers in limestone rocks, like flints in the chalk. When these materials exist to such an extent as to render the limestone useless for economical purposes, it is said to be "cherty."

CHERTSEY (Anglo-Saxon, Ceort's Eye or Island), a t. in the co. of Surrey, on a low strip of land between the right bank of the Thames, here crossed by a stone bridge, and the brook from Virginia water, 20 m. w.s.w. of London. It is irregularly built, chiefly consisting of two long cross-streets, and is surrounded by villas. The chief trade is in malt and flour. Many vegetables are raised for the London market. Pop. '71, 3,146. C. arose in a monastery founded in 666, and rebuilt in 964 by Edgar and the Benedictine monks. The South Saxon kings had a seat here during the heptarchy. Charles James Fox lived on St. Anne's hill, an abrupt elevation about a mile from the town. Cowley the poet resided in Chertsey.

CHERUB, in the plural *cherubim* or *cherubs*, is the Hebrew name of a winged creature with a human countenance, which in the Scriptures is almost always represented in connection with Jehovah, and especially as drawing his chariot-throne. Cherubim are first mentioned in the Old Testament as guards of paradise; a C. with a flaming sword hindered the return of the expelled human pair. In the Holy of Holies in the tabernacle, and afterwards in the temple, cherubim wrought in embossed metal were represented above the mercy-seat, or covering of the ark of the covenant, so that they appeared to rise out of it. Figures of cherubim were also wrought into the hangings of the Holy of Holies. The cherubim that appear in the visions of Ezekiel and the revelations of John depart much from the early representations. In Ezekiel they have the body of a man, whose head, besides a human countenance, has also that of a lion, an ox, and an eagle; they are provided with four wings, two of which support the chariot of Jehovah, and serve to fly, while the other two cover the body; the hands are under the wings, and the whole body is spangled with innumerable eyes. In the revelation, four cherubim, covered with eyes, and having six wings, surround the throne of Jehovah; the first has the face of a lion, the second of an ox, the third of a man, and the fourth of an eagle. This gave rise to a very early period to the symbolical figures of the four evangelists, the human countenance being associated with Matthew, that of the lion with Mark, of the ox with Luke, and of the eagle with John. Most Jewish writers and Christian fathers conceived the cherubim as angels; and Dionysius the Areopagite, in his *Celestial Hierarchy*, makes them a separate class in the first hierarchy. Most theologians also considered them as angels, until Michaelis showed them to be a poetical creation; and Herder, in his *Spirit of Hebrew Poetry*, compared them to the griffins that watch treasures, and other fabulous figures. In Christian art, they are generally represented as sexless figures, with wings from the shoulders, the legs also being either covered by wings, or having wings substituted for them. Very often they have also a glory round the head.

CHERUBINI, LUIGI-CARLO-ZENOBIO-SALVATORE-MARIA, an eminent musical composer, was b. at Florence in 1760, and received his early musical training there under the Felici (father and son), P. Bizzari, and C. Castrucci. He afterwards studied for a year at Bologna under Sarti, to whom he owed his thorough knowledge of counterpoint and fugue. He visited London in 1784, where he brought out two operas, *La Finta Principessa* and *Giulio Sabino*, and afterwards settled in Paris for the remainder of his life, paying occasional visits to Italy. His *Ifigenia in Aulide* appeared in 1788; and in 1791, his *Lodoïska*, which work first secured proper appreciation for his genius, and effected a change in the whole character of the French school of composition. These operas were followed in succession by *Elisa*, *Medea*, *Les Deux Journées* (also known as *Die Wasserträger*), *Anacreon*, and *L'Hôtelier Portugaise*. His latest opera, *Ali Baba*, was produced, after a long interval, in 1833. Besides operas, C. wrote numerous masses, motets, and other sacred compositions of so great merit, that Beethoven regarded him as the greatest living master of sacred music; also quartets for the violin, viola, and

violoncello, and symphonies. His latest work, *Cours de Contrepoint et de Fugue*, appeared in 1835. C. died at Paris in 1842, and his *Requiem*, the last of his masses, was performed at his funeral service.

CHERUBINI, MARIA LUIGI CARLO ZENOBI SALVADOR, one of the best Italian composers, was b. Sept. 8, 1760, at Florence, and d. Mar. 15, 1842, in Paris, where he was director of the conservatoire. In his thirteenth year, by his early compositions—a mass and an intermezzo—he attracted the attention of Sarti, who received him as a pupil. In the interval from 1780 to 1788, he composed eleven Italian operas, including *Ifigenia in Aulide*, the most successful of the series. In 1784, he visited London. After 1786, C. resided chiefly in Paris, whence his fame rapidly extended over Europe. Besides the *Ifigenia*, his chief pieces are *Demophon* (1788), *Lodoiska* (1791), *Elisa* (1794), *Médée* (1797), the *Portuguese Inn* (1798), *Les Deux Journées*, and *Anacreon*. C. also composed church music, chamber music, etc., with singular beauty and success. It is worthy of remark, that the richness of his instrumental music, which was once made a ground of objection, now appears moderate as contrasted with the monstrous prodigalities of the modern orchestra. See *Cherubini: Memorials illustrating his Life*, by Bellasis (Lond. 1874).

CHERUSCI, a German tribe first mentioned by Cæsar. They first dwelt n. of the Silva Bacencis, or Harz forest, but the exact boundaries of their territory cannot be ascertained. They are chiefly memorable in connection with their great leader Arminius, or Hermann, who, having formed an alliance with other German tribes, attacked and annihilated the Roman legions under Varus, in the forest of Teutoburg, 9 A.D. After the death of Arminius, internal strifes broke out among the C., and Tacitus says that they were subjugated by the Chatti, a neighboring tribe. Notwithstanding this, they again appear as the chief tribe in the military league of the Saxons about the end of the 3d century. In the beginning of the 4th c., they are included among the peoples who had leagued against Constantine, and towards the close of the same are still mentioned distinctively by Claudian.

CHEER VII. *Anthriscus cerefolium*, an umbelliferous plant, which has been long cultivated as a pot-herb, and used in soups and for a garnish, etc., in the same manner as parsley. It is much more used in some parts of the continent of Europe than in Britain. It is a native of Europe, naturalized in some parts of England. The leaves have a peculiar, somewhat sweetish, pleasantly aromatic smell and taste, by which the plant may be known from its congener *anthriscus vulgaris* or *scandix anthriscus*, a poisonous weed, whose leaves have a disagreeable smell, and which is also distinguished by its hispid fruit. There is a variety of C. with large roots, for the sake of which it is cultivated.—The umbelliferous plant called **VENUS' COMB** or **SHEPHERD'S NEEDLE** (*scandix pecten* or *S. pecten veneris*), a native of Britain and of the continent of Europe, often found in corn-fields, and remarkable for the appearance and large size of its fruit, and another species (*S. australis*) which grows in the s. of Europe, have a taste and smell resembling C., and are used in the same way on the continent. **SWEET C.** or **SWEET CICELY** (*myrrhis odorata*; *scandix odorata* of the older botanists), a native of the s. of Europe and of some parts of Asia, common in the neighborhood of houses in Britain, although probably not a true native, is frequently cultivated in Germany under the name of *Spanish C.* or *anise chervil*. In Scotland, the plant is commonly called *myrrh* by the peasantry. Its smell is peculiarly attractive to bees; and the insides of empty hives are sometimes rubbed with its leaves, to induce swarms to enter.—The species of *charophyllum*, coarse weeds, are also called chervil.

CHESAPEAKE BAY, the largest inlet on the Atlantic coast of the United States, being 200 m. long, and from 4 to 40 broad. Its entrance, 12 m. wide, has, on the n., cape Charles, in lat. 37° 3' n., and long. 76° 2' w.; and on the s., cape Henry, in lat. 36° 56' n., and long. 76° 4' w., both promontories being in Virginia. C. B. has numerous arms, which receive many navigable rivers, such as the Susquehanna and the Patapsco on the n., through Maryland; the James on the s.w., from Virginia; and the Potomac on the w., between these two states. Unlike the shallow sounds towards the s. (see **CAROLINAS**), this network of gulfs and estuaries, to say nothing of its noble feeders, affords depth of water for ships of any burden, virtually carrying the ocean up to the wharves of Baltimore and the arsenals of Washington.

CHESEBRO', CAROLINE, 1825-73; a native of New York, author of a number of works of fiction, mostly of a moral or religious nature; among them, *Dreamland by Daylight*; *The Little Cross-bearers*; *The Fisherman's Daughter*; *The Beautiful Gate*; and *The Foe in the Household*. She was for many years a teacher in the Packer institute, in Brooklyn, N. Y.

CHE' SELDEN, WILLIAM, an English surgeon and anatomist, was b. in 1688, at Barrow-on-the-Hill, in Leicestershire. He commenced his medical studies at fifteen, at twenty-three established himself as a lecturer on anatomy, and in the following year was elected a fellow of the royal society. He was afterwards appointed surgeon to St. Thomas's, St. George's, and Westminster hospitals, where he acquired great reputation as an operator. In this respect, few surgeons, if any, ever surpassed him. He died at

Bath, 11th April, 1752. C.'s principal works are *Anatomy of the Human Body* (1713), long a text-book on the subject in England; a *Treatise on the Operation for the Stone* (1723); and *Osteology, or Anatomy of the Bones* (1733). He also contributed several valuable papers to the philosophical transactions of the royal society.

CHESHIRE, a co. in s.w. New Hampshire, bordering on Vermont and Massachusetts, bounded on the w. by the Connecticut and drained by the Ashuelot river, and traversed by the Ashuelot and Cheshire railroad; 770 sq.m.; pop. '70, 27,365. It has a hilly surface, with some mountains, the highest being Grand Monadnock. There are several small lakes and ponds in the county. The soil is fertile, particularly along the rivers. The chief productions are grain, potatoes, hay, wool, butter, cheese, and maple sugar; and there are also many manufactories. Co. seat, Keene.

CHESHIRE, a maritime co. in the w. of England, bounded n. by the river Mersey, and partly also by the Irish sea, in lat. 52° 56' to 53° 54' n., long. 1° 47' to 3° 11' west. Its greatest length from n.e. to s.w. is 53 m.; greatest breadth, 32; area, 1052 sq.m., of which only $\frac{1}{8}$ is uncultivated; circuit, 200 m., of which 8 are coast. The surface forms an extensive nearly level plain between the Derbyshire and Welsh mountains, well wooded, and studded with small lakes or meres, and chiefly occupied by grazing and dairy tracts, which are among the most important in England. This plain, comprising four fifths of the surface, rests on new red sandstone, and is crossed, near the middle, by a tract of high ground running s.w. from a promontory overlooking the Mersey, near the mouth of the Weaver, to Beeston castle rock, 366 ft. high. On the e. border of the co. is a line of new red sandstone hills. In the n.e. is part of the Lancashire coal-field. In the e. are large tracts of peat, and much of the co. is wet and rushy. The n.w. part of C. forms a hammer-headed peninsula called Wirral, about 8 m. broad, between the estuaries of the Dee and Mersey. Coal-measures appear on the w. side of this peninsula, as well as on the w. border of the main part of the county. The chief rivers are the Dee, Mersey, and Weaver, which are navigable. The Dee skirts the co. on the w. 55 m., and the Mersey on the n. for 40 miles. The Weaver rises in the e. part of the co., and runs 40 m. w.n.w. into the Mersey. The co. contains an almost unrivalled system of canals, including the celebrated Bridgewater canal, and is traversed by the main line of the London and Liverpool railway, and the Crewe, Chester, and Holyhead railway. The chief mineral products are rock-salt and coal. The rock-salt, discovered in 1670, and mined by gunpowder, is found near the Weaver and its branches, especially near Norwich, at the depth of 28 to 48 yards, in two beds, the upper one being 15 to 25 yards, and the lower one above 40 yards thick, under a stratum of hard rock, 25 to 35 yards thick. The mines, one occupying 35 acres, when lighted up, resemble a fairy palace sparkling with gems and crystal. Much salt is also made from brine-springs 20 to 40 yards deep. Coal is worked in the n.e. part of the county. There are also lead (with cobalt) and copper-mines, and in almost every part of the co. freestone, limestone, millstone, and marl are found. The climate is moist. The soil is mostly a clayey or sandy loam, with marl and peat, and very fertile. The soil and climate are well fitted for pasturing, dairy-farming, and cheese-making, which are the chief agricultural occupations. About 160,000 cows are kept in C., and the quantity of cheese annually produced is estimated at from 15,000 to 30,000 tons—the best being made on the strongest lands. The hedgerows abound in oaks. C. is a manufacturing as well as an agricultural county. Pop. in 1871, 561,131. The chief towns are Chester (the co. town), Macclesfield, Stockport, Congleton, Knutsford, and Birkenhead. The co. of C. returns 6 members to parliament. C. has some Roman roads, tumuli, barrows, remains of religious houses, and many old castles and halls. The 12th Roman legion occupied Chester till the 3d century. Egbert, in 828, added C. to the Anglo-Saxon kingdom of Mercia. William the conqueror erected C. into a co. palatine, under Hugh Lupus, with an independent parliament and 8 barons. Henry VIII. subordinated it to the English crown; but C. did not send representatives to the English parliament till 1549, and the separate jurisdiction ceased entirely only in 1831.

CHESNE, ANDRÉ DU. See **DUCHESNE**, *ante*.

CHESNEY, CHARLES CORNWALLIS, 1826-76; a brevet-col. in the British royal engineers, who first attracted attention by *A Military View of Recent Campaigns in Virginia and Maryland*, published in 1863, which was followed two years later by *Campaigns in Virginia and Maryland*, both having reference to the war of the rebellion in the United States. The work from which he received the greatest fame at home was *Waterloo Lectures*. He published, also, *The Military Resources of Prussia and France*; *Recent Changes in the Art of War*; and *Essays in Modern Military Biography*.

CHESNEY, FRANCIS RAWDON, 1789-1872, a British soldier who projected and led the Euphrates expedition by an overland route to India in 1835-6. He was a brig.gen. in China in 1843, maj.gen. in 1855, and gen. in 1868. He wrote *Expedition for the Survey of Euphrates and Tigris*; *Observations on the Past and Present States of Fire-arms*; *Russo-Turkish Campaigns of 1828-29*; and *Narrative of the Euphrates Expedition*.

CHESS (Fr. *échecs*, Ger. *schaech*). The origin of this, the most purely intellectual of all games of skill, has been much disputed; thus much may now be considered as certain, that, under the Sanscrit name of *chaturanga*, a game, essentially the same as modern C., was played in Hindustan nearly 5,000 years ago. In its gradual diffusion through the world in succeeding ages, the game has undergone many alterations and modifications, both in nature and in name; but marked traces of its early Asiatic origin and descent are still discerned by the learned in its nomenclature and other characteristics. From Hindustan, C. spread into Persia, and thence into Arabia. The Arabs, it would appear, in the 8th c., introduced the game into Spain and the rest of western Europe; and in England, chess-play seems to have been known prior to the Norman conquest. Into Constantinople, and probably some other cities of eastern Europe, the game may have been imported from Persia at a period earlier than its Moorish conveyance into Spain.

The original Hindu game was played on a board of sixty-four squares, as now, but by four persons, two being allied against two, as in whist. Hence the name *chaturanga*, from *chatur*, "four," and *anga*, "a member" or "component part." The name *shatranj*, used by the Persians and Arabs, is a corruption of the Sanscrit. The English, French, and other European names are derived from the Persian term *shah*, "king." *Check*, the warning when the king is in danger, is but another form of *shah*; in fact, "king" is sometimes used for "check," and in German *schaech* is both the name of the game and the term of warning. The term *rook* is from the Sans, *roka*, Pers. *ruk*, meaning a ship or chariot; *pawn* is said to be from *peon*, an attendant, or foot-soldier.

The books written upon C. "would form a tolerably large library." Of works on the antiquities of the subject, we may mention Dr. D. Forbes's *History of Chess* (Lond. 1860). The best modern practical works on the art of chess-play are the *Chessplayer's Handbook*; *C. Praxis*; and *Chess: Theory and Practice*, by Staunton; Morphy's *Games at C.*, edited by Lowenthal; Jacnisch's *Treatise on the Openings*, translated by Walker; and Horwitz and Kling's *Collection of End-games*. The subject is also pretty fully treated in Chambers's *Information for the People*, "In-door Amusements."

The game of C. is played upon a square board marked out into sixty-four square divisions, which are colored alternately black and white, in order the more clearly to determine and denote the respective movements of the several pieces. In placing the board for play, each player must always have a *white* corner square at his right hand. There are two sets of pieces, of opposite colors, of sixteen men each, and of various powers according to their rank. These sets of men are arrayed opposite to each other, and attack, defend, and capture, like hostile armies. The accompanying diagram will best explain the name, form, and place of each man at the commencement of the game:

BLACK.

Rook. Knight. Bishop. Queen. King. Bishop. Knight. Rook.
WHITE.

The superior officers occupying the first row on each side are called *pieces*; the inferior men, all alike, standing on the row immediately in front of the pieces, are called *pawns*. Their moves and powers, along with the peculiar terms used in C., may be briefly described as follows:

A *pawn*, at his *first* move, may advance either one or two squares, straightforward; but after having once moved, he can only advance a single square at a time. In capturing* an adverse piece, however, a pawn moves one square diagonally, either right or left; but the pawn never moves backward. On arriving at an 8th square, or the extreme line of the board, a pawn may be exchanged for any piece his owner chooses to call for, except a king, so that a player may have several queens on the board at once. If, on moving two squares, a pawn pass by an adverse pawn which has arrived at the 5th line, the advanced adverse pawn may take the other *in passing* in exactly the same manner as if the latter had moved but one square.

A bishop moves any number of squares diagonally, but diagonally only; therefore a bishop can never change the color of his square.

A knight moves two squares, so as always to change color—that is, he moves one square forward or backward, and one diagonally. On account of this crooked movement, he can leap over or between any surrounding pieces; and therefore a knight's check—unless he can be taken—always compels the king to move.

The rook, or castle, moves any number of squares forward, backward, or sidewise, but not diagonally.

The queen is by far the most powerful of the pieces, and moves over any number of squares, either in straight lines or diagonals, forward, backward, or sidewise; so that her action is a union of that of the rook and bishop. At starting, the queen always stands on a square of her own color.

The king is the most important piece on the board, as the game depends upon his safety. He moves only one square at once, in any direction, except when he *castles*—a term to be explained presently. The king cannot be taken; but when any other piece attacks him, he is said to be in *check*, and must either move out of check or interpose some one of his subjects, unless the checking piece can be captured. When there is no means of rescuing the king from check, he is said to be checkmated, and the game is over. Of course, the two kings can never meet, as they would be in check to each other. *Double-check* is when a piece, by being moved, not only gives check itself, but also discovers a previously masked attack from another.

Castling is a privilege allowed to the king once in a game. The move is performed either with the king's rook or queen's rook—in the former case, the king is moved to the king's knight's square, and the king's rook is placed on the king's bishop's square; in the latter case, the king is played to the queen's bishop's square, and the queen's rook is played to the queen's square. But the king cannot castle after having once moved, nor at a moment when he is actually in check, nor with a rook that has moved, nor when he passes over a square attacked or checked by an adverse piece, nor when any piece stands between him and the rook with which he would castle, nor when in the act of castling either the king or rook would have to capture an adverse piece.

A *drawn* game results from neither player being able to checkmate the other: thus, a king left alone on each side must of course produce a draw, as do also a king with a bishop, or a knight, against a king.

Stalemate, or the not being able to move either the king or any other piece, also constitutes a drawn game.

Odds is a term applied to the advantage which a stronger player should give to a weaker: thus, the removal of a rook or knight from the better player's forces may be fair odds; or if the players are more nearly matched, the one may give a pawn. When the odds of a pawn are given, it is always understood to be the king's bishop's pawn.

Gambit is a technical word implying the sacrifice of a pawn early in the game, for the purpose of taking up an attacking position with the pieces.

Supposing the worth of a pawn to be represented by unity, the following is a tolerable average estimate of the comparative value of the pieces: Pawn 1, bishop 3, knight 3, king 4, rook 5, queen 9.

The chess-men being placed, the players begin the engagement by moving alternately; each aiming to gain a numerical superiority by capturing his opponent's men, as well as such advantages of position as may conduce to victory.

The rows of squares running straight up and down the board are called *files*, those running from side to side are called *lines*, and those running obliquely across are termed *diagonals*.

The playing over the following short game will serve the learner as a little initiatory practice:

WHITE.

1. King's Pawn two.
2. King's Bishop to Queen's Bishop's 4th.
3. Queen to King's Rook's 5th.
4. Queen takes King's Bishop's Pawn, giving Black checkmate.

BLACK.

1. King's Pawn two.
2. King's Bishop to Q Bp's 4th.
3. King's Knight to K Bp's 3d.

* Taking is always performed by lifting the captured man from the board, and placing the captor on his square. The pawn is the only man whose mode of taking differs from his ordinary move.

The foregoing brief mode of giving a checkmate is called the *Scholar's mate*, and is often practiced upon young and unwary players. Any contractions used, such as "K" for king, "B" for bishop, etc., will readily be understood by the use of the diagrams.

In the conduct of the game, and in the practice of C., the following rules, precepts, and hints will be found very generally useful:

Play forth your minor pieces early, and castle your king in good time. You may sometimes delay castling with advantage, but not often.

Do not expect to be able to establish an enduring attack with half your forces at home.

Seek to let your style of play be attacking; and remember the gaining or losing of time in your measures is the element of winning or losing the game.

Never touch a piece without moving it, nor suffer yourself or your opponent to infringe any other of the laws of the game.

You will find, when first player, that the opening, springing from your playing 1st king's pawn two, and then your king's knight to the bishop's 3d, is one of the best that you can adopt; but do not adhere to any one opening only.

If you wish to adopt a purely defensive opening, you may play 1st king's pawn one, and follow up with Q P 2, and Q B P 2.

Next to playing with good players, nothing will conduce to improvement more than looking on at two expert players whilst they play. Wanting these advantages, it is best to play over openings, and actual games, from books or journals.

To prevent blunders and oversights, always endeavor to perceive the motive of your adversary's move before you play; and look often round the board to see that you are not losing sight of any better move than the one you intended, or that you are not suffering yourself to be tempted by a bait.

When an onlooker, never interfere.

Always endeavor to lose with good temper, and to bear your adversary's faults with a good grace.

THE LAWS OF CHESS.—The laws of C. are at present in a somewhat unsettled, unsatisfactory condition; but the following are the principal prevailing regulations of the game:

1. If any error have been committed in the placing of the board or men, either player may claim that the game shall be finished as it stands, after four moves have been completed on each side, but not else.

2. A move once made, by your having moved a piece and left hold of it, cannot be retracted.

3. If you touch a piece, you must play that piece; but as long as you retain your hold, you can play it where you like. If you touch a piece that cannot move, your opponent may compel you to play your king, unless the king be unable to move. When you touch your pieces for the mere purpose of adjusting them, you are bound to say so.

4. If you make a false move, your opponent may either cause you to retract it and move your king, or he may claim that the false move shall stand, or that you shall make a legal move with the same piece, at his pleasure.

5. If you touch one of your opponent's men, he may compel you to take that man; or if that be impossible, to move your king, provided he can move without going into check.

6. If on the king being checked, due notice is not given, the player whose king is attacked is not bound to notice it.

7. In every fresh game, except when one is drawn, the first move alternates.

8. Drawn games counting as no games at all, the player who had the first move in a drawn game is also entitled to it in the next. (This absurd regulation is fast becoming obsolete; and it is now a common agreement in playing a series of games, that the move shall invariably alternate.)

9. A player who gives the odds of a piece, is entitled to the first move.

10. The time for consideration of a move is not limited; but a player leaving a game unfinished without his opponent's permission, loses such game.

11. When at the end of a game one player is left with just sufficient superiority of force to win—such as a king and rook against king, king and two bishops, or king, knight, and bishop against king—he who has the greater force must give checkmate within fifty moves on each side, or else the game is adjudged to be drawn. This law is framed to prevent unskillful players from wearying their opponents by persisting in the attempt to accomplish what they are too untutored to effect; and it is perfectly just, since the allotted number of moves is amply large enough and to spare.

12. In case of any dispute about the laws, both players are to agree as to an umpire, whose decision is to be considered final.

As there is no branch of chess-study better calculated to advance the skill of a learner than the attentively playing over recorded games between first-rate players, we have given an example of a game played blindfold, simultaneously with five other games, by the celebrated American chess-player, Paul Morphy. This gentleman visited England and the continent of Europe in 1858, and in his contests with the best players fairly carried all before him, so that he soon ranked as the greatest chess-player living.

White—Mr. Morphy.

CHESS, or **CHEAT**, common names of the *bromus secalinus*, a plant of the order *graminaceæ*; a troublesome weed that frequently springs up in wheat-fields, the seed mixing with the true wheat, from which it can be separated only with difficulty. It was once generally believed among farmers that wheat itself was transmuted into chess.

CHEST, MILITARY, is a technical name for the money and negotiable securities carried with an army, and intended to defray the current expenses. In the English military system, this department is managed by the commissariat.

CHEST, NAVAL. The name of C. has been given to certain funds, maintained for the benefit of seamen belonging to the royal navy. A fund, called the *Chest at Chatham*, was suggested so long ago as the days of Drake and Hawkins, for the relief of wounded and superannuated seamen. In 1590, all seafaring men in queen Elizabeth's service consented to a stoppage out of their pay of 2*d.* to 6*d.* per month, to support this fund. The money was not in those days, as it would be now, put out to interest; it was kept in a C., and hence the name given to the fund itself. During the 18th c., the system became organized in a better manner; but still the fund retained the name of C.; inasmuch that when the office was removed from Chatham to Greenwich, in 1803, it became the *Chest at Greenwich*. The C. is managed *ex officio*, and the accounts are annually laid before parliament. Handsome gifts are occasionally made to the fund by individuals. Disabled sailors receive a present sum of money, if not deprived of the power of earning a living; but if their injuries are more permanent, they receive a pension from the C., for one year, or for several years, or for life, paid half-yearly.

CHEST, or **THORAX**, in anatomy, is the part of the body which lies beneath the neck and above the abdomen (q.v.), constituting the uppermost of the two divisions of the trunk, or that which contains the heart and lungs, and is bounded externally by the ribs. The C. is somewhat conical in form, the broad or lower end of the cone being shut in by the diaphragm, a large muscular partition which projects upwards from the lower ribs, being convex towards the C., and concave towards the abdomen. In respiration (q.v.), the diaphragm descends by its own muscular contraction, while at the same time the ribs are drawn upwards and outwards by the intercostal muscles. The cavity of the C. is thus enlarged, the lungs are expanded, and air is drawn into them through the trachea or windpipe and bronchi. See **LUNGS**. The combination of bone, cartilage, muscle, and tendon entering into the composition of the C. is such as to permit of expansion-movement to the extent required, and yet to guard against over-expansion, which would be fatal to the delicate textures within. The bones of the C. are at the same time a powerful protection against external injury.

The structures forming the walls of the C. are: 1. The backbone or spinal column, divided into 24 vertebræ, 12 of which, called the dorsal vertebræ, form the thoracic portion. 2. Twelve ribs, attached to the transverse processes or projecting portions of the dorsal vertebræ, and ending in front in the costal cartilages, by which the ribs are connected with. 3. The sternum or breast-bone, which occupies the middle line. 4. The diaphragm (q.v.). See also **SKELETON**.

The contents of the C. are the heart, the great arteries and veins, the lungs, the

trachea or windpipe, the bronchi or branches of the trachea, leading to the lungs, the œsophagus or gullet, and the thoracic duct (q.v.), or general terminus of the lymphatic system of vessels, by which the chyle and lymph are discharged into the blood. The very great importance of these parts to life, and their great liability to deranged action, renders the C. the seat of a large proportion of the diseases which afflict humanity, and especially of those which end in death. Indeed, of the three organs which the great physiologist, Bichat, called the "tripod of life"—viz., the brain, heart, and lungs—the C. contains two; hence its condition in almost all diseases, and especially in fatal diseases, is an object of the utmost solicitude to the physician.

The diseases of the C. depend in some cases on alterations in its form, as by rickets (q.v.) and other diseases affecting the bones in early childhood or in youth, as by too tight lacing in girls. The lungs and air-tubes are subject to a great variety of diseases, among which the principal are consumption or phthisis pulmonalis, pneumonia, pleurisy, bronchitis or pulmonary catarrh. The heart is subject to pericarditis, endocarditis, and chronic organic disease of the valves, as well as to enlargement (hypertrophy), dilatation, and degenerations of its muscular texture. The aorta, or great artery, is often affected with degeneration of its walls, and occasionally with aneurism. The great veins are liable to over-distension, and to obstruction by tumors or by coagulation of the contained blood. The thoracic duct is also sometimes obstructed by external pressure; and the œsophagus has a number of diseases usually described in connection with the alimentary canal. Most of the diseases here referred to are described either under special articles, or under LUNGS and HEART.

The examination of the C. by physicians is now conducted not only by an investigation of the symptoms or obvious characters of the disease, but by a minute and elaborate examination into the physical condition of the contained organs by means of auscultation (q.v.), percussion (q.v.), measurement, etc. The application of these methods is too complicated and technical for explanation in detail, but their results will be shortly alluded to incidentally in the articles above referred to on the diseases of the chest. The name of Laennec (q.v.) will be long remembered in medicine as that of a great original observer, who has contributed more than any other to the progress of knowledge in this department.

CHESTER, a co. in s.e. Pennsylvania, on the Delaware and Maryland borders, traversed by the Pennsylvania Central, Philadelphia and Baltimore, Philadelphia and Reading, and other railroads; 738 sq.m.; pop. '70, 77,805. The soil is rich and is thoroughly cultivated, producing wheat, corn, oats, potatoes, hay, butter, wool, etc. There are deposits of chromate of iron, gneiss, porcelain clay, sandstone, copper, lead, iron, and occasionally zinc, agate, amethyst, silver, titanium, zircon, sapphire, and beryl are found. The historical Valley Forge is in the co., which also contains the birthplace of Anthony Wayne. Co. seat. West Chester.

CHESTER, a co. in n. South Carolina, between the Catawba and Broad rivers, traversed by the Charlotte, Columbia and Augusta, and the King's Mountain railroads. The surface is uneven, soil fertile; business mainly agricultural. Co. seat, Chesterville.

CHESTER, a city in Delaware co., Penn., on the Delaware river and the Philadelphia and Wilmington railroad; 10 m. s.w. of Philadelphia; pop. '70, 9,485. C. is the oldest town in the state, having been settled by Swedes in 1643. William Penn's provincial assembly was held in Chester, and it was the co. seat of Chester co. until Delaware co. was set off in 1789.

CHESTER, an ancient and episcopal city, municipal and parliamentary borough, and river-port, the capital of Cheshire, on the right bank of the Dee, 22 m. from the mouth of its estuary, 16 m. s.e. of Liverpool. It stands on a rocky sandstone height, and is mostly inclosed in an oblong quadrangle of ancient walls, 7 or 8 ft. thick, nearly 2 m. in circuit, and with 4 gates, and now forming a promenade with parapets, where two persons can walk abreast. The two main streets cross each other at right angles, and were cut out of the rock by the Romans 4 to 10 ft. below the level of the houses. The houses in these streets are curiously arranged; the front parts of their second stories, as far back as 16 ft., form a continuous paved promenade or covered gallery, open in front where there are pillars and steps up from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. This arrangement, called the "rows," together with the ancient walls, and the half-timbered construction of many of the houses, with quaintly carved ornamented gables of the 16th c., render C. perhaps the most picturesque city in England. C. cathedral is an irregular massive structure of crumbling sandstone, 875 by 200 ft., with a tower of 127 feet. It was formerly the church of the abbey of St. Werburgh, and for 650 years was one of the richest in England. St. John's church, now partially in ruins, is supposed to have been founded by Ethelred in 698. The Dee is crossed by a superb stone arch of 200 ft. span. Suburbs of villas have recently arisen outside the walls; and a public park, presented by the marquis of Westminster, was opened in 1867. The C. railway station is the center of several important railways, and is one of the largest and finest in the kingdom. C. has manufactures of lead, iron-foundries, chemical works, and an iron-ship-building yard. The chief exports are cheese, copper, cast-iron, and coal. C. has many charitable and religious institutions, and is the abode of many wealthy families. Pop.

'71, 35,257. The city is a county in itself, and returns two members to parliament. In 1875, 3,550 vessels, of 218,368 tons, entered and cleared, but the silting up of the mouth of the Dee is against the shipping trade.

C. was *Devana Castra*, or Colonia Devana, an important Roman station, and has yielded many Roman remains—as masonry, coins, inscriptions, fibulae, altars, a hypocaust, and a statue of Pallas. C. was only in 828 taken by the Saxons from the Britons. Its strength made it a refuge against the descents of the Danes and Northmen, but the Danes took it in 894. Ethelfrida retook it in 904, and rebuilt the walls. From the Norman conquest to the time of Henry III., the earls of C. had their own courts and parliaments at C., with 8 subfeudatories and the superiors of the great religious houses, C. being then a county palatine. Henry III. made his eldest son earl of C., a title held since by the prince of Wales. Llewelyn ravaged C. in 1255. The 25 famous C. mysteries or religious plays by Randle, a monk (1250-60), were acted in the church. After a long siege, the parliamentary forces defeated those of Charles I. at C., and took the city. Pearson and Porteus were bishops of Chester. Trinity church contains the remains of Matthew Henry, the Biblical commentator. The commerce of C. has steadily declined since the rise of Liverpool.

CHESTERFIELD, a co. in n.e. South Carolina, intersected by the Cheraw and Darlington railroad; 868 sq.m.; pop. '70, 10,584—4,309 colored. Productions chiefly agricultural. Co. seat, Chesterfield Court House.

CHESTERFIELD, a co. in s.e. Virginia, between the Appomattox and the James river, traversed by the Richmond and Petersburg, and the Richmond, Danville, and Piedmont railroads; 300 sq.m.; pop. '70, 18,470—8,733 colored. Coal is abundant, but agriculture is the chief business, and corn and tobacco are the principal crops. Co. seat, Chesterfield Court House.

CHESTERFIELD, a municipal borough in Derbyshire, near the Hipper and Rother rivulets, 24 m. n.n.e. of Derby by rail. There are manufactures of leather, silk, lace, earthenware, and machinery; and there are several blasting-furnaces in the neighborhood. The manufactures are increasing rapidly, and the minerals in the neighborhood, including coal, iron, potters' and brick clay, slates, and lead, are being greatly developed. The population was, in 1851, 7,100; in 1871, 11,427. Trade is facilitated by a canal connecting C. with the Trent, and by the main line of the Midland railway.

CHESTERFIELD, Earl of (PHILIP DORMER STANHOPE), an English statesman and author, eldest son of the third earl of C., was b. in London, Sept. 22, 1694, and studied at Cambridge. In 1714, he made the tour of Europe, and the following year was appointed a gentleman of the bedchamber to the prince of Wales. About the same time, he was elected M.P. for St. Germans, in Cornwall. In 1726, on his father's death, he became earl of C., and in 1727 was sworn a privy-councillor. In 1728, he was appointed ambassador extraordinary to Holland, and in 1730 was made a knight of the garter and lord steward of the household, but soon resigned that office. An eloquent and frequent speaker, he took an active part in all the important business in the house of lords, and was for several years the strenuous opponent of sir Robert Walpole, then premier. In 1744, he connected himself with the administration, and in 1745 was reappointed ambassador to the Hague, but was soon nominated lord-lieut. of Ireland, where he rendered himself exceedingly popular. In Oct., 1746, he became one of the principal secretaries of state, but, two years after, declining health caused him to resign office, and in 1752 he was seized with deafness. Distinguished by brilliancy of wit, polished grace of manners, and elegance of conversation, he lived in intimacy with Pope, Swift, Bolingbroke, and other eminent men of the day. Dr. Johnson, whose dictionary, on its appearance, he affected to recommend, called him "a wit among lords, and a lord among wits." He wrote several papers, on temporary subjects, in *The Craftsman*, *The World*, periodicals of the time; but he is now best known by his *Letters to his Son*, Philip Dormer, written for the improvement of his manners. These letters have been often republished, and they afford a good idea of the mental and moral caliber of the author. Lord C. died Mar. 24, 1773.

CHESTERFIELD INLET, a long and narrow gulf, penetrating to the westward from the n.w. of Hudson's bay. Its extreme dimensions are 250 and 25 m.; and the lat. and long. of its mouth are 63° 30' n., and 90° 40' west. C. I. is studded nearly throughout with islands.

CHESTNUT, *Castanea*, a genus of plants of the natural order *cupulifera*, closely allied to the beech (*fagus*), and distinguished from it by long male catkins, longitudinally set with groups of flowers, a 5 to 8-celled ovary, and compressed rounded nuts. The name is derived from the town of Castanum, near Magnesia, in Asia Minor. The COMMON C., SPANISH C., or SWEET C. (*C. vulgaris*), is said to have been first brought from Asia Minor to Sardinia, and from thence to have gradually extended over the s. of Europe, where it has long been naturalized, and forms extensive woods. It is an ornamental, stately, or, in exposed situations, a very spreading tree, of great size and longevity; the still surviving C. of Totworth in England was known as a boundary-mark in the reign of king John. A celebrated C. tree on Mt. Etna measured 204 ft. in circumference of trunk. The C. has oblongo-lanceolate, acuminate, serrated, smooth leaves. The timber is dura-

ble and hard, and is used in house-building, for making furniture, and for many other purposes. The timber of the C. so much resembles that of the oak, as in old buildings to be distinguished with difficulty. The bark is used for tanning, but is worth only about half the price of oak-bark. Young C. trees are much esteemed for hop and espalier poles. The C. is therefore frequently grown in England as coppice-wood; but it succeeds well as a timber-tree even in Scotland, although it does not generally ripen its fruit. In Devonshire, however, and in some other parts of England, it is planted to a considerable extent as a fruit-tree. It succeeds throughout all the middle latitudes of Germany, but dislikes a damp foggy atmosphere. It prefers a dry light soil, and succeeds only where there is a dry subsoil. The nuts are generally two in each husk. They form a principal part of the food of the poor in the s. of Europe, being used either roasted or boiled, and often ground into flour, and made into a kind of bread. They contain 15 per cent of sugar, and by pressure yield a sugary juice, which readily undergoes the vinous fermentation, and from which a crumb-like kind of sugar may be obtained. The best kinds of chestnuts are called by the French *marrons*. When cultivated as a fruit-tree, the C. is generally grafted, by which means the better varieties are secured. —Other species of C. also bear eatable fruits: those of the AMERICAN C. (*C. Americana*), a tree much resembling the common C., and of the DWARF C., or CHINQUAPIN (*C. pumila*), a low tree, or more generally a shrub of 7 to 8 ft. high, are used in America. The fruit of the dwarf C. is of the size of a common hazel-nut; the nut is convex on both sides. The plant reaches its southern limit on the banks of the Delaware.—A number of species are natives of the east. The inhabitants of the mountains of Java eat the fruit of the SILVERY C. (*C. argentea*), and the TUNGURRUT (*C. tungurrut*), boiled or roasted, like the common chestnut. Both of these are large trees, the tungurrut reaching a height of 150 ft.—The horse C. (q. v.) is entirely different from the true chestnut.

CHESUN'COOK LAKE, an expansion of Penobscot river in Piscataquis co., Me., about 24 m. long by 2 to 4 m. wide.

CHEVALIER (Fr. *cheval*, a horse), in heraldry, a horseman armed at all points. In its more general acceptation it signifies a knight (q. v.). See also BANNERET and CHIVALRY.

CHEVALIER, MICHEL, an eminent French economist, born at Limoges, Jan. 13, 1806, was at the age of 18 admitted a pupil of the polytechnic school. Thence he went to the school of mines, and some days before the revolution of July, he was attached as an engineer to the department du Nord. Led away by the theories of the St. Simonians, he was for two years editor of the *Globe*, the organ of that sect. Joining the schism of M. Enfantin, he took an active part in the compilation of the *Livre Nouveau*, the standard of their doctrines, and in 1832 suffered six months' imprisonment, on account of his free speculations in regard to religious and social questions, being regarded as an outrage on public morals. On his liberation, he at once retracted all that he had written in the *Globe* contrary to Christianity, and against marriage, and obtained from M. Thiers a special mission to the United States, to inquire into the systems of water and railway communication there. The results were published in his *Letters from North America* (1836, 2 vols. 8vo). After a visit to England, he issued a work, entitled *Material Interests in France: Public Works, Roads, Canals, Railways* (1838, 8vo). He was named, successively, chevalier of the legion of honor, councillor of state (1838), a member of the superior council of commerce, and of the royal council of the university; and in 1840, professor of political economy in the college of France. In 1840, he was re-established in the corps of mines as engineer of the first-class; and in 1846, elected a member of the chamber of deputies. Under the republic, he lost his various employments. He published, in 1848, *Letters on the Organization of Labor and the Question of the Laborers*; and after the *coup d'état* of Dec. 2 was restored to his professorship, and named councillor of state. In 1860, C. assisted Mr. Cobden in carrying into effect the commercial treaty between France and England, and was created a senator. He became a grand officer of the legion of honor, 1861. Besides the works mentioned, he has written *Political Economy* (1842-50); *Probable Fall of the Value of Gold* (1859—translated by Cobden); *Mexico, Ancient and Modern* (1863); etc.

CHEVAUX-DE-FRISE, in fortification, is a hastily constructed substitute for a regular abattis, to stay the progress of an advancing enemy. It may be constructed in any way of wood or iron, provided it presents an array of sharp or ragged points towards the enemy. Sometimes it is made of barrels or centers of timber, with spears springing out from all sides, in such a way as to constitute both a support and a defense. Among the *matériel* of an army under the care of the engineers, are sometimes comprised chevaux-de-frise formed of cylindrical iron barrels, about 6 feet long, each having 12 holes to receive as many spears; the spears can be packed away in the barrel, when not in use. Each such piece constitutes a *cheval*; and many such, ranged end to end, form *chevaux*, to be used in ditches around a fortification, on the berme beneath the parapet, behind the glacis, across a breach in the rampart, or in any spot where a check to the storming-party is needed. At Badajoz, during the peninsular war, great service was rendered by a chevaux-de-frise formed of sword-blades fixed into beams of wood. The name is said to have been derived from "Friesland horse," and to have been first applied by the French during the wars of the 17th century.

CHEVERUS, JEAN LOUIS ANNE MADELEINE LEFEBVRE DE, D.D., 1768-1836; the first Roman Catholic bishop in New England. He was raised to the priesthood in 1790, and had a curacy at Mayence, in France; but on refusing to take the oath required by the assembly he went to England, and in 1795 came to America and joined the Roman Catholic mission in Boston. He spent some months in Maine as an Indian missionary. During the prevalence of the yellow fever in Boston his faithful and efficient service, without regard to sect or belief, made him remarkably popular, and when he started a subscription for funds to build a church of his faith, John Adams, then president of the United States, headed the list. In 1808, he was made bishop against his own protest. In 1823, he was recalled to France, and made bishop of Montauban, and still later bishop of Bordeaux and peer of France. He was appointed a cardinal Feb. 1, 1836. Six months afterward he died suddenly from apoplexy.

CHEVES, LANGDON, LL.D., 1776-1857; a native of South Carolina; elected to the state assembly in 1808; and to congress in 1816, serving five years, for a part of the time being speaker of the house, in which position he gave the casting vote that defeated the rechartering of the U. S. bank; but in 1819 he became president of the same bank. He was chief commissioner in settling some of the provisions of the treaty of Ghent. In 1850, he was a delegate to the Nashville national convention, and in 1852, a member of the South Carolina state convention, in which he opposed a separate state secession.

CHEVIOT HILLS, a mountain-range occupying contiguous parts of the counties of Northumberland and Roxburgh, on the English and Scotch borders, and running 35 m. from near the junction of the Till and Tweed, in the n.e., to the sources of the Liddel, in the s.w. The highest points are C. hill, 2,684 ft., and Carter Fell, 2,020. West of Carter Fell, these hills chiefly consist of carboniferous sandstone and limestone, with protrusions of trap. The e. portion of the range is porphyritic, and includes higher and more or less conical hills. In the C. H. are the sources of the Liddel, Tyne, Coquet, and some of the branches of the Tweed. Grouse abound, and the golden eagle is seen. These hills afford pasture for the Cheviots, a superior breed of sheep. They have been the scene of many bloody contests between the English and Scotch.

CHEVRETTE. See GYN.

CHEVREUL, MICHEL EUGÈNE, a distinguished French chemist, b. Aug. 31, 1786, at Angers, in the department of Maine-et-Loire. In 1820, he was made an examiner in the polytechnic school; and in 1824, director of the dyeing department in the manufactory of the Gobelins. This last position led him to institute a series of accurate researches on colors, the results of which he made known in a series of *Mémoires* of the academy of sciences. Previous to this, C. had made himself known in the scientific world by a variety of researches and writings. In 1826, he was made a member of the academy; and in 1830, professor of applied chemistry in the museum of natural history. Besides a great number of articles in the *Journal des Savants*, beginning with 1820, the following works of C. deserve mention: *Leçons de Chimie appliquée à la Teinture* (1828-31); *De la Loi du Contraste simultané des Couleurs et de l'Assortiment des Objets coloriés* (1839); *Théorie des Effets Optiques que présentent les Etoffes de Soie* (1846); *De la Baquette divinatoire, du Pendule, et des Tables tournantes* (1854); *Des Couleurs et de leur Application aux Arts Industriels* (1864); and a work on a new organic acid, *L'Acide Arique* (1871). C. is a fellow of the royal society of London, and a commander of the legion of honor.

CHEVREUSE, MARIE DE ROHAN MONTBAZON, Duchesse de, 1600-79; a native of France, married first to the duc de Luynes, and next to Claude de Lorraine, duc de Chevreuse. Her friendship for Anne of Austria made Richelieu her enemy, and he resolved to have her arrested; but, learning of his purpose, she dressed in male attire, swam across the Somme, and escaped to England. She was concerned in other political intrigues, and was kept in banishment nearly all her life.

CHEVRON, in heraldry, an ordinary representing the couples or rafters of a house, and supposed to betoken the accomplishment of some memorable work, or the completion of some business of importance, generally the foundation of his own family by the bearer. The C. is formed of two lines placed pyramidically, i.e., joined together at the top, and descending to the extremities of the shield in the form of a pair of compasses. *Chevronel*, a diminutive—half the size—of the chevron. *Per chevron*, or *party per chevron*, is where the shield is divided by a line in the form of the chevron.

CHEVRON, in architecture, a molding in the form of a succession of chevrons, otherwise called a zigzag molding. In general, it is characteristic of Norman architecture, but is also found with the pointed arch, during the transition period from Norman to early English.

CHEVRONS are braids or bands of lace, worn as distinguishing marks by the non-commissioned officers of regiments. The corporals, and the various grades of sergeant, have C. varying from one to four in number, either of white or of gold lace. In most corps, they are worn on the right arm only; but in the guards, the fusileers, the light infantry, and the grenadier and light infantry companies of the ordinary regiments, on both arms.

CHEVY CHASE, the name of perhaps the most famous of British ballads. In its present form, the piece does not seem to be older than about the beginning of the 17th century. But more ancient versions, doubtless, existed; and bishop Percy has published a poem of the 16th c., which has obviously suggested passages in the more recent composition. It is impossible to reconcile its incidents with history, but the event which is meant to be commemorated appears to have been the battle of Otterburn, in Aug., 1388—a fight which Froissart declares to have been the bravest and most chivalrous which was fought in his day. According to the ballad, Percy vowed that he would enter Scotland, and take his pleasure for three days in the woods of his rival, and slay the deer therein at will. Douglas, when he heard the vaunt, exclaimed: "Tell him he will find one day more than enough." Accordingly, at the time of the hay-harvest, Percy, with stag-hounds and archers, passed into the domains of his foe, and slew a "hundred fallow-deer and harts of grice." When the English had hastily cooked their game, and were about to retire, earl Douglas, clad in armor, and heading his Scottish spears, came on the scene. Haughty challenge and defiance passed between the potentates, and the battle joined. In the center of the fray the two leaders met: "Yield thee, Percy!" cried Douglas. "I will yield to no Scot that ever was born of woman!" cried Percy. During this colloquy, an English arrow struck Douglas to the heart. "Fight on, my merry men!" cried he, as he died. Percy, with all the chivalrous feeling of his race, took the dead man by the hand, and vowed that he would have given all his lands to save him, for a braver knight never fell by such a chance. Sir Hugh Montgomery, having seen the fall of Douglas, clapped spurs to his horse, dashed on Percy, and struck his spear through his body a long cloth-yard and more. Although the leaders on both sides had fallen, the battle, which had begun at break of day, continued till the ringing of the curfew-bell. Scotsmen and Englishmen claim the victory. When the battle ended, representatives of every noble family on either side of the border lay on the bloody greensward.

CHEWINK, the popular name for the ground robin, or towhee bunting, *pipilo erythrophthalma*. It is of variegated colors, red, white, and brown, is about 7 or 8 in. long, nests on the ground, and flies with a peculiar jerky motion. It lives in thickets, and finds its sustenance in seeds and worms scratched up from leaves and grasses.

CHEYENNE, a co. in s. w. Nebraska, on the Colorado and Wyoming border, intersected by the n. and s. forks of the Platte; 6,000 sq. m.; pop. '70, 190. The Union Pacific railroad passes through the s. part. Co. seat, Sidney.

CHEYENNE, a city in Laramie co., Wyoming, the capital of the territory, on the Union Pacific railroad, where it is joined by the Denver Pacific, 516 m. w. of Omaha and 1400 m. e. of San Francisco; pop. about 5,000. The town is on a broad open plain, 6,000 ft. above tide, and the streets are wide and regular. It is connected by rail with Denver, 106 m. s. of Colorado. The main business is in receiving and distributing supplies for Indian agencies and government forts. There are, however, several manufactories, and a rapidly growing general business. The place was first settled in 1867, when the Union Pacific railroad reached that point. In 1869, a large portion of the city was destroyed by fire.

CHEYENNES, an Indian tribe of the Algonquin family, once residing on and near the Cheyenne river, a tributary of the Red river of the North. Driven away by the Sioux, they retired beyond the Missouri, and about the beginning of the century they were further driven to the Black Hills region. In 1825, the first treaty with them was made by gen. Atkinson. Since then many treaties have been made, and almost all of them immediately broken by the whites, and constant trouble has been the result. The fearful and cold-blooded massacre of nearly a hundred men, women, and children of this tribe, by col. Chivington, of Colorado, in Nov., 1864, led to war that cost the U. S. government \$40,000,000, and so embittered the Indians that a permanent peace can hardly be looked for. In 1867, gen. Hancock burned some of the villages, and began or rather continued a state of war, in the course of which gen. Custer defeated them at Washita, where Black Kettle, a chief, and two or three dozen squaws and pap-pooes were killed. The revenge taken upon Custer a few years later will not soon be forgotten. Almost while this article is being written, the government is in danger of another general Indian war, growing out of unfair dealing on its own part with the Cheyennes and other Indians with whom it has entered into solemn contracts.

CHEYNE, GEORGE, an eminent Scottish physician, b. in Aberdeenshire in 1671, was at first intended for the church, but, preferring the medical profession, studied at Edin-burg, under the celebrated Dr. Pitcairn. In 1700, after taking the degree of m. d., he repaired to London, where he practiced in winter, and in Bath in summer. From full living he became enormously fat, as well as asthmatic, and resolved on strictly adhering to a milk and vegetable diet, from which he derived so much benefit that he recom-mended it in all his principal medical treatises. In 1702, he published *A New Theory of Fevers*, and, in 1703, a work on *Fluxions*, which procured him admission into the royal society. Among his other works are: *Philosophical Principles of Natural Religion*, 1705; *Observations on Gout*, 1722; *Essay on Health and Long Life*, 1725; *The English Malady*—

a *Treatise on Nervous Disorders*, 1733; *Essay on Regimen*, 1739; *Account of Himself and of his various Cures*, 1743. Dr. C. died at Bath. April 12, 1743.

CHHATISGARH, a division of British India under the jurisdiction of the commissioner of the central provinces, comprising the districts of Raipur, Bilaspur, and Sambalpur, and seven small feudatory states, between 16° 50' and 23° 10' n., and 80° 30' and 83° 15' e.; 36,467 sq. m.; pop. '72, 3,289,043, of whom 2,054,874 were Hindus, 26,046 Mohammedans, 243 Buddhists, 451 Christians, and 1,207,429 aboriginal tribes of religion not specified. Two large rivers, the Nerbuddha and the Son, rise in the n.e. corner of the division, the former running nearly w. to the Bombay coast, and then falling into the Ganges in lower Bengal.

CHHINDWARA. See CHINDWARA, *ante*.

CHIABRERA, GABRIELLO, an Italian poet, b. at Savona, 8th June, 1552. He was educated at Rome under the care of his uncle, after whose death he entered the service of cardinal Cornaro, but was obliged to leave it in consequence of the revenge he had taken on an Italian nobleman who had done him an injury. In his 50th year he married, and remained independent for the rest of his life. He died 14th Oct., 1637. C.'s poetical faculty developed itself late. Having commenced to read the Greek writers at home, he conceived a great admiration of Pindar, and strove successfully to imitate him. He was not less happy in catching the naïve and pleasant spirit of Anacreon; his canzonetti being distinguished for their ease and elegance, while his *Lettere Familiari* were the first attempt to introduce the poetical epistle into Italian literature. C. also wrote several epics, bucolics, and dramatic poems. His *Opere* appeared at Venice, in 6 vols., 1768.

CHIANA (in ancient times, *Clanis*), a river in Tuscany, formed by several streams from the Apennines, and falling into the Arno a few miles below Arezzo. Along with another river of the same name, which, flowing in the opposite direction, enters the Paglia at Orvieto, it waters the perfectly level Val di Chiana, which its overflow rendered once the most pestilential district of Italy. Ferdinand III. and his minister, Fos-sombroni, undertook extensive hydraulic works for improving the bed of the river, which they led through the lakes of Montepulciano and Chiusi, and employed for the artificial irrigation of the whole valley. The district has since become the most fruitful, perhaps, of all Italy—a perfect garden, supporting a pop. of more than 100,000.

CHIA PA, or CHIAPAS, a state in the s.e. of the Mexican confederation, lying to the s.w. of Yucatan, and extending in lat. between 16° and 18° n., and in long. between 90° 30' and 94° west. It contains about 19,000 sq. m., and 194,000 inhabitants, chiefly aborigines. Near Palenque, one of the towns of C., are some of the most extensive and magnificent ruins in Central America.

CHIARAMONTE, a t. of Sicily, about 32 m. w.s.w. of Syracuse. It is situated on a hill, and has well-built, regular streets. Wine of good quality is produced in the district. Pop. about 9,000.

CHIARI, a t. of Lombardy, 14 m. w. of Brescia, on the railway between that place and Milan. It is an ancient place, many Roman remains being still found here; and at one time it was strongly fortified, but its walls are now ruinous. Silk is the staple manufacture. Pop. 10,000.

CHIAR-OSCURO (Ital.), an artistic term, composed of two Italian words, the one of which signifies light, the other darkness or shadow. But C. signifies neither light nor shadow; neither is it adequately described by saying that it is the art of disposing of both the lights and shadows in a picture, so long as either is regarded apart from the other. It is rather *the art of representing light in shadow, and shadow in light*, so that the parts represented in shadow shall still have the clearness and warmth of those in light, and those in light the depth and softness of those in shadow. It is not the making of the one die softly and gradually away into the other, but the preservation of both in combination, as we constantly see it in nature, when the light is not the mere glare of the sun striking on a particular object, nor the shadow the entire absence of the influence of light. That the skillful treatment of C. is a matter of extreme difficulty, is plain enough from the very small number of artists who ever attain to it. Still it is a branch of art without the mastery of which no painting can be successful in any department. It is as indispensable in portrait-painting as in the highest departments of ideal art; and though a just and even a lofty conception of the subject may be distinctly indicated by attention to form alone, it is impossible that its realization can ever be satisfactorily accomplished by any one who has not mastered this most subtle mode of handling colors. The only mode by which a knowledge of C. can be attained, so as to apply it to practice, is by studying it as exhibited by such painters as Titian, Rubens, Rembrandt, and, above all, Correggio.

CHIAVA RI, a maritime t. of Piedmont, situated on the gulf of Rapallo, at the mouth of the Sturla, 21 m. e.s.e. of Genoa. The houses in general are well built, with open arcades skirting the narrow streets. C. has several fine churches, the principal of which is the *Madonna del Orto*. Numerous picturesque old towers, one of them of considerable size, are scattered over the town. Lace and silk are manufactured here; and the place is also noted for its light, handsome, cheap furniture, made chiefly of cherry-

wood. The anchovy fishery is important; and in the vicinity are extensive slate-quarries. Pop. 10,457.—The old province of C., of which the above town was the capital, had an area of 155 sq.m., with a pop. of 109,000. Its surface is generally mountainous, but it has valleys of great fertility, yielding grain, grapes, olives, etc. Cattle, sheep, goats, and silk-worms are reared.

CHIAVENNA, a t. of Lombardy, beautifully situated in the midst of vineyards, at the junction of the valley of St. Giacomo and Val Bregaglia, 38 m. n.n.w. of Bergamo. It is overlooked by the Rhetian Alps; and its position on the Splügen road secures it considerable traffic. Silk, cotton, and a coarse ware cut out of a soft stone found in the neighborhood, are the chief manufactures. Pop. about 4,000.

CHICA, a red feculent substance, valuable as a dye-stuff, giving an orange-red color to cotton. It is obtained by boiling the leaves of a species of *bignonia* (*b. chica*), a native of the banks of the Cassiquiare and the Orinoco. The Indians use it for painting their bodies. The C. plant is a climber, with abruptly bipinnate leaves, smooth heart-shaped leaflets, and flowers in pendulous axillary panicles. See **BIGNONIACEÆ**.

CHICA, **PITO**, **POSO**, or **MAIZE BEER**, is a fermented liquor made from maize or Indian corn. It is much used in some parts of South America, and is made in a similar manner to ordinary beer; but the Indians sometimes prepare it by chewing instead of crushing the grain; and that which is so prepared (*chica mascada*, or chewed C.) is most highly esteemed by them. When they wish to make this liquor particularly strong and well flavored, they have also a practice of pouring it into an earthen jar, which contains some pounds of beef; and having made the jar perfectly air-tight, they bury it several feet deep in the ground, where it is left for several years. On the birth of a child, it is their custom thus to bury a jar of C., to be drunk at the same child's marriage. C. has an agreeable flavor, and is very strong and intoxicating. A spirituous liquor is obtained from it by distillation; vinegar is also made from it.

CHICACOLE, a t. of the district of Ganjam, in the presidency of Madras, being in lat. 18° 18' n., and long. 83° 58' e., and lying 415 m. to the s.w. of Calcutta, and 435 to the n.e. of Madras. It stands on the left or n. bank of Naglaudee, not far from the bay of Bengal. It is a military station, and contains, besides its garrison (1871), 15,587 native inhabitants. The place has a reputation for its richly worked muslins.

CHICAGO (pronounced *She-kaw-go*), the principal city of Illinois, and seat of Cook co., is situated on the south-western shore of lake Michigan, at the mouth of the Chicago river, lat. 41° 50' 20" n., long. 87° 37' west. The name is of Indian origin, signifying "wild onion," and is first mentioned by Perrot, a Frenchman, by whom it was visited in 1671. In 1803, a stockade fort was built near the mouth of the river, and named fort Dearborn. When the war with Great Britain broke out in 1812, the government, apprehensive that a post among the Indians so far from the frontiers could not be successfully maintained, ordered the commander to abandon it. The Indians destroyed the fort, which was rebuilt in 1816. C. was first settled in 1831, previous to which time it was a mere frontier-post; in 1832, it contained about a dozen families, besides the officers and soldiers in fort Dearborn. The town was organized by the election of a board of trustees, Aug. 10, 1833. On Sept. 26, of the same year, a treaty was made for all their lands with the Pottawatomies, 7,000 of the tribe being present, after which they were removed w. of the Mississippi river. The first charter of the city was passed by the legislature Mar. 4, 1837. The following table exhibits the rapid increase of Chicago. The estimated number of the pop. in 1835 was 1000, and the exact number, according to the census returns, was, in

1840.....	4,470	1852.....	38,733	1865.....	187,446
1845.....	12,080	1853.....	60,652	1870.....	298,977
1848.....	20,035	1855.....	83,509	1872.....	364,377
1850.....	28,260	1860.....	150,000	1875.....	410,000

C., perhaps the most remarkable city in the world for its rapid growth, is built upon a plain sufficiently elevated to prevent inundation. Some years ago, the elevation of the principal streets, also the buildings, were raised from 4 to 10 ft., the object of this gigantic undertaking being to admit a thorough system of sewerage. The Chicago river and its branches separate the city into three divisions, connected by large tunnels. The main stream, flowing directly w., is about 100 yards wide, and forms one of the best harbors on the lakes. Vessels ascend the river and its branches a distance of 4 m. from its mouth, thus affording nearly 18 m. of wharfrage. The water for the city is now supplied by a tunnel from lake Michigan, which was opened in 1867, and supplies 57,000,000 gallons daily. There are also about 40 artesian wells. C. possesses a splendid system of public parks, and numerous handsome buildings. More than 30 railways meet here.

The Illinois and Michigan canal, completed in 1848, connects the Chicago and Illinois rivers, thus affording communication between the lakes and Mississippi to the coal-fields of Illinois, and to the vast quarries of so-called Athens marble, regarded as the finest building-material in the country. It is found on the banks of the canal, about 20 m. from C.; and is easily worked when first quarried, like the Caen stone.

The 36 public schools of C.—some capable of holding 1000 children—afford the

means of education, free of charge, to every child in the city. At the head of the system is the high school. Here the sons and daughters of the poorest man may aspire to the highest honors in the classics and modern languages. There are also numerous private schools and seminaries, besides several universities, medical colleges, theological, literary, and scientific institutions, located in Chicago.

Since 1853, pork-packing has been conducted on an enormous scale. In 1872, cattle to the value of \$41,000,000 were received, and 16,080 head were packed as beef. The value of hogs received was \$33,500,000, and 1,456,650 were packed as pork. Since 1854, C. has been the largest primary grain *dépôt* in the world. In 1872, 88,426,842 bushels of breadstuffs were received, and 83,364,224 shipped. C. is also the most extensive lumber market in the world. There are 80 newspapers and periodicals.

In Oct., 1871, a terrible fire occurred, which burned 18,000 houses, extending over more than 2,000 acres; 200 persons perished, and nearly 100,000 were rendered homeless. The property burned was estimated at 200,000,000 dollars. This stupendous calamity awakened the sympathy of the civilized world. Great Britain and other countries subscribed money freely for the sufferers. The city was entirely rebuilt in a style of great magnificence within two years.

CHICAGO (*cont.*). In 1831, when the first white settlement was made at the mouth of the Chicago river, it seemed an unpromising site for a great city, and for years afterwards there probably was not among its inhabitants one who expected that such a city would grow up on that spot. The river mouth was a sluggish bayou; its banks marshy, muddy flats, suggestive of intermittent and congestive fevers. But harbors on the great lakes were not turned out ready made by nature, but had to be constructed to a greater or less extent by human enterprise and skill, and that of Chicago was no exception to the general rule. There was need of a good harbor at that point, and the location was not unfavorable, if the citizens and the government could be persuaded to spend money enough in the effort. The channel could be dredged, the flats filled, and the waves of the lake beaten back by artificial structures of wood or stone. This work, begun upon a small scale, has been rapidly extended to meet the growing wants of commerce, until C. now has a harbor adequate to the demands of a great city. The shore of the lake at this point presents an even line, extending very nearly due north and south. The river extends back from the lake westerly five eighths of a mile, at which point two branches come in, one from the northward, the other from the southward; thus dividing the city into three parts, known as the n., s., and w. divisions. The s. branch of the river is connected by the Illinois and Michigan canal with the Illinois river at La Salle, thus opening a direct water communication with the Mississippi. In the earlier period of its history, C. suffered much from intermittent and bilious fevers, cholera and other diseases, consequent upon its low, marshy situation; but at length the grade of a large portion of the city was raised from 8 to 10 ft.; block after block of heavy buildings, including some of the largest hotels and stores, being raised to the required level by jack-screws, worked by steam-power. It was one of the most stupendous engineering experiments ever undertaken, but it was successfully accomplished. The Illinois and Michigan canal was completed, 1848. It is 96 m. in length, and at its highest level was originally 12 ft. above the lake; but in 1866-70 the city deepened it at a cost of \$3,251,621. It is now 8½ ft. below the ordinary level of the lake. The river channel was also deepened, so that the lake no longer receives its waters, but itself furnishes a clear stream flowing the other way, giving improved navigation and carrying off the sewerage of the city towards the Illinois river at the rate of a mile an hour. The fruits of this engineering enterprise are seen in the suppression of the foul odors so long endured by the inhabitants, and the consequent improvement in the sanitary condition of the city. The harbor at the mouth of the river is protected by magnificent lines of breakwater, so arranged as to afford space for extensive ship channels and docks. One of the basins thus provided comprises an area of nearly 300 acres, the entrance to which from the lake is 600 ft. wide. The city extends along the lake side about 8 m., and westward 5 m., embracing an area of about 35 sq. miles. Its grade is 14 ft. above the lake on the eastern side, and 28 ft. at the western extremity. The descent towards the lake from the w. is sufficient for drainage. The city is regularly laid out, the principal avenues running parallel with the lake shore. The streets are generally 80 ft. wide, and some of them are from 3 to 7 m. in length. The scarcity of stone has led to the use of wood, cinders, and gravel for pavements. The streets are lighted with gas, and amply supplied with sewers. The n., s., and w. divisions are connected by numerous bridges across the river and its branches, and by two stone tunnels under the river-bed, of which, one passes under the s. branch, connecting the s. and w. divisions; the other, under the main river, connecting the n. and s. divisions. These tunnels cost nearly \$1,000,000. Horse cars traverse the city in every direction. The business portion of the city is mainly in the s. division, and here also are the chief public buildings, hotels, retail stores, etc. The most important public buildings are the U. S. custom-house and post-office, occupying an entire block 342 by 210 ft., and costing upwards of \$5,000,000; the chamber of commerce, a spacious and imposing structure, with elaborate interior decorations; the new city hall and county court-house, occupying a whole block and costing \$5,000,000; and the exposition building, a vast edifice of iron and glass, 800 ft. long and 200 ft. wide, and surmounted by a dome 60 ft. in diameter and 160 ft. in height. Some

of the 300 churches of the city are fine specimens of various styles of ecclesiastical architecture. C. has 6 public parks, with an aggregate area of nearly 2,000 acres, connected by boulevards 250 ft. wide, extending around the three sides of the city, with a drive on the lake shore. These afford a continuous driveway of more than 30 miles. Lincoln park, in the n. division, contains 230 acres fronting upon the lake. A boulevard on the n., $3\frac{1}{2}$ m. long, connects this with Humboldt park on the w.; while that by another boulevard is in turn connected with Central park, and that again by still another with Douglas park. From the latter a boulevard runs a distance of 9 m. to a park in the s. division. From the s. end of the northern park a broad avenue extends eastward to another fronting upon the lake. The parks of the s. division are just outside of the city limits.

The water communications of C. are of vast extent, embracing the whole chain of northern lakes, with their 3,000 m. of coast-line. Steamboats and sailing vessels of the largest class are employed in commerce with lake Superior, bringing down vast stores of iron and copper ore from that region; while through the Welland canal (around Niagara falls), connecting lake Erie with lake Ontario, vessels loaded at C. pass eastward to Montreal, where connection is made with steamships for Europe. The Erie canal through New York is also a commercial highway for Chicago to the ports of the Atlantic seaboard. The Illinois and Michigan canal, already mentioned, gives the city communication with the Mississippi and its affluents during nine months of every year. But, important as all these water channels are, they are not more so than the network of railroads by which C. is put in rapid communication with a vast region of country extending from the lakes of the north, eastward to New York, Philadelphia, Boston, and Portland; southward to Louisiana and Florida; and westward to the Pacific coast. There is not another such railroad center in the world. From 10,000 to 12,000 m. of railway are in a greater or less degree tributary to this great city, now about 50 years old. The different lines of road converging to the city, as represented on the map, are bewildering alike to the eye and to the imagination. Nearly 400 trains enter and leave daily upon these roads, making an aggregate of nearly 800 arrivals and departures. The accommodations for these roads are, upon the whole, excellent. The Union depot, one of the largest and finest buildings of the kind in the country, is used by two of the principal roads; the Central depot, by two others; and there are three or four more for the use of others. Plans for uniting all the roads at a common center, or for connecting them by a common track, have been proposed.

C. is supplied with an abundance of pure water from lake Michigan by a process which is one of the wonders of modern engineering skill. Two cylindrical brick tunnels, one 6 ft., the other 7 ft. in diameter, starting from the shore at different points, extend a distance of 2 m. under the lake, and meet in an immense crib inclosing a grated cylinder, through which the water descends into them in a stream unailing as the lake itself. The smallest of these tunnels, extending from the shore of the n. division of the city, was completed in 1866. The water as it is received at the shore end of the tunnel is forced by steam-pumps through a stone tower to a height of 160 ft. into a reservoir, whence it is distributed by pipes to different parts of the city. The top of the water-tower, which is reached by a spiral staircase, affords a fine view of the city and the surrounding country. On the crib, 2 m. out in the lake, stands a light-house, with a dwelling for the keeper. The second and larger tunnel, which supplies the south-western section of the city, was completed in 1874. A tunnel 7 ft. in diameter, passing under the central portion of the city, is to connect the old works with the new, and afford an independent supply of water for extinguishing fires. The tunnels under the lake cost \$1,507,622. The water-works altogether, to Jan. 1, 1873, are estimated to have cost more than \$5,000,000. Besides the supply from the lake, the city has another resource in some 40 artesian wells, two of which (694 and 911 ft. deep respectively) yield about 1,200,000 gallons per day. The great stock-yards, the west-side parks, and some of the manufacturing establishments, are supplied from these wells.

The educational facilities of C. are extensive, and of a high order of excellence. The public schools, which give instruction to the children of citizens with no distinction of class, are well organized and efficient. The number of these schools in 1872 was 32, occupying 45 buildings and employing 476 teachers—all but 31 women. The school pop. of the city (between 6 and 21 years of age) was 88,219; the number of pupils enrolled 38,035, of whom 512 were in the high school, and 63 in the normal school. Of the teachers, 221 were graduates of the normal and high schools. Total expenditure for these schools in 1872, \$499,349, including about \$360,000 for teachers' salaries. The school buildings with the land on which they stood were valued at over \$2,265,000. The Roman Catholics also have schools, and there are many private academies. The university of Chicago, a Baptist institution, founded by the efforts of Stephen A. Douglas, has connected with it a law school, and the Dearborn astronomical observatory, both well equipped and efficient, and a library of 20,000 volumes. St. Ignatius's college, founded in 1870, also is a flourishing institution. Of the six medical colleges of the city, one is open to women, one is homeopathic, and one eclectic. Of the four theological seminaries, one is Baptist, one Congregational, one Lutheran, and one Presbyterian. There are also three commercial colleges, and four female colleges or seminaries of high grade. The academy of sciences, established 1857, lost heavily by the great

fire of 1871, but is getting a new museum and library. The public library occupies the old custom-house and post-office, whose walls outlasted the great fire: the number of volumes is estimated at 100,000. According to the latest reports, there were more than 100 newspapers and periodicals published in the city. Of these 11 were daily, 5 tri-weekly, 45 weekly, 3 semi-monthly, 1 bi-monthly, and 4 quarterly; 18 were religious, 16 political, 18 literary, 10 commercial, and 5 juvenile. Some of these papers have a very large circulation, exerting a very wide influence in the north-western states.

The principal religious denominations, according to the number of their churches, rank as follows: Roman Catholic, 27; Methodist, 22; Baptist, Presbyterian, and Episcopal, each 18; Congregational, 17; Swedenborgian, 4; Unitarian, 5; Universalist, 4. Benevolent and charitable associations and institutions are numerous. Among them are 7 orphan asylums, 6 dispensaries, 2 asylums for the aged and indigent, 1 home for the friendless, and a multitude of smaller charities. The C. relief and aid society, from its foundation, 1857, has had the management of a large portion of the voluntary charities of the city for the benefit of the poor, infirm, and helpless. The same society disbursed to the sufferers by the great fire of 1871 the sum of nearly \$6,000,000, sent for their relief from Europe and every part of the United States. The young men's Christian association was also very active at that time, as it was before and has been since, for the relief of the poor and destitute. The population of C. in 1870 was 298,977; according to the unofficial figures of the census of 1880, as reported by the *Tribune* of that city, it is 503,298. [At the date of this writing the census has not been officially issued.]

As a commercial city C. ranks next to New York. It is the center of a vast trade in breadstuffs, live-stock, pork, beef, provisions, lumber, wool, hides, groceries, dry-goods, boots and shoes, hardware, clothing, and tobacco. The statistics now accessible are very inadequate as a means of showing the present extent of the trade and manufactures of the city. Every year shows a startling augmentation of the volume of business of almost every kind in this great western emporium, itself the wonderful growth of but half a century. The aggregate wholesale trade of the city in 1872 was reported by the board of trade at \$500,000,000. The total receipts of wheat in 1873 were 16,626,923 bushels; to this add 88,426,842 bushels represented by the flour received in 1872 (less, doubtless, than was received in 1873), and we have a total of 105,053,765 bushels for a single year. The great yards which are the center of the live-stock trade were opened in 1858. They cover an area of 345 acres, affording a capacity for 21,000 cattle, 75,000 hogs, 22,000 sheep, and 200 horses. They are thoroughly drained, supplied with water from artesian wells, and furnished with every convenience for the reception, care, and transfer of the animals. The total value of live-stock received in 1872 was estimated by the board of trade at \$75,475,000. The chief branches of manufactures in C. are iron, flour, high-wines, agricultural implements, pork and meats, boots and shoes, leather, cotton, and watches. It is supposed that at the present time not less than 60,000 people are employed in manufactures of one kind or another, and that nearly one third of the commerce of the city is based upon what they produce. Ship-building also is carried on to some extent. The flour manufacture was temporarily crippled by the great fire, 6 of the 15 mills having been destroyed. The banking business of C. is very large. In 1872, there were 21 national banks, with a capital of over \$11,000,000, and more than \$23,000,000 of deposits. There were also 18 savings-banks with over \$12,000,000 of deposits, and numerous private banks. The total valuation of real and personal property for taxation in 1872 was \$284,197,430; the actual value at the same time was more than \$620,000,000.

The great fire of Oct., 1871, raged two days and nights, destroying everything upon an area of 2,100 acres, embracing nearly all the business portion of the city, and a very large number of private residences, among which were the most costly in the place. More than 17,000 buildings were destroyed, including the custom-house, court-house, post-office, gas-works, the principal newspaper offices, 32 hotels, 3 railroad depots, 8 school-houses, 10 theaters and halls, 41 churches, 5 grain elevators, and all the national banks but one. The loss on buildings was estimated at \$50,000,000; on personal property and merchandise, \$140,000,000; total \$190,000,000, of which a little over \$40,000,000 was recovered on insurance. Many insurance companies were utterly ruined. Not less than \$7,000,000 were contributed in this country and in Europe to aid the sufferers. Over 98,000 persons were rendered homeless, while 200 were killed. The recovery of the city from this calamity was rapid, inasmuch that after the lapse of three years scarcely a trace of it could be seen, and almost its only evidence was in the immense improvement of the buildings over all the ravaged district.

CHICHEN, a t. of Central America, in the n.e. of the peninsula of Yucatan, which separates the gulf of Mexico from the Caribbean sea, 18 m. to the s.w. of Valladolid. It is one of the principal towns of the state, and is worthy of notice chiefly for the remains of an ancient city, comprising a ruined temple 450 ft. long, a pyramid with a base of 550 ft. square, and a domed edifice ornamented with sculpture.

CHICHESTER, a municipal and parliamentary borough and Episcopal city in Sussex, 17½ m. e.n.e. of Portsmouth. It stands on a plain between an arm of the sea and the South Downs, which rise gently on the north. It is well built, and has wide streets. The two main streets cross at right angles, and meet in an elaborately-worked eight-sided

cross. Within the suburbs the city is surrounded by an ancient wall, $1\frac{1}{2}$ m. in circuit, with some semicircular bastions, and now a promenade under the shade of elms. The cathedral, erected in the 12th and 13th centuries, on the site of a wooden one founded 1108, and burned 1114, measures 410 by 237 ft., with a spire 300 ft. high. The aisles are double—a mode of construction to be seen nowhere else in Britain. The cathedral has a rich choir, and portraits of the English sovereigns from the conquest to George I., and of the bishops down to the reformation. The chief trade is in agricultural produce, and live-stock. There are malting, brewing, and tanning establishments. Pop. '71, 9,054. C. returns one member to parliament. The harbor, 2 m. to the s.w. of the city, is a deep inlet of the English channel, of about 8 sq.m.; has several creeks and Thorny isle; and is connected with C. by a canal. C. was the Roman *Regnum*, and has afforded Roman remains—as a mosaic pavement, coins, urns, and an inscription of the dedication of a temple to Neptune and Minerva. C. was taken and partly destroyed, in 491, by the South Saxons. It was soon after rebuilt by Cissa, their king, and called Cissan-caster, or Cissa's camp. It was for some time the capital of the kingdom of Sussex. In 1642, the royalists of C. surrendered to the parliamentarians, after a siege of ten days.

CHICKADEE, *Parus atricapillus*, is distinct from the European blackcap. It is about $5\frac{1}{2}$ in. long, and 8 in. in spread of wings. Head and neck, and a patch on the throat, black; other plumage, ash-gray and brown; tail edged with white, and a white bar on the wings. Where it has not been driven away by the English sparrow, it destroys great numbers of canker worms and other caterpillars. It is a very lively, sociable, and useful bird.

CHICKAHOMINY, a river in Virginia, rising n.w. of Richmond and running e. between the James and the Pamunkey to the w. line of James City co., where it turns abruptly s., and after a course of about 10 m., joins the James. The surrounding country e. of Richmond is level, and in one section there is a large swamp. On and near the C. in the early years of the civil war occurred many of the most important military movements, skirmishes, and battles—here mentioned in the order of time. In 1862, the peninsular campaign on the part of the union army began with the siege of Yorktown, the objective point being Richmond, to reach which it was necessary that the C. should be crossed. McClellan, on the union side, had 118,000 men when the siege was begun, April 5. On the other side, the confederates had 15,000 men in Yorktown, and about 50,000 more scattered over n. Virginia, all under gen. Joseph E. Johnston. The 6th of May was the day for opening fire upon Yorktown, but on the 4th Johnston left the place, taking guns, baggage, etc., and retreated towards Richmond. On the 5th he was assailed by Hooker; and Longstreet, who commanded the rear of the confederates, turned on the defensive just as he had passed Williamsburg. He was met by Hancock's division, and was compelled to abandon his works after a sharp fight; but Longstreet held his position long enough to secure the confederate trains from pursuit. This was the battle of Williamsburg. The union loss was 1856 killed and wounded, and 372 missing. The confederate loss was about the same. On the 27th of May occurred the battle of Hanover Court-House, in which the union loss was 53 killed and 344 wounded and missing. The confederate loss must have been much greater, for McClellan's report says there were about 200 of their dead buried by our troops, and 730 prisoners were sent to the rear. The confederates had now concentrated in and around Richmond, where they had 67,000 men. The next fight on the C. was the battle of the Seven Pines, or of Fair Oaks, which took place on the 31st of May, and resulted in a substantial union victory. The confederate leader, gen. Johnston, was severely wounded, and their losses were very heavy, but, as in most cases, no trustworthy report was made of the numbers. The union army lost 890 killed, 3,627 wounded, and 1222 missing. It is well known that the confederates felt this to be a disastrous defeat, and in common with the people of the northern states, they expected that the next move would be the capture of Richmond; but, for reasons concerning which it is to be said only that they were never explained to the general satisfaction of the people in the northern states, McClellan made no demonstration, and soon the almost defenseless city was powerfully fortified under the direction of gen. Robert E. Lee, who had superseded Johnston in the confederate command. The fourth of the contests of the C. was the battle of Mechanicsville, June 26, and was not important in results. The confederates made several attacks upon two union brigades, but finally abandoned the work after losing about 1500 men; federal loss, 300. A more important action which occurred June 27, is known as the battle of Cold Harbor, or Gaines' Mill; the confederates call it the battle of the Chickahominy. Their loss was about 9,500; the union loss, 4,000 killed and wounded, and 2,000 prisoners. The sixth conflict in the neighborhood of the C. is known as the battle of Savage's Station, June 30, and was not an important affair. The losses were, union, 600; confederate reported at 400. The next was the battle of Frazier's Farm, also June 30, in which there was some sharp fighting, resulting in a union loss of 300 killed and 1500 wounded; and on the other side, 325 killed and 1700 wounded. The battle of Malvern Hill occurred July 1, and involved a union loss of 375 killed and 1800 wounded; and of confederates, 900 killed and 3,500 wounded. All these engagements from June 26 to July 1 cost the federals 1582 killed and 7,709 wounded; and the confederates 3,150 killed and 15,255 wounded. Including prisoners and missing, the totals of loss were:

union, 15,429; confederate, 19,405. The object, on the part of the confederates, was to relieve Richmond from the threatened siege and capture; and they succeeded. Near the end of the summer the union armies were withdrawn and combined to form the army of the Potomac. But nearly two years later there occurred one more (the second) battle of Cold Harbor, when Grant had command. The fight took place June 3, 1864, and was substantially a check of the union advance. The federal losses were about 7,000 in all; the losses on the other side were said to be only half as many. It was at this time that Grant sent to Washington the historical dispatch: "I propose to fight it out on this line if it takes all summer."

CHICKAMAUGA, BATTLE OF, Sept. 19-20, 1863, between the union army of the Cumberland, led by gen. Rosecranz, and the confederate forces led by gens. Bragg and Longstreet. The forces on the union side numbered about 55,000, a quarter of whom were not engaged; the losses were 1644 killed, 9,262 wounded, and 4,948 prisoners; total, 15,854. The confederate reports embrace but two thirds of their army, and show 1394 killed, 8,974 wounded, and 882 missing; total, 11,250. A few days after the battle gen. Rosecranz was relieved, and gen. Grant placed in command. The battle was credited as a victory for the confederates, though no substantial advantage was gained by them.

CHICKAREE, a popular name for the red squirrel, *sciurus Hudsonius*. It abounds in the southern and middle Atlantic states, and is esteemed for the tenderness and flavor of its flesh. It is not so gentle or so easily tamed as the gray squirrel.

CHICKASAW, a co. in n.e. Iowa, on the Wapsipimcan river and its tributaries, reached by the McGregor and Missouri river and the Cedar Falls and Minnesota railroads; 576 sq.m.; pop. '70, 10,180. The surface is prairie and woodland, and the soil fertile; agriculture is the chief business. Co. seat, New Hampton.

CHICKASAW, a co. in n.e. Mississippi, on the head waters and tributaries of the Tombigbee river, and touched by the Mobile and Ohio railroad; 990 sq.m.; pop. '70, 19,899—10,069 colored. The county is a part of the territory ceded by the Chickasaw Indians. It has a level surface and fertile soil, producing corn, cotton, etc. Co. seat, Houston.

CHICKASAW BLUFFS, BATTLE OF, Dec. 29, 1862. The siege of Vicksburg being in progress, gen. Sherman (union) was ordered to make an attack in the rear, and for that purpose sent a force up Yazoo river to land above the city and approach it from the north. In this march they came upon a bayou held by a confederate force strongly entrenched. Several attempts were made to force a passage, but without success. The union loss was 192 killed, and 982 wounded. That of the other side was very small.

CHICKASAWS, a nation of Indians occupying a section of the Indian territory, embracing 6,840 sq.m. on the left bank of the Red river. According to their traditions and the evidence of philology, they are closely connected with the Creeks and Choctaws; and they believe that they emigrated with those tribes from the west, crossed the Mississippi, and settled in the district now forming the n.e. part of the state of Mississippi. Here De Soto visited them in 1540. From the first they were hostile to the French, and were frequently at war with them; but with the English they were generally friendly. In 1786, they made a treaty with the United States, and in 1793, they aided the whites in the war against the Creek Indians. In the early years of the present century, part of their territory was ceded for certain annuities, and a portion of the tribe migrated to Arkansas; and in 1832-34, the remainder, about 3,600 in number, surrendered to the federal government the 6,642,000 acres of which they were still the owners, and entered into a treaty with the Choctaws for incorporation into that tribe. This union was afterwards dissolved and by paying the Choctaws \$150,000 they secured full possession of their present territory. In the civil war they assisted the confederates, but their rights were restored by the Union government in 1866. The next year they surrendered 7,000,000 acres of land at 4½ cents per acre, the money (\$300,000) to go to their late slaves unless, within two years, they adopted them as members of the tribe. In Jan., 1873, they concluded to adopt the negroes. The nation has a printed constitution prefaced by a declaration of rights, which asserts that all political power inheres in the people; that all men should be free to worship God according to the dictates of their conscience, and not be compelled to attend, erect, or support any religious ministry against their consent; that there should be freedom of speech; that there should be security from unreasonable searches of property or person; that every person accused of crime should have a speedy trial. All free males 19 years old or over who are Chickasaws by birth or adoption, may vote, unless idiotic, insane, or convicted of infamous crime. There are a senate and house of representatives, the latter of 18 members elected annually by the voters of the counties or districts. A representative must be 21 years old. There are 12 senators elected for two years from the four districts of the state. A senator must be 30 years old, a Chickasaw by birth or adoption, and a resident of his district six months. The governor must have all the qualifications of a senator; he is chosen for two years by popular vote, and has about the same powers and functions as a governor of one of the states. There is a supreme court consisting of a chief and two assistant justices elected to the legislature for four years. There are also circuit and county courts. The

nation has in the custody of the federal government \$1,200,000 in bonds on which interest is paid. In 1873, the number of Chickasaws was about 6,000. One newspaper is published at Tanlequah.

CHICKEN-POX, a contagious febrile disease, chiefly of children, and bearing some resemblance to a very mild form of small-pox (q.v.). C. is distinguished by an eruption of vesicles or blebs, which rarely become pustular or yellow, and leave only a very slight incrustation, which falls off in a few days, without any permanent mark or pit, as in small-pox. From its vesicular character, it has been called the *crystal pock*. It has been argued that C. is, in fact, only small-pox modified by previous vaccination; but this opinion, though maintained on good authority, is not generally received by medical men. It is a disease of little or no danger, the fever being often hardly perceptible, and never lasting long.

CHICKEN SNAKE, or **MILK SNAKE**, *Ophibolus Eximius*, a harmless individual of the serpent tribe, frequenting houses, stables, and dairies. It is sometimes 5 ft. long, though usually much less; the color is milky white above, sometimes tinged with red, with dusky spots along the vertebral line and smaller spots along the sides, the abdomen silver white or yellowish. It feeds on insects, mice, toads, frogs, and small birds.

CHICKERING, **JONAS**, 1798-1853; a self-taught piano-maker of Boston, who succeeded in establishing the largest piano-manufactory in the country, at times producing at the rate of 1,500 instruments in a year.

CHICK PEA (*Cicer*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having pinnate leaves; solitary, axillary, stalked flowers; and two-seeded pods, inflated like bladders. The common C. P. (*C. arietinum*) grows wild in the corn-fields of the countries around the Mediterranean sea, and in many parts of the east. It is an annual, 1½ to 2 ft. high, of a stiff upright habit, covered with glandular hairs. The seeds abound in farina, and have a slightly bitterish taste. They are about the size of common peas, curiously wrinkled, so that they have been thought to resemble a ram's (*arietis*) head. They are used as food, either boiled or roasted, and are the most common *parched pulse* of the east. They are an important article of French cookery. They have been in general use from the earliest times, and the plant is extensively cultivated in Egypt, Syria, India, the s. of Europe, etc. Its cultivation extends as far north as the southern part of Germany; but in the climate of Britain it is found too tender to be a profitable crop. It is the *Gram* of India, and the *Garvance* of the French, whence the English name *Carraunces*. The herbage affords a nutritious food for cattle, and the seeds are one of the occasional substitutes for coffee. In great summer heats, drops exude from this plant, which, on drying, leave crystals of almost pure oxalic acid.

CHICKWEED, *Stellaria media*, one of the most common weeds of gardens and cultivated fields, is a species of stitchwort (q.v.). It is a native of most parts of Europe and of Asia, appearing during the colder months even on the plains of India; an annual, with a weak procumbent stem and ovate leaves, very variable; some of the smaller varieties in dry sunny situations sometimes puzzling young botanists, from having only five or three instead of ten stamens; but always characterized by having the stem curiously marked with a line of hairs, which at each pair of leaves changes from one side to another, and in four changes completes the circuit of the stem. The leaves of C. afford a fine instance of the *sleep of plants*, closing up on the young shoots at night. C. is a good substitute for spinach or greens, although generally little regarded except as a troublesome weed, or gathered only by the poor to make poultices, for which it is very useful, or for feeding cage-birds, which are very fond both of its leaves and seeds. A number of species of a nearly allied genus, *cerastium*, natives of Britain, also bear the name of C., or **MOUSE-EAR C.**, and the name is occasionally given to other plants, either botanically allied, or of somewhat similar appearance.

CHICLANA, a t. of Andalusia, Spain, about 12 m. s.e. of Cadiz. It is pleasantly situated on a plain between two hills, and its houses being all built of white stone, present a cheerful appearance. It has a splendid hospital. The manufactures are linen, earthenware, and brandy. Its mineral baths are much frequented by the inhabitants of Cadiz. Pop. variously estimated, but probably about 5,000.

CHICOPEE, formerly **CABOTSVILLE**, and including Chicopee-falls, a manufacturing t. of Massachusetts, U. S., on the left bank of Connecticut river, at the mouth of Chicopee river, 5½ m. n. of Springfield. Chicopee falls supplies water-power to numerous cotton and woolen factories, paper-mills, brass cannon and bell foundries, and the Ames manufacturing company, which makes machinery, swords, bronze cannon, statues, etc. C. has 10 churches and several newspapers. Pop. '70, 9,607.

CHICORY, or **SUCCORY** (*cichorium*), a genus of plants of the natural order *compositæ*, sub-order *Cichoraceæ*, distinguished by bracts in two unequal rows, the outer always reflexed, the inner latterly becoming so, a nearly naked receptacle, *convate* striated achenia, and a pappus of two rows of minute scales. The species are few in number, herbaceous plants, full of milky juice, natives chiefly of the warmer temperate regions of the eastern hemisphere. The common C. or **SUCCORY** (*C. intybus*) is a perennial plant, found wild in England and most parts of Europe, growing in waysides, borders

of fields, etc. It has a long carrot-like root, externally of a dirty or brownish yellow color, and white within. The stem rises to the height of 2 to 5 ft., branching, the leaves are *runcinate*, resembling those of the dandelion; the flowers sessile, axillary, in pairs, rather large, beautiful, generally blue, more rarely pink or white. C. is pretty extensively cultivated, both in England and on the continent of Europe, for its roots. It is also cultivated for feeding cattle with its leaves. The blanched leaves are sometimes used as a salad, and they are readily procured in winter by placing the roots in a box with a little earth in a cellar.—To this genus belongs also the endive (q. v.).

C. has been used as a substitute for coffee, or to mix with coffee, for at least a century. The roots are pulled up, washed, cut into small pieces, and dried on a kiln, which leaves a shriveled mass not more than one fourth the weight of the original root. It is then roasted in heated iron cylinders, which are kept revolving as in coffee-roasting, during which it loses about 25 to 30 per cent of its weight, and evolves at the same time a disagreeable odor, resembling burned gingerbread. An improvement to the C. during roasting is the addition of 2 lbs. of lard or butter for every cwt. of C., which communicates to it much of the luster and general appearance of coffee. It is then hand-picked, to remove chips of wood, stones, etc., and is reduced to powder, and sold separately as *C. powder* or *C. coffee*, or is added to ordinary ground-coffee, and is sold as a mixture. C. contains a good deal of sugar, but otherwise does not serve to supply the animal economy with any useful ingredient. It gives off a deep brown color to water, when an infusion is made, and hence its main use in coffee. Some people dislike the taste of C., and when largely used, it has a tendency to produce diarrhea; but many people prefer to use coffee mixed with C. owing partly to the taste it communicates, but mainly to the appearance of strength which it gives to the coffee. The C. is liable to adulteration; and roasted beans, pease, carrots, parsnips, mangold-wurzel, acorns, horse-chestnuts, biscuit, oak-bark tan, logwood and mahogany dust, and even the livers of horses and bullocks, are said to be employed in its adulteration.

CHI'COT, a co. in s.e. Arkansas, on the Louisiana border and the Mississippi river, intersected by Crooked and Mason's bayous: 820 sq. m.; pop. '70, 7,214—5,393 colored. The surface is level, and in some parts is subjected to inundations; chief productions, corn and cotton. Co. seat, Lake Village.

CHICOUTIMI, the n.e. section of the organized territory of the province of Quebec, Canada; little settled except along the bank of the St. Lawrence and on the Saguenay rivers; 23,753 sq. m.; pop. '71, 17,493, all except about 100 being Roman Catholics, and all except about 800 of French descent. The surface is mostly rugged, and there are immense pine forests of great value. Chief town, Chicoutimi, on the Saguenay, 75 m. from the mouth.

CHIEF, in heraldry, an ordinary formed by a horizontal line, and occupying the upper part of the escutcheon. Like the other honorable ordinaries, the C. ought properly to take up a third part of the shield; but when the other charges are numerous, the C. is frequently diminished in size.—Any object borne in the upper or chief part of the shield is said to be *in chief*, though the C. be not divided off from the rest of the field, as a separate portion.—*On a chief*: Is when the object is represented on the C., divided off as above described.

CHIEF-JUSTICE, the presiding justice of the supreme court of the United States, and of the courts of highest jurisdiction in most of the several states. The chief-justice of the United States administers the oath on the occasion of the inauguration of the president and vice-president; he presides when an impeached president is tried, and has the nomination of certain judicial officers.

CHIEF-JUSTICE. See **JUSTICE COURTS**.

CHIEM-SEE, a lake of Upper Bavaria, the largest in the country, lies about 42 m. s.e. of Munich. It is situated at an elevation of more than 1600 fr. above the sea; its length is 12 m., with a breadth of 9, and its greatest depth 500 feet. Its shape is irregular, and its coast much indented. It has three islands; the Achen and Prien flow into it, and its surplus water is discharged by the Alz into the Inn. The C. is famous for its fish; and a small steamer which plies on it, enables travelers to view its fine scenery.

CHIERI, a t. of Piedmont, northern Italy, situated on the slope of a hill 9 m. s.e. of Turin. C. is an ancient place. By the later Romans it was called Carea. The church of St. Dominico, built in 1260, has some good paintings; and that of Santa Maria della Scala, built in 1405, is one of the largest Gothic structures in Piedmont. C. is one of the oldest manufacturing towns in Europe, its manufacture of fustians and cotton stuffs dating from 1422. Silk, cotton, and linen are still important manufactures. Pop. 9,000.

CHIETI (Province). See **ABRUZZO**, *ante*.

CHIETI, an archiepiscopal city of Italy, capital of the province of the same name, is situated on a hill near the Pescara, about 100 m. n. of Naples. It is a well-built and flourishing place, with some imposing public edifices, including a cathedral, lyceum, and theater; and its agreeable situation has made it the residence of numerous wealthy families. The district around is fertile and well cultivated, and in the city, the cloth and silk manufactures afford employment for a considerable number of people. Pop.

15,000. C. is a very old place, being built on the site of the ancient *Teate* of the Romans, many of the remains of which are still visible. In the year 1524, St. Gaetano founded here the order of the Theatines.

CHIFF-CHAFF, *Sylvia hippolais*, a small species of warbler, very widely diffused, being found both in England and in the neighborhood of Calcutta. It is common in the s. of Europe, is in Britain a summer bird of passage, arriving, however, very early in spring, and does not extend northward into Scotland. Its general color is brown; the under parts lighter. It is a very sprightly little bird; but its song consists merely of a frequent repetition of two notes resembling the syllables chiff-chaff. It is also called the lesser pettychaps.

CHIGNEC TO BAY, the more westerly of the two inlets at the head or n. end of the bay of Fundy, in British North America. It separates Nova Scotia from New Brunswick, is 30 m. long and 8 broad, and has an isthmus of only 14 m. in width between it and Northumberland strait, in the gulf of St. Lawrence.

CHIGOE, or JIG'GER, *Pulex*, or *Sarcopsylla penetrans*, a species of flea (q.v.), rather smaller than the common flea, and with less powerful limbs, found in the West Indies and South America, where it is excessively troublesome, attacking any exposed part of the human body, and affecting a lodgment between the skin and flesh, often under the skin of the foot or the nails of the toes. At first, its presence is indicated only by a slight itching or tingling; but an ulceration is likely soon to be the result, which is not only very painful, but even dangerous, when the female C. is allowed to remain and to deposit her numerous eggs. Before these are deposited, her abdomen becomes distended in an extraordinary manner, as a membranous bag, to the size of a pea. The ulcer speedily contains a great colony of chigoes. The negroes of the West Indies are very expert in extracting the C., which is also removed by washing with tobacco-juice. Rubbing with tobacco-leaves is also employed as a preventative of its attacks.

CHIH-LE, or PECHIH-LE, one of the northern provinces of China, and the most important of the 18, as being the center of government, and containing Peking, the imperial capital, the residence of the emperor and court. Pop. about 28,000,000; area, 58,949 sq. miles.

CHI- (or **TSIN-CHI-**) **HOANG-TI**, or **CHING-WANG**, Emperor of China from 246 to 210 B.C. He is said to have consolidated eight or more feudatory states in a single kingdom, which covered nearly the territory now occupied. One of his monuments is the great wall, built to keep out barbarians.

CHIHUA HUA, a city of the Mexican confederation, with 12,000 inhabitants, and a considerable trade between Santa Fé, in New Mexico, and the United States. It is in lat. 28° 40' n., and long. 105° 33' w., and has a cathedral, convents, and an aqueduct 3 m. long, besides appropriate buildings, as the capital of the state of its own name. The territory in question, stretching in lat. from 27° to 32° n., and in long. from 104° to 108° 40' w., is divided from Texas, in the United States, by the Rio Bravo del Norte. It is a table-land, more remarkable for mineral resources than for agricultural productions. It abounds in niter and other salts, and is rich in mines of gold and silver. Pop. 180,000.

CHILBLAINS. See **CHAPPED HANDS**.

CHILD, Sir **JOSIAH**, an eminent London merchant, and one of the ablest of the earlier English writers on commerce and political economy, b. in 1630, was the second son of Richard Child, a merchant of London. His principal work is entitled, *Brief Observations concerning Trade and the Interest of Money* (Lond. 1668, 4to); a 2d edition, much enlarged, entitled *A New Discourse of Trade*, was published in 1690. In this work he explains his plans for the relief and employment of the poor, including the substitution of districts or unions for parishes, and the compulsory transportation of paupers to the colonies. He was one of the directors, and for some time chairman of the East India company, and is said to have written several tracts in defense of the trade to the East Indies, which were published anonymously. In 1678 he was created a baronet, and died in 1699.

CHILD, **LYDIA MARIA**, b. Mass., 1802. When 22 years of age she published *Hobomok, an Indian Story*, and a year afterwards *The Rebels, a Tale of the Revolution*, in which she gave a speech by James Otis, and a sermon by Whitfield, both long believed to have been made by the men themselves. For eight years she was the editor of *The Juvenile Miscellany*, a monthly magazine for the young. Among her earlier works are: *The American Frugal Housewife*; *The Girl's Own Book*; and *The Mother's Book*. She was among the first of the New England anti-slavery writers, beginning with *Appeal in behalf of that Class of Americans called Africans*; and in 1841 she became one of the editors of the *National Anti-Slavery Standard*, in which paper she published her popular *Letters from New York*. Subsequently she published *History of the Condition of Women in all Ages and Nations*; *Biographies of Good Wives*; *Life of Isaac T. Hopper*; *Progress of Religious Ideas*; *Autumnal Leaves*; *Looking towards Sunset*; *The Freedman's Book*; *A Romance of the Republic*, etc.

CHILDBIRTH. See **MIDWIFERY**, *ante*.

CHILDERMAS, or HOLY INNOCENTS' DAY (28th Dec.), is observed by the church of Rome with masses for the children killed by Herod. It was considered unlucky to marry or to begin any work on this day. From Fenn's *Letters* (vol. i. p. 234) we learn that the coronation of king Edward IV. was put off till the Monday, because the preceding Sunday was Childermas day. The learned Gregory says: "It hath been a custom and yet is elsewhere, to whip up the children upon Innocents' day morning, that the memory of Herod's murder might stick the closer, and in a moderate proportion to act over the crueltie again in kinde." C. is also a holiday of the church of England.

CHILD-KILLING. See INFANTICIDE.

CHILDREN, LEGAL CAPACITY OF. See INFANT, MINOR, PUPIL, GUARDIAN, TUTOR, CURATOR.

CHILDREN, JOHN GEORGE, 1777-1852; an English scientist who traveled in the United States, devoting his attention chiefly to electricity and galvanism. Among his papers, are those discussing the conversion of iron into steel by union with diamond, and a method of extracting silver from the ore without amalgamation. He translated Berzelius on the blow-pipe, and Thenard on chemical analysis. He was for some years secretary of the royal society.

CHILDREN'S AID SOCIETIES, first established in New York city, chiefly by the exertions of Charles L. Brace, about the year 1853. The object of this and its many imitative societies is to care for the poor and neglected children of large cities, to rescue them from want and crime, afford rudimentary education, and provide homes for them, usually among the farmers of the agricultural states. At the last annual meeting of the New York society, the report showed that, during the 26 years of its operation, 55,717 persons had been sent to homes and places of work, and of these more than 45,000 were children. During the year 1879, no less than 3,713 persons were sent to homes, of whom 1920 were boys, 1380 girls, 210 men, and 203 women. In the lodging-houses, during 26 years, 200,000 different boys and girls have been sheltered and partly fed and instructed. In the industrial schools over 50,000 poor little girls have been taught. The society brings forward the police statistics on crime to show that "vagrancy and crime among young girls have been greatly diminished during the past 15 or 20 years; while among boys, criminal offenses have not grown with the population, but have been held decidedly in check." Among 162, 153 boys who, during the past 25 years, have been in the newsboys' lodging-house, there has been no case of contagious disease, and only one death. The other boys' lodging-houses have been almost equally fortunate. Statistics are given to show that since the establishment of the sick children's mission and summer home six years ago, 1000 lives annually have been saved under diarrheal diseases alone, and that the general death-rate has been reduced from 33.76 to 24.93 per 1000. The total expense of the 21 industrial schools in 1879 was \$71,540.15, and the average attendance 3,632, making the annual cost for each child \$19.69. The cost in 1878 for each child in the public schools, not including rents, was \$38.41; this expense not including food or clothing. In the lodging-houses, 13,652 boys and girls were fed, sheltered, and taught during the year, at a total expense of \$47,143.66. Deducting the receipts, together with the cost of construction (\$26,916.17), the net cost was \$20,227.49; dividing this by the nightly average attendance, the average cost to the public of each child was \$42.67. The average cost per year of each prisoner in the Tombs is \$107.75, and the Roman Catholic protectory draws from the city treasury over \$100, annually, for each of its inmates. The total number placed out by the society, mainly in western homes, during last year, was 3,713; the total cost for railroad fares, clothing, food, salaries, etc., was \$29,679.48; the average cost to the public, accordingly, for each person was \$8.04. Yet any one of these children placed in an asylum or poor-house for a year would have cost undoubtedly nearly \$140. The number who enjoyed the benefit of the summer home was 2,912; the total expense, deducting cost of construction, \$1000.28, and rent of 1878, \$350, was \$5,036.30; making the average cost for each child \$1.89.

CHILDS, GEORGE WASHINGTON, b. Md., 1829; a journalist, for many years and now proprietor of the *Philadelphia Ledger*, one of the earliest and most successful cheap newspapers of the country. He is noted especially for liberal patronage of men of letters, and for generosity towards deserving charities.

CHILD-STEALING. See ABDUCTION.

CHILE, a republic of Spanish origin, in South America, is the most southerly state on the w. side of that continent. It lies wholly between the water-shed of the Andes and the shores of the Pacific, stretching coastwise from Bolivia to Patagonia, in lat. 25° 30' to 43° 20' s., and in long. 69° to 74° w., having an extreme length of about 1240 m., and an average breadth of fully 120. Within these limits, however, lies the virtually independent Araucania (q.v.), comprising most of the mainland to the left of the Bio-bio; while the southern portion is confined chiefly to Chiloe (q.v.) and its archipelago. C. is divided into 16 provinces, of which the aggregate area is officially stated at nearly 130,000 sq. m.; and the pop., in 1875, at 2,068,447. This pop. and area exclude certain regions in Patagonia, over which C. has a merely nominal sway. The capital is Santiago, situated pretty nearly in the heart of the country, and connected with Valparaiso, the principal port, by a railway of 115 m. in length, and also by telegraphic wires. The

other towns are on or near the ocean; and, to arrange them according to the relative amounts of their trade, they are Valparaiso, Copiapo and Caldera, Coquimbo, Talcahuano and Concepcion, Huasco, Constitution, and Valdivia. In 1876, the total imports of C. were valued at £7,058,220, and the exports at £7,554,208; in 1874, at £7,683,600 and £7,308,200 respectively. The foreign commerce of C. is carried on mainly with Great Britain. The staple article of export to this country is copper, the value of which, in 1874, was £2,812,013. The articles of export next in importance are, in order of value, wheat, to the value of £1,180,278; silver ore, to the value, in the same year, of £225,988; and wool, £160,637. The principal articles of British produce imported into C. are cotton and woolen manufactures and iron. In 1874, the value of the total imports of cotton fabrics was £1,923,753; that of woolens, £258,288; and that of iron, wrought and unwrought, £465,596. Among the other imports were hardwares and cutlery, valued at £128,550. The national income amounted in 1878 to £4,088,800, while the expenditure was £4,275,000. In 1879, the public debt was close on £11,000,000, of which above £7,000,000 was held outside the country. The army, as mobilized and increased on account of the war that had then broken out between C. and Peru allied with Bolivia, comprised in 1879 as much as 20,000 men, besides a national guard raised to 30,000 men. The navy, which took an important part in the war, consisted in 1879 of 10 small steamers, and two large and powerful iron-clads.

Roman Catholicism is the prevailing religion, but other beliefs are protected by a law of 1875. In its political constitution, C. appears to be the least democratic republic in the new world. The legislature is composed of two houses. The deputies sit for three years; and the senators are chosen for nine, retiring in thirds at the end of every third year. The voters for a deputy—to say nothing of the still more select voters for a senator—must possess either £100 in real property, or £200 in personal effects, or £20 of income; a pecuniary qualification which is exceptionally doubled for the wealthier localities of Valparaiso and Santiago. In 1848, attempts were made, but in vain, to abolish or modify these restrictions on the suffrage. Under this form of government, C. has maintained a degree of peace and prosperity utterly unknown to the other transatlantic commonwealths of kindred race. In this respect, however, the character of the people has doubtless co-operated with the tendency of the institutions. As contrasted with Spanish America in general, C. contains an unusually large proportion of European blood.

Immediately after the conquest of Peru, C. was seized by Almagro, a companion of Pizarro, subsequently becoming the seat of a captain-generalship, which held sway as far as cape Horn. In 1810, commenced the war of independence, which, at the close of eight years, was decided against Spain by the victory of Maypo.

Geology.—The predominant rocks of C. are crystalline and metamorphic. They form the range of the Andes, except in those districts in which active volcanoes exist, where they are covered with recent volcanic rocks. They occupy also the whole of the level ground between the mountain-range and the shores of the Pacific, with the exception of a narrow stretch of palæozoic fossiliferous strata which run along the coast s. from Santiago for a distance of 300 miles. The coast-line of C. is being continually altered from the elevation of the whole country to an extent of at least 1200 m. along the Pacific shores, produced by volcanic agency. In 1822, the coast was raised 4 ft. at Quintero, and 3 ft. at Valparaiso. Oysters and other mollusks were left dry, and perished, becoming offensive as they decomposed. The change of level was permanent, over an area of 100,000 sq. m., nearly as large as the whole extent of Great Britain and Ireland. A similar extensive elevation was noticed in 1835 by Capt. Fitzroy.

Physically, the continental portion of the republic—for its insular section will, in this respect, be noticed under the head of CHILOE—presents many singularities. Of all the maritime regions on the globe, it is perhaps the most isolated. On every side but the sea—and that sea very remote from the main thoroughfares of commerce—it is beset by difficulties of communication. With the lonely wilderness of Patagonia to the s., and the dreary desert of Atacama on the n., it is bounded on the e. by a mountain chain which, altogether impracticable in winter, can be crossed, even in summer, only by a few passes ranging between 12,450 ft. and 14,370 in elevation. Moreover, this strip between the Andes and the Pacific is broken into plateaus in the interior, and valleys on the coast, by two longitudinal ranges, with numerous lateral spurs; while, throughout the length and breadth, the general level gradually descends, as well to the s. as to the west. In point of mere temperature, so rugged a surface—covering fully 15° of lat., and attaining an altitude of more than 4 m. within about 2° of long.—must present nearly every possible variety. Through the reciprocal action of the Andes (q.v.) and the prevailing winds, the rain-fall graduates itself, with something of mathematical regularity, from the parching skies of the n. to the drenching clouds of the s.—a graduation which, disturbed merely by the melting of the mountain-snows, is, in a great measure, necessarily reflected in the condition and magnitude of the countless water-courses. Hence the rivers to the n. of the Maypo, which enters the Pacific near lat. 34°, are but inconsiderable streams; while, further to the s., the Maule, the Biobio, and the Calacalla are all to some extent navigable.

From the cause last mentioned, different districts vary remarkably in their productions. To the n. of the Coquimbo, about lat. 30°, is chiefly an arid waste, redeemed,

however, from being valueless by its mines; and to the s. of the Biobio, about lat. 37°, timber and pasturage divide the soil between them. The intermediate center alone is fitted for agriculture, yielding, besides maize and hemp, European grains and fruits in abundance. Notwithstanding all the varieties and vicissitudes of climate, the country may claim to be, on the whole, extremely healthy. The manufactures are earthen-ware, copper-ware, linens, cordage, soap, leather, and brandy; and, in addition to the wheat and metals already specified, the exports, especially to the south, embrace tallow, hides, jerked beef, and live-stock. C. had, in 1878, 1050 m. of railways. Santiago is connected with Buenos Ayres by a line going over a pass of the Andes 6,000 ft high. There are also common roads; but they are neither numerous nor good. In fact, the want of highways and bridges is a serious obstacle to the progress of trade and cultivation. In the basin of the lower Biobio, coal is plentiful.

CHILI (*ante*), though less revolutionary than some of its sister republics, has been subjected to several forcible attempts to change the government. The most formidable of these was in 1851. At first the insurgents were victorious, but after 4,000 men had fallen in battle and great damage had been done to business and commerce, the government succeeded in effecting peace by money more than by arms. This was during the presidency of Don Manuel Montt, a man of great ability. He restored peace and prosperity to the country, and it has since been free from internal strife. In 1864, C. sympathized warmly with Peru against Spain, and in the following year its coast was blockaded by a Spanish fleet. March 31, Valparaiso was bombarded, notwithstanding the protest of the foreign ministers and consuls. Thousands of shot and shell were thrown into it, destroying many public and private buildings and involving a loss of 10 millions of dollars, the chief part of which fell on the foreign residents. The remonstrances of the European governments soon compelled a cessation of hostilities and the raising of the blockade. In 1871, a treaty of peace was negotiated through the mediation of the United States government, and signed at Washington. During the past few years C. has advanced greatly both in material and intellectual development. New mines are worked, agricultural schools and societies are exerting a beneficial influence, and great improvements in rivers, harbors, and streets are projected. In 1877, more than 1200 m. of railroad and nearly 5,000 m. of telegraph were in operation, and additional lines of both are in progress. There are 500 efficient government schools, and an equal number established by cities, churches, and private persons. Two normal schools, for male and female teachers are in good condition. The government university at Santiago has a preparatory department connected with its higher course. The conciliar seminary combines collegiate and theological studies. There are also at the capital agricultural, naval, and military schools. The national library, founded by the Jesuits, contains 25,000 volumes, many of which are on theological subjects. In 1843, a dispute arose between C. and the Argentine Republic for the possession of Patagonia. Many unsuccessful attempts to settle it were made, and war between the two countries often seemed imminent, but in 1879 a treaty was signed by which the disputed territory was ceded to the Argentine Republic. C. having transferred a portion of disputed territory to Bolivia on condition that the Chilians residing in it should not be taxed, Bolivia did refrain from taxation but confiscated some property owned by a Chilean company. Upon this C. sent troops into Bolivia. Peru offered to mediate between the parties, but the offer having been rejected an alliance followed between Bolivia and Peru, and, in April, 1879, war against C. was declared. Hostile operations have been carried on with great energy. In a naval engagement the Chilians captured the powerful iron-clad steamer *Huascar* and turned it against its former owners. Peru, with inferior vessels, has since accomplished several daring exploits, and the war goes on with bitterness and varied success. Recently, however, C. has gained decided advantages, capturing Arica, and entering on the siege of Lima. The victories in this war have been not without the accompaniment of indiscriminate pillage and ravage.

CHILI, or CHILLI. See CAPSICUM.

CHILIASTAS. See MILLENNIUM, *ante*.

CHILI NETTLE. See LOASACEÆ.

CHILI SALTPETER is a commercial name applied to the nitrate of soda. See SODA, NITRATE.

CHILLAN, a t. in the province of Ñuble, Chili; 120 m. n.e. of Concepcion, 35° 56' s., and 71° 37' west. The houses have only a ground floor and are built around rectangular courts; the streets are 60 to 70 ft. wide, having open drains in the center. C. is in the center of a large agricultural district of great productiveness, and is an important outlet for grain and cattle by railroad to Tomé. The place is also celebrated for mineral baths. The town was founded by Ruiz de Gamboa in 1594, but has since been several times destroyed and reconstructed. In 1601, it was wasted by the Indians; in 1657, by an earthquake, and in 1797, by the overflow of the river Ñuble. The people then removed to La Horca, where in 1835 their town was again leveled by an earthquake. The next year they began to rebuild on the present site, and now have a prosperous town of about 20,000 population.

CHILLIANWALLA, a village of the Punjab, being 5 m. from the left or e. bank of the Jhelum, the most westerly of the five rivers which give name to the country. It is in lat. 32° 40' n., and long. 73° 39' e., being 85 m. to the n. w. of Lahore. C. claims notice as the scene of lord Gough's dearly won victory, over the Sikhs, of Jan., 1849, and also as the site of an obelisk erected to the memory of those who fell in the two Sikh wars.

CHILLICOTHE, a city in Lexington co., Mo., on the Hannibal and St. Joseph, the Chillicothe and Des Moines, and a branch of the St. Louis, Kansas City and Northern railroads, 76 m. e. of St. Joseph; pop. '70, 3,978. It is the largest town in the Grand River valley.

CHILLICOTHE, or **CHILICOTHE**, a city of Ohio, U. S., beautifully situated on the right bank of the Scioto river, 45 m. from its confluence with the Ohio, and the same distance s. of Columbus, on the Cincinnati and Marietta railway and Ohio and Erie canal; has 13 churches, 3 banks, court-house, foundries, steam-engine and agricultural implement factories, etc. Founded in 1796, and former capital of the state. Pop. '70, 8,920.

CHILLINGWORTH, **WILLIAM**, a famous theologian of the church of England, was b. at Oxford in 1602, and educated at Trinity college in that university, where the arguments of a Jesuit named Fisher induced him to become a Roman Catholic. He withdrew to Douay; but was induced by his godfather, Dr. Laud, then bishop of London, to re-examine the whole controversy between Catholics and Protestants, and, in 1631, he returned to the bosom of the Anglican church. Four years later, he published a work, entitled *The Religion of Protestants a Safe Way to Salvation*. It was exceedingly keen, ingenious, and conclusive in point of argument. C. was perhaps the ablest disputant of his age; and had there not been a certain fickleness and want of solidity about his intellect, and a nervous suspicion that all human reasoning might be vitiated by undiscovered fallacies, he might have produced a really great work. *The Religion of Protestants* acquired a wide popularity. C. was offered church preferment, which he at first refused—having certain scruples in regard to the subscription of the 39 articles—but afterwards accepted. He became chancellor of the church of Sarum, and prebendary of Brixworth, in Northamptonshire. He was a strong royalist, and, on the breaking out of the civil war, accompanied the king's forces. He died Jan., 1644. The best edition of *The Religion of Protestants* appeared in 1742, with sermons, etc., and a life of the author, by Dr. Birch.

CHILLON, a celebrated castle and fortress of Switzerland, in the canton of Vaud, 6 m. s. e. of Vevey. It is situated at the e. end of the lake of Geneva, on an isolated rock, almost entirely surrounded by deep water, and is connected with the shore by a wooden bridge. The castle is said to have been built in 1238, by Amadeus IV. of Savoy, and it long served as a state prison. It is famous as the prison of Bonnivard, the prior of St. Victor, who having, by his efforts to free the Genevese, rendered himself obnoxious to the duke of Savoy, was carried off by emissaries of that potentate, and confined here for six years, at the end of which time the castle had to surrender to the Bernese and Genevese, when Bonnivard was liberated. C. has been immortalized by Byron's *Prisoner of Chillon*. The castle is now used as a magazine for military stores.

CHILMA'REE, or **CHALAMARI**, a t. in British India, in the presidency of Bengal, 35 m. s. e. of Rungpur, on the Brahmaputra. It is remarkable chiefly as the seat of a great religious and commercial festival which brings together sometimes 100,000 people.

CHILOE, the insular province of Chili (q. v.), is an archipelago on the w. side of South America, which takes its name from its principal island. It is separated from the rest of the republic, or rather from Patagonia, by the gulf of Ancud, extending in s. lat. from 41° 40' to 43° 20', and in w. long. from 73° to 74°. The province—which, in 1875, numbered 64,536 inhabitants—contains, in addition to C. proper, about 60 islets, of which about 30 are uninhabited. In the archipelago are two towns, both of them seaports of C. proper—Castro, the ancient capital, on the e. coast; and San Carlos, the modern seat of government, towards the n. w. extremity. The atmosphere, like that of the mainland opposite, is excessively moist; the westerly winds, more particularly in winter, bringing almost constant rains. The climate, however, is on the whole healthy. This fact is the more remarkable, inasmuch as C. proper is one natural forest, measuring 100 m. by 40, with a partially cleared and cultivated margin on the sea. The chief products are wheat, barley, potatoes, apples, and strawberries; and cattle, sheep, and pigs are reared in considerable numbers. Agriculture, however, is in a very primitive state; and the staple food of many consists of mussels and oysters. The population, equally indolent and poor, differs from that of the rest of Chili in the great preponderance of aboriginal blood. Schools are numerous; but, from the ignorance of the teachers, education has not made satisfactory progress. The principal manufacture is a coarse woolen cloth, dyed blue. This archipelago was discovered by the Spaniards as late as 1558; and as it was the last integral portion of Spanish America to be colonized, so also was it the last to throw off the mother-country's yoke.

CHILOGNA'THA AND **CHILO'PODA**. See MYRIAPODA.

CHILON, or **CHILO**, one of the seven sages of Greece, by birth a Lacedæmonian. He appears to have lived about the 6th c. B. C. It is said that he died from joy, on

learning that his son had gained a prize in the Olympian games. Many of his apophthegms have been handed down to us. According to Chilon, the greatest virtue of man was prudence, or well-grounded judgment as to future events.

CHILTERN HILLS, the s. part of the low chalk range which runs n.e., about 70 m., from the n. bend of the Thames, in Oxfordshire, through Bucks and the borders of Herts and Beds, and ends in Norfolk and Suffolk. In Oxford, Herts, and Beds, the C. H. are 15 to 20 m. broad, and the highest points are Wendover, 905 ft.; and Whitehouse, 893.

CHILTERN HUNDREDS. In former times, the beech-forests which covered the Chiltern Hills, in Buckinghamshire, were infested with robbers, and in order to restrain them, and protect the peaceable inhabitants of the neighborhood from their inroads, it was usual for the crown to appoint an officer, who was called the steward of the Chiltern Hundreds. The office, which has long ceased to serve its primary, now serves a secondary purpose. A member of the house of commons cannot resign his seat unless disqualified either by the acceptance of a place of honor and profit under the crown, or by some other cause. Now, the stewardship of the C. H. is held to be such a place, and it is consequently applied for by, and granted, in the general case as a matter of course, to any member who wishes to resign. As soon as it is obtained, it is again resigned, and is thus generally vacant when required for the purpose in question. When the C. H. are not vacant, however, the same purpose is served by the stewardship of the manors of East Hendred, Northstead, and Hempholme. As to the offices which are held to vacate seats, see ELECTION. "The practice of granting the C. H. for the purpose above described began only about the year 1750, and its strict legality has been doubted, on the ground that the stewardship is not an office of the kind requisite to vacate a seat. The gift of the C. H. lies with the chancellor of the exchequer, and there is at least one instance of its being refused. In 1842, after very awkward disclosures had been made before a committee of the house of commons, as to corrupt compromises, which had been entered into for the purpose of avoiding investigation into gross bribery in the election to certain boroughs, of which Reading was one, the member for Reading applied for the stewardship of the C. H., and was refused—the chancellor of the exchequer being of opinion that, by granting it, he would in some sort have made himself a party to transactions which he did not approve, and of which the house of commons had implied its condemnation."—*Standard Library of Political Knowledge*, p. 500.

CHIMERA, a genus of cartilaginous fishes, ranked by Cuvier with the sturgeons (*Sturionidae*), but now generally regarded as the type of a distinct family, of which only two or three species are known. The gills have a single wide opening, as in the sturgeons; but the gill lid or *operculum* is merely rudimental, and concealed in the skin, whilst there is an approach to sharks in the structure of the gills. The only known species of C. is *C. monstrosa*, occasionally found in the British seas, and more common in more northern latitudes. It is sometimes called the *king of the herrings*. It pursues the shoals of herrings, and is consequently sometimes taken in herring-nets. It is seldom more than 3 ft. long. Its general color is silvery white, the upper parts mottled with brown. It produces very large leathery eggs.

CHIMERA, a mythical monster, described by Homer as having a lion's head, a goat's body, and the tail of a dragon. The rationalistic account of C. is, that it represented a mountain in Lycia whose top was the resort of lions, its middle of goats, and the marshy ground at the bottom of which abounded with serpents. In the same manner, Bellerophon's (q.v.) victory over the C. is explained by saying, that he first made his residence on this mountain. The myth seems, at all events, to have belonged to Asia Minor, as gigantic carvings of the C. on rocks are there found. It is usually represented as a lion, out of the back of which grows the head and neck of a goat.—C. is used figuratively to denote any monstrous or impossible conception, the unnatural birth of the fancy. It is frequently depicted on shields, as a heraldic charge.

CHIMAPHILA. See WINTER-GREEN.

CHIMARRA, or CHIMARRI. See CERAUNIAN MOUNTAINS.

CHIMAY, JEANNE MARIE IGNACE THÉRÈSE, Princess of; 1775-1835; daughter of count Cabarrus, minister of finance in Spain; early married to M. de Fontenay, soon divorced, and next married to Tallien, the French revolutionist, whom she induced to engage in a plot for the overthrow of Robespierre, and thus made herself the chief promoter of the revolution of July, 1794. Her beauty and her free manners with her consequent social triumphs gave her husband offense, and he left her, going with Napoleon to Egypt. A mutual divorce followed on his return, and Jeanne then married count Caraman, with whom she lived peaceably. While ranking first among the beauties of the time, she was never admitted to court circles. She is represented as amiable, witty, kind, and always ready to serve even her enemies.

CHIMBORA CO, a conical peak of the Andes, in Quito, 21,510 ft. above the sea, but only about 12,000 above the level of its own table-land. It is capped with perpetual snow, and was long regarded as the loftiest mountain in the world. Latterly, how-
U. K. III.—50

ever, it has been ascertained to be overtopped by some peaks, not merely of the Himaayas, but even of the central division of its own chain. Its lat. and long. are $1^{\circ} 20' s.$, and 79° west. The summit was for the first time reached by Stübel in 1872. Humboldt ascended within 2,138 ft. of it, and Boussingault and Hall within 1729.

CHIMÈRE, "the upper robe worn by a bishop, to which the lawn-sleeves are now generally attached." Since the time of queen Elizabeth, it has been of black satin, but previously it was of a scarlet color, like that worn by the bishops when assembled in convocation, and when the sovereign attends parliament.

CHIMES, music performed on bells in a church tower, either by the hands of a performer or by mechanism. The most perfect C. are to be found in Holland and Belgium.

CHIMES (*ante*). This class of music is believed to have originated in some of the German monasteries, and the first instrument for the production of C. to have been made in 1487 at Alost, in the Netherlands. Among the celebrated chimes of Europe are those of Copenhagen, Ghent, and Amsterdam. A number of bells is required for a proper execution of this music. The *carillons à clavier* are played like a piano-forte; the keys are handles connected with the bells by rods or cords, and the *carillonneur* employs his hands and feet to play an air. The pedals communicate with the larger bells for the bass. The keys on which the treble notes depend are struck with the hand, which is protected by a leather covering. It is stated that Potthoff, a blind organist of Amsterdam, was able to perform fugues on this instrument. The invention of carillon machinery is of modern origin; one person now is able by simply turning a barrel similar to that of a music box to chime eight bells with little difficulty. C. have been largely introduced into our American churches. In New York there are four churches that have large chimes, St. Thomas, Grace, Trinity, and St. Ann's. The C. of Christ church in Philadelphia, Christ church in Boston, and Trinity church in New York, are probably the oldest in this country. Little is known of the Trinity church bells, except that five of them were cast in London before the year 1845. The ten bells have an aggregate weight of about 15,000 lbs.; the largest weighs 3,081 lbs., the smallest, 700 lbs.; they are hung in a frame-work of wood, and the machinery is somewhat primitive. St. Thomas church has ten bells which were cast at Meneely's in w. Troy, and put up in 1874; they are very fine in tone and tune. Grace church has ten bells with an aggregate weight of 10,300 lbs., the largest, called the Rector's bell, weighs 2,835 lbs.; they are played on by means of a *carillon à clavier*, like those in Holland. The C. of old Christ church in Philadelphia are of historic interest. These bells were sent from England as a present from queen Anne; they were taken down during the revolution, and sunk in the Delaware river, as it was feared the British might capture them. At the close of the war they were hung in the old belfry; and may now be heard on every holiday through the year. Christ church in Boston also has an ancient and notable chime. Full and partial chimes, the latter called peals, can now be heard in all parts of the country. There are three sets of chimes in Troy, N. Y. The church of the Good Shepherd, in Hartford; St. James church in Birmingham, Conn.; old St. John's in Savannah, Ga.; churches of different denominations in Indianapolis, Petersburg, Va.; Cleveland, O.; Concord, N. H.; Rochester, N. Y.; and many others, produce chime music. Worth mentioning are those of St. Ann's, in Brooklyn; St. John's, in Newark; Grace church, and St. Patrick's, in Buffalo; the cathedral of the Immaculate Conception, in Albany; St. Paul's, in Reading, Pa.; Pilgrim church, in St. Louis; in the bell-tower of Cornell university, at Ithaca, N. Y.; and in the college chapel at Amherst, Mass. The half C. and peals in the United States are very numerous. (See BELL, *ante*.)

CHIMNEY (Fr. *cheminée*, Lat. *caminus*). There seems reason to believe that the C., in its present sense of a funnel from the hearth or fire-place to the roof of the house, is a modern invention. In Greek houses it is supposed that there were no chimneys, and that the smoke escaped through a hole in the roof. What the arrangement was in houses in which there was an upper story, is not known; perhaps the smoke was conveyed by a short funnel through the side-wall of the house, which seems to have been the first form of C. invented in the middle ages. The Roman *caminus*, again, was not a C., but a sort of stove; and it has been a subject of much dispute, whether the Romans had any artificial mode of carrying off the smoke, or whether it was allowed to escape through the doors, windows, and openings in the roof. As the climate and the habits of the people both led to the houses of the ancients being very much more open than ours are, it is probable that the occasional fires which they had of wood or charcoal may have given them no great inconvenience. It is known, besides, that the rooms in Roman houses were frequently heated by means of hot air, which was brought in pipes from a furnace below. In England, there is no evidence of the use of chimney-shafts earlier than the 12th century. In Rochester castle (*circa* 1130), complete fire-places appear; but the flues go only a few feet up in the thickness of the wall, and are then turned out through the wall to the back of the fire-place, the openings being small oblong holes. The earliest chimney-shafts are circular, and of considerable height. Afterwards, chimneys are found in a great variety of forms. Previous to the 16th c., many of them are short, and terminated by a spire or pinnacle, having apertures of various shapes.

These apertures are sometimes in the pinnacle, sometimes under it, the smoke escaping as from some modern manufacturing chimney-stalks which are built in the form of an Egyptian obelisk. Clustered chimney-stalks do not appear until late in the 15th c., when they seem to have been introduced simultaneously with the use of brick for this purpose. Each of the earlier clustered chimneys consists of two flues which adhere to each other, and are not set separate, as afterwards was the practice. Long after they were invented, and in use for other rooms, our ancestors did not generally introduce them into their halls, which, till the end of the 15th, or beginning of the 16th c., continued as formerly to be heated by a fire on an open hearth in the center of the hall, the smoke escaping through an opening in the roof known by the name of *louvre*. In many of the older halls in which chimneys exist, they have evidently been inserted about this period.

The action of a C. depends upon the simple principle, that a column of heated air is lighter than a cooler column of equal height; when therefore a flue full of heated air communicates freely by the lower part with the cooler air around it, the greater weight of the latter pushes the warm air upwards, and thus an ascending current is produced. Other conditions being equal, the draught of a C. will thus be proportional to its perpendicular height, and the difference between the temperature within and without it. The straighter and more perpendicular the C., the stronger will be the draught, because the friction of the ascending current will be less, and the cooling effect of a long or tortuous course will be saved. The maximum efficiency of a given C. is attained when all the air that passes up it enters by the bottom of the fire. In this case, its temperature is raised to the uttermost by passing through the whole of the fire, and the fire is at the same time urged to vivid combustion by the blast thus obtained. A powerful furnace may be constructed by connecting a suitable fire-place, capable of being closed all round excepting at the bottom, with a tall C.; and the amount of draught may be regulated by increasing or diminishing the aperture through which the air is admitted to the bottom of the fire-place, or by an adjustable opening above the fire-place, which will diminish the effective draught as its size is increased, or by a combination of both of these contrivances.

When the fireplace can be inclosed thus, there is little liability to descending currents or "smoky chimneys," as they are called, even when the C. is very short, or has a tortuous course. It is chiefly with open fireplaces that this defect occurs, and the means of prevention and cure is a subject of some interest and importance. As with most other evils, the prevention is far easier than the cure; for by properly constructing the C. in accordance with the principles above stated—by placing the opening of the C. as nearly over the fire, and contracting the open space above the fire, as much as possible—downward smoking may in most cases be easily prevented. When a C. is in the neighborhood of a wall or building nearly as high as itself, or—what is still worse—higher, it is apt to smoke on account of the eddies and other complex currents in the air, caused by the interference which such an obstacle presents to the regular movement of the wind. In towns, such tortuous movements of the atmosphere are very common, and the contrivance for preventing the wind from blowing down the chimneys are very numerous, and often grotesque. Revolving cowls of various forms, but alike in having a nearly horizontal outlet, which is so turned by the wind that the mouth shall always point in the direction opposite to that whence the wind is blowing, are the most common, and usually the most effectual. They are generally constructed of sheet-zinc, with an arrow, a flattened pigeon, or other device, as a vane, to determine the rotation of the cowl. The curing of smoky chimneys, in conjunction with the economizing of fuel, was one of the favorite subjects of investigation of that very practical philosopher, count Rumford. He says: "Those who will take the trouble to consider the nature and properties of elastic fluids—of air, smoke, and vapor—and to examine the laws of their motions, and the necessary consequences of their being rarefied by heat, will perceive that it would be as much a miracle if smoke should not rise in a chimney—all hindrances to its ascent being removed—as that water should refuse to run in a siphon, or to descend a river. The whole mystery, therefore, of curing smoky chimneys is comprised in this simple direction: find out and remove those local hindrances which forcibly prevent the smoke from following its natural tendency to go up the chimney; or rather, to speak more accurately, which prevent its being forced up by the pressure of the heavier air of the room."* He then goes on to speak of above 500 smoking chimneys that he has had under his hands, and which were supposed incurable, and states that he was never obliged, "except in one single instance, to have recourse to any other method of cure than merely reducing the fireplace and throat of the chimney, or that part of it which lies immediately above the fireplace, to a proper form and just dimensions."

In this reduction, the section of the fireplace is changed in form and size, whence it is better adapted for radiation into the room than the former square opening; the fire being brought further forward, has also more heating effect; the space of the fireplace being smaller, the air within it will, with a given sized fire, become hotter, and therefore

* *Essays: Political, Economical, and Philosophical*, by Benjamin count Rumford, vol. i. p. 299.

have more ascending power; while in the contracted throat widening downwards, and having its sides strongly heated, there is a rapid rush of heated air, which carries the smoke upwards, and resists the passage of temporary down-draughts. Most modern chimneys and fireplaces are now constructed in accordance with count Rumford's suggestions. See GRATE.

One frequent cause of smoky chimneys is the want of sufficient inlet for air to the room. Sand-bags placed under doors, and other devices for preventing ventilation, may cause a well-constructed C. to smoke. Openings must exist somewhere, of sufficient capacity to supply the air which is to ascend the chimney. If the air enters the room on the same side as the fireplace, and sudden gusts of air pass across the front of the fireplace, a temporary descending current is likely to be produced. The openings are best opposite the fire. For the methods of arranging and regulating such openings for the admission of air, see VENTILATION.

Tall factory-chimneys, usually built of brick, are very costly structures, many of them rivaling in height our loftiest cathedral spires. Their construction has been considerably economized by building from the inside, and thus saving the expensive scaffolding. Their walls are built very thick at the base, and gradually thinner upwards: recesses are left at regular intervals in the inside, and stout wooden or iron bars rest upon these to form a sort of temporary ladder for the workmen to ascend; the materials are hoisted by ropes and pulleys.

Sheet-iron chimneys are largely used in Belgium. They are much cheaper but less durable than brick, and are objectionable on account of their rapid cooling by the action of the external air.

CHIMPANZEE, *Troglodytes niger*, a species of ape; one of those which in form and structure exhibit the greatest resemblance to man. It is a native of the warmest parts of Africa; to which also the gorilla (q.v.), a larger species of the same genus, belongs. The C. is sometimes called the black orang; but differs from the orang (q.v.) (*pithecus*) of Asia in the proportionally shorter arms, which, however, are much longer than those of man; in the possession of an additional dorsal vertebra, and an additional or thirteenth pair of ribs; and in other particulars, in some of which it more nearly resembles, and in others more widely differs, from the human species. In both, the difference from man is very wide in the general adaptation of the structure for movement on all-fours and for climbing and moving about among branches, rather than for erect walking, although the C. is able to move in an erect posture more easily than any other ape, usually, however, when so doing, holding its thighs with its hands; and still more in the form of the skull, and consequent aspect of the countenance, the facial angle being as low as 35° in the C. when it is measured without regard to the high bony ridges which project above the eyes; the jaws excessively projecting, and the outline of the face rather concave. There is also an important difference from the human species in the dentition; although the number of teeth of each kind is the same, the canine teeth of the apes are elongated, so as to pass each other, and corresponding intervals are provided for them in the opposite jaw. An interesting point of difference of the anatomy of the C. and orang from that of man, is in the muscle which in man terminates in a single tendon, and concentrates its action on the great toe, terminating in the apes in three tendons, none of which is connected with the great toe or hinder thumb, but which flex the three middle toes; part of the adaptation of the foot for clasping as a hand. The great toe both of the C. and orang is shorter than the other toes, and opposed to them as a thumb.

The C. does not seem to attain a height of quite 4 ft. when in an erect posture. Its skin is thinly covered with long black hair in front; the hair is thicker on the head, back, and limbs. The ears are remarkably prominent, thin, and naked, not unlike human ears in shape. The nose appears as little more than a mere wrinkle of the skin. The thumb of the hand is small and weak, that of the foot comparatively large and powerful. In a wild state, the animal appears to be gregarious, but its habits are not well known. Truth and fable have been so mixed up in the accounts of it that new information must be obtained from reliable sources, before even things not in themselves very improbable can be believed. In a state of confinement, it exhibits, at least when young, considerable gentleness and docility, and readily learns to imitate human actions, in eating with a spoon, drinking out of a glass, and the like; but its intelligence does not appear to be superior to that of many other monkeys, or indeed of many kinds of brutes. Its natural food consists chiefly of fruit and other vegetable substances; in confinement, it exhibits a great fondness for sweetmeats and for wine. The C. is impatient of cold, and the climate of Britain soon proves fatal to it.

CHIMSEYANS, Indians of the n.w. coast of North America, between 53° and 55° n., including several small tribes. They are noted, like the Indians of Alaska, for disfiguring themselves by inserting a large piece of wood or ivory in the under lip. Their language is said to be sonorous and comprehensive.

CHINA. See CHINESE EMPIRE.

CHINA, or CHINA-WARE. See PORCELAIN.

CHINA BARK, a name of cinchona (q.v.) bark, often to be met in books, and in common use on the continent. It is derived, not from the empire of China, but from *kina* or *quina*, the Peruvian name of cinchona.

CHINA CLAY, or KA'OLIN. See CLAY.

CHINA GRASS, or CHINESE GRASS, the popular name of a fiber used in China for the manufacture of a beautiful fabric known as *grass-cloth*. The name appears to have originated in the belief that the fiber was that of a grass; but this is not the case, it being chiefly obtained from *bahmeriu* (q.v.) *nivea*, a plant allied to the nettle. Besides this and other species of the natural order *urticaceæ*, other plants, as species of *corchorus* (q.v.) and *sida* (q.v.) are believed to yield fibers employed in the same manufacture. The fibers are said not to be spun after the European manner, but joined into long threads by twisting their ends together. Grass-cloth is now brought in considerable quantity to Europe, especially in the form of pocket-handkerchiefs. It has a fine glossy appearance and a peculiar transparency.

CHINANDE'GA, a t. of Central America, Nicaragua, stands in a fertile plain at the foot of some mountains, about 18 m. n.w. of Leon, and about 10 m. from the Pacific coast. The houses are straggling, of one story, built of adobes, and many of them are inclosed by gardens and plantations. Maize, sugar, cotton, hides, and poultry are produced in the vicinity. Pop. about 10,000.—OLD CHINANDEGA, which is contiguous, has a pop. of about 4,000.

CHINA ROOT, the root, or rather the *rhizome* (root-stock) of *smilax China*, a climbing shrubby plant, closely allied to sarsaparilla, and belonging to the same genus; a native of China, Cochin-China, and Japan. See SARSAPARILLA and SMILACEÆ. The stem is round and prickly, the leaves thin and roundish oblong; the rhizome tuberous and large; sub-astringent and diaphoretic. It is occasionally used in medicine, and is imported in a dry state into Europe; but it is also employed in the e. as an article of food. It abounds in starch.

CHINA WAX, produced by an insect which lies on the ash trees of China. It is scraped from the limbs, melted and strained, when it resembles bees' wax.

CHINCHA ISLANDS, three small islands in the Pacific, 13° 38' s. and 76° 28' w., 12 m. from the coast of Peru, and 106 m. from Callao. The largest, known as north island, is only about 170 acres in surface. The importance of the islands is owing to their immense deposits of guano. They are of granitic formation, rising from the sea in precipitous cliffs, worn into countless caves and hollows, which furnish convenient resting places for sea-fowl. Their highest point, now 113 ft., was once nearly 90 ft. higher, the whole deposit being of guano. The name of the islands and of the town and valley of Chincha in the mainland is derived from an ancient Indian race, which has left some interesting relics of its sojourn. A stone idol and two water-pots of grotesque form were discovered under 62 ft. of guano; and a number of wooden idols, two regal emblems, and a curious stone slab have been found. In 1846, the amount of guano in these islands was estimated to be 18,250,000 tons, and in 1852 there still remained 12,360,000 tons. The supply is now nearly exhausted. Between 1853 and 1872, 8,000,000 were taken from the n. and middle islands. In 1868, there was a population of 6,000; in 1874, only 105 remained.

CHINCHAYCO'CHA, a lake in Peru, 10° 42' s. and 75° 40' w., 10 m. s.s.e. of Pasco, and 13,000 ft. above sea-level. It is 35 m. long by about 7 wide.

CHINCH BUG, *Blissus leucopterus*, an insect which has sometimes done immense damage to wheat and other crops in the western United States. The female lays her eggs on the ground, and there are often two swarms of bugs in a single year, one in June and one in the autumn. The chinch bug is from a seventh to a fifth of an inch in length; the wing-covers are black, with three or four white dashes, sometimes wanting; the body is usually black, though the unwinged young are at first red, with a white band on the back.

CHINCHEW, or CHINCHU, an ancient and famous port of China, in the province of Fuh-keen, 27° 57' n. and 118° 35' east. Though occasionally visited by missionaries and others, Chinchu is not one of the treaty ports. The chief exports are tea, sugar, china-ware, tobacco, and nankeens. The English Presbyterians have had a chapel in the city since 1862. In the middle ages this city was the great port for western trade with China, and was known to Europeans as Zayton.

CHINCHILLA, *Chinchilla*, *Eriomys*, or *Callomys*, a genus of South American quadrupeds, of the order *rodentia*; the type of a family, *chinchillidæ*, allied to cavies (*caviæ*), but differing from them in possessing clavicles. The general aspect is somewhat rabbit-like. There are several genera of *chinchillidæ*, distinguished in part by the number of toes; the true chinchillas having four, with the rudiment of a fifth on the fore-feet, and four on the hind-feet; whilst in the genus *lagidium* or *lagotis* there are four on each foot;

and in *lugostomus*, four on the fore-feet and three on the hind-feet. All the species of this family are gregarious; feed much on roots, for which their strong and sharp incisors are particularly adapted; and live either in holes, which they select for themselves in rocky districts, or in burrows, which they excavate. They are valued for their fur, particularly the CHINCHILLA of the Andes (*C. lanigera*), of which the fur constitutes an important article of commerce. Their numbers are said to be sensibly decreasing in consequence of the demand for the fur. The ancient Peruvians were accustomed to employ the wool of the *C.* for the manufacture of fine fabrics. Molina suggests that it might easily and profitably be kept in a domesticated state.

CHINCHILLA, a t. of Spain, in the province of Albacete, 10 m. s.e. of the city of that name. It is situated on an abrupt rocky hill, crowned by a castle, and is surrounded by walls. The town is in general well built, with good streets, and a fine parish church, containing some excellent works of art. It has manufactures of cloth, linen, leather, earthenware, and glass, and a trade in the agricultural produce of the district. Pop. 7,500.

CHINCHON, a t. of Spain, in the province of Madrid, 25 m. s.s.e. of the city of that name. It is pleasantly situated on a hill near the Tagus, and is well built, with wide, regular, and clean streets. Agriculture forms the chief occupation of the inhabitants, but leather, linen, and earthenware are manufactured to a small extent. Pop. 5,400.

CHINDWARA, a t. in the central provinces of India, lat. 22° 3' n., and long. 78° 58' east. It occupies a plateau amid the Deoghur mountains, standing 2,100 ft. above the level of the sea. Its climate is consequently one of the most agreeable and salubrious in India, attracting many visitors in search of health or recreation. Pop. '72, 8,626.

CHINE, LA, a village of the dominion of Canada on the s. side of the island of Montreal, and about 9 m. to the w. of the city of that name. Both the city and the village stand on the left bank of the St. Lawrence, or rather, of a branch of the Ottawa; for here, and at least 10 or 12 m. further down, these united rivers keep their waters unmingled. As the intermediate portion of the stream forms the rapids of St. Louis' the consequent interruption of the navigation naturally rendered La C. a turning-point between the maritime and the inland communications. Gradually, however, its importance in this respect has been diminished, if not extinguished, by works between it and Montreal—a canal, a railway, and even improvements in the rapids themselves. The pop. in 1871 was 1696.

CHINESE EMPIRE, a vast territory in eastern Asia, comprehending five great divisions, viz.: 1. Mantchuria (q.v.); 2. Mongolia (q.v.); 3. Turkestan (q.v.); 4. Thibet (q.v.); 5. China proper or the eighteen provinces (*Shih-pá-sang*), including the two large islands of Formosa and Hainan—the former being reckoned in the province of Fuh-keen, and the latter as a department of Kwang-tung.

China Proper occupies the eastern slope of the table-lands of central Asia. In form it approaches to a square, and covers a surface eighteen times as large as Great Britain. It is inhabited by more than 360 millions of the human race, living under the same government, ruled by the same laws, speaking the same language, studying the same literature, possessing a greater homogeneity, a history extending over a longer period, and a more enduring national existence than any other people, whether of ancient or modern times; indeed, when we consider its high antiquity, its peculiar civilization, its elaborate administrative machinery, its wondrous language, its philosophy and classic literature, its manufacturing industry and natural productions, giving rise to such a gigantic commerce with our own land, China is perhaps the most remarkable country in the world, and is worth a closer and more serious study than has yet been generally accorded to it. China proper is included between 18° and 40° n. lat. (which takes in the island of Hainan), and 98° to 124° e. longitude. Its coast-line exceeds 2,500 m. and the land-frontier 4,400 miles. A line running direct n. and s. would give a length of 1474 m.; and another at right angles to this, 1355 m.; but one drawn diagonally from its north-eastern extremity through Yun-nan would measure 1669 miles. The area of China proper is usually given as 1,297,999 sq.m.; but Dr. Williams considers that the entire dimensions of the 18 provinces, as the Chinese define them, cannot be much under 2,000,000 sq. miles. All these measurements, however, must be taken as mere approximations.

Physical Features.—China has a general slope from the mountains of Thibet to the shores of the Pacific. The two principal mountain-chains divide it into three longitudinal basins, drained by those great rivers for which China is famous. Within its provinces are found alluvial plains, fertile river-valleys, large populous towns, as well as thinly inhabited, hilly, and mountainous regions. To describe its surface more particularly, it may be viewed under its natural divisions of mountainous country, hilly country, and the great plain. The first comprehends more than half the region between the meridian 113° and Thibet. East of this meridian, and to the s. of the Yang-tse-kiang river, is the hilly country, which includes the provinces of Fuh-keen, Keang-se, Kwang-tung, and a portion of Hu-nan and Hu-pih; while to the n.e. stretches the great plain. This latter extends from the great wall to 30° n. lat.; a line drawn from King-chow in Hu-pih to Hwae-king on the Yellow river, may be considered its western limit; and the

sea forms its boundary on the east. This vast and generally fertile tract has an area of 210,000 sq. miles, and supports a population of 177 millions.

From the mountains of Thibet two grand ranges stretch across China, having a general direction from s. w. to n. e. The more northerly of these—the Thsin-ling or Blue mountains—are included between the parallels of 31° and 34°. The southern or Nan-ling chain is a spur of the Himalayas. Commencing in Yun-nan, it bounds Kwang-se, Kwang-tung, and Fuh-keen on the n., and passing through the province of Che-keang—where some of its peaks reach the height of 12,000 ft.—enters the sea at Ning-po; thus forming a continuous barrier—penetrated only by a few steep passes, of which the Mei-kwan, or Mei Pass, is the best known—that separates the coast-land of south-eastern China from the rest of the country. This great chain throws off numerous spurs to the s. and e., which, dipping into the sea, rise above it as a belt of rugged islands along the southern half of the Chinese sea-board. Of this belt, the Chusan archipelago is the most northerly portion.

The magnificent *river-system* of China is represented by those noble twin streams, the Hoang-ho or Yellow river, and the Yang-tse-kiang, which, springing from the same water-shed, the eastern mountains of Thibet, are widely separated in their mid course, but enter the sea within 2° of each other. The former has its source in 35½° n. lat. and about 96° e. long.; and after a very tortuous course, empties itself into the ocean in lat. 34°.* It is a “mighty, impracticable, turbid, furious stream” for the most part, and little adapted for Chinese navigation. But the river most beloved by the Chinese is the Yang-tse-kiang, or “son of the ocean”—more correctly translated, “the son that spreads”—which name is only applied to it by the natives below the commencement of the delta; for above that it is called simply Ta-kiang or Great river. The basin drained by it is estimated at 750,000 sq. miles. Of the other rivers that water the country, the Peiho in the n., and the Choo-keang in the s., are the most noteworthy.

The principal *lakes* of China are five in number—viz., the Tung-ting-hu, in 113° e. long., with a circumference of about 220 m.; the Poyang-hu, in 116° e. long., 90 m. in length by 20 in breadth; the Hung-tsin-hu, in Keang-su; the Tsau-hu, between Ngankin-fu and Nankin; and the Tai-hu, in 120° e. long. On these lakes, artificially constructed floating islands, with houses, fields, and inhabitants, animals, and birds, are sometimes seen.

The *Grand Canal* has very greatly facilitated the internal navigation of the country. Until lately the great annual grain-fleet, with its 430,000 tons of rice for the use of the capital, passed from the s. to the neighborhood of Peking by this great water-way; thus avoiding the storms and pirates of the coast, but the alteration already mentioned in the course of the Hoang-ho, has rendered it comparatively useless. It connects Tientsin in Chih-le with Hang-chow in Che-keang; though the canal proper commences in Shan-tung, and its total length is about 650 miles.

Another world-famous structure is the *Great Wall*—called Wan-li-chang (myriad-mile-wall) by the Chinese—which was built by the first emperor of the Tsin dynasty about 220 B. C., as a protection against the Tartar tribes. It traverses the northern boundary of China, extending from 3½° e. to 15° w. of Peking, and is carried over the highest hills, through the deepest valleys, across rivers and every other natural obstacle. The length of this great barrier is, according to McCulloch, 1250 m. Including a parapet of 5 ft., the total height of the wall is 20 ft.: thickness at the base, 25 ft.: and at the top, 15 ft. Towers or bastions occur at intervals of about 100 yds. These are 40 ft. square at the base, and 30 ft. at the summit, which is 37 ft., and in some instances 48 or 50 ft., from the ground. Earth inclosed in brickwork forms the mass of the wall; but for more than half its length it is little else than a heap of gravel and rubbish.

Geology.—The high lands, where are the sources of the great rivers of China, consist of granitic and metamorphic rocks. These are continued round the s. and s. e. of the country, until they leave a huge basin, through which flow the Yang-tse-kiang and Hoang-ho, occupied by fossiliferous strata. The wild and rugged scenery of the larger portion of China is owing to the predominance of those crystalline and sub-crystalline rocks. The fossiliferous strata exhibit representatives of the various formations. The paleozoic rocks are but sparingly developed in a narrow stripe which runs from near Peking in a south-westerly curve, to nearly the center of the empire. Cretaceous rocks occur in the valley of the Yang-tse-kiang. Tertiary beds fill up the eastern portion of the immense basin; while extensive districts to the w. of this region, extending to the crystalline rocks in the extreme w., are covered with modern detritus.

Though no active volcanoes are known to exist except one in Formosa, yet indications of volcanic action are not wanting. Salt and hot-water springs are found in Yun-nan; sulphur springs near Foochow; and wells of petroleum in Shen-se and Formosa. The most famous amongst the *minerals* of China is jade or the yu-stone, obtained chiefly in Yun-nan. Coal, limestone, and porcelain clays are abundant. Precious stones are said to be met with in some districts. In Yun-nan, gold is washed from the sands of the

* The Hoang-ho has recently altered its course, and now enters the sea in a somewhat higher latitude. Such changes, causing losses, and entailing expense, are not unusual; and hence this river has been called “China’s sorrow.”

rivers, and in the same province silver-mines are worked; here, too, is obtained the celebrated pe-tung or white copper. All the commoner metals are likewise found in China. Near the city of Ning-po are extensive stone-quarries.

Vegetable Productions.—Our knowledge of the flora of China has been much advanced by the researches of Mr. Fortune; and his works contain valuable notices of the geography, culture, and varieties of the tea-plant, and of the botany of the country generally. The tea-plant (*thea viridis* and *thea bohea*) is the most important vegetable production of China. See TEA. The tallow-tree (*stilingia sebifera*), the *dryandra cordata* or varnish-tree, the camphor-tree (*laurus camphora*), the Chinese pine (*pinus sinensis*), the Chinese banyan (*ficus nitida*), the funeral cypress—introduced into this country by Mr. Fortune—and the mulberry, are amongst the most important trees of China. The cocoa-nut and other palms flourish on the southern coast. Of the bamboo, which grows as far n. as lat. 38°, there are 63 principal varieties; and it is said that the bamboos of China are more valuable than her mines, and, next to rice and silk, yield the greatest revenue. The various uses to which they are applied is truly astonishing; and, amongst others, the bamboo is famous as an instrument of punishment. The fruits of both the tropical and temperate zones—apples, grapes, pomegranates, mangoes, pine-apples, three species of orange, the lichi, etc.—are found in the country; and camellias, azaleas, and gardenias are natives of the “flowery land.” The *nymphaea*, or water-lily, is greatly prized by the Chinese, both for ornament and in an economical point of view. *Agriculture* is held in higher estimation in China than, perhaps, any other country in the world. On the first day of each year, a grand state-ceremony is performed in its honor. The emperor, accompanied by his great officers of state, repairs to the sacred field, and, having offered sacrifices on an altar of earth, he traces a furrow with the plough, and his example is followed by princes and ministers. A like solemnity is celebrated by the governor of every province, who represents the emperor. The agricultural system of the Chinese is rude, but effective; and every inch of arable land is carefully cultivated. Spade-husbandry and irrigation are carried on to a great extent. The Chinese have a strong perception of the value of night-soil as a manure; for, whilst in this country thousands of pounds’ worth are annually thrown into the Thames, in China it is everywhere saved, bears a high price, and is collected in a manner exceedingly offensive to European notions. In the northern provinces, the cereals are principally maize, barley, and wheat; but in the south, rice is raised in vast quantities, and forms the staple food of the people. Tobacco and the poppy are also raised in considerable quantities.

Animals.—Very little is really known of the zoology of China. Some of the more ferocious of the carnivorous animals still linger in the jungles of Yun-nan, and are occasionally found along the whole of the Nanling range of mountains as far as Ning-po, where there is a mart for their skins. Wild-cats are common in the forests of the south, and bears are still found in the hills of Shan-se. Of the ruminantia, there are the musk-deer (*moschus moschiferus*), the moose-deer, and a few other species. The gold and silver pheasant, the argus pheasant, and other gallinaceous birds, hold a prominent place in the ornithology of China. Fly-catchers, thrushes, grackles, and goat-suckers have their representatives in China, and there are several species of crows, jays, and magpies. Water-fowl inhabit the lakes, rivers, and marshes. The larger reptiles are unknown; but tortoises and turtles abound on the coast, and lizards are plentiful in the south. The ichthyology of China is considered to be one of the richest in the world. Sharks, rays, sturgeons, and other cartilaginous fishes, are common on the coast; and the carp formerly was very plentiful in the lakes and rivers. The goldfish has been introduced into Europe from China. Of insects, the arachnidae are large and numerous; indeed, a tree-spider captures and kills small birds. Locusts often commit extensive ravages. Silk-worms are highly valued, and reared in large numbers.

In a country of such vast extent—extending from 18° to 40' n. lat.—the *climate* must vary greatly. Indeed, as regards both climate and productions, China may be divided into three zones—the northern, the central, and the southern. The northern zone extends to the 35th parallel, and includes the fine provinces of Shang-tung, Chih-le, Shan-se, Shen-se, and Kan-su. It produces the grains, fruits, and animals of northern Europe. Here the children are red-cheeked, and the extremes of heat and cold are great. In Chih-le, the winters are very severe; and at that season ice a foot-thick renders the rivers unnavigable. The natural productions of this and the contiguous northern provinces are wheat, barley, oats, apples, the hazel-nut, and the potato; they are also rich in wood and minerals. The central zone, the richest portion of China, contains eight provinces—Sze-chuen, Kwei-chow, Hu-nan, Hu-pih, Keang-se, Gan-hwuy, Ho-nan, and Keang-su—and is bounded by the 27th or 28th parallel; tea and silk are its characteristic products; the middle portion is the granary of China, and the eastern part is celebrated for its manufactures of silk and cotton. The southern zone embraces five provinces—Yun-nan, Kwang-tung, Kwang-se, Fuh-keen, and Che-keang. The exchange of its tropical productions for those of the northern zone is an important branch of the internal commerce of the country. Kwang-tung lies partly within the tropics; and the whole province is tropical, both in climate and productions. The following table (no later census has been made) exhibits the situation, area, and population of the eighteen provinces into which China is divided for administrative purposes:

PROVINCES.	Population, Census of 1812.	Sq. miles	Pop. per sq. mile.
<i>Northern Provinces—</i>			
Chih-le.....	27,990,871	58,949	475
Shang-tung.....	23,958,764	63,104	444
Shan-se.....	14,004,210	55,268	252
Ho-nan.....	23,037,171	65,104	420
<i>Eastern Provinces—</i>			
Keang-su.....	37,843,501	44,500	850
Gan-hwuy.....	34,168,059	48,461	705
Keang-se.....	23,046,999	72,176	320
Che-keang.....	26,256,784	39,150	671
Fuh-keen.....	14,777,410	53,480	276
<i>Central Provinces—</i>			
Hu-pih.....	27,370,098	70,450	389
Hu-nan.....	18,652,507	74,320	251
<i>Southern Provinces—</i>

Kan-su.....	15,193,125	86,608	175
Sze-chuen.....	21,435,678	166,880	128
Totals.....	360,279,897	1,298,079	277

But, according to the *Almanach de Gotha* for 1877, the population of China, properly so called, was estimated at 405,000,000; and of the rest of the empire, including Manchuria, Mongolia, Tibet, and Corea, 28,000,000—in all, 433,000,000. After Peking, the capital, the largest cities in China are Canton, Tien-Tsin, Foochow, Hankow, Hangchow-Foo, Ning-po, Amoy, Shanghai, etc.

Inhabitants.—Ethnologically, the Chinese belong to that variety of the human species distinguished by a Mongolian conformation of the head and face, and a monosyllabic language. See CHINESE LANGUAGE, WRITING, AND LITERATURE. A tawny or parchment-colored skin, black hair, lank and coarse, a thin beard, oblique eyes, and high cheek-bones, are the principal characteristics of the race. The average height of the Chinaman is about equal to that of the European, though his muscular power is not so great; the women are disproportionately small, and have a broad upper face, low nose, and linear eyes. Of the general character of the Chinese, it is not easy to form a fair and impartial judgment; and those who have resided long in the country, and know them well, have arrived at very different conclusions. M. Huc asserts that they are “destitute of religious feelings and beliefs,” “skeptical and indifferent to everything that concerns the moral side of man,” “their whole lives but materialism put in action;” but “all this,” says Mr. Meadows, “is baseless calumny of the higher life of a great portion of the human race.” He admits, indeed, that these charges are true of the mass of the Chinese, just as they are true of the English, French, and Americans; but as amongst these there is a large amount of generosity and right feeling, and also “a minority higher in nature, actuated by higher motives, aiming at higher aims,” so also, he maintains, is there amongst the Chinese a similar right feeling, and a like minority who live a higher life than the people generally. See HIOUEN-TSANG. As regards valor, their annals record “deeds akin to the courage of antiquity;” they have no fear of death, commit suicide as the solution of a difficulty, and endure the most cruel tortures with a passive fortitude; but neither their arms nor discipline enable them to stand before European forces. The Chinese are, as a race, unwarlike, fond of peace and domestic order, capable of a high degree of organization and local self-government, sober, industrious, practical, unimaginative, literary, and deeply imbued with the mercantile spirit. It is to be observed that the inhabitants of China Proper are essentially one people; the differences, except in dialect, being hardly more marked than between the Northumbrian peasant and the Cornish miner. The south-eastern Chinese—the people of Kwang-tung, Fuh-keen, and the south of Che-keang—are the most restless and enterprising in all the eighteen provinces, and may be regarded as the Anglo-Saxons of Asia. In the mountainous districts of the four south-eastern provinces of China, but principally in Kwang-se, are certain tribes who maintain a rude independence, wear a peculiar dress, and are descended from the aboriginal inhabitants of China. Of these, the Meaon-tze are the best known.

The *manners and customs* of the Chinese can only here be glanced at. The *worship of ancestors* is a remarkable and prominent feature in their social life, and is dictated by that principle of filial piety which forms the basis of Chinese society. The rich have in their houses a chamber—a kind of domestic sanctuary—dedicated to their forefathers. Tablets, representing the deceased persons, and inscribed with their names, are here carefully preserved; and at stated seasons, prostrations and ceremonies are performed

before them according to the book of rites. All Chinese worship from time to time at the tombs of their parents. In everything that relates to death and sepulture, the customs of the Chinese are no less singular. They meet their last enemy with apparent unconcern; but whilst their future state troubles them little, they regard the quality of their coffins as of vital importance, and frequently provide them during their lifetime; indeed, a coffin is reckoned a most acceptable present, and is frequently given by children to their parents. "To be happy on earth," say the Chinese, "one must be born in Su-chow, live in Canton, and die in Lianchau"—Su-chow being celebrated for the beauty of its women, Canton for its luxury, and Lianchau for furnishing the best wood for coffins. Yet death is never alluded to in direct terms, but indicated rather by periphrases, such as—the person "exists no more," "he has saluted the age," "ascended to the sky," etc. Banquets are offered to the dead, and pathetic speeches addressed to them. In China, *marriage* is universal, and within the reach of all; but there is a strict separation of the sexes, and betrothal is undertaken by the parents or by professional match-makers. Minute ceremonial observances regulate every step, and frequently the bride and bridegroom see each other on the wedding-day for the first time. Women hold a very inferior position, and are little better than slaves. Polygamy is not recognized by law, but secondary wives are common, especially when the first proves barren. Infanticide, though regarded as a crime, is undoubtedly practiced to some extent, as is proved by edicts issued against it; and parents possess almost unlimited authority over their children. The intercourse of the Chinese with each other, especially of the upper classes, is regulated by a tedious and elaborate etiquette; indeed, they are the slaves of custom, and everything is done by precedent. Many curious instances of Chinese politeness might be cited. The well-bred host presses many things on a visitor, which the latter must never dream of accepting. "A Chinaman," says Mr. Oliphant, "has wonderful command of feature; he generally looks most pleased when he has least reason to be so, and maintains an expression of imperturbable politeness and amiability, when he is secretly regretting devoutly that he cannot bastinate you to death." The *Le-king*, or book of rites, regulates Chinese manners, and is one cause of their unchangeableness; for here they are stereotyped, and handed down from age to age. The ceremonial usages of China have been estimated at 3,000; and one of the tribunals at Pekin—the board of rites—is charged with their interpretation. Chinese cookery, in the use of made dishes, more nearly resembles the French than the English. Birds' nests soup, sharks' fins, deer-sinews, and ducks' tongues, are amongst its delicacies. The wine, or weak spirit (*tsau*), more correctly speaking, used by the Chinese is made from rice; and from this, again, they distill a stronger spirit, the "samshoo" of Canton. The former is drunk warm in minute cups at their meals; tea never appears during a repast, though it may be taken before or after. The Chinese have numerous *festivals*; and perhaps the most remarkable of these is that celebrated at the commencement of the new year, when unbounded festivity prevails. Preparatory to this, debts are settled, and the devout repair to the temples to gain the favor of the gods. The first day of the year may, in one sense, be reckoned the birthday of the whole people, for their ages are dated from it. Visiting is, at the same time, carried on to a great extent, whilst parents and teachers receive the prostrations and salutations of their children or pupils. The festival of the dragon-boats is held on the fifth day of the fifth month; and at the first full moon of the year, the feast of lanterns. In the manufacture of these the Chinese excel; and on the night of the festival, lanterns illuminate each door, wonderful in their variety of form and material.

In the matter of *dress*, the Chinaman exhibits his usual practical sense, and varies the material according to the season, from cotton-wadded or fur-lined coats to the lightest silk, gauze, or grass-cloth. On the approach of cold weather, he lights no fire in his dwelling, but puts on additional clothing until the desired temperature is attained. A tunic or kind of loose jacket fitting close round the neck, and a wide short trouser, are his principal garments. Shoes are made of silk or cotton, with thick felt soles. White is the color of mourning. The Tartar tonsure and braided queue became general with the Mantchu conquest of the country, since which 180,000,000 of men have the hair removed from their heads at short intervals; and as no Chinaman is his own barber, a great number of this calling find employment. The Chinaman is very sparing in his ablutions, and appears to be afflicted with a strange hydrophobia; for cold water, either as a beverage or for washing his person, he holds in abomination. Long nails are fashionable. The custom of the women differs but little from that of the men, and their shoes are the most remarkable part of their toilet. A lady's shoe measures about $3\frac{1}{2}$ in. from the heel to the toe. The feet of the Tartar women are left as nature made them; but amongst the Chinese, all young girls of the better classes are crippled by a tyrant custom. In early infancy the feet are tightly bound, the four small toes being tucked under the sole, of which, after a time, they become a part, and the heel is brought forward. The process is at length complete; stumps have been substituted for the ordinary pedal extremities, and the Chinese lady totters on her goat's feet.

The principal *manufactures* of the Chinese are silk, cotton, linen, and pottery, for which latter they are especially celebrated. The finest porcelain is made in the province of Keang-se. The Chinese invented printing in the beginning of the 10th c., and in 932 A. D. a printed imperial edition of the sacred books was published. The skill of the

Chinese in handicraft is astonishing. Their rich silks and satins, light gauzes, beautiful embroidery, elaborate engraving on wood and stone, delicate filigree-work in gold and silver, carvings on ivory, fine lacquered ware, antique vessels in bronze, and their brilliant coloring on the famous pith paper, command our admiration.

Of the grand modern discoveries in the *physical sciences* the Chinese are profoundly ignorant, and the study of nature is altogether neglected. The Chinaman objects to be wiser than his forefathers, but spends a life-time in studying his classical literature and the sages of antiquity; and here is doubtless one great cause of the homogeneity of the race, and the stereotyped nature of the Chinese mind.

Of *animal physiology and medicine* the Chinese have very crude notions, as is shown by their *scheme* of the human body, in which the heart is placed in the center, with the other organs ranged round it, and their unphilosophical theory of the pulse, which plainly demonstrates that they are ignorant of the true circulation of the blood, and the vascular system in man; hence their practice of medicine must be empirical. Chinese physicians believe that man is composed of five elements; that so long as each maintains its due proportion, health is preserved; but should one gain the ascendancy, illness follows, and the equilibrium must be restored by proper remedies. Acupuncture is practiced. The Chinese have had the opportunity of practically testing the superiority of western medical science, by the establishment of English and American hospitals, the introduction of vaccination, and by the publication of popular treatises on physiology and practical surgery, etc., by Dr. Hobson, late of Canton. It is worthy of remark, that these books were eagerly sought after, and excited a deep interest among their *literati*; indeed, the physiology has been twice republished by persons holding high official situations at Canton, and in a preface to the Chinese edition, the publisher observes: "Our science, indeed, cannot compete with that of the philanthropic author."

Government.—In the centralized autocratic government of China, the emperor is absolute in the empire, the governor in the province, the magistrate in the district. The emperor claims no *hereditary* divine right, and is not always the eldest son of the preceding monarch; the ablest son is nominated, but his right to the throne as the *Tien-tze*, or *Tien-tze*, "son of heaven," the *Fung-tien*, "divinely appointed," can only be established by good government, in accordance with the principles laid down in the national sacred books. If, on the contrary, he violates these principles, the people firmly believe that heaven signifies, by unmistakable signs, that their ruler is not its chosen representative. "The rivers rise from their beds, the ground sullenly refuses its fruits, the plains tremble, the hills reel, and the typhoon rages over seas and coasts, all alike uttering a 'Numbered, numbered, weighed and parted,' that requires no interpretation, but is read in anxiety by the people, in dismay and terror by the prince," who seeks by repentance, and a return to the true principles of the government, to avert his doom. The emperor is absolute as legislator and administrator; but he must legislate in accordance with the general principles acknowledged in the country. He also constitutes, in his own person, the highest criminal court. The Chinese possess a carefully digested code of laws, which is added to and modified from time to time by imperial edicts. Their penal code commenced 2,000 years ago, and copies of it are sold at so cheap a rate as to be within reach of people of the humblest means. Death, which the Chinaman prefers to long confinement, is the penalty for a large number of offenses, and in ordinary years about 10,000 criminals are executed. Several modes of torture are legal. The emperor is assisted in governing by two councils—1. *The inner or privy council*, composed of six high officials, three of whom are Chinese and three Manchus. The four senior ministers exercise functions corresponding to those of an English prime-minister. 2. *The general or strategical council*, which closely resembles our cabinet; being composed of the most influential officers in the capital, who exercise high legislative and executive duties. Under these are six *yamuns* or colleges of government, each charged with a distinct department of government. Over all is the court of general inspection, or the *ensorate*, as it is called by foreigners. The mandarins composing this number from 40 to 50; they are "the eyes and ears of the emperor;" for it is their province to see that all officers of the government, provincial or metropolitan, are faithful in the discharge of their respective duties; and they alone have the right to make representations or complaints to the emperor.

The *administrative machinery* of the Chinese is very perfect in its organization, and demands an attentive consideration for the right understanding of the people and government. In each of the 18 provinces is an imperial delegate or governor, who, besides being at the head of the civil jurisdiction, is commander-in-chief, and possesses the power of life and death for certain capital offenses. He is privileged to correspond with the cabinet-council and the emperor. Under the governor are the superintendent of provincial finances, the provincial criminal judge, and the provincial educational examiner; each communicates with his especial board in Peking. The governor is also assisted by many other judicial and administrative officials. The governmental organization of each province is complete in itself, but in a few instances two provinces—Kwang-tung and Kwang-se, for instance—form a viceroyalty, over which a governor-general, in addition to the governors, exercises authority. Every province is again subdivided into districts, departments, and circuits. The average number of districts in a province is eighty, and each of these is about the size of an English county. A civil functionary,

called sometimes the district-magistrate, presides over this division, and is assisted by several subordinate officers. A group of districts—six is the average number for the whole 18 provinces—forms a department, and is ruled by a prefect, who resides in the *fu* or departmental city. Three departments, on an average, constitute a circuit, of which an intendant (*taoutae*) has the charge.

The several grades of mandarins, or Chinese government officials (Chinese name, *kwan-fu*), are distinguished chiefly by a different-colored ball or button on the top of the cap. There are twelve orders of nobility confined to the imperial house and clan, and also five ancient orders of nobility open to the civil and military servants of the state. The normal government of China is less a despotism than a morally supported autocracy, and it is in principle paternal. What the father is to his family, that the governor, the prefect, and the magistrate are intended to be, each in his own sphere, to the people; whilst the emperor stands in the same relation to the myriad inhabitants of his vast dominions. In ordinary times, the Chinaman enjoys much practical freedom and can travel through the country without passport, or follow any calling he likes.

The Chinese executive system is based on those noteworthy *competitive examinations*, which are intended to sift out from the millions of educated Chinese the best and ablest for the public service. The first examination takes place every three years in the capital of each department, when the lowest degree—that of bachelor—is conferred on a certain number of candidates from each district. Triennial examinations are held in the provincial capital, presided over by two examiners from Peking, at which sometimes as many as 10,000 bachelors present themselves, and compete for the degree of licentiate. Some 1200 obtain it, and these may attend the triennial metropolitan examination at Peking, when about 200 may hope for the coveted degree of doctor, which insures immediate preferment.

Mr. Meadows, the most philosophical, perhaps, of our writers on China, and from whose works the foregoing sketch of the administrative system of the country has been chiefly derived, has entered very fully into what may be termed the *philosophy of Chinese government*, which he sums up in the following doctrines, and believes them to be deducible from the classic literature of the country, and the true causes of the wonderful duration of the Chinese empire. 1. That the nation must be governed by moral agency, in preference to physical force. 2. That the services of the wisest and ablest men in the nation are indispensable to its good government. 3. That the people have the right to depose a sovereign who, either from active wickedness or vicious indolence, gives cause to oppressive and tyrannical rule. And to these he adds an institution—the system of public-service competitive examinations. But, on the other hand, these examinations, by directing the attention of students solely to the ancient literature of the country, to the exclusion of the physical sciences and inductive philosophy, however efficient in producing that wonderful homogeneity for which the inhabitants of the central kingdom are famous, stunt and stereotype the national mind, which, like the dwarfed tree the Chinaman delights to raise in a flower-pot, or the feet of a Chinese girl, can never fully expand.

Education, as the high road to official employment, to rank, wealth, and influence, is eagerly sought by all classes. Literary proficiency commands everywhere respect and consideration, and primary instruction penetrates to the remotest villages. Self-supporting day-schools are universal throughout the country, and the office of teacher is followed by a great number of the *literati*. Government provides state-examiners, but does not otherwise assist in the education of the people. The Chinese have a remarkable reverence for the written character. Waste printed paper is collected from house to house and burned, to preserve it from profanation.

Army.—According to the *Peking Gazette*, China has a prodigious army, but in reality the greater part figures only on paper. Each province is provided with a military force varying from 8,000 to about 68,000 men. According to Mr. Meadows the average for each province is about 34,500 men, and 640 officers. The governor of a province is also commander-in-chief, and is assisted by a general-in-chief, as well as lieutenants and majors general. The Chinese and Tartar troops form two important divisions of the army. The Tartar garrisons are indeed the real strength of the Manchu emperor. That at Peking is 150,000 strong; and 18 others, averaging each about 3,000 men, are dotted about the provinces, forming, with their wives and children, military colonies. These troops, which are armed with good two-edged swords, and serviceable matchlocks, or the national bow, have alone been able to stand against the victorious Tae-ping rebels, and turn them from the capital. According to the most recent statistics (see *Die wirthschaftlichen Zustände im Süden und Osten Asiens*, Stuttg. 1871), the army is composed of 678 companies of Manchus of 100 men each, of 211 companies of Mongols, of 106,000 Chinese cavalry, and of 500,000 Chinese infantry, besides a large body of irregular militia—in all 858,000 men. The Tartar infantry soldier receives four taels a month, and the trooper four and a half. The marquis de Moges (see baron Gros' Embassy) thinks that "two regiments of chasseurs and two regiments of zouaves would suffice to conquer China." "There is not," he says, "a corps in the empire that could stand fast under a bayonet charge." This, however, is no longer the case. The native troops in all the large cities of the empire are drilled after the European fashion, and armed with the Snider and other breech-loading rifles; and in the opinion of intelligent English

residents, the next Chinese war will be a very different affair from anything that has preceded it.

Navy.—The imperial navy is divided into river and sea-going vessels. The former amount, it is said, to 1900 ships; the latter to 918—with an aggregate number of 188,000 sailors. This force, however, is insufficient to extirpate or even keep in check the pirates who infest the whole coast of China, and the expedient was formerly resorted to of promoting a pirate chief to some high civil employment. Even yet he is sometimes appointed pilot. The Chinese are now building frigates on their own account—another evidence of the stride taken under the regency of prince Kung.

Revenue.—The estimates of the public revenue of China vary greatly, and while they are stated by some to exceed 100 millions sterling, are held by others not to come up to half that amount. Official returns of the Chinese government—intended for a special use—were published in 1844, according to which the revenue amounted to £63,934,713, derived mainly from three sources—customs duties, licenses, and a tax upon land.

Religion.—The Chinese, remarkable in so many ways, exhibit, in the matter of religion, their usual eccentricity. Three forms of belief—the Confucian, the Buddhist, and the Taoist—may be considered the national religions, as they are believed in, more or less, by the great mass of the people. Of these, the Confucian and the Taoist are indigenous, but Buddhism was introduced from India. A struggle for ascendancy was long maintained between these religions, but has now entirely ceased; indeed, it is no unusual thing for all three to be professed by the same person, and as they supplement each other, this is not altogether inconsistent. Confucianism is the basis of the social life and political system of the Chinese. It has been professed by all their greatest men, and is still the sole belief of the educated classes. It is, however, less a religion than a philosophy, and does not pretend to treat of spiritual things; hence room was left for other creeds to supply its deficiencies in this respect. The questions to which Confucius replied were: "How shall I do my duty to my neighbor? How can I best discharge the duty of a virtuous citizen?" Funeral temples are erected to Confucius, and though his image is not used as an idol, his tablet is worshiped, and sacrifices of oxen and sheep are offered before it at the vernal and autumnal equinoxes. For an account of Confucius's philosophy, see CONFUCIUS.

Buddhism in China, though extending over the whole country, and influencing more or less the mass of the people, is fast losing its hold on them, and has very little of the power and authority it once possessed. Its edifices are going to decay, and no new ones rise upon their ruins. Its priests are illiterate, and together with their religion, are held in contempt by the philosophic Chinaman. Aged people and women are now its chief devotees. The begging-monk is characteristic. He wears a loose yellow robe and large stockings; at his back is a wallet in which to receive the contributions of the faithful; and he gives notice of his approach by striking his *muh-yu*. The northern form of Buddhism, which differs considerably from that of Ceylon and the Indo-Chinese peninsula, prevails in China. Its sacred books, in common with those of Nepaul and Tibet, are written in Sanscrit, or are translations from that language. Amongst other additions to the creed are the western paradise and the goddess of mercy.

Taoism has not more hold than Buddhism on the literate Chinese. Its priests are generally ignorant men, few of them teaching or understanding the real principles of their faith. They practise a mystic alchemy, prepare spells and incantations, and like modern spiritualists, hold intercourse with the dead. When all other remedies have failed with a sick person, the Taoist priests are sometimes sent for to exercise the evil spirit that is supposed to afflict the patient; and they chant prayers from their mystic ritual, amid the din of gongs, drums, flutes, etc. These mystics worship certain stars, which are supposed to influence human life, and also genii, devils, and inferior spirits. They live in temples with their families, and are known by their slate-colored robes. For a fuller account of Taoism and its doctrines and founder, see LAO-TSE.

Besides these three religions, which alone affect the bulk of the people, there is a *ritual state worship*, which regards the emperor and court alone—a kind of philosophic pantheism, an adoration of certain natural objects; but it is a mere ceremonial, and associated with no theological doctrines. Three classes of objects are distinguished, to which the great, medium, and lesser sacrifices are offered. The first-class includes the heaven and earth. Equal to these, and likewise restricted to the worship of the emperor, is the great temple of imperial ancestors. The medium sacrifices are offered to the sun and moon, the gods of the land and grain, genii, and sages. In the third class are reckoned certain natural phenomena, as well as deceased statesmen and scholars. The emperor appears to acknowledge a supreme Being as king-of kings, the rewarder of virtue and the punisher of vice; but still, Chinese philosophy, as fixed by Chu-tze, is atheistical, and deduces "the development of the universe from one unintelligent and will-less principle." Hence all educated Chinese are atheists, at least theoretically, as will be found by arguing with them; but when they speak of human affairs generally, and their own particular lot in life, they exhibit a belief in *teen* as a supreme, intelligent, rewarding, and punishing power.

Between the followers of the three national religions there is not only a total absence of persecution and bitter feeling, but a very great indifference as to which of them a man may belong. It arises probably from religious apathy; yet still it is preferable to

the fanatical zeal and cut-throat earnestness of the Moslem. Amongst the politer classes, when strangers meet, the question is asked: "To what sublime religion do you belong?" and each one pronounces a eulogium, not on his own religion, but on that professed by the others, and concludes, with the oft-repeated formula: "Religions are many; reason is one; we are all brothers." The government is equally tolerant of religious diversity, except where a political design is suspected.

Temples belonging to the three religions are very numerous. Those dedicated to Confucius are funereal in character. The Buddhist temples are crowded with images, and Buddha is represented expounding his doctrine to attentive listeners. The many-storied tower takes the place of the bell-shaped dagoba or relic-shrine of other Buddhist countries.

History and British Intercourse.—The early annals of China, like those of most other countries, belong rather to mythology than to history. Beginning with Pan-ku, the first of all beings, the country was ruled over first by gods, and then god-descended personages, who revealed to men the essential arts of life. Of those mythical rulers the most famous is Fo-hi. The historical period may be said to commence with the Hsia period or dynasty, begun by Yu the great about 2200 B.C., although a great infusion of the fabulous still continues. Some date the real history of China from the Tchow or Chow dynasty, which began with Wu-wang about 1100 B.C. It was during the reign of Ling-wang (571-544), one of this dynasty, that Confucius was born. China would seem during this period to have been divided into a number of independent states. The kings of Tsin gradually gained the ascendancy, and at last one of them reduced the other states to subjection (247 B.C.), and assumed the title of Hoang, or emperor. It is from the Tsin dynasty that the country has taken its name, Tsina or China. This first emperor finished the great wall (see above), as a protection against the Tartars, who had all along, under the name of Hiong-nu (Huns), been a source of danger and annoyance to the richer and more pacific Chinese. We cannot enumerate the various dynasties that followed, nor the frequent divisions and reunions of the empire, varied by incursions and partial subjugations by the troublesome Tartars. At last, the Mongols or western Tartars, being called in to aid the Chinese (1209), became finally (see KUBLAI KHAN) masters of the whole country (1279), and reigned over it till 1368, when they were expelled by the Chinese, and the Ming native dynasty succeeded, which lasted 276 years, and fell at length through its own misgovernment. A general of the last Ming emperor, who was employed in keeping the Manchus (q.v.) in check, made peace with them, and obtained their assistance against the native usurper who had deposed his sovereign. The Manchus established themselves in Pekin (1644), and finally, after a seven years' struggle, acquired the sovereignty of the whole empire. Many of the conquering race now filled the highest offices of state, and owed their position to birth alone. More than one powerful emperor of the race has ably conducted the government of the country; but Hien Fung, who ruled from 1850 to 1861, was reported to have passed his time in a state of drunken imbecility. The late emperor, Tung-chi, succeeded to the throne when only a child five years old, but the government was ably carried on under the co-regency of the empress-dowager, Tze-an, the empress-mother, Tze-sse, and the enlightened prince Kung, brother of Hien Fung. Tsai-Tien, cousin of Tung-chi, ascended the throne in 1875. As he was then only about four years old, the empresses continued to act as regents.

Of recent events in Chinese history, the most remarkable is the rise, progress, and overthrow of the Tae-ping rebels. Their famous leader, Hung-sew-tseuen, was a man of humble origin, and an unsuccessful candidate for government employment. Some Christian tracts, it is said, led him to renounce idolatry, and he founded a society of God-worshippers, which, in the autumn of 1850, was brought into collision with the imperial authorities, and immediately assumed a political character. Hung persuaded himself and his followers that he had received a divine commission to uproot idolatry, extirpate the Tartar intruders in the country, and establish the new native dynasty of Tae-ping, or universal peace. He assumed the title of heavenly or divine prince (Tae-ping-wang, sometimes called Tien-wang), and bestowed the titles of eastern prince, western prince, southern prince, northern prince, and assistant prince on five of his chosen leaders. The fanatical principle of divine revelations and other extravagances followed. They spoke of Tien-na, the wife of the Heavenly Father; they held that Tien-wang was the son of God as really as Jesus, and worshiped him accordingly. Polygamy was a dark feature of their system, the Tien-wang himself having married 30 wives. The course of this religio-political rebellion, the victorious march of the Tae-ping army from Kwang-se to Naukin in 1850-53, and its subsequent career, cannot here be traced. We can only afford room to state, that after a series of wasteful and revolting barbarities, it was finally suppressed in 1865 by the imperial troops, led by British and American officers, of whom the most conspicuous and able was col. Gordon. See TAE-PINGS.

In early times, the Chinese do not appear to have been opposed to intercourse with foreigners; but the conduct of the Spaniards and Portuguese between 1520 and 1570 excited their hostility. The Mantchu government restricted British trade and intercourse to Canton, where it was carried on through the medium of the *hong* merchants on the one side, and the East India company on the other. Differences arose, however, from time to time between these two commercial bodies, occasioned chiefly by the exac-

tions of the mandarins on foreign trade. With a view to a better understanding, the British government despatched to Peking an embassy under lord Macartney in 1792, and another under lord Amherst in 1816. On the 22d April, 1834, the monopoly of the East India company ceased, and British imperial officers were appointed to carry out the new judicial and fiscal arrangements. Constant dissensions between these and the mandarins continued till the end of the year 1839, when the latter, under pretense of stopping the opium-trade, committed acts of open hostility. A war broke out the following year, at the commencement of which Chinese officials talked of invading England overland, by way of Russia. The imperial government was, however, sufficiently humbled by the middle of the year 1842, and on the 29th Aug., a treaty of peace was signed before Nankin, by which the ports of Amoy, Fu-chow, Ning-po, and Shang-hae were, in addition to Canton, thrown open to foreign trade. The other most important articles of the treaty provided that the island of Hong-kong should be ceded in perpetuity to her Britannic majesty, her heirs and successors, and that the emperor of China should pay \$21,000,000 towards the expenses of the war.

With five free ports, British trade with China soon assumed gigantic proportions; and though the Chinese evaded the treaty whenever practicable, no important event occurred to interrupt commercial intercourse till 8th Oct., 1856, when the authorities at Canton seized the crew of the lorcha *Arrow*, a vessel registered at Hong-kong, and entitled, it was considered, to British protection. Under pressure from the British forces at hand, the imperial commissioner, Yeh, delivered up the men, but refused all apology. Yeh continuing obstinate, Canton was stormed (Dec. 28, 1857) by the allied French and English forces, and the Chinese imperial commissioner captured (Jan. 5, 1858). The government of the city was still carried on by Chinese officials, but under the authority of the plenipotentiaries and commander-in-chief. The former now proceeded to the n. of China, to put themselves in more direct communication with the imperial government, which still continued obstinate. The forts at the mouth of the Peiho were taken (May 20, 1858), and at length an important treaty was signed at Tientsin, June 26, 1858, which stipulates that the queen of Great Britain may (art. ii.) appoint diplomatic agents to the court of Peking, who (art. iii.) shall be allowed to reside at the capital, where also her majesty may acquire a building site. The Christian religion (art. viii.) shall be protected by the Chinese authorities. British subjects (art. ix.) shall be allowed to travel for pleasure or business to all parts of the interior, under passports issued by their consul. British merchant-ships shall trade (art. x.) upon the Great river (Yang-tze); but as its lower valley is disturbed by outlaws, no port except Chin-keang shall be opened for the present. Chin-keang to be opened in a year from the date of the signing of the treaty.

By this treaty, the vexed question of transit-dues is settled, it being agreed that the British merchant may purchase at the rate of $2\frac{1}{2}$ per cent *ad valorem*, in the case of imports at the port of entry; and in the case of exports, he may purchase a certificate enabling him to pass his goods, duty-free, to the port of shipment. By a separate clause, the Chinese government agreed to pay two million taels (about £650,000), as indemnity for losses sustained by British subjects at Canton, and a like sum towards the expenses of the war.

The repulse on the Peiho (June, 1859), by a Tartar force concealed in the Taku forts, of the expedition forming the escort of the British and French ambassadors, who were on their way to Peking, to ratify with the emperor of China the treaty of Tientsin, entailed another costly demonstration in the Chinese waters. The Taku forts were captured by the allied English and French forces, Aug. 21, 1860, and Peking itself in Dec., 1860. The treaty of Tientsin was ratified, two additional articles being inserted, one of which legalized coolie emigration. Since 1861, a gradual but beneficial change has come over the spirit of the Chinese government. Prince Kung proved a vigorous and successful regent. The army has been reorganized, and is now subjected to European drill (see par. *army*); a respect for the observance of treaties has sprung up; a national flag has been adopted, and a desire shown on the part of the Chinese to make themselves acquainted with international law. In 1866, arrangements were begun for telegraphic communication between Peking and the rest of the world; and emigration to all other countries was allowed. Shanghai has telegraphic communication with Europe, and some local lines; but the first Chinese railway opened there in 1876, has unluckily been closed again. Chinese are now found on almost every shore of the Pacific, where their industry, skill, and sobriety secure them abundant employment. They are especially numerous in the Pacific states of the American Union, where harsh measures, including a heavy tax on arriving, have recently been adopted in order to repress Chinese immigration. Between 1855 and 1878, upwards of 200,000 Chinese had, for a longer or shorter time, established themselves in the United States.

Commerce.—The rivers and numberless canals of China are covered with vessels of all sizes, employed in the internal commerce of the country. The Chinese are devoted to traffic, and the Middle Kingdom is throughout its length and breadth a perpetual fair. The total value of the imports into China in 1876 is given at £23,423,190, and of the exports, £26,950,170. Tea and silk are the great staple exports from China. The table gives some recent statistics of British trade with C. :

Year.	Exports from China to Great Britain.	Imports of British Home Produce into China.
1870.....	£9,481,737	£6,139,633
1873.....	12,454,234	4,882,701
1875.....	14,809,632	8,528,311
1877.....	15,323,342	7,912,663

There is no *coinage* in China except the copper *tchen*, or "cash," which is in value about the tenth of a halfpenny; and all but the most trifling payments are made by a certain weight of silver, or in Mexican or Spanish dollars. Chinese accounts are kept in taels, mace, candareens, and cash. A tael is worth 6s. 8d., British currency.

The following works (which have been used as authorities in the preparation of this article) may be consulted for further information on China. Meadows's *Chinese and their Rebellions* (Lond. 1856); Davis's (sir J. F.) *China: a General Description of that Empire* (Lond. 1857); Davis's *China during the War and since the Peace* (Lond. 1852); Williams's *Middle Kingdom* (New York and Lond. 1848); Oliphant's *Narrative of the Earl of Elgin's Mission to China and Japan, in the years 1857, 1858, and 1859* (Edin. 1859); Marquis de Moges's *Recollections of Baron Gros's Embassy to China and Japan in 1857 and 1858* (Lond. 1860); Huc's *Chinese Empire* (Lond. 1858); Cooke's *China in 1857 and 1858*; Fortune's *Three Years' Wanderings in China* (Lond. 1847); Fortune's *Visit to the Tea Districts of China* (Lond. 1852); Edkin's *Religious Condition of the Chinese* (1858); Cobbold's *Pictures of the Chinese by Themselves* (1859); *Twelve Years in China, by a British Resident* (1860); *Memoires sur la Chine* (1869); Rev. A. Williamson's *Journeys in North China, etc.* (1870); also Dr. Gray's *China: a History of the Laws, Manners, and Opinions of the People* (1878); and the Freiherr von Richthofen's great work, *China* (1st vol. 1877).

CHINESE EDIBLE DOG. The kind of dog used as an article of food in China, and reared in order to be so used, being esteemed as a delicacy, is a small dog of greyhound-like form, with somewhat terrier-like head, and muzzle more elongated than in terriers. It is fleet and active, gentle and affectionate. The skin is almost destitute of hair; but there is a variety having a crest of long hair on the head, and a large tuft of hair at the tip of the slender and otherwise naked tail.

CHINESE HEMP. See CORCHORUS.

CHINESE INK. See INDIAN INK.

CHINESE LANGUAGE, WRITING, AND LITERATURE. The Chinese language belongs to those Asiatic languages commonly called monosyllabic, because each word is uttered by a single movement of the organs of speech, and expresses in itself a complete idea or thing. All Chinese words end either in a vowel, a diphthong (in which, however, each vowel sound is distinctly pronounced, making the word often to appear of more than one syllable), or a nasal. Of such simple words or roots there are about 450. But the emphasis or accent of many of these words may be varied by the speaker in four or five different ways, so as to produce a corresponding variety in their meaning, by which means the number of simple words or roots amounts to about 1200. There is no distinction of parts of speech in the Chinese language, and no recognition of the principle of inflection, Chinese words being incapable of any modification of *form*. The relations of words are ascertained by their position in a sentence. Hence Chinese grammar is *solely* syntax. Thus *ta*, according to its position in a sentence, at one time serves the purpose of an adjective, meaning "great;" at another, a substantive, meaning "greatness;" and again of a verb, meaning "to enlarge" and "to be great," or of the adverb "very." There are certain words, however, which have at length lapsed into so vague and general a signification, that in conversation and literature they are now used in some cases as particles to determine the relations of other words; but in the older literature this is very rare, and is against the genius of the language. From what has been said, it will readily be inferred that the gender, number, and case of words are not determined by the *form* of the words themselves. They are, in fact, denoted by the addition of other words. Thus, *people* in Chinese is *multitude man*, *son* is *man child*, *daughter* is *woman child*. *The best of men* is in Chinese *a hundred man good*. The purest Chinese is spoken at Nankin, but the same idiom, called "the language of the mandarins," is spoken by the educated in all parts of the empire. For a knowledge of Chinese grammar, see Schott's *Chinesische Sprachlehre* (Berlin, 1857); Summers's *Handbook of the Chinese Language* (1863); Julien, *Syntaxe Nouvelle de la Langue Chinoise* (Paris, 1870); Morrison's *Dictionary of the Chinese Language* (Shanghai, 1865).

In Chinese the written character, generally speaking, does not indicate the sound of the word, but gives a kind of hieroglyphic or pictorial representation of the idea or thing to be expressed. Hence there are required as many of these characters or symbols as there are ideas to be represented. Since many words similar in sound are different in signification, whilst in writing each *idea* has its peculiar symbol, the number of words represented by writing—without reckoning those peculiar to certain dialects—is perhaps ten times greater than those distinguished by the ear. The number, in fact, is reckoned at 50,000, but these are far from being all in general use. In writing and

printing, the characters are arranged in perpendicular columns, which follow one another from right to left.

In its origin, Chinese writing is hieroglyphic or picture-writing, with the addition of a limited number of symbolical and conventional signs; the larger number of Chinese characters are formed by the combination of such hieroglyphs and signs. But as one such character by itself seldom determines the sound, an additional word is conjoined for this purpose; so that the great mass of Chinese written words consist of an ideographic and a phonetic element. Native grammarians divide their characters into six classes. The first class comprises simple pictorial representations of sensible objects, such as sun, moon, mountain, etc., and contains 608 characters. The second class includes such characters as are formed by the combination of two or more simple hieroglyphs, which together convey, in a more or less intelligible manner, some other idea; for example, the hieroglyph for sun, combined with that for moon, conveys the idea of light; mouth and bird, that of song, etc.; of these there are 740. The third class embraces those characters which indicate certain relations of position, as above, below, the numerals, etc.; of these there are 107. The fourth class consists of characters which, by being inverted, acquire an opposite signification, as right, left, standing, lying, etc., and contains 372. The characters of the fifth class are termed derived characters; the meaning of the simple or compound characters used to express physical objects, is transferred to mental objects, or to other physical objects with which they are associated, e. g., the hieroglyph for a heart signifies the soul—that for a room, signifies the wife, etc.; of these there are 598. The characters of the sixth class include those which are composed, as above mentioned, of sign and sound. Almost all names of plants, fishes, birds, and many other objects which it would be difficult to represent hieroglyphically, are denoted by the compound characters of the sixth class, which amount to 21,810 in number. As this class, however, consists merely of repetitions of the other five classes, the immense number of Chinese characters may be reduced to 2,425; and whoever learns these may be said to know them all.

The hieroglyphical characters in their oldest form were easily recognizable figures: thus, the hieroglyph for sun was as in the fig. at *a*; for moon, as at *b*; for light, a combination of sun and moon, as at *c*; for to listen, folding-doors and an ear, as at *d*; for white, a very squint eye, in which hardly anything but the white is seen, as at *e*; for friends, the two valves of a bivalve shell, as at *f*. In the course of time, through hasty and careless tracing, the objects denoted by the hieroglyphs have almost ceased to be recognizable. The modern hieroglyphs corresponding to the above are as represented at *a'*, *b'*, *c'*, etc. See Abel Rémusat's "Mémoire sur l'Écriture Chinoise," in the *Mémoires de l'Académie des Inscriptions*, vol. viii.; and for a view of the Chinese characters, both ancient and modern, Hager's *Monument de Yu* (Par. 1802).

Chinese Characters.

The Chinese literature, in a geographical, ethnographical, and historical point of view, is unquestionably the most comprehensive and important of the whole of Asia. The printed catalogue of the emperor Kien-long's library is composed of 122 volumes; and a selection of the Chinese classics, with commentaries and scholia, which was begun by the order of the same emperor, is said to comprise 180,000 volumes, of which, in the year 1818, 78,731 volumes had already appeared. In the five canonical or classical books, called *King*, are contained the oldest monuments of Chinese poetry, history, philosophy, and jurisprudence, some portions of which belong, perhaps, to the most ancient writings of the human race. Confucius (q.v.), in the 6th c. B.C., collected them from various sources, and in this collection they have been pretty faithfully handed down to us. Next to these in value are the *Sse-shu*, or the four books. These, as they were written by Confucius and his disciples, must be regarded as the most trustworthy source of insight into the intellectual and political life of the Chinese. A complete and elaborate edition of the five *King* and the four *Shoo* has been undertaken by our great English Sinologue, Dr. Legge, under the title of "The Chinese Classics, with a translation, critical and exegetical notes, prolegomena, and copious indexes. In seven volumes;" of which five vols. appeared between 1861 and 1878. A popular edition, under the title of "The Chinese Classics translated into English," has also been published, of which vols. i. and ii. deal respectively with the "Life and Teachings of Confucius" and the "Works of Mencius." Almost contemporary with Confucius lived Lao-tse (q.v.), who was born 604 B.C. He was the founder of a school of philosophy, more spiritual in its character than that of Confucius, but which has now degenerated into the lowest and most vulgar kind of demonology; see *Le Livre de la Voie de la Vertu*, Chinese and French, by Julien (Par. 1842). In mythology, the Chinese have *The Book of the Mountains and Seas*, *The History of the Gods and Spirits*, and some others. In jurisprudence may be mentioned the universal collection of laws, and the criminal code of the present dynasty; see *Ta-Tsing-lu-li, being the Fundamental Laws and Supplementary Statutes of the Penal Code of China*, by Staunton (Lond. 1810). The Chinese literature is also very rich in works on medicine, natural

history, astronomy, agriculture, military science, music, and all branches of mechanics and industry; see *Résumé des principaux Traités Chinois, sur la Culture des Mûriers et l'Éducation des Vers-à-soie*, by Julien (Par. 1837). In philology, the most valuable works are the dictionaries, in which the Chinese characters have been collected and elucidated by examples from the whole treasury of Chinese literature; but the greatest of all works of this kind is the dictionary of the emperor Kaug-li, which is now regarded as the highest authority for the pronunciation and meaning of the characters. Of the encyclopedias of the Chinese, the most conspicuous are that by Ma-tuan-lin (1300 A.D.), called *Wen-hien-thong-khao*—i.e., an accurate investigation of the ancient documents, with rich supplements; and the *Koo-kin-too-shoo-tsei-ching*, or *Complete Collection of Ancient and Modern Books*—of which latter vast work a copy was secured for the British museum in 1877. But the most valuable portions of the Chinese literature are, undoubtedly, their historical and geographical works, which are indispensable to a knowledge of Upper Asia. Sse-ma-thsian (100 B.C.) compiled, from every recognized authority, a work called *Sse-ki*, or historical memorials, which embraces the history of China from the year 2637 B.C. up to the commencement of the dynasty of Han in the 2d c. B.C. This work has been continued by the different dynasties, and forms a complete collection of the annals of the empire up to the termination of the Ming dynasty in 1643 A.D. It is known under the title of *Nian-eul-sse*, or the 22 histories. The entire collection of the official annals from 2698 B.C. to 1645 A.D., comprising a period of 4343 years, and consisting of 3706 books, is to be found in the library at Munich.

Amid all their scientific labors, the Chinese have not neglected the art of poetry, in which they possess voluminous collections that have yet to be made known to Europe. In lyrical poetry, the most distinguished names are Li-thai-pe and Tu-su, both of whom flourished at the beginning of the 8th c. A.D.; see Davis "On the Poetry of the Chinese," in the *Transactions of the Royal Asiatic Society*, vol. ii. The romantic poetry of the Chinese, although void of poetic beauty, is valuable for the insight it gives into their domestic life. Their dramatic poetry has laws peculiar to itself, and resembles partly the romantic drama of the Germans, and partly the *comedia delle arte* of the Italians. They have also a kind of novel in dialogues, which forms a subordinate species of drama. Besides the speaking persons or actors, there is what they call a singing person, who introduces into the piece songs which he sings to popular melodies, and appears to correspond in a rude way to the Greek chorus. The best collection of works in this species of literature is the *Yuen-dschin-pe-tschong*, i.e., the hundred dramas from the Mongol dynasty (1260-1341), from which all the Chinese dramas known to Europeans have been taken. A Chinese novel, affording a graphic view of the tastes and literary views of that people, was some time ago placed within the reach of European readers by the eminent Chinese scholar Stanislas Julien, under the title of *Les Deux Jeunes Filles Lettrées* (Par. 1860). English readers may also obtain instructive pictures of Chinese life from *Iu-kius-li*, or the Two Fair Cousins, translated from the French version of Rémusat in 1827; and *The Flowery Scroll*, translated, with numerous learned notes, by sir John Bowring, in 1868. But valuable sketches will be found in Schott's *Chinesische Sprachlehre* (1857), Davis's *Chinese Miscellanies* (1865), and Wylie's *Notes on Chinese Literature* (Shanghai, 1867).

CHINESE SEA, or CHINA SEA, that portion of the Pacific ocean which has China and Siam on the w., the island of Formosa, on the n., the Philippines on the e., and Borneo on the s., and which forms the great gulfs of Tonquin and Siam.

CHINESE WHITE. The white oxide of zinc has recently been introduced into the arts, under this name, as a pigment in place of the preparations of white-lead. It changes very little either by atmospheric action, or by mixing with other pigments; but it has not the body of white-lead.

CHINGLEPUT.—1. A fort, with a t. adjacent, in lat. 12° 41' n., and long. 80° 2' e., 36 m. to the s.w. of Madras. It is accessible to an enemy only from the s., having a tank or artificial lake on the e. and part of the n., and rice-fields, irrigated from the same, on the remainder of the n. and on the west. In the dry season the tank is nearly exhausted, the weeds and slime in its bed causing malaria. Notwithstanding this, however, the place is considered to be more than ordinarily healthy. Pop. of town (officially spelt *Chengalpat*) in 1871, 7,979.—2. A district taking its name from the town above mentioned. It stretches in n. lat. from 12° 14' to 14°, and in e. long. from 79° 35' to 80° 25', and contains 2,753 sq. miles. Pop. 71,938,184. With about 120 m. of coast, it has not a single harbor or anything like shelter from the surf. Nor is its internal navigation of any value. The only considerable river, the Palar, is in most parts destitute of water during the dry season. Excepting in Oct., Nov., and Dec., comparatively little rain falls. From that circumstance, and perhaps also from an inferiority of soil, cultivation is said to be so much circumscribed as to embrace only about 96,000 acres, or $\frac{1}{10}$ th part of the entire area.

CHINI, a village of the Punjab, about a mile from the right bank of the Sutlej, the most easterly of the five rivers which give name to the country. It is in lat. 31° 31' n., and long. 78° 19' e., and is 8,770 ft. above the sea. Notwithstanding this elevation, it is a delightful place of sojourn, and was a favorite residence of Lord Dalhousie. It occu-

pies a slight depression on the southern slope of a lofty mountain, which fertilizes the soil with a net-work of never-failing rills. The neighborhood is remarkable for the size and flavor of its grapes, while the vines, trained over horizontal lattices, afford, while in foliage, a tolerably continuous shelter.

CHIN-INDIA, or FARTHER INDIA. See SIAM, BURMAH, COCHIN CHINA, *ante*.

CHIN-KEANG-FOO ("River-Guard City"), a Chinese city and port on the Yang-tze-kiang, at the junction of the grand canal with that river, and about 150 m. from its mouth, was opened to European commerce by the treaty of Tien-tsin (1858), and a British settlement was begun in 1864; but trade is very slowly developing, and there is reason to doubt if C. will ever become a place of importance. The anchorage is bad, the port is not a natural outlet for any staple of exportation produced in the neighboring country, and it possesses no advantage as regards the introduction of foreign goods. Formerly, however, as the southern key of the Grand canal, it was both an important stronghold and a center of traffic. The injury which the Grand canal has sustained has for the present practically extinguished the inland trade, and the four years (1853-57) during which it was in the barbarous hands of the Tae-pings are said to have reduced the pop. from half a million to 500.

CHINNOB, a musical instrument of the ancient Hebrews, with 32 strings.

CHINON, a t. of France, in the department of Indre-et-Loire, beautifully situated on the Vienne, 25 m. s.w. of Tours. It has the remains of a huge old castle, formerly the occasional residence of the Plantagenet kings of England, and also of some of the French sovereigns, and celebrated as the place where Joan of Arc commenced her historical career, and as the birthplace of Rabelais. C. has manufactures of druggets, serges, earthenware, etc. Pop. '76, 4,536.

CHINOOKS, Indians of n.w. North America who once inhabited the region around Columbia river, in Oregon. They are now nearly extinct.

CHINQUAPIN. See CHESTNUT and OAK.

CHIN SURA, a t. on the right bank of the Hooghly, about 20 m. above Calcutta, in lat. 22° 53' n., long. 88° 23' east. Pop. along with Hooghly, '71, 34,761. It contains the Hooghly college, and is considered one of the healthiest places in Bengal. It was originally a Dutch settlement, but was ceded in 1824 to the British, along with some other places on the mainland, in exchange for the English possessions in the island of Sumatra.

CHINTZ, a highly glazed printed calico, with a pattern in many colors on a white or light colored ground. It is chiefly used for bed-hangings, for covering furniture, and other purposes where gay colors are desired, and where there is much exposure to dust, which does not adhere to its highly calendered surface.

CHIO. See SCIO.

CHIOCCCA, a genus of tropical and sub-tropical plants, of the natural order *cinchonaceæ*, of which two species in particular, *C. anguifuga* and *C. densifolia*, the former a trailing herb, and the latter a bushy shrub, enjoy a high reputation in their native country, Brazil, as cures for snake-bites. An infusion of the bark of the root is certainly one of the most violent emetic and drastic medicines known, its action being accompanied with spasmodic agitations of the whole frame and other symptoms, such as to preclude its use except in the most extreme cases. Yet it had at one time a high reputation in Europe, and was administered in small doses as a diuretic and purgative.

CHIOGGIA, or CHIOZZA, an important commercial t. and seaport of northern Italy, in the province of Venice, stands on an island of the same name in the Adriatic, and is connected with the mainland by a stone bridge of 43 arches. The pop., amounting to (1872) 26,336, are chiefly engaged in the coasting-trade, in lace-making, and in ship-building.

CHION, OF HERACLE'A, one of Plato's pupils, who sought to liberate his native city by slaying the tyrant Olearchus, but the friends of the tyrant slew the conspirators and the oppression of the people became still greater.

CHIONIS and CHIONIDÆ. See SHEATH-BILL.

CHIP HATS. See BRAZILIAN GRASS.

CHIPMAN, DANIEL, LL.D., 1762-1850; brother of Nathaniel; educated at Dartmouth college and began law practice in Vermont in 1790. He was a member of the legislature and of congress, and professor of law and jurisprudence in Middlebury college from 1806 to 1816. He was the first official reporter of the decisions of the supreme court of the state, and the author of *An Essay on the Law of Contracts for the payment of Specific Articles*.

CHIPMAN, NATHANIEL, LL.D., 1752-1843; a native of Connecticut, educated at Yale, served as a lieut. in the revolutionary army, and was present at the battle of Monmouth. He was admitted to the bar in 1779, and began practice in Vermont, where he became chief-justice of the state. In 1791, he was a member of the convention called to decide whether Vermont should join the union, and was one of the commissioners to arrange for the state's admission. Washington appointed him judge of the U. S. court for the district of Vermont. In 1797, he was chosen U. S. senator, and in 1813, he was again

ected chief-justice of the state. He was afterward for 27 years professor of law in Middlebury college. Among his published works are *The Sketches of the Principles of Government*; a volume of *Reports and Dissertations*; and *Principles of Government—A Treatise on Free Institutions, including the Constitution of the United States*.

CHIPMUNK, the common name of the ground squirrel, *tamias striatus*, especially in the New England and northern states. See SQUIRREL, *ante*.

CHIPPENHAM, a parliamentary and municipal borough in Wiltshire, in a valley on the left bank of the upper part of the Bristol Avon, on the Great Western railway, 22 m. e. of Bristol. It consists chiefly of a well-built street above half a mile long. A bridge of 21 arches crosses the Avon here. C. is famed for its markets of cheese and corn, its cheese market being one of the largest in Britain. There are silk and woolen manufactures, and some mineral springs in the vicinity. Population of parliamentary borough (1871), 6,875; of municipal, 1387. It returns one member to parliament. C. was the seat of the Saxon kings of Wessex. About 880, the Danes took it from Alfred, and kept it two years.

CHIPPEWA, a co. in n.e. Michigan, on lakes Huron and Superior and the straits of Ste. Marie; 1500 sq. m.; pop. '70, 1689. The surface is hilly, and mostly covered with pine forests. Co. seat, Sault Ste. Marie.

CHIPPEWA, a co. in s.w. Minnesota, on the Minnesota, Chippewa, and Chetomba rivers, reached by the St. Paul and Pacific railroad; 2,445 sq. m.; pop. '70, 1467. Productions, almost entirely agricultural. Co. seat, Chippewa City.

CHIPPEWA, a co. in n.w. Wisconsin, on the head-waters of the Chippewa river; 4,000 sq. m.; pop. '70, 8,311. The surface is varied, and to a great extent covered with forests. Lumbering is the chief business. Co. seat, Chippewa Falls.

CHIPPEWA, a village in the province of Ontario, Canada, at the junction of the Chippewa with the Niagara river, 2 m. above the great falls. It was here that gen. Scott defeated the British, July 5, 1814. The Americans had 1900 men, of whom 68 were killed and 267 wounded; the English had 2,100 men, of whom 138 were killed and 365 wounded.

CHIPPEWA RIVER, in Wisconsin, rising in the n.w. part of the state and emptying into the Mississippi just below lake Pepin. Its length is about 200 miles.

CHIPPEWAYS. See INDIANS.

CHIPPING BIRD, or CHIPPING SPARROW, *Spizella socialis*, a common American bird, 5 or 6 in. long, white underneath, back and sides ash color, with stripes of black and white. Its half-dozen notes of song are repeated with great rapidity.

CHICHUQUI PALM, *Leopoldinia piassaba*, the PIASSABA of the n. of Brazil, and one of the palms which yield the piassaba (q.v.) fiber, now so much used for making brushes. The piassaba fiber exported from Pará is all obtained from it. It grows in swampy or occasionally flooded lands on the banks of the Rio Negro and other rivers of Venezuela and the n. of Brazil; and has a crown of very large, regularly pinnate leaves, with smooth slender stalks. The leaves, like those of many other palms, are much used for thatching. The commercial fiber is obtained from a remarkable covering of the stem; formed of marginal processes of the leaf-stalks, elongated into ribbon-like strips, and interlaced, finally splitting into fine fibers, hanging down 5 or 6 ft., and entirely concealing the stem, so as to give the tree a very extraordinary appearance. It twists readily into cordage, and the fiber has been long used for cables of canoes on the Amazon and other rivers. Before the independence of Brazil, the Portuguese government had a factory on the Rio Negro, for the manufacture of cables of this fiber. The export of the unmanufactured fiber from Pará to England began about the middle of the present century.

CHIQUMULA, ISTHMUS OF, in Central America, to the s.e. of the peninsula of Yucatan, in long. 89° west. Its breadth from the Caribbean sea to the Pacific is about 150 m.—the greatest elevation not exceeding 2,000 feet.

CHIQUMULA, a department of Guatemala, running from the Caribbean sea along the Honduras border; 4,000 sq. m.; pop. about 75,000. The river Motagua runs through the middle of C. and empties into the gulf of Honduras at San Tomas de Castillo, one of the best ports in Central America.

CHIQUITOS, a nation of Indians once very powerful in South America, inhabiting the region w. of Paraguay river. Early explorers described them as an intelligent, warlike, and independent people, living in families, subsisting by agriculture and by the chase, very numerous, and having ample material resources. The Spaniards first invaded their country in 1525, and there were frequent wars with little advantage to the whites. The first permanent white settlement among them was not effected until 1691, when a Jesuit mission was established. The missionaries soon obtained great influence over them, and agriculture and arts prospered, and a considerable trade grew up with the adjoining Spanish settlements. The missions were prosperous until the expulsion of the Jesuits in 1767. Thereafter the Indians rapidly deteriorated, and within a third

of a century following the abandonment of the missions two thirds of the C. nation had disappeared.

CHIRATA, **CHIRETTA**, or **CHIREETA** (*agathotes chirayta*, also known as *Ophelia chirata*), an officinal plant belonging to the natural order *gentianeæ*, and possessing properties similar to those of the common gentian, the centaury, and other plants of that order. It is a native of the mountains of the n. of India. The whole plant is intensely bitter, and has been long used in its native country as a tonic and stomachic. It is also in high estimation with European practitioners in India as a febrifuge, and is often used by them as a substitute for cinchona. The medicinal virtues reside both in the herb and root. The whole plant is pulled up at the time when the flowers begin to fade, and is dried for use. It is now imported to some extent into Britain.

CHIRIQUI, a name of various application in Central America.—1. A province on the isthmus and in the state of Panama, Colombia; area 500 sq. m.; pop. 18,000.—2. A river flowing towards the n.—the lat. and long. of its mouth being about 9° n., and 82° 30' east.—3. A spacious lagoon with three entrances, and with a depth of water for the largest ships, which receives the river. It measures 90 m. along the coast, and 40 or 50 in width.—4. An archipelago between the lagoon and the Caribbean sea.

CHIRONANCY, fortune-telling by a study of the human hand (always the left hand), once widely believed in and still practiced to some extent. The points to be observed are the lines, the projections, the joints, the nails, and the contour of the thumb and fingers. The principal line is the *line of life*, running in a curve from the upper joint of the forefinger around the ball of the thumb to the joint of the wrist. If this line shows four distinct and equal furrows near its beginning at the forefinger joint, the person is promised an easy attainment of wealth and honor. If the line be regular and deeply colored, a long and happy life is predicted; if it be freely marked, tortuous and broken, it foretells ill health and short life. If short perpendicular lines run from the line of life toward the palm of the hand, the person may be expected to go on a long journey; if toward the wrist, to be exiled. If the line of life be narrowed but long and strongly colored, it indicates ingenuity and wisdom; a deep line, equally colored, denotes a malicious disposition; and if separated near the center by sharply defined cross lines, it is a sign of approaching death. The next important line is the *line of health*, starting with the line of life and running nearly or wholly across the middle of the hand. If the line be clear and unbroken, it indicates excellence of body and mind; if it be broken and feeble, timidity and ill health are indicated. The *line of fortune*, or *happiness*, is below the line of health, and runs from the base of the fore to the base of the little finger. When this line is distinct and straight it indicates happiness and pleasant temper; if it begins close to the upper side of the hand, it indicates pride; if red in the upper section, envy is foreshadowed; a cross line, so that the two form an upright cross, indicates generosity; if broken and crossed by small lines near the middle, it indicates duplicity. Another line not found in all hands is the *line of the joint*, or *line of the triangle*, extending from the base of the little finger to the middle of the joint of the wrist. When this line is clear, it promises great success after much difficulty. The *mountain of Venus* is the elevation at the base of the thumb, and when smooth and unfurrowed a happy temperament is indicated. The *mountain of Jupiter* is the fleshy projection at the base of the forefinger; that of *Saturn* at the base of the middle finger; that of the *sun* at the base of the ring finger; that of *Mercury* at the base of the little finger, and that of the *moon* is the elevation or bunch on the lower side of the hand. When these mountains are clear and smooth, the indications are: of Jupiter, a heart inclined to virtue; of Saturn, love of labor, and simplicity of character; of the sun, eloquence and vivacious temperament; of Mercury, firmness in men, and modesty in women; of Mars, courage and heroism; of the moon, a tranquil disposition inclined to melancholy. The lines and shades on the mountains have their significance. Small lines near the little finger, parallel with the line of fortune, indicate happy wedded life, and some say their number foretells the number of children. One more line is called the *milky way*, running downward on the mountain of the moon from the wrist joint toward the little finger; if it be long and clearly defined, it foretells success in studies or in arts or fortune in a distant land. Small white spots under the nails indicate the fulfillment of wishes, at near or remote periods as they are far or near the roots. Aristotle regarded C. as a distinct science; the Roman soothsayers, and even the emperor Augustus, practiced it; in the middle ages it was studied with alchemy and astrology by the greatest philosophers; the church tolerated it while condemning astrology, or its interference with the doctrine of human liberty. No longer regarded as scientific, it presents at least a curious study.

CHIRON, or **CHEIRON**, the most famous of the Centaurs (q. v.). In the ancient works of art, C. of course appears as half-man, half-animal; but his features, instead of expressing mere savage and sensual strength, as those of the Centaurs generally do, are marked by a mild wisdom, in harmony with the character and deep knowledge attributed to him by the Greek mythologists.

CHIRONECTES, a genus of salt-water fishes remarkable for their grotesque forms. The mouse-fish may be taken as a specimen.

CHIR RA POON JEE, a t. in the n.e. of India, in lat. 25° 14' n., long. 91° 45' east. It stands on the Cossya hills, at the height of 4,200 ft. above the sea, and has a temperature during the hot months 20° F. lower than that of the plains of Bengal. Notwithstanding this, however, the place has proved unsuccessful as a sanatorium. The vicinity abounds in mines of coal and iron, which may be profitably worked.

CHI RU, *Antelope Hodgsoni*, a species of antelope, inhabiting the pine-forests and elevated open plains of Thibet, in regions bordering on the limits of perpetual snow. It is much larger than the chamois, being about 5 ft. in length, and the height at the shoulder about 3 ft. The C. lives in great herds, and seems to exceed almost all the other gregarious ruminants in watchfulness against the approach of danger. Sentinels are constantly posted to prevent surprise.

CHISA GO, a co. in e. Minnesota, on the Wisconsin border; 450 sq. m.; pop. '70, 4,358. It is intersected by the Lake Superior and Mississippi railroad. The principal productions are wheat, corn, oats, hay, and butter. Co. seat, Chisago City.

CHISELHURST, a parish in Kent, England, 11 m. s.e. of London. It was here that Napoleon III. fixed his residence in 1871, and died, Jan. 9, 1873. His widow, the empress Eugenie, dwells in Chiselhurst (1880).

CHISHOLM, CAROLINE (JONES), b. England, 1810; a noted philanthropist who settled in Australia in 1838 and founded at Sydney schools and asylums for destitute girls. In 1840-44 she procured employment for more than 11,000 persons, and lent in small sums about \$6,000, of which all but \$120 was returned. In her honor the people of Sydney founded the "Family Colonization Society."

CHIS WICK, a village in the center of Middlesex, 7½ m. s.w. of St. Paul's, London, on the left bank of the Thames. Pop. '71, 8,508. Around C. are many fine villas, extensive market-gardens, to supply London, and the gardens of the London horticultural society.

CHI TIN forms the skeleton of all insects and crustaceans. In insects, it constitutes not merely the external skeleton, the scales, etc., but also forms their tracheæ, and thus penetrates into the most remote portions of their organs; indeed, one of the layers of their intestinal canal consists of chitin. Hence, we can make good preparations of these parts by treating insects with a solution of potash, which dissolves all but the C.: in this way, we can microscopically examine the most delicate parts, as, for instance, the valves of the tracheal openings.

In a state of purity, it is a white amorphous body, which usually retains the form of the tissue from which it is prepared. It has been analyzed by C. Schmidt, Lehmann, and other chemists. Schmidt considers that its composition is represented by the formula $C_{17}H_{14}NO_{11}$. The best method of obtaining C. is by boiling the elytra of the cockchafer with water, alcohol, ether, acetic acid, and alkalies. The substance left after these respective boilings is pure chitin. It seems to be identical with the substance termed by Lassaigne *entomaderm*.

CHITON, a Linnæan genus of mollusks. Linnæus, regarding merely the shell, placed them in the class multivalves, a class entirely artificial. They are now regarded as constituting a family (*chitonidae*) of gasteropodous mollusks, of the order *cyclobranchiata* of Cuvier, and as occupying a place in systematic arrangement close to limpets. The shell is composed of eight narrow, transverse, calcareous pieces, overlapping each other in a row along the back, and strongly attached to the mantle, which is remarkably fleshy and fibrous. They have the power of rolling themselves up into a ball. The organ of locomotion is an oval foot, more or less wide, according to the species, and extending the whole length of the animal. More than 200 species are known; they occur in all climates, most abundantly on rocks at low water, but some of them at great depths. Some of them creep along the sand. All the British species are small; but some foreign ones grow to 3 or 4 in. in length. The fry of these mollusks swim about by means of long vibratile cilia.

CHITTAGONG, a maritime district in Lower Bengal, taking its name from its capital below mentioned. It is bounded on the s. by Arracan, and on the w. by the bay of Bengal, and stretches from lat. 20° 45' to 23° 25' n., and from long. 91° 32' to 93° east. It has an area of 2,498 sq. m., with a pop. (1871) of 1,127,402. C. (properly *Chattagram*) also gives name to a *division*; area, 13,592 sq. m.; pop. 3,444,874. In the forests of C., large numbers of elephants are annually caught.

CHITTAGONG, or ISLAMABAD (the second name having been conferred by Aurungzebe, who captured it towards the close of the 17th c.), a city of India, standing on the Kurrumfuli, about 7 m. from its mouth, in lat. 22° 20' n., and long. 91° 54' east. It came into possession of the British, along with Bengal proper, in 1760-65. But having originally formed part of Arracan, it was claimed, after a lapse of sixty years, by the Burmese emperor as a dependency of that territory—a claim which formed one of the grounds of the war of 1824. Through the results of that contest, C. diminished in importance, but some European merchants began to settle there in 1864, and its prosperity is returning. In 1873, it exported 104,565 tons of rice. Its ship-building business is now transferred in great measure to Moulmein, in Tenasserim. Pop. '71, 20,604.

CHITTAGONG HILL TRACTS, a district on the e. frontier of British India, between 21° 13' and 23° 47' n., and 91° 46' and 92° 49' e.; 6,882 sq.m.; pop. '72, 69,607; among whom were only 31 Christians. The region is hilly, with deep ravines and prominent cliffs, covered with gigantic creeping plants. The crops are rice, corn, tobacco, and cotton.

CHITTAGONG WOOD, the wood of *chickrassia tabularis*, a tree of the natural order *cedreluceæ*, a native of the mountainous countries to the e. of Bengal. In some parts of India, it is called *cedar* or *bastard cedar*, names, however, which are also given to other kinds of wood. C. W. is much valued in India, and is used for all purposes for which mahogany is used in Britain. It makes beautiful and light furniture, but is apt to warp in very dry weather. Beautifully veined and mottled pieces are occasionally met with, and are highly valued.

CHITTELDROOG, or **CHITRADURG**, a t. in British India, in the province of Mysore, 280 m. w.n.w. of Madras. It is in a fertile plain, and was once one of the strongest places in India. The present fortress crowns a high rock in the rear of the town, and is a formidable defense. Hyder Ali besieged C. in 1776, getting possession eleven years later, but then only through treachery.

CHITTENDEN, a co. in n.w. Vermont, on lake Champlain; 517 sq.m.; pop. '70, 36,480. It is drained by the Winooski and Lamoille rivers, and traversed by the Central Vermont, the Rutland and Burlington, and the Burlington and Lamoille railroads. The productions are wheat, corn, oats, potatoes, hay, cheese, butter, wool, and maple sugar. Co. seat, Burlington.

CHITTENDEN, MARTIN, 1766-1840; son of Thomas; a graduate of Dartmouth college, and for many years in judicial offices in Vermont. He was chosen to congress in 1803, and four times thereafter; and was governor of the state from 1813 to 1815.

CHITTENDEN, THOMAS, 1730-97; the first governor of the state of Vermont, b. in Conn., where he was a member of the legislature. In 1774, he settled in Vermont, and participated in all the political action of the people in councils and conventions, until the territory became a state, before and after which period he was the governor.

CHITTOR, the name of two fortified towns in India.—1. C. in the district of Arcot, about 80 m. to the w. of Madras, in lat. 13° 12' n., and long. 79° 9' east. It stands on the s. or right bank of the Puni, an affluent of the Palar, and is about 1100 ft. above the sea. Its river varies, according to the season, from a small rivulet to an expanse of 400 yards in width. When the stream is at its lowest, the very tanks, as well as the deserted channel, become little better than slime—the result being fever, ague, dysentery, and other diseases. The thermometer has occasionally reached 140° in the sun; but the annual range in the shade runs from 56° to 100°.—2. C. in Odeypoor, or Mewar, about 270 m. to the s.w. of Agra, in lat. 24° 52' n., and long. 74° 41' east. The fortress occupies the summit of an isolated rock of nearly 6,000 yards in length, and of 1200 in breadth, which is scarped all round to a depth of 80 or 100 feet, about a fourth part of its entire altitude. Within the inclosure are several antique structures—such as temples, tanks, a palace, commemorative pillars, and an inner citadel.

CHITTY, JOSEPH, 1776-1841; a lawyer of England whose text-books have been considered almost necessary for students and young practitioners. The chief of his works are, *Treatise on the Parties to Actions and to Pleadings*; *Treatise on the Law of Nations relative to the Legal Effects of War on the Commerce of Belligerents and Neutrals*, and *Orders in Council in Licenses*; *Political Treatise on Criminal Law*; and *Synopsis of Practice in the King's Bench and Common Pleas*.

CHIU SA, LA, a t. of n. Italy, province of Cuneo, situated on the left bank of the Pesio, 8 m. s.e. of Coni. It has manufactures of silk and glass, and a pop. of 3,000.

CHIU SA, LA (so called from the ground having been originally inclosed as pasture-land for horses), a t. of Sicily, in the province and 30 m. s.s.w. of Palermo, on the slope of some hills. The t. was built in 1320. Agates are found in the vicinity. Pop., 6,840.

CHIU SI, a t. of central Italy, province of Siena, 37 m. s.e. of Siena, with a pop. of 3,000, stands on an eminence in the Val di Chiana, not far from the lake of the same name. In ancient times, under the name of *Clusium*, it was one of the twelve republics of Etruria, and the residence of Porsena (q.v.). When Italy was overrun by the barbarians, C. fell into decay, the whole valley was depopulated, and became the pestilential pool described by Dante. Since the improvement of the course of the Chiana (q.v.), C. has begun to flourish again along with the whole district. But it is in connection with the discovery of Etruscan antiquities that C. is chiefly heard of. Within the last quarter of a century, immense quantities of these remains have been found in the neighborhood in the grottos that served the ancient Etruscans as tombs. There are three museums in C. filled with them, and a great number are in the public gallery at Florence. They consist chiefly of sun-dried earthenware vases, black, and partly covered with mythological figures. Excavations still continue to be made, but discoveries have become rarer of late years.

CHIVALRY (Fr. *chevalerie*, from *chevalier*, a knight or horseman), the system of knighthood, together with the privileges, duties, and manners of knights. The social arrangement to which this term is applied seems first to have assumed the character of a positive institution during the 11th c.; but so far from being an invention of that period, it had its roots in the manners of the Germanic races, amongst whom it ultimately arose, at the earliest period at which they are historically traceable. In the description which Tacitus has given us of the manners of the Germans, we find the most unequivocal indications of the existence, not only of the general spirit, but, in a partially developed form, of many of the special arrangements of chivalry. But it was in connection with feudality that C. attained to its full proportions, and in many respects it must be regarded as the complement of that institution. See FEUDAL SYSTEM. Whilst feudality exhibits the political, in C. we see the moral and social side of the arrangements of mediæval life. It was in the feudal mansions of the barons that the system was developed; and to the lay portion of the youth of the higher classes, the instruction which they there received in the usages of C. formed by far the most important part of education. In addition to the martial accomplishments, which corresponded to those of a modern cavalry-officer, they were instructed in the political relations which subsisted between the vassal and his lord, by which the whole body of society was then bound together; and in what might almost be called a system of ethics, strangely enough exhibiting unmistakable traces of the stoic philosophy. The analogy between the severer virtues recommended to the special cultivation of their disciples by the followers of Zeno, and those inculcated on the novice in C., and practiced by the knights of the middle ages, might be ascribed to other than historical causes, were it not that we are able to trace the connection between them with something approaching to certainty. If any one wishes to convince himself of the truth of our assertion, let him compare the last production of the intellectual life of antiquity with one of the earliest and most important of our own literature, the *Consolations of Philosophy* of Boethius with Chaucer's *Testament of Love*. The resemblance is so close, that the latter work has, not without reason, been regarded as an imitation of the former; but the main features which distinguish them, and mark Chaucer's work as belonging to the modern world, are more instructive than even their similarity. The place which Philosophy, the celestial consolator, occupies in the work of Boethius, in that of Chaucer is supplied by *Love*—a being whom we must in nowise confound either with the heathen goddess, or, as some have done, with the divine love of the Christian religion. She is neither more nor less than the embodiment of an abstract idea which formed the central point of the whole system of C.; and her substitution for the philosophy or reason of Boethius is very characteristic of a state of society in which the affections and passions, rather than the intelligence, were the motive principles. The "Love" of Chaucer is a complete generalization, altogether independent of individual object, and the consolation which she proffers to her votary is that of enlisting in his favor the special guardian, the "Margarite," who is supposed to watch over his individual fortunes. The "Margarite" seems to correspond to the chivalrous idea of the *Lady-love*, in its purest sense, when its reference to a person was by no means indispensable, but when it signified rather "the love of woman," the highest object of the knight's ambition. Under the protection of this guardian spirit, the lover is represented as altogether sheltered from the caprices of fortune, and in her name he has a dose of rather frigid comfort administered to him, greatly resembling that which Boethius receives at the hands of Philosophy. Such is the general idea of the book, and it is a noble idea, embracing the very essence of society as it existed then, and presenting a much deeper view of that singular institution C. than is usually to be met with in writers who have not been actually brought in contact with its influences. But to the two elements which we have mentioned as ingredients in the spiritual life of C., the Germanic traditions on the one hand, and those of classical antiquity on the other, a third falls to be mentioned, which was, perhaps, the most important of all—that of Christianity as represented by the church. The clergy were too fully aware of the importance of early impressions, not to seize on the imagination of the aspirant to C. at the all-important moment of his inauguration. The purifications, prayers, and vigils, the sacrament and the vows by which this solemn rite was accompanied, are detailed elsewhere (see KNIGHT, BANNERET, BATH, etc.); and their influence in casting a religious character over the whole institution of C., and occasionally in directing its energies specially to the propagation of Christianity, by means of the various religious orders of knighthood and the crusades, is well known. Nor was the poet behind the priest in availing himself of the influences of C., and developing them in the region of the imagination. What Chaucer has exhibited in the work to which we have referred, may be regarded rather as the philosophical than the poetical side of the institution. But to poets of a lighter and more imaginative cast of mind, C. has furnished, from the days of the troubadours down to the present poet-laureate, no insignificant portion of their subject-matter. King Arthur and his knights of the round table, the traditions regarding whom had been taken from a period altogether mythical, and long anterior to the existence of C. as an institution, became to the poetry of the middle ages very much what the heroes of the Trojan war were to that of the whole ancient world. Much astonishment has often been expressed at the contrast between the lofty and ideal purity of the code of morals inculcated by C., and the gross-

ness of the lives of the men who were trained under its influences. The case is one which in a remarkable degree proves the practical importance of the inculcation of sound doctrine, for the practice gradually, though slowly, conformed itself to the principles; and it is probably in no insignificant degree to the elevated tone of the latter that we owe the moral superiority of the modern over the ancient world.

CHIVALRY, COURT OF, a military court, established by Edward III., of which the earl marshal and the lord high constable were joint judges. When held before the earl marshal alone, it was merely a court of honor; but when both were present, it was also a criminal court. Having encroached on the common law, its jurisdiction was defined by 13 Rich. II. stat. i. Under this act, the court claimed power to give relief to such of the nobility and gentry as think themselves aggrieved in matters of honor, and to keep up the distinctions of degrees and quality. In criminal cases, a jury was sworn; but in general the proceedings of the court were summary matters, being brought under its cognizance by complaint or petition. An attempt was made to revive the functions of the court in queen Anne's time; but, except as represented by the earl marshal's court (see COLLEGE OF ARMS), it has now gone into abeyance.

CHIVAS' SO, a small city of Piedmont, northern Italy, situated in a fertile plain on the left bank of the Po, about 15 m. n.e. of Turin. It was formerly a place of considerable military importance, but its fortifications were destroyed in 1804 by the French. The lampreys of C. are celebrated throughout Piedmont. It has manufactures of bricks, earthenware, soap, etc., and a trade in the agricultural produce of the district. Pop. 4,800.

CHIVE, or **CIVE**, *Allium schæno'prasum*, a plant of the same genus with the leek and onion (see **ALLIUM**), a perennial, $\frac{1}{2}$ to 1 foot in height, with very small, flat, clustered bulbs, increasing by its bulbs so as to form a sort of turf. The leaves are tubular, cylindrical-tapering, radical, nearly as long as the almost leafless flowering-stem, which is terminated by a hemispherical, many flowered, not bulbiferous umbel of bluish red, or, more rarely, flesh-colored flowers. The stamens are included within the perianth. This rather pretty little plant grows wild on the banks of rivers, and in marshy or occasionally flooded places in the middle latitudes of Europe and Asia. It is a rare native of Britain. In some of the mountainous districts of Europe a variety is found, larger and stronger in all its parts, and with flowering-stems more leafy. Chives—the name is generally used in the plural—are commonly cultivated in kitchen-gardens, often as an edging for plots, and are used for flavoring soups and dishes. Their properties are very similar to those of the onion. The part used is the young leaves, which bear repeated cuttings in the season.

CHIZEROTS AND BURINS form one of those peculiar races in France that live isolated in the midst of the rest of the population, and are despised and hated by their neighbors. They live in the arrondissement of Bourg-en-Bresse, in the department of Ain; and the communes of Sermoyer, Arbigny, Boz, and Ozan belong to them. According to tradition, they are descended from the Saracens. Although industrious and prosperous, they are held in the utmost contempt and detestation by their peasant neighbors, who are often indolent and destitute. They are looked upon as covetous and malicious, and scarcely would the daughter of a small farmer, or well-to-do day-laborer, become the wife of one of them, so that they mostly marry among themselves. From time immemorial, the C. and B. have been field-laborers, cattle-dealers, butchers, etc. Many of them are very good-looking. The young women are handsome, clear-complexioned, with large black eyes. See Michel, *Histoire des Races Maudites de la France et de l'Espagne* (2 vols., Par. 1847).

CHLADNI, ERNST FLORENS FRIEDRICH, founder of the science of acoustics, was b. at Wittenberg, Nov. 30, 1756. He studied law in his native place, and also in Leipsic, where, in 1782, he was made doctor of laws. C. ultimately abandoned judicial studies altogether, devoted his mind to natural science, and, being acquainted with music, was led to observe that the laws of sound were by no means so well established as those of other branches of physics. He therefore began to apply his knowledge of mathematics and physics to acoustics, and traveled for 10 years (after 1802) through Germany, Holland, France, Italy, Russia, and Denmark, giving lectures on the subject, which were very successful. He died in Breslau, April 3, 1827.—C.'s writings include *Discoveries concerning the Theory of Sound* (1787); *Acoustics* (1802); *New Contributions to Acoustics* (1817); and *Contributions to Practical Acoustics, with Remarks on the making of Instruments* (1822). C. also wrote several essays on meteoric stones.

CHLAMYDOSAU'RUS, a lizard of Australia, which has on its neck a singular mantle or plaited frill covered with scales and edged with spines. When full grown, this lizard is nearly 3 ft. long.

CHLAMYPH'ORUS (Gr. *chlamys*-bearing; *chlamys*, a soldier's cloak), a very remarkable genus of mammalia of the order *edentata*, ranked by naturalists in the same family with the armadillos, but differing in important respects from them, and from all other known quadrupeds. Only one species is known, *C. truncatus*, 5 or 6 in. long, a native of the interior of Chili, living underground like the mole, which it much resembles in its habits, and feeding on the same kind of food. Its forefeet are adapted for digging,

although in a different manner from those of the mole. The skull is destitute of sutures; there are resemblances to the osteology of birds in the ribs and their union to the sternum; the hinder part of the body is altogether unlike that of any other known animal, in its terminating quite abruptly, as if cut off almost where its thickness is greatest, or as if the back were suddenly bent down at right angles, the tail not springing from where the line of the back appears to terminate, but far below. The whole upper and hinder parts of the body are covered with a coat of mail, made up of a series of square plates; the under parts and legs are covered with long silky hair. The tail is very peculiar; it is covered with small scales, is expanded at the tip, and is usually incurved along the belly, but is furnished with such muscles as to suggest the probability of its being employed to throw back the earth in excavations.

CHLAMYS, an outer garment worn by the Greeks and some other people of the east. It was of wool, smaller than the more common blanket, of finer material, and often of brilliant colors. It was an oblong square, twice as long as its width. The wearer fastened the corners of the shortest side to the middle of the chest, the chlamys falling down over the back to the knees; or when fastened on the right shoulder it fell over the left arm and side. The chlamys for women often had a fringe or border of rich colors.

CHLOPICKI, JOSEPH, a Polish general, and dictator of Poland during the revolution of 1830, was b. in Galicia in 1772. He entered the army in 1787, attracted the notice of Kosciusko during the first insurrection of the Poles, and after the storming of Praga, 9th Nov., 1794, when the hopes of the patriots were extinguished for a while, he passed into the service of the new Cisalpine republic, and distinguished himself in various battles. In 1806, when Bonaparte called the Poles to arms, C., among others, obeyed, and fought gallantly at Eylau and Friedland. He was subsequently sent by the emperor into Spain, and in 1812 followed him to Russia, taking part in the bloody engagements at Smoleusk and Moskwa. After the relics of the invading force had returned, C. left the imperial service, on account of receiving certain slights in the way of his professional advancement. After the taking of Paris by the allies in 1814, he led back to Poland the remains of the Polish troops who had fought under Bonaparte, and was well received by the emperor Alexander, who made him a general of division. When the second insurrection of the Poles broke out in 1830, C., who foresaw the hopeless nature of the attempt, concealed himself; but the voice of the nation called him forth from his hiding-place, and on the 5th Dec., 1830, he was elected dictator. His moderate views, however, involved him in disputes with the extreme patriotic party, and on the 23d Jan., 1831, he resigned his office; but, to prove his sincerity, he entered the Polish army as a simple soldier, and took part in the murderous battles at Wavre and Grochow. After the suppression of the insurrection, C. went to Cracow, and withdrew altogether from public life. He died at Krzeschowitz, 30th Sept., 1854.

CHLORAL ($C_2Cl_2HO_2$) is a body formed when anhydrous alcohol is acted upon by dry chlorine gas. It is an oily liquid with a peculiar penetrating odor.

CHLORAL (*ante*), a liquid prepared from absolute alcohol by the action of dry chlorine. It is composed of carbon, hydrogen, oxygen, and chlorine, formula C_2HOCl_2 . Combined with water, it forms chloral hydrate, a transparent crystalline substance, having the appearance of alum, sometimes administered to induce sleep. Its effect is attributed to chloroform produced in the system from the chloral by the alkaline reaction of the blood. As a rule 20 grains causes in a healthy adult a light and refreshing sleep, after about half or three quarters of an hour, without headache or other bad results. Repeated use blunts the good effect, and causes serious nervous demoralization; overdoses have caused death. Chloral hydrate has special value where the use of opium is inadmissible; also in delirium tremens, mania, rheumatism, gastralgia, and as antagonistic to tetanus and the effects of strychnia.

CHLORANTHACEÆ, a natural order of exogenous plants, closely allied to the peppers; herbaceous and half shrubby plants, with jointed stems, opposite simple leaves, and minute stipules between them. The flowers are in terminal spikes, and are destitute of calyx and corolla, but have each a small scale or bract. The stamens are lateral; either only one or few, and partly cohering. The ovary is one-celled, immediately crowned with the stigma; the ovule is pendulous; the fruit a drupe or one-seeded berry; the embryo naked, not in a fleshy sac as in the peppers.—The number of known species is small: all of them are tropical, or natives of China and Japan. They are generally aromatic, and some of them, as species of *chloranthus* in the East Indies, and of *hedysmum* in the West Indies and South America, are used as antispasmodics, stimulants, stomachics, and tonics. The roots of *chloranthus officinalis* and *C. brachystachys* have been ranked among the most efficacious remedies in fevers and other diseases requiring continual and active stimulants, and instances have occurred of great benefit from their employment during the prevalence of epidemics in Java. *C. inconspicuus* is the **CHU-LAN** of the Chinese; its leaves, spikes of flowers, and berries are used by them for imparting a peculiar fragrance to tea. All the teas which have what is called the *conslip* flavor owe it to this plant.

CHLORIC ACID (ClO_3) is a compound of one atom of chlorine and five atoms of oxygen, and is generally met with in combination with potash, as the white crystalline salt, chlorate of potash (KO, ClO_3). This salt is mainly interesting from the readiness with which it parts with its oxygen to combustibles, as when thrown on red-hot charcoal, when it causes violent deflagration. The salt is employed in the fabrication of certain kinds of lucifer-matches, which give a slight explosion when struck. If a crystal of chlorate of potash be placed on a piece of paper saturated with turpentine, and a drop or two of oil of vitriol added, it causes the inflaming of the turpentine with explosive rapidity. The chlorate of potash is also used in medicine, with the view of imparting oxygen to the blood.

CHLORIC ETHER, a name formerly given to a compound of chlorine and olefant gas, also called chloride of ethylene, or *Dutch liquid*. Now applied to a mixture containing one part of chloroform and eight or nine parts of strong alcohol. Dr. John C. Warren's "chloric ether," used by him as an anæsthetic, contained one part of chloroform and two of alcohol. C. E. is used as a means of administering chloroform internally; it is a mild anodyne, useful to allay restlessness and spasmodic disturbances, as of the air-passages.

CHLORIMETRY, or **CHLOROMETRY**, is the process of estimating the proportion of available chlorine in bleaching powder (q. v.), which may vary from 20 to 36 per cent. The process depends upon the great power with which chlorine, in the act of being liberated from its compounds, causes the oxidation of many substances. The salt generally used is pure crystallized sulphate of iron, which, in its ordinary state, gives a deep blue color, with a drop of ferridcyanide of potassium, but ceases to do so when it has been fully oxidized, or converted from a proto-salt into a per-salt, through the influence of chlorine. It being known that 78 grains or parts of sulphate of iron are oxidized by 10 grains or parts of chlorine, the mode of procedure in C. is as follows: 78 grains of fine crystals of the sulphate of iron are dissolved in water slightly acidulated with hydrochloric acid in a white porcelain basin. A given quantity of the bleaching powder—say 50 grains—is dissolved in a little tepid water, and introduced into a tall measure-glass called a chlorimeter or burette, similar to an alkalimeter, which is divided into 100 parts, and water added till the solution rises to the top mark. After subsidence of the insoluble matter, the clear solution is very gradually poured into the solution of sulphate of iron in the basin, the whole being kept constantly stirred, and every now and again a drop of the iron solution is taken out and placed on a new drop of ferridcyanide of potassium placed on a white plate; and whenever the iron solution ceases to produce a deep blue, and only forms a light greenish-yellow tint, it is known that the iron has been fully oxidized by the chlorine. Suppose that at this stage the burette has been emptied to the 55th division; as we know that the liquid poured out must have contained 10 grains of chlorine, we can calculate the chlorine contained in the whole; for

$$55 : 10 :: 100 : 18.18.$$

Thus 50 grains of the powder contain 18.18 grains of chlorine, or 36.36 per cent. Protochloride of manganese, subchloride of mercury (calomel), or a solution of indigo of known strength, may be employed instead of the sulphate of iron; but the latter is preferable, and is generally employed by chemists and manufacturers.

CHLORINE (Gr. *chlōros*, pale green) is a non-metallic element discovered by Scheele in 1774, and named by him *dephlogisticated marine air*. Afterwards, in 1810, Davy proved it to be an elementary body, and gave it the name which it now bears. In nature it is always found in a state of combination. United with sodium (Na), it occurs very largely as the chloride of sodium (NaCl)—common salt—in the ocean; in large beds, as rock-salt; in all natural waters, including even rain-water; in clays, soils, limestone; in volcanic incrustations; and in the vegetable and animal kingdoms. The preparation of gaseous C. by its liberation, directly or indirectly, from common salt, has been fully described under BLEACHING POWDER, which is the form in which C. is prepared and employed commercially. For experimental purposes, the gas may be received in jars filled with water at the pneumatic trough, when the C. rises into the jar, and displaces the water. When thus obtained, it is a yellowish-green gas with a peculiar and suffocating odor, is not combustible, and a very feeble supporter of ordinary combustion. A lighted candle placed in it burns with a very smoky flame, owing to the hydrogen of the oil alone burning, and the carbon being liberated. Several of the metals, such as antimony, copper, and arsenic in a fine state of division, or in the condition of thin leaves, at once become red hot, and burn when introduced into the gas. A piece of thin paper soaked in turpentine likewise bursts into flame. C. has the symbol Cl, and the atomic weight or equivalent of 35.5. It is a very heavy gas, nearly $2\frac{1}{2}$ times heavier than air, its specific gravity being 2.470 (air=1000); it is soluble in cold water to the extent of two volumes of C. in one of water, and yields a solution resembling the gas in color, odor, and other properties. The principal properties of C. are those of a bleacher of cotton and linen (see BLEACHING), and a most powerful disinfectant (q.v.). The gas can be condensed by pressure and cold into a transparent dark greenish-yellow limpid liquid, with a specific gravity of 1330 (HO=1000), which also

possesses bleaching properties, and a most powerful odor. On the animal system C. acts, in very minute quantity, by producing a sensation of warmth in the respiratory passages, and increasing the expectoration: in large quantity, by causing spasm of the glottis, violent cough, and a feeling of suffocation. The workmen in chemical manufactories, who get accustomed to the C. in small quantity, are generally stout—at least, lay on fat—but complain of acidity in the stomach, which they correct by taking chalk, and also suffer from the corrosion of their teeth, which are eaten away to stumps. The antidotes to the evil effects of the introduction of C. into the lungs are the inhalation of the vapor of water, alcohol, ether, or chloroform; but the two latter should never be resorted to except under medical supervision.

C. unites with the metals and many other substances to form an extensive class of salts known as *chlorides*.

CHLORITE (Gr. *chlōros*, green), an abundant mineral, consisting of silica, alumina, magnesia, and protoxide of iron, in somewhat variable proportions. It is of a green color, rarely occurs crystallized in hexagonal crystals, sometimes foliated like talc. It is rather soft, and is easily broken or scratched with a knife. Before the blow-pipe, it is with difficulty fused on thin edges. It is readily distinguished from talc by yielding water in a closed tube.

CHLORITE-SCHIST, or **CHLORITE-SLATE**, a green slaty rock, in which chlorite is abundant in foliated plates, usually blended with minute grains of quartz, and sometimes with feldspar or mica.

CHLORODYNE is a patent or quack medicine of considerable popularity, invented by a Dr. Collis Browne, but largely imitated by various chemists. It contains opium, chloroform, prussic acid, and probably Indian hemp, and is flavored with sugar and peppermint. As it is apt to separate into two liquids on standing, it should never be taken unless it has previously been well shaken; and as, in taking a dose of chlorodyne, the patient swallows an unknown quantity of three or four of the deadliest poisons with which we are acquainted, it is always advisable to begin with small doses. It is unquestionably a compound which sometimes succeeds in allaying pain and inducing sleep, when opiates have failed; but whether a physician is justified in recommending a remedy with the composition of which he is unacquainted, is a doubtful question. Ten or fifteen drops is the average dose.

CHLOROFORM, or the **TERCHLORIDE OF FORMYLE** (C_2HCl_3), was originally discovered by Soubeiran, and experimented upon by Dumas, and was long known only to scientific chemists as a rare organic body, possessing interest from being one of a series of organic substances, but not known to possess any properties likely to call it into use, or even likely to let it be known by name to the general public. The remarkable power, however, which it possesses of producing anæsthesia, has led to the preparation of C. on a very extensive scale. The materials employed are alcohol, water, and bleaching powder, and the proportions are four parts of bleaching powder, to which sufficient water is added to make a thin paste, and thereafter one part of spirits of wine; the whole is introduced into a capacious retort, which must not be more than half filled, and heat being applied, the C., accompanied by water and a little alcohol, distills over. As the C. is heavier than water, and is not readily miscible therewith, two layers of liquid are obtained in the receiver—the upper being water and alcohol, and the lower being chloroform. The upper liquid being cautiously poured off, the C. is agitated with fused carbonate of potash, which abstracts the remaining traces of water, and on subsequent redistillation the C. is obtained pure and ready for use.

C. is a highly limpid, mobile, colorless liquid, which is very volatile, has a characteristic and pleasant odor, and an agreeable sweetish taste. It has a specific gravity of nearly 1500 (water = 1000), being thus half as heavy again as water, and boils at 140° F. It is not inflammable in the ordinary sense of the term, as it will not take fire when a light is brought down upon it; but when thrown on red-hot coals, it burns with a green flame, evolving much smoke. It is slightly soluble in water, but more readily mixes with alcohol and ether. It dissolves camphor, amber, copal, and other resins, wax, caoutchouc, black and red sealing wax, iodine and bromine, as well as strychnine and other alkaloids. Its purity may be determined by placing some on the palm of the hand, and allowing it to evaporate, when no alcoholic or other odorous substance should be even momentarily recognized; and by agitation with oil of vitriol, when, on settling, the C. should readily swim on the surface of the vitriol, and the two layers of liquid remain colorless. The employment of C. as an anæsthetic has already been considered under **ANÆSTHESIA**; but it may be here repeated that C. is a substance that cannot be too cautiously dealt with, and that it should never be administered except in the presence and by the sanction of a medical practitioner. When skillfully given, it is among the safest of all anæsthetics, and the greatest boon that chemistry has bestowed on suffering humanity.

CHLORO METHYL, or **METHYLENE BICHLORIDE**, CH_2Cl_2 ; a liquid—clear, volatile, of pleasant odor; when inhaled, producing anæsthesia more quickly than chloroform, and usually free from disagreeable consequences. Like chloroform, not absolutely safe.

CHLOROPHYLL (Gr. *chlōros*, green, and *phyllon*, a leaf), the substance to which the leaves and other parts of plants owe their green color. It is somewhat analogous to wax, is soluble in alcohol and ether, but insoluble in water, and floats in the fluid of the cells, in the form of minute granules. Light is indispensable to its formation, and hence arises the familiar phenomenon of blanching (q.v.), either from accidental causes, or by the art of the gardener. Young leaves do not exhibit so deep a green as those which have been longer exposed to the light; and the green of a leaf generally deepens till it begins to change into the tints of autumn. *Hydra viridis*, and other minute animals, appear to owe their green color to a substance analogous to chlorophyll.

CHLOROPS. See CORN-FLY and WHEAT-FLY.

CHLOROSIS (Gr. *chlōros*, pale green), a peculiar form of anæmia or bloodlessness, common in young women, and connected with the disorders incident to the critical period of life. It has been called the *green sickness*, from the peculiar dingy greenish-yellow hue of the complexion; the green color, however, is not always characteristic. The disease is attended with very great debility, and often with breathlessness, palpitation, and other distressing or even alarming symptoms. When there is no organic disease present, however, C. may be pronounced curable in a large proportion of cases. The principal means to be employed are air, exercise, often salt-water baths, the use of iron, with a nutritious and rather stimulating diet, and purgatives if required; together with such special remedies as are adapted for restoring deficient secretions, and bringing the entire female system of organs into a natural condition.

CHLOROSIS, a diseased state of plants, in which a sickly green or greenish-yellow color takes the place of the natural lively hue. Sometimes only a particular shoot is affected by it, but very generally the whole plant; and it seems to depend upon causes which render the plant altogether unhealthy, the pallid appearance being merely symptomatic, and not only the formation of chlorophyll, but all the functions of vegetable life being languidly and imperfectly carried on. Bad seed, damp soil, and cold wet weather, appear to be the most common causes of chlorosis. Plants affected by this disease are often to be seen among crops generally healthy; but whole crops of grain, potatoes, etc., sometimes perish from it, or are much diminished in value. Fruit-trees also suffer from it.

CHLOROXYLON, plants of the order cedrelaceæ, the fruit having only three cells and splitting into three parts. The satin-wood of India is a specimen.

CHOATE, RUFUS, LL.D. 1799-1859; a native of Massachusetts, graduated from Dartmouth college in 1819, and a tutor there for a short time. In 1824, he commenced the practice of law in Danvers, soon removed to Salem, and in 1825 and 1827 was a representative and a senator in the state legislature. In 1832, he was elected to congress, and on the expiration of his term, removed to Boston. In 1841, he was chosen U. S. senator to fill Daniel Webster's unexpired term, the latter having been appointed secretary of state. In 1846, he resumed law practice in Boston, and in 1853, was chosen attorney-general of the state. His mind was acute, his scholarship broad and fine, his rhetoric magnificent. For many years he was recognized as the foremost lawyer of New England, and was especially renowned for eloquence in pleading. His more famous efforts were a eulogy on president Harrison, an address on the landing of the Pilgrims, and a eulogy on Daniel Webster. His works and correspondence have been published.

CHOCARD, or CHOQUARD, *Pyrhocorax*, a genus of birds of the crow family (*corvidæ*), differing from the choughs in having a shorter bill, which, however, is arched like theirs, but resembling them in their habits. The only European species is the Alpine C., also called Alpine chough, and Alpine crow (*P. pyrrhocorax*). It is about the size of a jackdaw, of a brilliant black, with yellowish bill and red feet.

CHOCKS are pieces of wood employed on ship-board to aid in the support of various articles. Amongst them are anchor-chocks, rudder-chocks, boat-chocks, stow-wood chocks, and chocks to support the ends of the beams.

CHO CO, a bay and province of New Granada, in South America.—1. The bay, forming part of the gulf of Darien, receives the Atrato (q.v.), a stream of note in connection with interoceanic communication. Its lat. and long. are about 3° 30' n., and 77° 30' west.—2. The province forms the w. portion of the department of Cauca (q.v.).

CHOCOLATE is made from the seeds of *theobroma cacao* (see COCOA), reduced to a fine paste in a heated iron mortar, or by a machine, and mixed with pounded sugar and spices, as cinnamon, cloves, cardamom, vanilla, etc. The paste is then poured into molds of white iron, in which it is allowed to cool and harden. C. is sometimes made without spices, but is then more generally called cocoa. The paste is sometimes mixed with flour, and with Carrageen or with Iceland moss; and for medicinal purposes with cinchona, etc. C. is used as a beverage, and for this purpose is dissolved in hot water or milk. Sometimes the yolk of an egg is added, and sometimes it is dissolved in soup or wine. It is also employed in making certain liqueurs. In a pure state, it soon satisfies the appetite, and is very nourishing; when it contains spices, it is also stimulating. Good C. is externally smooth, firm, and shining—not gritty in the fracture—easily soluble, aromatic; not viscid after having been liquefied and cooled, but oily

on the surface, and leaves no sediment of foreign substances. C. is adulterated in many ways, by mixing it with rice-meal, oat-meal, flour, potato-starch, roasted hazelnuts or almonds, and with benzoin, storax, etc., in place of vanilla. The Mexicans, from time immemorial, were accustomed to prepare a beverage from roasted and pounded cocoa, dissolved in water, and mixed with maize-meal and spices. This they called *chocolatl* (*choco*, cocoa, and *atl*, water). From the Americans, the Spaniards derived an acquaintance with C., and by them it was introduced into Europe in 1520. C. is used in South America, Spain, and Italy, more than in other parts of the world, although it is used to a considerable extent in Germany. Its use in Britain has given place in a great measure to that of the simpler cocoa.

CHOCOLATE ROOT. See GEUM.

CHOCTAW, a co. in s.w. Alabama, on the Mississippi border; 800 sq.m.; pop. '70, 12,676—6,872 colored. It is watered by tributaries of the Tombigbee. Productions chiefly agricultural. Co. seat, Butler.

CHOCTAW, a co. in central Mississippi, on Big Black river; 900 sq.m.; pop. '70, 16,988—4,462 colored. Agriculture is the chief business. Co. seat, Greensborough.

CHOCTAWS, or **CHAHTAS**, a tribe of American Indians now occupying a portion of the Indian territory on Red river, numbering about 16,000, and possessing 10,450 sq. m. of land. When first known to Europeans they occupied the country now forming the w. part of Alabama and s. part of Mississippi. When Louisiana was settled they formed an alliance with the French against the Chickasaws and the Natchez. By degrees they became friendly to the English, and in 1786 they recognized the supremacy of the federal government. About 1800, they began to emigrate beyond the Mississippi. In the war with England and the Creek war they did great service to the union. Georgia gave them special privileges, even making them citizens, but they preferred to emigrate, and were all gone soon after 1830. In 1818, missions were established among them. In the civil war, they went with the confederates, but after it was over new treaties were made by the United States, slavery was abolished, and other necessary changes made. They have a regular constitution, prefaced by a bill of rights. Free males 21 years old and six months citizens of the nation are voters. There is a house of representatives of 17 to 35 members chosen for two years. The governor is elected for two years by the people, and is eligible for four years only out of any term of six. There are courts, supreme, civil, and probate; and justices of the peace. Books are printed in their language, and a newspaper is regularly issued every week at their chief town.

CHODOWIECKI, DANIEL NICOLAS, 1726—1801; a Polish painter and engraver who designed and engraved subjects from the seven years' war, and subsequently the "History of the Life of Jesus Christ," a series of miniature paintings that made him at once famous. Thereafter he was represented by his work in almost every book of importance published in Prussia in which engravings could be used. Still, the picture of "Calas and his Family" is the only one of C.'s that has wide reputation.

CHENIX, a Grecian measure of capacity variously represented as equal to 0.186, 0.248, and 0.495 of an English gallon. It is supposed to have been used chiefly for measuring grain.

CHERILUS, a Greek tragic writer of the time of Thespis and Æschylus. He was a competitor for the tragic prize in 529 B.C. It is said that he took 13 prizes, and was the author of 150 tragedies, besides other works that have been lost.

CHERILUS, OF SAMOS, a Greek writer, b. about 470 B.C.; author of a poem treating of the wars of Greece with Darius and Xerxes. Fragments of his writings have been preserved in the works of Aristotle, Josephus, and Ephorus.

CHOIR (Lat. *chorus*). In its literal sense, the C. is the portion of the church devoted to the singers; and in all descriptions which concern the ritual it is so limited, including only the space from the western door or screen to the end of the stalls, whilst the part from the stalls eastward to the high altar is called the presbytery. But in ordinary language, and even as used by architects, it denotes the entire space which is inclosed for the performance of the principal part of the service. In this sense, it includes the C. proper and the presbytery, and corresponds to the chancel in parish churches. Where the church is cruciform, and the term is confined to the eastern limb, it comes to be entirely different from the C. in the ritual sense, or the stall-place, which in such a building is commonly situated either under the tower or in the nave. In large churches, the aisle generally runs along each side of the C., and frequently passes across the e. end of it; an arrangement which is very common in the larger churches of the continent which have polygonal or semicircular terminations.—C. is also the name given to the singers of the choral service.

CHOIR-SCREEN, or **CHOIR-WALL**, the screen or wall which divides the choir and presbytery from the side aisles. It is often very richly ornamented.

CHOISEUL, CLAUDE ANTOINE GABRIEL, Duc de, 1760—1838; a col. of dragoons during the French revolution, and a warm supporter of the royal cause. He made an attempt to rescue Louis XIV. from the revolutionists, but the royal party was recaptured, a price was set upon C.'s head, and he was compelled to fly. He raised a regiment of

hussars and joined the royalist army. He was finally taken prisoner and confined at Dunkirk. He escaped, and sailed for India, but was wrecked on the coast of France, captured, and condemned to death. Yet he escaped death, and at the restoration he was called to the house of peers by Louis XVIII. In the revolution of 1830, he was a prominent member of the provisional government, and afterwards received from Louis Philippe the post of aide-de-camp to the king and governor of the Louvre.

CHOISEUL-AMBOISE, ETIENNE FRANÇOIS, Duc de, minister of Louis XV., was b. June 18, 1719, educated by the Jesuits, and on the completion of his studies, entered the army. He fought bravely in the Austrian wars of succession; but only after he had attracted the fancy of the king's mistress, Madame Pompadour, did fortune also really favor him. Through the influence of Madame Pompadour, he was made lieut.-gen. in 1748, ambassador to the courts of Rome and Vienna in 1756, and duc de Choiseul in 1758. C. now became instrumental in bringing about a family league of the Bourbon monarchs in Europe; and in 1763, at the close of the war so disastrous to the French arms, he obtained, by his prudence and dexterity, milder terms for his nation than had been expected. This made him very popular, as did also his successful attempt to overthrow the Jesuits. In 1764, Madame Pompadour died, but the power of C. continued unabated. He conceived, and almost carried out, a plan for the formal emancipation of the Gallican church from papal influence, paid great attention to the improvement of the army and navy, developed the trade and industry both of the nation and of the colonies, and opened up anew an intercourse with India, whose native princes were assisted by French officers in their endeavors to expel the British from the peninsula. He had spies in every European court, and so ruled all diplomatic and political cabals, that the empress of Russia, who dreaded him, called him *Le Cocher de l'Europe* ("the driver of Europe"). But the rise of Madame Dubarry, who succeeded Madame Pompadour in the royal affections, gradually alienated Louis from his able minister, and in 1770 he retired to his magnificent estate of Chanteloup, where he lived in princely splendor. After the accession of Louis XVI., C. received permission to return to Paris. He was often consulted, but never recovered his official position. He died May 7, 1785.

CHOISEUL-GOUFFIER, MARIE GABRIEL FLORENT AUGUSTE, Comte de, 1752-1817; a French scholar who traveled in the east, and published in 1782 the first volume of his *Voyage Pittoresque en Grèce*. During the revolution he adhered to the royal cause, and afterwards went to Russia, where he was made director of the imperial libraries, and of the academy of fine arts. Another part of his work appeared in 1809, and the concluding portion in 1824, after his death.

CHOKE-CHERRY, a name given to certain nearly allied species of cherry (q.v.), of the bird-cherry section of the genus or sub-genus, natives of North America, having small fruit in racemes, and the fruit at first rather agreeable, but afterwards astringent in the mouth. Some confusion has long existed as to the different kinds, and their botanical names (*prunus* or *cerasus virginiana*, *serotina*, and *borealis*) are not more determinate than the popular ones. Perhaps they ought to be regarded as mere varieties rather than distinct species. They have a considerable resemblance to the Portugal laurel, although the leaves are deciduous. The bark is used as a febrifuge and tonic, under the name of *wild cherry bark*; and by distilling it with water, a volatile oil is obtained from it associated with hydrocyanic acid, called *oil of wild cherry*. This bark allays nervous irritation, and is particularly suitable as a first tonic in cases of recovery from fever or inflammation.

CHOKE-DAMP. See CARBONIC ACID.

CHOKING, the obstruction of the gullet, or of the passage leading to it, by morsels of food imperfectly chewed, or other substances accidentally swallowed. The consequences of C. in the human subject are serious, and will be best considered in connection with the parts concerned. See PHARYNX and ŒSOPHAGUS. What follows relates to the C. of cattle.

Causes.—These may be classified under two heads: 1. Those that depend on the material swallowed; and 2. Those that depend on the animal swallowing. Under the first head we find sharp-pointed objects which become fixed into or entangled in the membrane lining the throat and gullet; solid masses too large to pass on to the stomach; dry farinaceous materials which clog in the passage. The second class of causes consists in inflammation of the throat, or irritation of the organs of deglutition; constrictions of the passage, as in crib-biting horses; ulceration of the œsophagus, which is apt to run after C., and is the cause of a relapse; lastly, without any disease of the deglutating organs, an animal may be choked by eating too greedily, and imperfectly masticating or salivating its food.

Symptoms.—These vary according to the position of the obstruction. If high up in the pharynx, the animal cannot swallow, evinces great distress, and attempts to cough up the object. Saliva drips from the mouth, the animal chews, and makes an occasional ineffectual effort to swallow. The breathing is very greatly disturbed. In some cases a large lump of food has become fixed in the larynx or upper part of the windpipe, and has suddenly suffocated the animal. When the obstruction is in the course of the gullet down the neck, the symptoms are very similar, though less urgent, and there is addition-

ally the local sign of swelling, with the peculiar hardness or softness of the substance indicating its nature. When an animal is choked by a substance lodging in the gullet within the chest, the symptoms are more mysterious, and likely to mislead. The animal swallows; a considerable quantity of liquid may enter the gullet, but it is suddenly regurgitated or thrown up, as in the act of vomiting. The distress is great; and in the course of three or four days, unless the animal is relieved, it dies of prostration. In the ox, sheep, and goat, the most alarming symptoms, in any case of C. arise from the paunch becoming distended by gas. This condition will be treated under the head HOVEN.

Treatment.—Remove the obstruction with the hand, when you can. Cause the animal to swallow the substance, if possible, by giving it water or oil. Carefully push the offending agent down by a probang, if it is possible to effect this, and if withdrawal by the mouth is impracticable. In some cases, the gullet has to be cut into by a qualified surgeon. After a case of C., keep the animal on soft food, and attend to its general health, in order to avoid a relapse, which is of frequent occurrence in cattle.

CHOLERA, a Greek term used in the Hippocratic writings, but of indeterminate etymology, being derived perhaps from *cholē*, bile, or from *cholera*, a water-spout or gutter. It is now universally employed in medicine as indicating one of two or three forms of disease, characterized by vomiting and purging, followed by great prostration of strength, amounting in severe cases to fatal collapse. The variety called *cholera sicca* (dry C.) by ancient writers (in which collapse and death take place without discharges) is comparatively rarely observed. The milder forms of C. occur almost every summer and autumn, even in temperate latitudes, and are hence termed by some—in reference to this country, and by way of contrast—British or summer C.; while the more devastating and fatal forms of the disease are generally supposed to originate only in tropical countries—especially in India—and thence to be propagated epidemically over vast populations, and in a somewhat regular geographical course, reaching this country usually through Persia, the steppes of Tartary, Russia, and the Baltic, at the same time extending to Egypt, Turkey, and the south of Europe. These very fatal forms of the disease are commonly called Asiatic, Oriental, or epidemic C.; sometimes cholera morbus, or pestilential cholera. The milder forms are sometimes also called bilious C.; and the severer, spasmodic C., from the character of the symptoms in each. Some writers of great authority are inclined to consider the two forms as one disease, varying in individual cases and according to season. It is certain that it is not always possible to distinguish the one form from the other in particular instances; but the marked difference between the mortality of groups of cases of British C. on the one hand, and of Oriental or Asiatic C. on the other, renders it probable that there is something in the latter disease which amounts to a distinction in kind. Whether in the milder or severer form C. is usually ushered in by a period of premonitory symptoms, when the more distinctive characters of the disease are not established; the case resembling one of common diarrhoea (q. v.) or looseness of the bowels. At this stage it is very apt to be neglected, and unfortunately, in the severer epidemic forms of the disease this is the only stage much under control. Whenever, therefore, there is a reasonable suspicion that epidemic C. is threatened, every person attacked with diarrhoea should make a point of placing himself under medical advice, and, if possible, of escaping from any situation in which epidemic disease is known to be prevalent. He should also be particularly attentive to diet, and especially to the purity of the water he drinks, and to its absolute freedom from contamination by animal matters filtering through the soil, or thrown into water-courses by sewers, etc. If water absolutely cannot be had in a pure state, it should be boiled before being used for drink, or indeed for any domestic purpose. Many cases of C., and several local epidemics, have been traced in the most positive manner to organic impurities of the drinking-water; and no single cause of the disease has been established by so much evidence as this. Hence, in all probability, arises the well-known preference of C. for low situations, and particularly for the low-lying flats on the banks of rivers, especially where the inhabitants are supplied with water from streams polluted by sewerage, and wells into which the contents of drains are permitted to filter from a superior elevation.—See Dr. Snow's work on the communication of cholera, 2d edition, 1855; also the report of the registrar-general of England on the cholera of 1848-49, and his 17th annual report, for 1854.

It is hardly within the scope of a work such as this to present a minute description of fully developed C. in its severer or Asiatic variety. It is truly an appalling pestilence* too easily recognized by a few leading features. After some hours or days of simple relaxation of the bowels, vomiting commences, and occurs again and again, accompanied by frequent and extremely copious discharges downwards, at first of matters colored with bile as usual, but in the end of colorless and turbid fluid resembling water in which rice has been boiled. These discharges (often to the extent of gallons of liquid), succeeding each other with the most alarming rapidity, act as a drain upon the fluids of the body generally; and by the changes they effect upon the blood, contribute

* The epidemic of 1848-49 carried off 53,293 persons in England and Wales; and that of 1854, 20,097 persons. See the Registrar-General's report for the latter year. This estimate is exclusive of cases of fatal diarrhoea.

to bring about the state called *collapse*. In this condition, the patient lies motionless and apathetic, except when tormented by cramps, which are of frequent occurrence; the surface is cold; the finger-ends, lips, and tip of the nose become livid; the eyes are deeply sunk in the sockets, and often bloodshot; the tongue is clammy; the breath without any sensible warmth when caught on the hand; the pulse is suppressed at the wrist, the breathing extremely slow and feeble, the heart just audible through the stethoscope. Purging and vomiting have ceased; even the urinary secretion has dried at its source. In fact, all the vital processes are nearly brought to a stand, and unless reaction comes, a few minutes, or at most a few hours, suffice to bring life to a close. Reaction in the most favorable cases is gradual and without accident; it is not unfrequently, however, accompanied by fever, closely resembling typhus, and constituting, at least in the temperate zone, one of the chief dangers of the progress of cholera.

Medicine is almost powerless against C., except in the earliest stages, in which the treatment usually pursued in diarrhea (q. v.) has sometimes been found useful. Very remarkable temporary restorative effects have been found to follow the injection into the veins of dilute solutions of saline matter, resembling as nearly as possible the salts of the blood which are drained away in the discharges. Unhappily, these experiments have as yet only very imperfectly succeeded. The patient is restored to life, as it were, from the very brink of the grave; but he revives only for a few hours, to fall back into his former condition.

The true medicine of C., so far as we yet know, is preventive medicine. The measures to be adopted have been partly pointed out above; in addition, it may be said that personal cleanliness is of the first importance; and that all unnecessary contact with the sick should be avoided, as the disease is probably to some extent contagious, though by no means in the highest degree. In short, all the precautions are to be taken which are recommended in the case of epidemic disease (q. v.).

CHOLERA INFANTUM. A disease of infants characterized by intestinal disturbance more or less obstinate and dangerous. Opinion is unsettled in regard to the nature of the complaint, and it passes under different names in different countries. In this country, besides C. I. a common name for it is *summer complaint*, because it is essentially a disease of hot weather. Most British authorities describe it under the general head of diarrhea, others call it weaning brash, watery gripes, and choleric fever of children. In France it has various names, principally alluding to its location, as colenteritis, follicular enteritis, and gastro-intestinal catarrh, the latter name being also the one in most frequent use in Germany. But the disease as it is known in this country, and doubtless elsewhere, depends upon a variety of pathological conditions, which, however, may change from one to another during the progress of the case. The causes of the complaint are not completely settled, although all the authorities agree that hot and badly ventilated apartments and malaria generally are highly conducive to it. The older American physicians were, with Dr. Benjamin Rush, accustomed to call it infantile bilious remittent fever, and many of the cases which occur in those rural districts where remittent malarial influences prevail have much of the character of remittent fever, but in cities, particularly where the sewerage is bad, and the streets are suffered to be choked with decaying garbage, the diarrhea has more the character of that of typhoid fever, and many of the symptoms are of a general typhoid, that is, of a weak nervous character. Too high a heat maintained in the nursery, will, if continued, probably so alter the functions of secretion as to bring on the disease; especially if the diet is defective, as from poor milk, or the injudicious giving of solid articles of food. It sometimes comes on very suddenly, but is often insidious in its advances, deluding the mother and family with the idea that it is merely a temporary diarrhea that will soon pass away, or can easily be relieved. The attack, however, may commence with violent symptoms, and there will be much excitement of the circulation, with vomiting and purging. There is in all cases great weakness of the digestive and assimilative powers. Milk which has been given but a short time before is voided by the rectum in curds, mixed with greenish slime of various depths of color, and containing fibrinous shreds and gelatinous masses, indicating mucous inflammation, and having a peculiar and diagnostic odor. The evacuations are preceded by colic pains, often intense, the movement usually giving temporary relief. The abdomen may be quite full at first, but gradually, often rapidly, grows gaunt, with more or less rapid emaciation of the whole body. The child becomes peculiarly fretful and impatient, the expression of its features and its general appearance being highly diagnostic to the experienced observer. In advanced stages there is a withered, clammy appearance of the hands, arms and legs, peculiar to the disease. Without change of air or diet, or under bad treatment, the disease usually runs a rapid and fatal course, but sometimes, under fair but not decided treatment, the sufferer lies for several weeks, when, according to statistics, death is more likely than recovery. There is a considerable difference, according to the testimony of practitioners, in the mortality which occurs in the practice of different individuals. In some charitable institutions the deaths of cases of C. I. run as high as 70 per cent, even under as good hygienic regulations as may be had in a city, and many private physicians, from the result of their practice, place the percentage of deaths above 50 per cent. There are others, and they form a large portion of the profession, who maintain that under their method of treatment the

mortality is much less, ranging on an average from 10 to 25 per cent, and even below this. All concur as to the importance of pure air and proper diet. Often the simple removal to a mountainous district will, alone, result in recovery; or even a change from hot to cold weather, without removal, will often produce decided relief. As the digestive functions are very much weakened, the food should be the most digestible which can be obtained, also nutritious. If the case be one in which the child is suckled by the mother, but there is reason to suppose that her milk disagrees with it, weaning may be advisable; but, as a rule, the mother's milk is the best food for a child under 14 months of age. When the child is fed from a bottle, beef tea, made either from fresh beef, or from beef extract, may be given with advantage. Farinaceous articles, such as farina, tapioca, corn starch, and arrow root, are, contrary to the ill-advised conclusions of many, not proper food for infants. The only article of the kind that ever ought to be given in a case of cholera infantum, is rice water, which, from its slight astringent properties, may sometimes be given in moderate quantities together with good milk and beef tea. The radical difference between physicians, in the medical treatment aside from hygienic measures, and aside from any reference to the different "schools" of medicine, consists in the degree of reliance to be placed upon opiates and astringents, or in other words, upon palliative treatment, as distinguished from that which seeks to produce a decided change in the functions of the various secreting organs, a great majority of which are manifestly much deranged in the disease under notice. The bile is scanty and not of normal character, and the inflamed and highly irritated mucous membrane of many parts of the intestinal tract interferes greatly with the functions of the mucous glands of these parts. There has long been a discussion among physicians as to the therapeutical value of mercurial preparations, particularly as to calomel, and its power of influencing the secretion of the liver, and diminishing inflammation. It seems proper therefore to say that in the experience of the most successful physicians it is found that the administration of small and oft repeated doses of calomel in cases of C. I. is attended, as a rule, with decidedly beneficial results; so that in the course of two or three days, frequently in a few hours, a change takes place for the better in the character of the fecal evacuations and in the appearance of the patient. The administration of the calomel alone, given in a little pulverized sugar, slightly moistened and placed on the child's tongue, in quantities from one twelfth to one quarter of a grain, and repeated every two, three, or four hours, will often produce decided relief; but it is generally advisable, or necessary, also to give a slight opiate, such as paragoric elixir, and perhaps a few drops of the tincture or aromatic syrup of rhubarb. The calomel must be persisted in for several days after the evacuations have become natural, although not given so often. It is a rule with but few exceptions among physicians of experience, that an infant cannot be salivated. On the contrary, the child grows strong and hearty under the use of calomel in those cases when the secretions are much deranged and the system reduced. In doses sufficiently small it undoubtedly possesses the power of improving assimilation. Warm baths, or rather warm sponging, and general attention to cleanliness, and the preservation of an equable temperature, should not be neglected. Patients who cannot be removed to the country, may be taken out in an easy carriage and wheeled on the shady side of the street, or in a park or grove.

CHOLESTERINE is one of those bodies which are termed by chemists lipoids, or non-saponifiable fats. It was originally discovered in gall-stones, but is now recognized as an ordinary constituent (although occurring in very minute quantity) of bile, blood, and the tissue of the brain. It likewise occurs in pus, the contents of cysts, and other morbid fluid products.

It separates from its solutions in glistening nacreous scales, which, when examined under the microscope, appear as very thin rhombic tablets, whose obtuse angles are $100^{\circ} 30'$, and whose acute angles are $79^{\circ} 30'$. Different formulæ have been assigned for its composition, the one generally accepted being $C_{27}H_{48}O$. It is not always very easy of detection in animal fluids, but if, by its insolubility in water, acids, and alkalies, and its solubility in hot alcohol and ether, it has been recognized as a fatty substance, it may be readily distinguished from all similar substances by the measurement of the angles of its rhombic tablets. The best method of preparing C. is by boiling gall-stones containing it in alcohol, and filtering the solution while hot. From this hot filtered solution it crystallizes as the fluid cools.

Chemists have obtained substances known as *cholesterilins* and *cholesterones* from the decomposition of cholesterine.

CHOLET, a t. of France, in the department of Maine-et-Loire, on the right bank of the Maine, 32 m. s.w. of Angers. Here, during the Vendean war, two actions were fought in 1793, in both of which the royalists were defeated. In the first, they lost their brave gen. Bonchamps; and the second drove them across the Loire, thus virtually deciding the war against them. It has manufactures of fine woolen and mixed fabrics, and leather, and a trade in cattle. Pop. '76, 12,335.

CHOLULA, a once flourishing, but now decayed, t. of Mexico, 60 m. to the e.s.e. of the capital, and 15 to the w.n.w. of La Puebla. Cortes found in it 20,000 houses, and as many more in the suburbs, and also 400 temples. Now the place contains only about 10,000 inhabitants. Its most remarkable memorial of aboriginal times is a pyramid of

clay and brick, surmounted on the top by a chapel of Spanish origin. Its height is 177 ft., while the side of its base measures 480 yards. C. stands on the table-land of Anahuac, at an elevation of 6,912 ft. above the level of the sea.

CHOMEL, AUGUSTE FRANÇOIS, 1788-1858; a French physician long employed in the Paris hospitals; author of *Essai sur les Rheumatismes*; *Éléments de Pathologie générale*; and *Traité des fièvres et des Maladies pestilentiellees*. He was made professor of medicine at the faculty of Paris, as successor to Laennec. He had a more lucrative practice than any other physician in France.

CHONDA, a t. of Gwalior, 18 m. to the n.w. of the fort of the latter name, in lat. 26° 27' n., and long. 78° east. It claims notice merely as the scene of a decisive victory gained by sir Hugh, afterwards lord Gough, over the Mahrattas, on 29th Dec., 1843.

CHONDRINE. See GELATINE.

CHONDROPTERYGII. See CARTILAGINOUS FISHES.

CHONETES, a genus of fossil brachiopodous mollusca, nearly allied to the well-known genus *productus*. It is characterized by its transversely-oblong shell, and by having the long margin of the ventral valve armed with a series of tubular spines. Twenty-nine species have been described from the paleozoic formations.

CHONOS ARCHIPELAGO, a group of islands off the w. coast of Patagonia, lat 44° to 46° s., long. 74° to 75° west. With the exception of a few of the most westerly, all are bare and scantily peopled, though several are of considerable extent.

CHONS, or **KHOXSOU**, an Egyptian deity worshiped at Thebes as the great eldest son of Amen-Ra and Mut, and identified with the moon. The Greeks thought him to be a form of Hercules. Like Horus, he is represented as a youthful god, his form mummied, wearing the lock of hair at the right side of his head, and a skull-cap surmounted by the full and dichotomized lunar disk; or hawk-headed, wearing the same. He holds a crook and whip. He was a celestial deity, and at a later time connected with Thoth, and was said to have proceeded from Nu or Han, the celestial waters. A tablet found in a temple at Karnak which was dedicated to this god, records the departure of C. in his ark in the 16th year of the reign of Ramesses XII. to the land of Baktan to expel a demon which had possessed the daughter of a king of that country and sister of the queen of Egypt. He succeeded, and returned in his ark 17 years later. The worship of C. appears to have been common in the Ptolemaic period, and figures of the god in porcelain and bronze are not uncommon. He represents the youngest, as Ammon did the oldest, of the divin: circle.

CHONTALES, a district of Nicaragua, n.e. of lakes Nicaragua and Managua, traversed by the Cordilleras, along the slopes of which are valuable mines. There are a number of small towns peopled chiefly by native Indians. Some of the gold mines now worked by them were worked by the early Spanish adventurers. There is a bed of coal near lake Nicaragua. The grassy plains among the mountains support large herds of horses and cattle. Tropical fruits grow abundantly, and there is good timber in the neighborhood of the mines.

CHOPIN (Scotch, *chappin*), the name of a Scotch liquid measure equivalent to the English quart.

CHOPIN, FREDERIC, a distinguished Polish pianist and musical composer. He was b. at Zelazowa-wola, near Warsaw, in 1810, and studied music at Warsaw under prof. Joseph Elsner. An exile after the revolution of 1830, he took up his residence in Paris, where he lived admired both professionally and in society. His health, always delicate, broke down in 1837, when he went for a time to Majorca, from which he afterwards returned, benefited by the change. After again suffering much from illness and depression of spirits, he visited England and Scotland in 1848, and in London was welcomed with enthusiasm in public and private. He never recovered from the fatigues of this journey, but died in Paris, 17th Oct., 1849, and was buried, by his desire, beside Bellini, in the cemetery of Père-la-Chaise. His compositions, restricted to pianoforte music, are in high esteem among musicians, and consist chiefly of preludes, nocturns, polonaises, mazurkas, and walses, with a few concertos and sonatas. They are pervaded by a sensitive, restless, and highly poetic fancy, and abound in subtle ideas, graceful and original harmonic effects, and rich ornamentation. The so-called polonaises, mazurkas, and walses are not dance music, but dreamy compositions suggestive of the rhythm and character of these dances, in which the peculiarities of Polish national music are blended with French elegance and taste.

CHOPINE (Spanish, *chapin*), a high clog, or slipper, deriving its name, as is supposed, from the sound *chap, chop*, made by the wearers in walking. Chopines were of eastern origin, but were introduced into England from Venice during the reign of Elizabeth. They were worn by ladies under the shoes, and were usually made of wood covered with leather, often of various colors, and frequently painted and gilded. Some of them were as much as half a yard high; and in Venice, where they were usually worn, their height distinguished the quality of the lady. The C. is mentioned by Shakespeare in *Hamlet*.

CHOPTANK RIVER rises in Delaware, and flows s.w. through that state and Maryland, forming a wide estuary as it nears Chesapeake bay, into which it empties. It is navigable for small vessels for about 50 miles.

CHORAGIC MONUMENTS. The choragus, or person at Athens who, on behalf of his tribe, had supported the chorus (q.v.), and who, in competition with the other tribes, had exhibited the best musical or theatrical performance, received a tripod for a prize; but he had the expense of consecrating it, and of building the monument on which it was placed. There was at Athens a whole street formed by these monuments, called the "street of the tripods." The figure represents the monument of Lysicrates, popularly known as the "lantern of Demosthenes."

CHORALE', a musical term adopted from the German, means a melody to which sacred hymns or psalms are sung in public worship by the whole congregation in unison. The melody of the C. moves in notes of a slow and strictly measured progression, and of a solemn and dignified character that disposes the mind to devotion. Although the term C. is now always applied to the music of the Protestant church, it belonged to the Christian church at all times, as melodies still in use can be traced with certainty to have been sung by the congregations in the first centuries of Christianity. Among these is the song of praise by St. Ambrose, still retained in the Lutheran church, to the words "Herr, Gott, dich loben wir." The C. is intimately connected with the history of music, as vocal music was the only kind used in worship until far on in the middle ages. The C. is precisely what our psalm-tune is, or rather what it formerly was, and ought again to become. The pure, simple C. has, in a great degree, been cast aside in the British isles, and its place occupied by tunes of a comparatively puerile style, which are frequently only adaptations of operatic songs and other profane pieces.

CHORAL MUSIC, the ancient music of the church. Music in parts for different voices. See SACRED MUSIC.

CHORAL SERVICE, the musical service of the English church, celebrated by a full complement of clergymen and choristers in a cathedral church, and when all those parts of the service are sung as ordered in the rubrics.

CHORD. The C. of an arc of a curve is a straight line joining its two extremities. A **SCALE OF CHORDS** is used in laying off angles. It is thus constructed: Let AB be

the radius of the circle to which the scale is to be adapted. With center A and radius AB describe a quadrant BEC. Divide the quadrantal arc BEC into nine equal parts BD, DE, etc. This may be done by taking a radius equal to AB, and from the centers B and C cutting the arc in G and F. As the radius is always equal to the chord of 60° or $\frac{2}{3}$ of a quadrant, the arc CB is thus divided into three equal parts, BF, FG, GC, and each of these parts may then be trisected by trial, as no direct method is known. Draw the chord of the quadrant BC; from B as a center, and the chord of BD as a radius, describe an arc cutting BC at 10; with the chord of BE as a radius, describe an arc cutting BC in 20; with the chord of BF, describe an arc cutting BC in 30; and in a similar manner, find the divisions 40, 50, 60, 70, 80. Then the arcs BD, BE, BF, being arcs of 10° , 20° , 30° , etc., respectively, the distances from B to 10, 20, 30, etc., are the chords of arcs of 10° , 20° , 30° , etc.; so that BC is a scale of chords for every 10° , from 0° to 90° . To lay down or measure angles with such a scale, the arc of measurement must be described with the chord of 60° .

CHORD, in music, is the simultaneous and harmonious union of different sounds, at first intuitively recognized by the ear, and afterwards reduced to a science by the invention of the laws or rules of harmony. See HARMONY. Chords may consist of from two to five parts. Absolute chords of two parts are produced only by thirds or sevenths. Chords of more than two parts are either fundamental chords or inversions of them, and are divided into concords and discords. The union of sounds in all chords will be found, on analyzing their component parts, to be an admixture of major and minor thirds. The common chord, or *trias harmonica perfecta*, is the basis of all harmony, and consists of a bass note, or prime, with its third and fifth above, thus:

These three sounds are at the distance of a third from each other. When the lowest third is the greater third, as above, the C. is a major chord; but when the lowest third is the lesser,

thus: the C. is called a minor chord. A chord of two minor thirds combined is called diminished, as the interval from the lowest note to the highest is less than

a perfect fifth, thus: The common C. admits of two inversions, accord-

ing as one or other of its notes is made the bass, or lowest note of the C., thus:

Fundamental Chord. 1st inversion. 2d inversion.

By adding another third above the common C., a C. of four parts is produced, which is called the chord of the seventh, because the highest note is a seventh above the bass. When the C. of the seventh is produced on the fifth of the scale, it is then called the dominant seventh, which is the most perfect species of the C. It then consists of a major third, perfect fifth, and seventh, the minor, which is the next harmonic produced by nature above the fifth. The C. of the seventh may also be formed on any of the notes of the major or minor scale taken as a bass note, which produces the varieties of major, minor, and diminished sevenths, thus:

Dominant 7th. Major 7th. Minor 7th. Diminished 7th.

The C. of the seventh admits of three inversions, according as the notes above the fundamental note are used as bass notes. From its nature, it requires a resolution, and is therefore always followed by a common C. whose fundamental bass is a fifth below that of the seventh. For the C. of the ninth, see HARMONY. The first proper arranged system of chords is by Rameau, in 1730, which has from time to time been extended and improved by Marpurg, Kirenberger, G. Weber, F. Schneider, Marx, and the late professor S. W. Dehn of Berlin.

CHORE'A (Gr. *chorcia*, a dancing or jumping), a disease popularly called St. Vitus's dance, and consisting of a tendency to involuntary and irregular muscular contractions of the limbs and face, the mind and the functions of the brain generally being quite unaffected. The spasms of C. differ from those of most other convulsive affections in being unaccompanied either by pain or by rigidity; being, in fact, momentary jerking movements, indicating rather a want of control of the will over the muscles, than any real excess of their contractions. In some cases, the disease resembles merely an exaggeration of the restlessness and "fidgetiness" common among children; in others, it goes so far as to be a very serious malady, and may even threaten life. Fatal cases, however, are fortunately very rare, and in the large majority of instances the disease yields readily to treatment carefully pursued, or disappears spontaneously as the patient grows up. C. is a disease much more common among children of 6 years old, and upwards, than at any other period of life; it is also more common among female children than among males. The treatment generally pursued is the use of metallic tonics, such as zinc, copper, iron, and arsenic (the last, perhaps, the best), sometimes preceded or accompanied by purgatives. Exercise in the open air is also to be recommended; and gymnastics afford material aid in the cure. It is to be observed that the name St. Vitus's dance (dance of St. Weit) was applied originally in Germany to a different form of disease from that above referred to—one closely approaching in its characters the epidemic "dancing mania," which, in Italy, was called tarantism (q.v.).

CHOREPIS'COPI, an order of ministers of ancient origin, whose functions were to assist city bishops in rural districts or remote places. They acted in a subordinate capacity, and possessed limited powers, acting as colleagues or vicars of the bishops. They possessed the privilege of attending councils in their own right, and not merely as substitutes for bishops. At first they were confined to the eastern church, but began to multiply in the western church in the 5th century. They were succeeded after the 10th c. by archdeacons, vicars-general, and rural deans. In the east the order was abolished by the council of Rodicea about 365 A.D.

CHORLEY, a t. in Lancashire, on a hill on the Chor, 9 m. s.s.e. of Preston. It has an ancient parish church, supposed to be of Norman origin, and manufactures of cotton-yarn, jaconets, muslins, fancy goods, calicoes, and gingham. In the vicinity are several coal-mines, a lead-mine, besides mines and quarries of iron, alum, slates, millstones, etc. Pop. '71, 16,864.

CHORLEY, HENRY FOTHERGILL, 1808-72; an English author who paid much attention to musical criticism. After long effort he got a position on the London *Athenæum*, and for 35 years conducted the musical department of that journal. He wrote on other subjects besides music, producing the librettos of the *Amber Witch*; the *May Queen*; *St. Cecilia*; *Kenilworth*; *The Sapphire Necklace*; and *Faust*. Other of his works are: *Conti the Discardel, and Other Tales*; *Sketches of a Seaport Town*; *Memorials of Mrs. Hemans*; *Lion, a Tale of the Coteries*; *Music and Manners in France and Germany*; *Pomfret*; *Criticisms on Modern German Music*; and *Thirty Years' Musical Recollections*.

CHOROID COAT See EYE, ante.

CHORUS, among the ancients, meant a band of singers and dancers employed on festive occasions of great pomp, and also in the performance of tragedy and comedy

on the stage. In the time of the Attic tragedy, the C. consisted of a group of persons, male and female, who remained on the stage during the whole performance as spectators, or rather as witnesses. When a pause took place in the acting, the C. either sang or spoke verses having reference to the subject represented, which served to increase the impression or sensation produced by the performers. At times, the C. seemed to take part with or against the persons in the drama, by advice, comfort, exhortation, or dissuasion. In early times, the C. was very large, sometimes consisting of upwards of fifty persons, but afterwards it was much reduced. Its leader was termed the coryphæus. The charge of organizing it was considered a great honor among the citizens of Athens. The person appointed for this purpose was called the *choragus*. The honor was very expensive, as the choragus had to pay all the expenses incurred in training the members of the C. to perform their parts efficiently. They were, besides, fed and lodged by him during training-time, and he had also to provide for them masks and dresses. At times, the C. was divided, and spoke or sang antiphonally. These divisions moved from side to side of the stage, from which movement originated the naming of the single songs or stanzas, such as strophe, antistrophe, and epode. How the musical element of the ancient C. was constituted or composed, is not known with any certainty. Possibly, it was only a kind of rhythmical declamation, and doubtless very simple. It was accompanied by flutes in unison. With the decline of the ancient tragedy, the C. also fell into disuse; and only lately has there been an attempt to produce the same on the stage in the manner of the ancients, as, for example, in Schiller's *Bride of Messina*. The music which has been set in modern times to some of the Greek tragedies, does not give the least idea of the original music.

In modern times, by C. is understood the union of singers or musicians for the joint performance of a musical work. C. is also the name given to a musical composition for numerous voices, either with or without accompaniment, and intended to express the united feelings of a multitude. The musical C. is the only artistic means by which a simultaneous movement or sentiment of a multitude can be represented in the drama, the language or text being always of a simple rhythm, permitting only of a limited movement suited to the combination of a multitude. It is, however, not always necessary that every part of the C. should manifest the same feeling or sentiment. Two or more parts of the C. may act against each other, as suits the purport of the drama. Double, triple, and quadruple choruses are found in the old Italian compositions for the church. In modern times, the C. is much used, and with great effect, in operas, especially those of Meyerbeer and Wagner. In oratorio, the C. is of the greatest importance, and the numbers now employed to sing the C. far exceed anything attempted a century ago; but this is not always an advantage, for the *tempi* must necessarily be taken much more slowly, which has a sluggish effect; while increase in the number of voices does not always produce a greater power of sound. The C. of 35 well-trained voices from the pope's chapel, who sang at the coronation of Napoleon I., in the cathedral of Notre Dame, Paris, produced a far greater and more wonderful effect when they entered singing the *Tu es Petrus*, than another C. of hundreds of voices, and 80 harps, that had been assembled and trained for the same occasion, in expectation of surpassing all that man could imagine. The greater the number, the greater is the difficulty in obtaining unity.—C., in organ-building, is the name given to stops of the mixture species, some of which contain 2, 3, 4, 5, 6, or more pipes to each note, tuned at consonant intervals in relation to the fundamental stops.

CHOSE IN ACTION, in the law of England, is that kind of property which consists not in possession, but in the legal right to possess. As this right can, in general, be vindicated and made available only by means of an action, the property to which it relates, whether real or personal, is called a thing (*res* or *chose*) in action, to distinguish it from a thing already in possession. Money due upon bonds and bills, goods bought and not yet delivered, are examples of choses in action, as is also the right to compensation for damage occasioned by breach of contract. "By the strict rule of the ancient common law, no chose of action could be assigned or granted over, because it was thought to be a great encouragement to litigiousness, if a man were allowed to make over to a stranger his right of going to law. [See **CHAMPERTY**.] But this nicety is now not so far regarded as to render such a transaction really ineffectual. It is, on the contrary, in substance, a valid and constant practice: though, in compliance with the ancient principle, the form of assigning a chose in action is in the nature of a declaration of trust, and an agreement to permit the assignee to make use of the name of the assigner, in order to recover possession. . . . The King is an exception to this general rule, for he might always either grant or receive a chose in action by assignment; and our courts of equity, making the rule itself give way to the expediency, in a commercial point of view, of facilitating the transfer of property, allow the assignment of a chose in action as freely and directly as the law does that of a chose in possession."—Stephen's *Commentaries*, ii. p. 45. One would imagine that the more convenient and philosophical arrangement would be, by the interposition of the legislature, to make law conform at once to equity and expediency.

CHOSROES. See **KHOSRU**, *ante*.

CHÔTA NAGPORE, or NAGPORE THE LESS, one of the lower provinces of Bengal, containing 5 British collectorates, besides 7 tributary minor states. The area of the British divisions is 28,482 sq. m., and in 1871 the pop. was 3,419,591, consisting chiefly of aboriginal tribes who are little removed from barbarians. The country is for the most part wild and hilly, consisting of an undulating plateau 3,000 ft. above the sea. Its chief products are coal, jute, tea, and indigo; iron is also found. From the elevation of the tract, the temperature varies considerably, ranging in winter from 32° to 62°, and in summer from 78° to 98°.

CHOTEAU, a co. in Montana, on the Canadian border, near the head waters of the Missouri river, drained by the Missouri, the Dog, Milk, Arrow, Teton, Judith, Bear, and other rivers; about 12,500 sq. m.; pop. '70, 517, besides Indians. Co. seat, Fort Benton.

CHOTYN, **KHOTIN**, or **CHOCZIN**, a t. in Bessarabia, on the river Dneister, 45 m. s. w. of Kamieniec: pop. '67, 20,917. It is a fortified military post, and once belonged to the Turks, but was taken by the Russians in 1739.

CHOUANS were bands of insurgent royalists, who, during the French revolution, organized a reactionary movement in Brittany. They obtained their name from their leader, Jean Cottereau. This person, who had been a smuggler, went by the name of Chouan—a corruption, it is said, of *chat-huant* ("screech-owl")—because, while he and his accomplices were engaged in their nocturnal work, they were wont to be warned of their danger by some one on the watch imitating the cry of this bird. At the period of the revolt, however, he followed the humble occupation of a clog-maker. The first indications of an anti-revolutionary spirit in Brittany manifested themselves in the beginning of 1791, when several trees of liberty were destroyed at night, and other more serious outrages committed. These disturbances were fomented by seditious priests. In 1792, and insurrection was planned by the marquis de la Rouarie, with the sanction and approval of the two brothers of Louis XVI. The agents of the marquis entered into communications with Jean Cottereau—well known for the reckless audacity of his character—and other smugglers; but having the misfortune to be arrested, the carrying out of the insurrection devolved upon the latter. The *Chouannerie*, as the insurrection was called, at first disgraced itself, both by the drunken license and the cruelty which marked it. After several successful exploits of the guerrilla sort, Jean Cottereau perished in an engagement which took place on the 28th July, 1794, near the wood of Mison, the theater of his first efforts. Before this, however, other and more illustrious leaders had appeared in Brittany to direct the movement, the chief of whom were Georges Cadoudal (q. v.) and Charette. Through their endeavors it was more widely extended, and for a time seemed likely to imperil the security of France, but was suppressed towards the close of 1799. Petty *spurts* of insurrection, however, broke out till about 1803, when the *Chouannerie* ceased for awhile. In 1814–15, it again made its appearance on both sides of the Loire; and after the July revolution, was once more excited by the duchess of Berry on behalf of the duke of Bordeaux, but crushed by the energetic measures taken by M. Thiers.

COUGH, *Fregilus*, a genus of birds of the crow family (*corvidæ*), but approaching to the characters and appearance of the starlings (*sturnidæ*). The length of the bill has induced some naturalists, among whom was Cuvier, to place them beside the hoopoes; but this is now generally regarded as an error; they agree with crows in having their nostrils covered with stiff bristles directed forward, and in their habits. The beak is longer than the head, strong, arched, and pointed. The tail is slightly rounded. The only European species is the common C., sometimes called the Cornish C., or red-legged crow (*F. graculus*), a widely distributed but very local bird, inhabiting the Swiss Alps, the high mountains of Spain, of Greece, of India, and of Persia, the s. of Siberia, the n. of Africa, and some parts of the British sea-coasts; but almost exclusively confined to situations where there are high cliffs. In these it generally makes its nest; sometimes, however, in ruined towers. Its long hooked claws enable it to cling easily to a rough rock, but it seems unwilling even to set its feet on turf. It lives in societies like the rook. It feeds on insects, berries, grubs, and grain. It is easily tamed, becomes very familiar and forward, and exhibits in the highest degree the curiosity, the pilfering disposition, and the delight in brilliant or glittering objects, which also characterize others of the crow family.—Other species of C. are known, natives of Australia, Java, etc. Some naturalists unite the chocards and the coughs into one genus.

CHOULES, JOHN OVERTON, D. D., 1801–56; a native of England, who emigrated to the United States in 1824. In 1827, he became minister of the Second Baptist church in Newport, R. I. Six years later, he went to New Bedford; in 1837, to Buffalo; in 1841, to the Sixth street Baptist church in New York; and in 1843, to the church at Jamaica Plain, near Boston. In 1847, he returned to his Newport church; and in 1854, accompanied commodore Vanderbilt in his yacht voyage to Europe. Among his publications are *Young Americans Abroad*, and *The Cruise of the North Star* (the commodore's yacht). He also contributed to and edited several historical works.

CHOUTEAU, AUGUSTE, 1739–1829; a native of New Orleans, and a pioneer in north-western settlements. With his brother Pierre he was the founder of the present city of St. Louis.

CHOUTEAU, PIÈRE, 1749-1849; brother of Auguste, and with him the founder of St. Louis, where they settled in 1764. The two were members of an expedition under Laclède, sent by the French government of Louisiana to open trade in the region of the Missouri and upper Mississippi. The brothers remained in St. Louis all their lives, Auguste reaching 90 and Pièrre 100 years of age. They were the heads of large families of high standing and great wealth and influence in Missouri and adjoining states.

CHOUTEAU, PIÈRE, 1789-1865; son of Pièrre the founder of St. Louis. He was all his life engaged in the fur trade, following the Indian tribes as they retired before white encroachment, and establishing trading-posts in many remote points. In 1834, he and his associates bought the fur-trade interests of John Jacob Astor, and extended their operations over all the regions e. of the Rocky mountains down to Mexico. Chouteau was a member of the convention that framed the first constitution of Missouri.

CHOWAN, a co. in n.e. North Carolina, on Albemarle sound, and bounded w. by Chowan river; 240 sq.m.; pop. '70, 6,450-3,369 colored. The surface is uneven, and the soil fertile, producing corn, cotton, etc. Co. seat, Edenton.

CHOYA. See CHAY ROOT.

CHRESTIEN, or **CHRÉTIEN**, DE TROYES, an early writer of French romance, of whose life little is known, except that he was b. at Troyes in the 11th century. It is supposed that he was attached to the court of Philip of Alsace, count of Flanders. The six romances that critics concede to be of his composition are: *Irec et Enide*, from which Tennyson took one of his Arthurian legends; *Cliges* or *Cliget*, a second round-table romance; *Le Chevalier au Lion*; *Guillaume d'Angleterre*; *Le Chevalier de la Charette*; and *Perceval le Gallois*. He also wrote *Tristan, ou le Roi Marc et le Reine Yseult*, and *Le Chevalier de l'Épée*, but these two works are lost.

CHRESTIEN, FLORENT, 1541-96; a Latin poet, at an early age tutor to Henry of Navarre, afterwards Henry IV., who made him his librarian. Chrestien was the author of many translations from Greek into Latin verse, and also of translations into French. He wrote in verse against Pibrach, the apologist of the massacre of St. Bartholomew; but his claim to a place among satirical writers rests upon his share in the *Satyre Menippée*, a pasquinade in the interest of Henry IV.

CHRESTOMATHY, a collection of extracts, or text books, useful in learning a language, or in gaining special information.

CHRISM (Gr. *chrisma*, ointment) is the name given to the oil consecrated on holy Thursday, in the Roman Catholic and Greek churches, by the bishop, and used in baptism, confirmation, orders, and extreme unction. There are two kinds of C.—the one, a mixture of oil and balsam, is used in baptism, confirmation, and orders; the other, which is merely plain oil, is used in extreme unction.

CHRISOME, the name of the white vesture laid by the priest on the child in former times at baptism, to signify its innocence. It was generally presented by the mother as an offering to the church, but if the child died before the mother was "churched" again, it was used as a shroud. By a common abuse of words, C. came to be applied to the child itself. A C. child is a child in a C. cloth. As late as Jeremy Taylor (*Holy Dying*, c. i., s. 2), we have the following: "Every morning creeps out of a dark cloud, leaving behind it an ignorance and silence deep as midnight, and undiscerned as are the phantasms that make a chrisome child to smile."

CHRIST, a title of our Saviour (see JESUS), now in general use almost as a name or part of his name. It is originally Greek, signifies *anointed*, and corresponds exactly in meaning and use with the Hebrew word Messiah (q.v.); so that this title given to Jesus of Nazareth, is an acknowledgment of him as the Saviour long promised to the house of Jacob and to the human race. As prophets, priests, and kings were anointed on being called to their several offices (I Kings i. 34, 39; I Sam. xvi. 13; Exod. xxix. 7), so the Saviour was anointed as at once prophet, priest, and king; the Holy Spirit, often represented under this figure, being given to him to qualify his human nature for all that belonged to his mediatorial office and work.

The whole system of Christianity depends on the doctrine of the PERSON OF CHRIST. An essential difference necessarily exists on almost every point between the systems of doctrine maintained by those who do and by those who do not acknowledge a union of the divine and human natures in his person. Some of the early heretics maintained an opinion, which has long ceased to have any supporters, that the body of C. was not a real body, but a mere visionary appearance. See DOCTÆ and GNOSTICS. The opposite extreme is that of Socinians, by whom C. is regarded as a mere man; whilst Arians (q.v.) regard him as in his *pre-existence*—i.e., before his *incarnation*—the highest of all created beings; and according to the generally received doctrine of Christians, he is "God and man in two distinct natures and one person." This doctrine, of course, bears a most intimate relation to that of the Trinity (q.v.); and all who hold the divinity of Jesus Christ, regard him as the incarnate second person of the godhead. The proof of the whole doctrine may almost be said to consist simply in a proof of the *divinity* of C.; his real *humanity*, although equally important, being no longer disputed. And this

proof is found, not so much in particular texts which directly assert the divinity of C.—although such texts are important—as in the multitude of texts which imply it, and admit of no reasonable or natural explanation apart from it; and in showing that certain doctrines are taught in Scripture which cannot be maintained without this.

The ancient Apollinarians, Eutychians, Monophysites, etc., regarded C. as having only one nature—a *compound* of the divine and human; but such a notion as that C. had only a human body, the divine nature supplying the place of a soul, is held to be subservive of the whole Christian system; and his human nature, to be real, must be viewed as consisting both of a true body and a true soul. His human nature never existed, however, apart from his divine nature, and was “conceived by the power of the Holy Ghost.”

Closely connected with this subject is that of the *humiliation* and consequent *exaltation* of C., in his character of mediator between God and man; a subject, to the former branch of which belongs the whole doctrine of the *work* of C. for the redemption of sinners, including the great doctrine of atonement (q.v.). To the latter belongs the doctrine of the reward of his work, in his sitting at the right hand of God, and having all things put under his feet; not only exercising dominion as king in his church, but over all things for the advancement of the salvation of his church, and of every member of it; while also he sends forth the Holy Spirit to apply to men the blessings which, as the reward of his work, he has mediatorially obtained for them; and still continuing to act as a priest, makes continual intercession (q.v.), founded upon his work and sacrifice.

CHRIST, ORDER OF, IN PORTUGAL. When the Templars were expelled from France, and their property confiscated by Philippe le bel, with the sanction of pope Clement V., they were received into Portugal, and their order revived in 1317, under the title of “The Order of our Lord Jesus Christ.” With some difficulty, pope John XXII. was induced to sanction the new order. The knights of the order of Christ joined the Portuguese in all their crusades against the infidel, and also in their African and Indian expeditions, receiving in compensation continual additions to their own possessions. The grand prior of the order was invested by pope Calixtus III. with power equal to that of a bishop; and as an encouragement to adventure, the knights were promised all the countries which they might discover, to be held under the protection of Portugal. At length, their wealth and power excited the jealousy of the kings of Portugal; their future acquisitions, and, subsequently, even their actual possessions, were declared to be crown possessions, and the offices of administrator and grand-master were transferred to the crown. A fine cloister belonging to the order is still to be seen at Tomar, to which place the seat of the order was transferred from Castro-Marino in 1366. Noble descent, and three years’ military service against the infidel, were required for admission. The members took the three monkish vows of chastity, poverty, and obedience, till the pope released them from the first two, on condition of their applying the third part of their revenues to the support of Tomar cloister, the priests of which were bound by the three vows. This cloister is now a theological institution for the instruction of the priests of the order.

It is said that the order still possesses 26 villages and farms, and 434 prebends. It is very numerous—consisting of 6 knights of the grand cross, 450 commanders, and an unlimited number of knights. Catholics of noble descent alone are admitted, and foreigners are excluded from participation in the revenues, being exempted in return from its rules.

CHRIST, PAPAL ORDER OF. This is a branch of the Portuguese order, created by pope John XXII. It has only one class.

CHRIST, PICTURES OF. To represent the form and countenance of C. in a manner that shall even approximate to the latent ideal in the minds of men, is unquestionably the most sublime and the most difficult work which an artist can undertake. It is the highest pictorial effort of the creative faculty. From a very early period in the history of the church, we can trace the growth of the endeavor. At first, indeed, the horror entertained for the idols of the pagans, must have inspired Christians with an aversion to images or pictures of the Savior. Gradually, however, as paganism disappeared, and time removed C. further from his people, this feeling would subside, and the longing would arise to possess some representation of him on which the eye might rest with pious delight. When Christian art originated we cannot precisely say; it is usually dated from the time of Constantine. Nevertheless—as lord Lindsay remarks, in his *Sketches of the History of Christian Art* (Lond. 1847)—“it would be more correct to say that it then first emerged above ground; its earliest efforts must be sought for in the catacombs.” In these subterranean excavations, forming a maze of unknown extent and labyrinthine intricacy, to which the Roman Christians had recourse in the days of persecution, are to be found the first traces of Christian sculpture and painting. The *sarcophagi* of the martyrs and confessors, of the heroes and heroines, of the bishops, and, in general, of those of higher mark and renown, were painted over with the symbols and devices of Christianity. The parables were the chief source from which these sepulchral artists drew their symbols. C. is painted as the good shepherd in the midst of his flock, or, with “pastoral pipe,” seeking the lost sheep, or returning with it on his

shoulders. Sometimes he figures as an ideal youth in the bloom of his years, sometimes as a bearded man in the prime of life, sometimes as Orpheus surrounded by wild beasts enrapt by the melody of his lyre. Such pictures, however, were only *symbolical*, and did not satisfy the religious craving for a *portrait*. The age of Constantine marks the transition from the symbolical to the *pseudo-historical* picture. We now find C. represented in the midst of his disciples, or in the act of performing a miracle; but it is not till about the close of the 4th c. that we actually encounter that type of countenance which, which certain modifications, continued to rule the conceptions of artists during the whole of the middle ages. To vindicate this type, myths, at a later period, sprang into existence; and we read of a portrait of C. possessed by king Abgarus of Edessa, and imprinted on a handkerchief, and of another miraculously obtained by St. Veronica at the crucifixion; but there is as little foundation for these legends as for that which attributes to the evangelist Luke such a picture. The emperor Alexander Severus (230 A.D.) is said to have possessed in his palace an image of Christ. An antique mosaic, probably of the 3d c., which exists in the *Museo Cristiano* of the Vatican—where are to be found also some specimens of the frescos of the catacombs—gives an idea of the manner in which the heathen artists expressed their notion of Christ. He is depicted as a bearded philosopher in profile. A letter which Lentulus, the predecessor of Pilate, is declared to have written to the Roman senate, but which is evidently apocryphal, attributes to C. a figure and countenance of manly beauty. Towards the middle of the 8th c., John of Damascus gives a description which he pretends to have gathered from more ancient authors. According to him, C. was tall, had beautiful eyes, but the eyebrows meeting; a regular nose, flowing locks, a black beard, and a sandy or straw-colored complexion, like his mother. Among the most ancient representations of C. which profess to be portraits, are the two paintings in the Calixtine and Pontine catacombs near Rome, and which are given in Arighi's *Roma Subterranea Noa*. The Savior is there represented with an oval visage, a straight nose, arched eyebrows, and high forehead. The expression is earnest and mild; the hair is parted on the forehead, and falls over the shoulders in waving locks; the beard is short and scattered. These two busts agree with the apocryphal letter of Lentulus, and the artist or artists who executed them, may possibly have employed it as a model. The majority of the Byzantine and Italian painters, down to the age of Michael Angelo and Raphael, adhered to this type.

CHRIST or **CRIS CROSS ROW**, the alphabet arranged in the form of a cross, for the use of children; and so printed, in old "horn" books, or primers. The letter A was at the top, and Z at the foot of the cross.

CHRISTADELPHIANS, a recently organized religious sect in America, whose principles are thus stated: The Old and New Testaments are equally important; God will restore to immortal life all who love him in this life, but those who have not accepted this immortal principle cease to exist at death; there is no personal devil; Christ is the son of God, deriving from the Deity moral perfection, but from his mother a human nature; he has the three-fold character of prophet, priest, and king; the first office he fulfilled by his life and death on earth, and now as priest he mediates before the deity; as king he will return to earth and reign over all the world from the throne of David. The adherents of this sect are few.

CHRISTCHURCH, a parliamentary and municipal borough and seaport on the English channel, in Hampshire, at the head of the estuary formed by the Avon and Stour, 24 m. s.w. of Southampton. It has manufactures of fuscé chains for clocks and watches, and of hosiery. It has also a salmon-fishery. The priory church, one of the most interesting and magnificent of English ecclesiastical structures, dates from the reign of William Rufus, and was restored in 1861. A battery of artillery is generally stationed in the commodious barracks. The borough comprises two favorite watering-places, Muford and Bournemouth. There are traces here of a Roman temple to Mars. Pop. '71, 15,415. It returns one member to parliament.—C. bay has a double tide every 12 hours.

CHRISTCHURCH, capital of the province of Canterbury, in New Zealand, situated on the river Avon, about 8 m. from the sea. Its port is Littleton, with which it is connected by a railway, and it is in railway communication with the n. and south. It is the center of a great grazing district, and has also flourishing manufactories. There is a large export trade, chiefly in timber and wool. The city possesses numerous fine public buildings, churches, theater, etc. Pop. '75, 10,294; of electoral district, 13,000.

CHRIST-CHURCH, THE CATHEDRAL OF (Oxford). This great society has had three distinct foundations. In 1526, cardinal Wolsey obtained from Clement VII. a bull for the suppression of 22 monasteries, the site of one of which he selected as the site of a new college, to be called cardinal college, and which he intended to endow on a scale of magnificence beyond that of any other foundation in Oxford. On the fall of Wolsey in 1529, the whole establishment came into the hands of king Henry VIII. In 1532, that prince re-founded it under the name of king Henry VIII.'s college, and in 1546, he once more re-established the college, under the name of "Christ-church cathedral in Oxford, or the foundation of king Henry VIII., with a dean and 8 canons, 60 students, 40 school-boys, clerks, choristers," etc. This foundation is now subsisting, though it has under-

gone considerable modifications. To none of the canonries were any duties assigned by king Henry VIII. From time to time, however, the canonries have been annexed to various university professorships, more particularly one to the professorship of divinity, by king James I.; one to the professorship of Hebrew, by king Charles I.; and one to the professorships of ecclesiastical history and pastoral theology respectively, by queen Victoria.

Several changes were introduced by the commissioners appointed under 17 and 18 Vict. c. 81. There is now only one sinecure-enjoying canon. When he is off the list, no one may hold a canonry save a professor, the archdeacon, or the sub-dean. The studentships are now 80 in number, and are, as before, divided into junior and senior studentships, differing considerable as to emolument. All these are now open, the old system of appointment by nomination having been abolished. About three junior students are elected every year in Lent term, one in every three for excellence in mathematics or physical science; and besides these, three are sent up yearly from Westminster. The senior studentships are also open, with the usual limitation of independent income. Of these, however, only a third can be held by laymen. The studentships were very poor; but an improvement in this respect has been included among the recent changes. Some valuable exhibitions, however, and 90 benefices, are in the gift of the society. In 1875, there were about 1150 names on the college books. No statutes were given to C., owing to the death of the king having taken place shortly after the final foundation of the college. It was, in consequence, entirely governed by the orders of the dean and chapter, to the total exclusion of the tutors. To this separation of the governing from the teaching body, as well as to the small value of the studentships, may be ascribed, in great measure, the inconsiderable degree of success in the schools, which, for many years past, brought no small discredit on this magnificent society.

CHRISTENING, a term often used as equivalent to baptism (q.v.). It is disliked by some, and of course liked by others, as favoring the doctrine of baptismal regeneration; being, indeed, according to its derivation, expressive of the notion that a person is *made a Christian* in baptism. But, like many other terms, it is frequently employed without reference to its origin, and without any intention of conveying the opinion which it might be strictly held to imply.

CHRISTIAN, a co. in central Illinois, traversed by the Illinois Central, the Indianapolis and St. Louis, the Springfield and Illinois South-eastern, and the St. Louis division of the Toledo, Wabash, and Western railroads; 675 sq.m.; pop. '70, 20,363. It is generally level timber-land and prairie; productions agricultural. Co. seat, Taylorsville.

CHRISTIAN, a co. in s.w. Kentucky, on the Tennessee border, intersected by the Evansville, Henderson and Nashville railroad; 704 sq.m.; pop. '70, 23,227—9,812 colored. It is hilly in the n., but level in the s., with productive soil; the products are wheat, corn, hay, butter, wool, and tobacco. Co. seat, Hopkinsville.

CHRISTIAN, a co. in s.w. Missouri, drained by James river, and intersected by the Atlantic and Pacific railroad; 500 sq.m.; pop. '70, 6,707—114 colored. The surface is hilly, and the soil in the valleys is rich, producing wheat, corn, tobacco, etc. Timber abounds. Co. seat, Ozark.

CHRISTIAN II. King of Denmark, Norway, and Sweden, b. at Vyborg, in the island of Funen, 2d July, 1481. He ascended the throne of Denmark in 1513. Shortly after his marriage in 1515, with a sister of the emperor Charles V., a young Norwegian peasant-girl, with whom C. was in love, died, or, as it was believed, was murdered. That natural ferocity, for which C. was surnamed the *Angry*, burst forth most furiously on this occasion. He caused the governor of the castle, Torben Oxé (see DYVEKÉ), to be beheaded. He afterwards declared open war against Sweden, took Stockholm through fraud, and had himself crowned king. But the cruel vengeance and treachery of C. after this event excited the indignation of that country, which, headed by Gustavus Wasa (q.v.), succeeded in driving out the Danes, liberating itself from the yoke of the house of Kalmar, and finally electing Gustavus Wasa (in 1523) to the throne. In Denmark, too, the aristocracy had risen, and an insurrection in Jütland following, C. found himself forced to flee for refuge to the Netherlands, and his uncle Frederick I. (q.v.), the introducer of the reformation into Denmark, elected king in his place. Encouraged, however, by the Catholic party in the Netherlands, and assisted by Charles V., C. landed successfully in Norway in 1531; but at the battle of Aggerhuus in 1532, he was totally defeated, and made prisoner in the castle at Sonderburg, from which he was liberated after 12 years of confinement. He died 28th Jan., 1559.

CHRISTIAN IV., King of Denmark and Norway, and duke of Schleswig Holstein, b. in Zealand, 12th April, 1577, and elected successor to the throne in 1580. He assumed the scepter in 1593. From 1610 he carried on a successful war, known as the Kalmarian war, against Charles IX. of Sweden, and his successor, Gustavus Adolphus, which ended in an advantageous peace in 1613. As leader of the Protestants in the thirty years' war, C. was not successful. His labors for the improvement of his country, in which he was indefatigable, were, however, most beneficial. He strengthened its maritime power; extended its commerce as far as the East Indies, where he obtained

inland trade of the country. His legislative and financial reforms, together with his love and patronage of the arts and sciences, gained for him the esteem of his people, especially of the learned. He died in 1648.

CHRISTIAN VII., King of Denmark, son of Frederick V. and Louisa of England, b. 29th Jan., 1749. He succeeded to the throne of his father 14th Jan., 1766, and in the same year married Caroline Matilda, sister of George III. of England. The dissipations of his early life had enfeebled his energies, and rendered him unfit for government. The management of the state was, in consequence, seized by his ministers, with count Bernstorff, who had possessed the entire confidence of the king's father, at their head. Bernstorff, however, was soon forced to retreat before Struensee (q.v.), who exercised unbounded influence over the king and his imprudent young queen. But innovations of a despotic tendency, and insults offered to the national feeling, soon drew upon this minister the hatred of the nation. The queen-dowager seeing this, made it an occasion for satisfying her ambitious nature, by attaching herself to the malcontents; and in 1772 she succeeded, with the assistance of her son, Frederick (b. 1754, d. 1805), in persuading the vacillating king to draw up an order of arrest for Struensee and the young queen. Bernstorff was recalled from Hamburg. The king, who was now incapacitated by mental disease, governed only nominally. In 1784, his son, Frederick VI. (q.v.), came to the head of the government, as joint regent with the queen-mother. C. died 13th Mar., 1808.

CHRISTIAN VIII., 1786-1848; king of Denmark, nephew of Christian VII. When Norway was ceded to Sweden by the treaty of Kiel, the people of the former country repudiated the transfer, and C. was then made governor, raised an army and convened a diet, at which a constitution was framed, and he was elected, May 29, 1814, king of Norway under the title of Christian I., but the allied powers compelled him to relinquish the throne on the 10th of Oct. On the death of Frederick VI., Dec. 3, 1839, he became king of Denmark. He tried to unite Schleswig and a part of Holstein to Denmark, but did not succeed. He died just before the beginning of the revolution of 1848.

CHRISTIAN BURIAL. See BURIAL and FELO DE SE.

CHRISTIAN CHARITY, KNIGHTS OF THE ORDER OF, in France. King Henry III. having instituted the order of the Holy Ghost for princes and persons of distinction, founded the order of C. C. for the support of maimed officers and soldiers, who had done good service in the wars. He assigned revenues to the order, drawn from all the hospitals in the kingdom. The knights wore on the left breast an anchored cross embroidered on white taffety or satin, with a border of blue silk, and in the middle of the cross a lozenge of sky blue charged with a *fleur de lis or*. The completion of the institution was reserved for Henry IV., who placed it under the charge of the marshals and colonels of France; and by means of it, many of those who had served their country faithfully were enabled to spend the latter portion of their lives in peace, and above want. The order formed the germ of that noble hospital the *Invalides*, which was founded by Louis XIV., and which served as a model for our own hospitals of Chelsea and Greenwich. When the *Invalides* was founded, the order of C. C. was superseded.

CHRISTIAN COMMISSION, THE UNITED STATES, an important organization in the loyal states during the war of the rebellion, to aid and co-operate with the sanitary commission, and generally to assist in the cause of the union. Its purpose was to supply material wants and comforts for the army, especially to the sick or wounded. It gave also an unsectarian religious help. Like the sanitary commission, it accomplished a vast amount of valuable work. The C. C. was originated by a call from the Young Men's Christian association of New York. It is noticeable as one of the earliest signs, as well as causes, of the growing charity among different denominations so marked in recent years.

CHRISTIAN CONNECTION, a denomination of Christians which originated about the beginning of the 19th c. in the United States of America, and is diffused over all the states. The name was assumed in avowed dislike to the acknowledgment of any human authority and to sectarian distinctions, and all doctrinal terms of communion were rejected, the Bible being adopted as the only rule of faith, and personal piety made the test of qualification for membership. The connection soon came to consist, however, almost exclusively of persons denying the divinity of Christ.

CHRISTIAN CONNECTION (*ante*), an organization of American Christians drawn mostly from the Baptist, Methodist, and Presbyterian churches in various parts of the United States. The earliest organizations were "Republican Methodists," seceders from the Methodist church in 1793, who took the name of "Christians." In 1800, there was a secession from the Baptist churches in Vermont, which soon grew to considerable importance. Nearly at the same period there was a secession from the Presbyterian church in Tennessee and Kentucky, and a separate synod was formed. These three organizations finally merged in one body, and adopted the common name of "Christians." Each congregation is independent, and they take the Bible as their standard of doctrine. They hold that the Scriptures are inspired, and are of divine authority; that

every man has the right to interpret the Bible for himself, and that therefore differences of theological views are no bar to church fellowship; that there is one God, but the doctrine of the Trinity is not generally received; that Christ is a divine being, that he pre-existed, and is the mediator between God and man; that the sufferings of Christ atone for the sins of all men, who, by repentance and faith, may be saved; that immersion is the only proper form of baptism, and believers the only proper subjects for that ordinance; that communion at the Lord's table is open to believers of all denominations. In government and usage they are congregational, each church being independent, although there are annual or state conferences which receive and ordain pastors, but can pass no laws that will be actually binding on the several churches. They have an American Christian convention, which has a regular constitution, officers, and departments. Among their institutions of learning are Hesperia and Pierce Christian colleges in California; Eureka college in Illinois; Bedford college, Butler university, and Union Christian college in Indiana; Oskaloosa college in Iowa; Eminence college and Kentucky university in Kentucky; Christian university in Missouri; Christian college in Oregon; and Bethany college in West Virginia, besides a number of theological seminaries and academies. Antioch college in Ohio, though not officially known as belonging to this connection, has had much favor in the denomination.

CHRISTIAN ERA, sometimes called the era of the incarnation, is now almost universally employed in Christian countries, and is used by some eastern nations. Its epoch, or commencement, is the 1st of Jan. in the fourth year of the 194th olympiad, the 753d year from the foundation of Rome, and the 4,714th of the Julian period. It is usually supposed to begin with the year of the birth of Christ, but there are various opinions with regard to the year in which that event took place. The general opinion seems to be that Christ was born four years earlier than the dates now used imply. The C. E. was introduced into Italy in the 6th c., and began to be used in Gaul in the 8th c., though not generally used in England before the close of the 8th century. Before its introduction the usual practice in Latin countries was to distinguish the years by their number in the indiction. In the C. E. the years are distinguished by Arabic numerals, those before the birth of Christ being marked B.C. (before Christ), or A.C. (*ante Christum*); and those after Christ A.D. (*anno Domini*, in the year of our Lord). There is difficulty in determining the years before Christ, since astronomers reckon the year preceding our era as the year 0 B.C., while chronologers call it 1 B.C. The latter seems to be correct, and by that method the leap years before Christ fall on the years 1, 5, 9, 13, etc., while those after Christ fall upon 4, 8, 12, etc. Dates of the C. E. are greatly confused by variations of time for the beginning of the year. Dionysius, who was the author of the C. E., began the first year on the 25th of Mar., or on the day of the Annunciation to the virgin Mary, 9 months before the birth of Christ. By this calculation the C. E. began 9 months and 7 days before our year 1, which began on the 1st of January. This beginning the year on the 25th of Mar. was the practice in most Italian states as late (in Pisa) as 1745. It was adopted in some papal documents, and it was employed in France about the middle of the 11th century. In some instances the year was counted from the 25th of Mar. following our epoch, which would be 2 months and 24 days after our beginning of the era. A few writers of the 6th and 7th centuries began the year on the 1st of January. In France, the practice as late as the middle of the 16th c. was to begin the year with Easter; but in 1663 Charles IX. directed that thereafter the year should commence on the 1st of January. In Germany, about the 11th c., it was usual to begin the year with Christmas, and this practice prevailed at Milan, Rome, and other Italian cities in the 13th, 14th, and 15th centuries. In England, the practice of beginning the year at Christmas was introduced in the 7th c., and traces of it are found down to the 13th century. Gervase of Canterbury mentions that most writers of his country agreed in regarding Christmas as the first day of the year, because it formed the term at which the sun finished and recommenced his annual course. This is a remnant of the old Norse religion. In the severely cold regions of Scandinavia the return of the sun from its extreme southern declination was hailed with great rejoicing; the great yule festival was held, and offerings and thanksgiving marked the period. This was, of course, at the winter solstice, in early ages very nearly on the day of Christmas. When Anshar and other Roman Catholic missionaries penetrated to Denmark, they engrafted upon the heathen yule the Christian Christmas, and for the return of the material sun they taught the rising of the son of God. Thus, the church Christmas may be the successor not only of the Roman saturnalia, but of the Odinic yule. The memory of the latter is still strong among the rural population of England. In England, in the 12th c., the practice prevailed of beginning the year on the Annunciation, the 25th of Mar., and that was the general practice until the reformation of the calendar, in 1751, by a parliamentary law, which directed that the year 1752 should be reckoned from the 1st of Jan., thus leaving 1751 nearly three months short. English authors, however, have endeavored to make the beginning of the historical year on the 1st of January. The liturgic year of the church of England began with the first Sunday in Advent, the Lord's day before Christmas. These variations in the commencement of the year lead to much confusion in dates. The English revolution is popularly called the revolution of 1688; but if we reckon

from the 1st of Jan., it began in 1689. In the tables of modern works on chronology, the birth of Christ is placed in the year 4 before Christ. Some recent chronologers of eminence place the Nativity nearer the Christian era. Eusebius dates the crucifixion in the year 33 A.D.; but Augustine, Origen, and others, place it in the year 29 A.D. In either case, the long-established date of the commencement of the C. E. is not altered. See CHRONOLOGY.

CHRISTIANIA, a province in s. Norway; about 10,000 sq. m.; pop. '76, 489,915. It is a rough, mountainous region containing many lakes, and is traversed by the Glommer, the Drammen, and other rivers. The mineral products are copper, silver, and iron. Agriculture is scarcely profitable, though cattle and horses are raised in large numbers. The chief article of export is lumber.

CHRISTIANIA, capital of Norway, is situated in the province of Aggerhuus, in a beautiful open valley on the northern side of the Christiania fiord. Pop. '75, 77,041. C. is the seat of the Norwegian government, the superior courts, and the *storting*. Besides the suburbs of Pipervigen, Hammarsborg, Vaterland, and Groenland, the town consists of C. properly so called (which was laid out by Christian IV. in 1614, in the form of a regular parallelogram of 1000 paces in length and breadth); the Old Town or Opslo, where the bishop resides; and the citadel Aggerhuus, from which the broad straight streets of the town can be fired upon. The most important public buildings are the royal palace, the bank and exchange, the house of representatives or *storting*, the governor's palace, and the cathedral. To these may be added the university, the only one in Norway, which was opened in 1813, and possesses a staff of 41 ordinary and 6 extraordinary professors. About 800 students attend it annually. This institution contains, besides various scientific collections, a library of about 150,000 books, a botanical garden, and an observatory (in 59° 54' 42" n. lat., and 10° 50' e. long.). The latter was opened in 1833. C. has also some good schools and learned societies, of which the "society for northern antiquities" is famous. The manufactures of C. are cotton, oil, paper, soap, and bricks. There are also numerous distilleries and corn-mills. It exports in considerable quantities wood, iron, anchovies, and glasswares. In 1871, 1894 vessels of 262,853 tons entered the port (which, however, is covered with ice for four months). It has a regular steam-boat communication with Gottenburg, Copenhagen, Kiel, Hull, and Leith. C., by means of its bay, is connected with Drammen (pop. 18,838), famous for its extensive trade in timber, etc. The scenery of the whole bay is unsurpassed in beauty.

CHRISTIANITY. It is proposed in the present article to give a very brief outline of the system of the Christian religion, and of the evidences by which its truth is established. The principal parts, both of the system and evidences of C., will be found noticed under separate heads.

C. comes to us with a claim to be received as of divine origin. It is no product of the human mind, but has for its author the Being whom it sets before us as the object of worship. It is consequently altogether exclusive; it claims to be deemed the only true religion—"the truth"—and admits of no compromise or alliance with any other system.

C. cannot be viewed as distinct from the religion of the Jews and of the patriarchs; it is the same religion accommodated to new circumstances; there has been a change of *dispensation* only. In studying either the system or the evidences of C., we are compelled continually to revert from the New Testament to the Old, and must in some measure trace the history of the true or revealed religion through the previous and preparatory dispensations.

The whole system of C. may be regarded as having its foundation in the doctrine of the existence of one God. See GOD. Next to this may be placed the doctrine of the fall (q.v.) of man. Man is represented as involved in misery by *sin* (q.v.)—*original* and *actual*—and every individual of the human race as incapacitated for the service and fellowship of God, obnoxious to the displeasure of God, and liable to punishment in a future and eternal state of being. See PUNISHMENT, FUTURE. And here we may regard the doctrine of the atonement (q.v.) as next claiming our attention—a doctrine taught in all the sacrifices (see SACRIFICE) of the patriarchal and Jewish dispensations, as well as by the words of inspired teachers. Man being utterly incapable of effecting his own deliverance from sin and misery, God sent his Son to save sinners, to deliver them from hell, to make them holy, and partakers of the eternal joy and glory of heaven.

By those who regard Christ as a mere creature, *atonement* or *reconciliation* with God is made to depend on the repentance of man as its immediate cause; whilst the life and death of Christ are represented as merely an example to us of obedience, virtue, and piety in the most trying circumstances; the doctrines of a propitiatory sacrifice, a substitutionary obedience, and an imputed righteousness, with all that form part of the same system, falling completely and even necessarily to the ground. These doctrines, however, are all consistently maintained in connection with the doctrine of the Trinity and the generally received doctrine as to the person of Christ. See CHRIST and TRINITY. The *very* incarnation (q.v.) of the Son of God is regarded as a glorious display of the divine condescension, and a wonderful exaltation of human nature; whilst a personal enjoyment of the highest dignity and bliss of which humanity is capable in the favor and fellowship of God for ever, is to be attained by faith in Jesus Christ. See FAITH and JUSTIFICATION.

The indissoluble connection between faith and salvation arises from the divine appointment, but secures a moral harmony, as it provides for bringing into operation—in accordance with the intellectual and moral nature of man—of most powerful and excellent motives for all that is morally good, the partakers of salvation being thus fitted for the fellowship of him into whose favor they are received; and as it prevents the possibility of any of them taking to themselves, or giving to others, the glory of that salvation which they really owe to Christ, and which they must therefore ascribe to Christ, as God is a God of truth, and truth must reign in the kingdom of heaven.

Salvation is ascribed by all Christians to the grace of God. The mission of Christ was an act of supreme grace; and all must be ascribed to grace for which we are indebted to Christ. The doctrine of grace, however, is part of the system of C. on which important differences subsist, especially as to the relation of the grace of God to individual men. Such are the differences concerning election (q.v.), and concerning the origin of faith, and man's ability or inability to believe of himself. But by Christians generally, the personal relation of the believer to Christ, and his faith in Christ, are ascribed to the Holy Ghost or Spirit of God, the third person of the Godhead, and so to the grace of God. See ARMINIUS, CALVINISM, and PELAGIUS.

In the view of all who hold the doctrine of the Trinity, the doctrines concerning the Spirit of God form a very important part of the Christian system. To the agency of this person of the Godhead, besides all that is ascribed to Him concerning the human nature of Christ, we are indebted for all that is spiritually good in man; He, in the economy of grace, being sent by God, on the intercession of Christ, to communicate the blessings purchased by Christ in his obedience and death. See HOLY GHOST.

Salvation begins on earth; and whenever a man believes in Christ, he is a partaker of it—is in a state of salvation. It forms an essential part of the Calvinistic system, that he who is in a state of salvation always remains so, and that the salvation begun on earth is in every case made perfect in heaven. See PERSEVERANCE OF SAINTS. Thus salvation is viewed as beginning in regeneration (q.v.), and as carried on in sanctification (q.v.), and all its joys as connected with the progress of sanctification. Faith in Jesus Christ cannot be unaccompanied with repentance, and repentance is always renewed when the exercise of faith is renewed. For although all believers are *saints* or *holy*, as set apart to God, and in contrast to what they previously were, yet there is none in this life free from temptation and sin; the successful tempter of our first parents, who assailed our Saviour with temptation and was defeated, being still the active enemy of man, against whom believers in Jesus Christ are called to contend, to watch, and to pray. See DEVIL. The sense of responsibility belongs to human nature; and the doctrine of a judgment (q.v.) to come may be considered as to a certain extent a doctrine of natural religion, as may also that of the immortality (q.v.) of the soul; but the clear and distinct enunciation of these doctrines belongs to the Christian revelation, to which belongs entirely the doctrine of the resurrection (q.v.) of the dead.

Of the moral part of C., which has already been referred to, it may be sufficient here to state, that it is as harmonious with the doctrinal as it is inseparable from it; that it is founded upon the attributes of God, and is perfectly illustrated in the character of Jesus Christ; and that it is divisible into two great parts—one, of the *love of God*, and the other, of the *love of man*, or of ourselves and our neighbors. See LAW, MORAL.

The *means of grace*, or of the attainment or the blessings of salvation, form an important part of the Christian system. Of these the WORD OF GOD—or divine revelation contained in the Bible (q.v.)—first claims attention as the means of *conversion* to Christ, and of *edification* in Christ, the instrument by which salvation is both begun and carried on in men. The ordinances of God's worship are among the means of grace. Thus prayer (q.v.) is one of the chief means of grace. The sacraments (q.v.) are means of grace, concerning the precise use of which, and their relative importance as compared with the other means, considerable difference of opinion prevails among Christians. The same remark applies also to the combination of Christians into an organized body or community, the church (q.v.) with its own laws or system of church government (q.v.) and church discipline (q.v.).

We have endeavored to sketch the outline of the system of C., as much as possible according to the general belief of Christians, merely indicating the points on which the chief differences of opinion exist. Some of the principal controversies will be found noticed under separate heads.

The truth of C. is established by many different *evidences*, distinct and independent, but mutually corroborative. It appeals to reason, and demands to have its claims examined and admitted. Nor is there any *faith* where there is not a mental conviction arrived at by a process of sound reasoning.

The evidences of C. are very generally divided into two great classes, *internal* and *external*—the former consisting of those which are found in the nature of the Christian system itself, and in its adaptation to the nature and wants of man; the latter, of those which are derived from other sources. The boundary between the two classes, however, is by no means so distinct in reality as it appears in the definition of the terms. Of the multitude of books which have been written on the subject of the evidences of C., some are devoted mainly to one of these classes, and some to the other; whilst some are occupied with the development of particular evidences or arguments, and some with

the refutation of objections, and in particular of what may be called a preliminary objection—that a divine revelation can never be established by sufficient evidence at all. See REVELATION.

The evidence of miracles (q. v.) and the evidence of prophecy (q. v.), two of the principal branches of the external evidences of C., will be found noticed in separate articles. Another argument, which has been much elaborated—for example, in Paley's *Evidences*—is derived from the character and sufferings of the apostles and other first preachers of C.; their high moral worth, considered along with their great earnestness and devotedness; the absence of all possibility of selfish or base motives; and at the same time, their perfect opportunity of knowing the truth or the facts which they proclaimed. A subsidiary argument is found in the admission of the great facts regarding Jesus of Nazareth, by the early opponents of Christianity. A most important and valuable argument is found in the perfect coherence of all the parts of the Christian system, and in the agreement, as to the religion which they teach, of all the books of Scripture, notwithstanding the widely different dates of their composition, and their very different nature in other respects. See BIBLE. The relation of the Jewish ceremonies to the doctrines of C. supplies another argument of this kind, capable of being developed in a multitude of particulars. The minor coincidences between the different books of Scripture have been pointed out with happy effect in the *Horæ Paulinæ* of Paley, and in other works. The character of our Savior supplies an argument of great power: the impossibility of the invention of such a character, and of the history in which it is exhibited, by any effort of human genius, is also urged as corroborative; and the inconsistency of the morality displayed, with the supposition of imposture, has been dwelt upon with the same view. The excellency, both of the doctrinal and moral part of the system of C., its elevating and purifying tendency, the agreement of its doctrine with the facts of man's sinfulness and misery, and the suitable provision which it makes for his most deeply felt wants, are principal branches of the internal evidence of its truth. The effects of C., where it has prevailed, supply a confirmatory argument in its favor, which has formed the subject of works of great learning and interest.

CHRISTIAN KNOWLEDGE, SOCIETY FOR PROMOTING, one of the great religious associations connected with the church of England, and the oldest of them all. It was founded in 1698, although it did not receive its present name till 1701; and had for its object: "1. To promote and encourage the erecting of charity schools in all parts of England and Wales. 2. To disperse, both at home and abroad, Bibles and tracts of religion; and, in general, to advance the honor of God, and the good of mankind, by promoting Christian knowledge, both at home and in other parts of the world, by the best methods that should offer." These objects it has never ceased to pursue, chiefly directing its efforts to the British dominions: partaking at once of the nature of an educational association, a missionary society, a Bible society, and a religious tract society; and notwithstanding the operations of other great societies in these several departments of Christian benevolence, its revenue amounts to about £100,000 a year. The Protestant missionaries who labored in the s. of India in last century, were supported chiefly by this society, which has also contributed largely of its funds for the establishment of Christian schools in that country.

CHRISTIAN NAME. See NAME.

CHRISTIANSAND, the principal t. of the province or *stift* of that name in Norway, is situated at the mouth of the Torridalselvi, in the bay of Christiansand. Pop. 75, 12,137. C. is the residence of a bishop and high-bailiff or *stift-amtmand*, and possesses a branch of the Norwegian bank, a gymnasium, and several charitable foundations. The manufactures are leather, tobacco, cotton, etc. Ship-building forms also a considerable branch of its industry. The town, which was built in 1641 by Christian IV., has an excellent harbor, divided into two parts by the island of Oddern, upon which are situated the quarantine hospital and custom house. C. exports wood, lobsters, and salmon in large quantities. The town and harbor are protected by several fortifications. To the west of C. lies the harbor of Ny-Hollesund.

CHRISTIANSFELD, a settlement of Moravian brothers, in the northern part of Schleswig, was founded in 1772. It consists of 64 houses and about 700 inhabitants. The houses, which are well built, and cheerful in appearance, are arranged in two parallel streets, with the church upon a green plot in the middle. The settlement is represented by the inspectors or chiefs appointed by the directors of the fraternity, and the representatives elected by the members of the sect. The manufactures are linen, soap, cotton, leather, etc.

CHRISTIANS OF ST. JOHN, or NAZAREANS, a sect in Persia, in the country around Bassorah. They seemingly deify John the Baptist and consider Jesus an impostor. They say that they dwelt on the Jordan in the time of Jesus, but were driven from Palestine by the Mohammedans. Their name "Christians" is wholly a misnomer. They consider the Jehovah of the Jews a spurious divinity, and Christ a false teacher; that the world was created by seven angels of darkness who inhabit the seven planets, and there is also a kingdom of light superintended by good angels. Behind these kingdoms is a region of splendor, and there is the supreme original being, Ferha, and the

female principle, Ajar. There are conflicts between the worlds of darkness and of light, but light is to triumph. The Mosaic and Christian systems of religion came from the region of darkness; but that of John the Baptist from the region of light. Baptism is the means of introducing men to the kingdom of light. John was married, but his children sprang from the Jordan. These people practice polygamy, and forbid mourning for the dead. They have five sacred books, of which four are doctrinal, and one treats of astrology. It is supposed that, 200 years ago, they numbered about 100,000.

CHRISTIANS OF ST. THOMAS, the name of a branch of an old Persian church still existing on the Malabar coast, formed originally by excommunicated Nestorians. Their liturgy is in the Syriac language. They still celebrate the early agape or love feast, use bread, salt, and oil in the communion of the supper, and anoint infants in baptism. Their priests are allowed to marry. While the Portuguese held Malabar they were submissive to the Roman Catholic church, but as soon as the Dutch took control the Nestorian system was resumed.

CHRISTIANSTAD, the strongly fortified capital of a province of the same name in the s. of Sweden. It is situated on the Helge, about 9 m. from the Baltic, and 265 s.w. of Stockholm. C. is the residence of a governor, and the seat of a court of justice. It is a beautifully built town, and possesses an arsenal, a school, a magnificent church, and a senate-house. Pop. 6,422, employed chiefly in the manufacture of woolen goods, leather, gloves, etc. There is also some trade in wood, pitch, potash, etc. The town, which was founded by Christian IV., has suffered many sieges during the wars between Denmark and Sweden. The province of Christianstad has an area of 2,400 m.; pop. 75, 229, 176.

CHRISTIANSTED, the chief t. of the Danish island of St. Croix, in the West Indies. It stands on the n.e. coast of the island, and has an excellent harbor, which is defended by a fort and a battery. Here resides the governor-general of the Danish West Indies. The number of its inhabitants is 5,700.

CHRISTIANSUND, a seaport on the w. coast of Norway, 85 m. w.s.w. of Trondhjem, in 63° 3' n.; and 7° 40' e.: pop. 5,709. The town is built on three small islands by which its harbor is inclosed. The chief exports are fish and fish products.

CHRISTIAN UNION CHURCHES, an organization projected at Columbus, Ohio, in 1865, and supposed to have 30,000 to 40,000 members, principally in the western and south-western states. Their leading doctrines, as stated in their publications, are: the oneness of the church, with Christ the only head, and the Bible the only rule of faith and practice; the good works of a Christian life the only condition of fellowship; the suppression of controversy; local or congregational church government; no preaching of party politics. They adopt the motto, "In things essential, unity; in non-essentials, liberty; in all things, charity." Baptism is a condition of membership, but in communion they are practically unrestricted.

CHRISTINA, Queen of Spain. See **MARIA CHRISTINA**.

CHRISTINA, Queen of Sweden, only child of the great Gustavus Adolphus, was b. Dec., 1626, and succeeded her father in 1632, when only six years old. Distinguished equally by beauty and the possession of a lively imagination, a good memory, and uncommon intelligence, she received the education rather of a man than of a woman; and to this may in part be attributed the many eccentricities of her life. During her minority, the kingdom was governed by the five highest officers of the state, the principal being chancellor Oxenstiern. In 1644, she assumed the reins of power, and, in 1650, was crowned with the title of *king*. She had previously declared her cousin, Charles Gustavus, her successor. For four years thereafter, she ruled the kingdom with vigor, and was remarkable for her patronage of learned and scientific men. In 1654, however, at the age of 28, weary of the personal restraint which royalty imposed on her, she abdicated in favor of her cousin, reserving to herself sufficient revenues, entire independence, and supreme authority over her suite and household. Leaving Sweden, she proceeded to Brussels, where she embraced the Roman Catholic religion. She afterwards went to Rome, which she entered on horseback, in the costume of an amazon, with great pomp. Confirmed by pope Alexander VII. she adopted the surname of Alessandra. In 1656, she visited Paris; and the following year, on a second residence there, she caused her grand equerry, Monaldeschi, who had enjoyed her entire confidence, to be executed in her own household for treason. In 1658, she returned to Rome, and, in 1660, the death of the king, her cousin, caused her to hasten to Sweden; but, failing in her attempt to be reinstated on the throne, she again left the country. In 1666, she aspired to the crown of Poland, but was unnoticed by the Poles. The remainder of her life was spent in Rome in artistic and scientific pursuits. Besides founding an academy, she collected valuable MSS., medals, and paintings, and died April 19, 1689. Much of her conduct favors the idea that at times she was scarcely sane.

CHRISTINOS, a political party in Spain during the regency of queen Christina, who were opposed to the Carlists.

CHRISTISON, Sir ROBERT, D.C.L., an eminent physician, son of Alexander Christison, professor of humanity in the university of Edinburgh, was b. at Edinburgh, July

18, 1797; was educated at the high school of his native place, and, in 1811, became a student at the university there. After graduating in 1819, he proceeded to London and Paris; and, in the French capital, studied toxicology under the celebrated Orfila, a department of medical science in which in Britain his name has become eminent. Commencing the practice of medicine at Edinburgh, he was, in 1822, appointed professor of medical jurisprudence in the university of that city, and, in 1832, was promoted to the chair of *materia medica*. Besides contributing papers on various subjects to medical journals, C. is author of a *Treatise on Poisons*, published in 1829, recognized as a standard work on the subject; *Biographical Sketch of Edward Turner, M.D.*, 1837, being an address delivered before the Harveian society of Edinburgh; a treatise *On Granular Degeneration of the Kidneys*, 1839; and *The Dispensatory, a Commentary on the Pharmacopœias of Great Britain*, 1842. Twice president of the royal college of physicians, Edinburgh, and ordinary physician to the queen in Scotland, in 1871 he was created a baronet. In 1877, sir Robert retired from professorial and other public work.

CHRISTLIEB, THEODOR, D.D., b. 1833; a native of Wurtemberg; educated at Tubingen, a teacher in France, a preacher in London, and an author of lectures on *Modern Doubt and Christian Belief*. He returned to Germany in 1865, and was made professor of theology at Bonn. In 1873, he was a delegate to the evangelical alliance, meeting that year in New York. At its sessions his addresses excited great interest.

CHRISTMAS, the day on which the nativity of the Savior is observed. The institution of this festival is attributed by the spurious Decretals to Telesphorus, who flourished in the reign of Antoninus Pius (138-61 A.D.), but the first certain traces of it are found about the time of the emperor Commodus (180-92 A.D.). In the reign of Diocletian (284-305 A.D.), while that ruler was keeping court at Nicomedia, he learned that a multitude of Christians were assembled in the city to celebrate the birthday of Jesus, and having ordered the church doors to be closed, he set fire to the building, and all the worshippers perished in the flames. It does not appear, however, that there was any uniformity in the period of observing the nativity among the early churches; some held the festival in the month of May or April, others in Jan. It is, nevertheless, almost certain that the 25th of Dec. *cannot* be the nativity of the Savior, for it is then the height of the rainy season in Judea, and shepherds could hardly be watching their flocks by night in the plains.

C. not only became the parent of many later festivals, such as those of the Virgin, but especially from the 5th to the 8th c., gathered round it, as it were, several other festivals, partly old and partly new, so that what may be termed a *Christmas cycle* sprang up, which surpassed all other groups of Christian holidays in the manifold richness of its festal usages, and furthered, more than any other, the completion of the orderly and systematic distribution of church festivals over the whole year. Not casually or arbitrarily was the festival of the nativity celebrated on the 25th of Dec. Among the causes that co-operated in fixing this period as the proper one, perhaps the most powerful was, that almost all the heathen nations regarded the winter-solstice as a most important point of the year, as the beginning of the renewed life and activity of the powers of nature, and of the gods, who were originally merely the symbolical personifications of these. In more northerly countries, this fact must have made itself peculiarly palpable—hence the Celts and Germans, from the oldest times, celebrated the season with the greatest festivities. At the winter-solstice, the Germans held their great yule-feast (see **YULE**), in commemoration of the return of the fiery sun-wheel; and believed that, during the twelve nights reaching from the 25th Dec. to the 6th Jan., they could trace the personal movements and interferences on earth of their great deities, Odin, Berchta, etc. Many of the beliefs and usages of the old Germans, and also of the Romans, relating to this matter, passed over from heathenism to Christianity, and have partly survived to the present day. But the church also sought to combat and banish—and it was to a large extent successful—the deep-rooted heathen feeling, by adding—for the purification of the heathen customs and feasts which it retained—its grandly devised liturgy, besides dramatic representations of the birth of Christ and the first events of his life. Hence sprang the so-called “manger-songs,” and a multitude of C. carols, as well as C. dramas, which, at certain times and places, degenerated into farces or fools’ feasts (q. v.). Hence also originated, at a later period, the Christ-trees, or Christmas-trees, adorned with lights and gifts, the custom of reciprocal presents, and of special C. meats and dishes, such as C. rolls, cakes, currant-loaves, dumplings, etc. Thus, C. became a universal social festival for young and old, high and low, as no other Christian festival could have become.

In the Roman Catholic church, three masses are performed at C.—one at midnight, one at daybreak, and one in the morning. The day is also celebrated by the Anglo-Catholic church—the Achanian creed is sung, a special preface is made in the communion service, and the Athanasian creed is said or sung. The Lutheran church, on the continent, likewise observes C.; but the Presbyterian churches in Scotland, and the whole of the English dissenters, reject it, in its religious aspect, as a “human invention,” and as “savoring of papistical will-worship,” although, in England, dissenters as well as churchmen keep it as a social holiday, on which there is a complete cessation from all business. But within the last hundred years, the festivities once appropriate to C. have

much fallen off. These at one time lasted with more or less brilliancy till Candlemas, and with great spirit till twelfth-day; but now a meeting in the evening, composed, when possible, of the various branches and members of a family, is all that distinguishes the day above others.

CHRISTMAS-BOX, a small money-gift to persons in an inferior condition on the day after Christmas, which is hence popularly called *boxing-day*. The term, and also the custom, are essentially English, though the making of presents at this season and at the new year is of great antiquity. A number of interesting particulars concerning the Christmas-box will be found in Braud's *Popular Antiquities*. Here, we need refer only to the usage in its later aspect. Within the memory of middle-aged persons, the practice of giving Christmas-boxes, or petty presents, to apprentices, domestic servants, and tradesmen, had become a serious social nuisance, more particularly in London, where every old custom seems to linger, and is most difficult to be got rid of. Householders felt under an obligation to give money to the apprentices in the shops where they dealt, also to various inferior parish officers, including scavengers and lamplighters; while shopkeepers, on the other hand, were equally impelled to make presents to the male and female servants of their customers. Thus, as referred to in *Christmas*, a poem:

"Gladly, the boy, with Christmas-box in hand,
Throughout the town his devious route pursues;
And, of his master's customers, implores
The yearly mite: often his cash he shakes:
The which, perchance, of coppers few consists,
Whose dulcet jingle fills his little soul
With joy."

At length the Christmas-box system became such an intolerable grievance, that tradesmen stuck up notices in their windows that no Christmas-boxes would be given; and at the same time, the public authorities issued remonstrances to the same effect. At Christmas, 1836, the secretary of state for foreign affairs issued a circular to the different embassies, requesting a discontinuance of the customary gifts to the messengers of the foreign department, and other government servants. Since this period, the practice has greatly decreased, doubtless to the improvement of the self-respect of the parties interested.

CHRISTMAS CAROLS. The word carol (Ital. *carola*, and Fr. *carole*, a round dance—probably from Lat. *corolla*; Welsh, *coroli*, to reel, to dance; the name is thence applied to the music or song accompanying such a dance: *carillon* is probably allied) signifies a song of joy. The practice of singing carols, or, at all events, sacred music, in celebration of the nativity of Christ as early as the 2d c., is considered as proved by the circumstance that a large sarcophagus belonging to that period has sculptured upon it a representation of a Christian family joining in choral praise for this purpose. A century or two after this, however, the C. C. seem to have sadly degenerated, and become, in fact, so indecent, that the clergy found it necessary to forbid them. Under the Anglo-Saxon kings, merriment and piety were pleasantly combined in English life, a peculiarity that affected the C. C. of that period not a little; but by the 13th c. the jocosity had unhappily lapsed into what would now be considered profanity. The oldest printed collection of English C. C. bears the date of 1521. The majority of these, though written by men of learning—priests and teachers—exhibit a lamentable ignorance of the character of the two most prominent persons in the carols—Mary and Jesus. In 1525 was kept the "still Christmas," on account of the illness of king Henry; but with this exception, the sacred season appears to have been regularly celebrated with joyous music and songs during the Tudor period. In 1562, C. C. of a more solemn nature were introduced. By the Puritan parliament, Christmas was abolished altogether, and holly and ivy were made seditious badges; and in 1630 the Psalms, arranged as carols, were advertised. After the restoration, the C. C. again exhibited a hearty, cheerful, and even a jovial character. Those with which the dawn of Christmas is now announced in England are generally religious, though not universally so. In France, the carols at this season used to be much less sacred than gay. Often, indeed, they were grossly Bacchanalian.

See an interesting paper in the *Athenæum* for Dec. 20, 1856; also Sandys's *Christmas Carols*, 8vo, 1833; Sylvester's *Christmas Carols and Ballads*.

CHRISTMAS ROSE. See HELLEBORE.

CHRISTOLOGY is the doctrine of the person of Christ. The word itself is to be found, once or so, in the divines of the 17th c. (see Dean Trench on the *Study of Words*), but the department of scientific theology which it now represents is almost entirely the growth of modern, and particularly of German inquiry. As yet, it can hardly be said that the word C. is accredited in Great Britain, but the same differences of opinion which led to its adoption in Germany, are beginning to manifest themselves here also. There are only three methods of apprehending the doctrine of the person of Christ. First, there is the *rationalistic* method. This consists in representing the development of the Messianic idea in Jewish history as purely natural, and conditioned by purely human and historical influences—in short, as a subjective or self-originated notion, to which there was no correspondent divine reality. Second, there is, what, for want of a better word, we may call the *spiritualistic* method (that of theologians like Neander, Rothe, etc.). This consists in representing the development of the Messianic idea in Jewish

history as both natural and supernatural; that is to say, it asserts the existence of a divine objective reality ("the eternal Son of God") as the basis of the subjective idea in the minds of the Jews, and regards the growth of that idea, and the influence of historical circumstances, as the result of a supernatural providence, which culminated in the revelation "of the mystery of godliness, God manifest in the flesh." Third, there is the *dogmatic* method, which is the one accepted by the common order of theologians. This consists in representing the doctrine of the person of Christ as *symbolically* known to the spiritually-minded among God's people from the earliest ages. "Abraham saw his (Christ's) day afar off." This is interpreted to signify that, by the grace of prophetic illumination, the righteous men of old were enabled to foresee in a mysterious and inexplicable manner the atonement of Christ, as it happened in history. Admitting with the spiritualistic theologians, that the Messianic idea among the Jews underwent, in some sense, a historical development, the dogmatic Christologists differ, in general, from the former by attributing to the higher minds such a knowledge of the *work* of Christ, as logically involves a knowledge of his person and character. The entire absence, however, of any *personal* traits of Christ in the Old Testament, such as might be expected of those who had seen him even with the eye of faith, has induced many orthodox theologians to shrink from making any statement in regard to what may have been the doctrine of the person of Christ among the ancient Jews.

CHRISTOPHE, HENRI, king of Hayti, b. Oct. 6, 1767, was at one period a slave and tavern-cook in Cape Town, St. Domingo, and afterwards overseer of a plantation. In 1790, he joined the black insurgents against the French, and, from his gigantic stature, energy, and courage, soon became a leader among them. By Toussaint Louverture, he was appointed brig. gen., and employed to suppress an insurrection headed by Moysé or Moses, his nephew. C. captured the latter, and on his execution, succeeded him as governor of the northern province of French St. Domingo. In 1802, he gallantly defended Cape Town when gen. Leclerc arrived there with a French army destined for the reduction of the blacks, and effected his retreat with 3,000 men, after having burned the greater part of the town. The perfidious seizure of Toussaint he amply revenged, and during the short-lived government of Dessalines, who was slain by a military conspiracy in Oct., 1806, C. was gen.-in-chief of the Haytian army. In Feb., 1807, he was appointed president of Hayti for life. A republic being, about the same time, organized at Port au-Prince, with Petion at its head, civil war commenced between them. On Mar. 28, 1811, C. was proclaimed *king* of Hayti, by the name of Henri I., and solemnly crowned, June 2, 1812. In 1814, he and Petion suspended hostilities, and by his power and skill, C. was enabled to counteract the attempts made by France to regain its authority in the island. His avarice and cruelty led to an insurrection, which was aided by gen. Boyer, who had succeeded Petion in 1818; and the rebellion having spread to Cape Town, C.'s deposition was proclaimed, at the head of the troops, by the duke of Marmalade, one of the first dignitaries in the kingdom. Deserted by his body-guard and all his nobles, he shot himself, Oct. 8, 1820. He left a code of laws, which he called the "Code Henri," in imitation of the Code Napoleon.

CHRISTOPHER, HERB. See ΑΤΤΑΛΑ.

CHRISTOPHER, SAINT, a saint of the Roman Catholic and Greek churches. He is supposed to have suffered martyrdom about the middle of the 3d century. According to vulgar legend, C., whose name was originally *Adokimos* (the unrighteous), was a native of Palestine, Syria, or Lycia, and a person of prodigious bulk and strength. His height was 12 feet. So proud was he of his gigantic frame, that he would serve only the mightiest princes. Having attached himself to one, who went for the greatest of his day, C. stayed with him for a short time, but soon discovered that his master was terribly afraid of the devil, in consequence of which, C., with fearless consistency, passed into the service of the latter. One day, however, when the devil and he chanced to be walking through a wood, they came across an image of Christ. His new master exhibited such perturbation and alarm at the sight, that C. entirely lost confidence in him, and resolved to find out the Savior, and follow him. For a long while he searched in vain, but finally he fell in with a hermit, who showed him Christ, and baptized him. C. despised the customary penances, and in consequence, it was imposed on him to carry Christian pilgrims on his shoulders over a stream which had no bridge. One day, a little child came to the stream; C. took it on his shoulders, but soon began to sink under the weight of his burden. The child was Christ himself, and to prove it, he commanded C. to stick his staff into the ground. He did so, and next morning it had blossomed into a palm-tree bearing fruit. This miracle converted thousands to Christianity. C.'s success excited the enmity of Dagnus, the prefect of that region, who put him in prison, scourged him with red-hot rods, put a burning helmet on his head, and clapped him on a burning stool. C. still remained uninjured. Multitudes of poisoned arrows were now discharged against him, but they rebounded from his charmed body, and one even wounded the prefect himself in the eye. C. pitied his tormentor, and freely offered his head to the executioner, that the prefect might be healed by the blood which should flow from it. This was done, and, as a matter of course, Dagnus and his family became Christians. The Greek church celebrates his festival on the 9th of May; the Roman Catholics, on the 25th of July.

St. C. was greatly invoked in times of pestilence, or when people were digging for treasures, to frighten away the spirits who watched over them. The formula used was called a *Christopher's prayer*. He was also the patron of an order of moderation, founded in Austria in 1517, for the purpose of checking excessive drinking and swearing, and which was called the order of St. Christopher.

CHRISTOPHER'S, Str., or, popularly, *St. Kitts*, an island near the n.e. bend of the great arch of the Antilles, 46 m. to the w. of Antigua, and 2 m. to the n. of Nevis. With a very unequal breadth, it is 20 m. long from s.e. to n.w., containing about 44,000 acres, and (1871) 28,169 inhabitants. It belongs to Great Britain, and has a legislature of its own, with an executive immediately subordinate to the governor-in-chief of the Leeward group, residing in Antigua. In 1876, the revenue of the colony was £32,000, having been only £3,638 in 1834; so that, under the system of free labor, it had increased nearly nine-fold in 42 years. During the same interval, the imports had risen in value from £63,018 to £139,000, and the exports from £105,267 to £156,000. The staple exports are sugar, rum, and molasses. The debt of the island in the year 1876 amounted to £6,000. Education is in a promising condition. In the year 1865, there were 27 schools receiving government aid, attended by 1367 pupils in all—11 of the establishments belonging to the church of England, 8 to the Moravians, and 8 to the Wesleyans.

The chief towns, both of them seaports with open roadsteads, are Basse-Terre, defended by fort Smith, and Sandy Point, protected by fort Charles and Brimstone Hill. Of fort Smith, the exact lat. and long. are $17^{\circ} 17' 7''$ n., and $62^{\circ} 48'$ west. The mean annual temperature of these places, and of the coast generally, is about 80° F.; but the mornings and evenings, even of the hottest days, are agreeably cool. The length of the island is traversed by a well-wooded ridge of volcanic origin, which has in its center a crater; and towards the w. extremity of the range, rises the nearly perpendicular crag of Mt. Misery, with an altitude of 3,711 ft. above the level of the sea. Over the adjacent slopes, which gradually descend to the water's edge, this central range sends down several streams—almost every plantation, in fact, receiving its rivulet in the rainy season. The springs, though numerous, are yet mostly brackish; and indeed the southern extremity of the island presents a number of salt ponds.

St. Kitts, appropriately named by the natives "the fertile isle," was discovered by Columbus in 1493, and colonized by the English in 1623, who were almost immediately joined by some French adventurers. After treacherously exterminating the Caribs, the French and English, often quarreling, occupied the island, till, in 1713, the treaty of Utrecht gave the whole to England. In 1782, during the war of American independence, St. Kitts was captured by the French, but restored. On July 31, 1865, a terrific fire took place at Basse-Terre.

CHRISTOPULUS, ATHANASIOS, 1772–1847; a Greek poet, the son of a Wallachian priest. He studied at Buda and Padua, and became teacher in the family of the Wallachian prince Mourousi, and, after the fall of that prince, he assisted the hospodar Caradja in drawing up a code of laws for the nation. He wrote love ditties and drinking songs, which are very popular among the Greeks. He is also the author of a tragedy, and some philological works.

CHRIST'S COLLEGE, Cambridge, was originally founded by Henry VI., under the name of God's house, and was intended by him to consist of a master, 12 fellows, and 47 scholars. In 1505, however, there were only three fellows besides the master, when lady Margaret, countess of Richmond and Derby, mother of Henry VII., "counting herself, as of the Lancaster line, heir to all Henry VI.'s godly intentions," made up the full number, and endowed the college liberally, changing its name to Christ's college. Edward VI. added one fellow, and three scholars; and sir John Finch and sir Thomas Baines increased the number of fellows to fifteen. C. C. possesses many rich benefactions for the encouragement of students, amongst which are specially to be noticed four studentships founded by Christopher Tancred, worth £107 per annum, and tenable for three years after taking the degree of B.A. A student is elected annually before coming into residence. Amongst the illustrious men connected with this college may be noted bishop Latimer, John Milton, and Ralph Cudworth, author of the *Intellectual System*.

CHRIST'S HOSPITAL, Newgate street, London, was founded on the site of the Greyfriars' monastery, by Edward VI., June 26, 1553, as a hospital for orphans and foundlings. It is usually called the "blue-coat school," on account of the dress worn by the boys. This consists of a blue woolen gown or coat with a narrow red leather girdle round the waist, yellow breeches, and yellow stockings, a clergyman's bands at the neck, and a small blue worsted cap, but this last they seldom wear, and are generally seen going about bareheaded—such has been the costume of the boys since the foundation of the school in the reign of Edward VI.; the persistency in it through successive generations, affording a curious instance of the unchangeableness in some of the English usages. No boy is admitted before seven years of age, or after 10, and none can remain after 15, with the exception of "king's boys" (i.e., those who attend the mathematical school founded by Charles II. in 1672) and "Grecians" (i.e., the highest class of scholars in the hospital), of whom eight are sent on various scholarships to the universities of Oxford and Cambridge. Altogether, about 800 boys can be admitted. The

right of presentation is vested in the managing governors. These are the lord mayor of London, the aldermen, and 12 common councilmen. Besides these, all noblemen and gentlemen who benefit the hospital to the extent of £400 are governors. The managing governors are the patrons of several churches, chiefly in Surrey and Essex. The most of the income of C. H., which amounts to about £50,000, is derived from legacies subsequent to its original charter. King Charles' foundation enriched it by £7,000, with an additional annuity of £370 10s., for the purpose of educating yearly 10 boys for the sea-service. Most of the building perished in the great fire of 1666; but, through the generosity of the corporation of London, and the liberal help of wealthy Englishmen, it was soon rebuilt, under the superintendence of sir Christopher Wren. In the course of time, the new hospital fell into decay, and in 1825, a third structure was erected by Mr. Shaw. The great hall of the hospital is a magnificent room, second only to that of Westminster. C. H. is essentially a classical institution, Latin and Greek being the basis of education; but, to satisfy the wants arising from the changed condition of society, the modern languages, drawing, etc., are also taught. In 1683, the governors built a preparatory school at Hertford, where the children are trained till they are old enough to enter the hospital. The *girls*, however, remain permanently here. It can receive about 400 of both sexes. Dependent schools in Newgate street accommodate 1200 children. Several eminent persons have been educated at C. H., such as Camden, Stillingfleet, Coleridge, and Lamb.

CHRIST'S THORN. See JUBBE and PALIURUS.

CHROMATIC, in music, is a term applied to a series of notes at the distance of a semitone from each other. Such a series is produced by dividing the whole tones of the diatonic scale into semitones, so that with the two diatonic semitones, already in the natural scale, the octave is divided into 12 semitones. The word C. is from the Greek, and means colored. Ascending C. passages are formed by the whole tones of the diatonic scale being raised or elevated by a sharp or a natural, according to key, and descending passages by their being lowered by a flat or a natural, thus:

It is usual to speak of the C. scale, but that is wrong, as it is only a melodious progression of semitones, certain notes of which belong to, and form the diatonic scale, showing that the foundation of the system of music does not rest on a C. basis, but on the natural diatonic progression of sounds.

CHROMATIC, in optics. See ACHROMATIC.

CHROMATICS is that part of the science of optics (q.v.) which explains the properties of the colors of light and of natural bodies. Before 1666, when sir Isaac Newton began to investigate this subject, the notions which prevailed respecting the nature of colors were purely fanciful. Till Descartes' time, indeed, it seems not to have been conceived that color had anything to do with light. As examples of the notions prevalent at very early times, we may cite those propounded by Pythagoras and Zeno. According to the former, color was the superficies of bodies; according to the latter, it was "the first configuration of matter"—whatever that may be. It is now settled that white light is not homogeneous, but consists of rays of different colors, endued with different degrees of refrangibility, and that the different colors of bodies arise from their reflecting this or that kind of rays most copiously. According to this, a body that appears red reflects red rays in greater abundance than the others; and one that appears black reflects none of the rays—in other words, absorbs all the light that falls upon it. The analysis of a beam of the sun's light by a prism was the experiment by which Newton demonstrated his great optical discovery of the unequal refrangibility of the variously colored rays, and laid the foundations for the above theory of color. The reader will find an account of this experiment, and of the most interesting phenomena presented by the spectrum, under the article SPECTRUM. Newton concluded from his experiments that white light is composed of seven colors, which he called the primary colors—viz., red, orange, yellow, green, blue, indigo, and violet, and that all other shades of color arise from the admixture of these in different proportions. Sir David Brewster, on the other hand, conceives that he has established that the primary colors are only three in number—red, yellow, and blue. This result he obtained by examining the rays of the spectrum through different absorbing media—a mode of experiment now admitted to be fallacious in principle. Professor Maxwell, by direct examination of the rays, concludes that the three primary colors are red, green, and blue. Recently, a theory has been propounded, that all the colors are the results of the admixture of white light and of shade, or darkness; but as yet no attempt has been made to support this theory by direct experiment on the sun's rays. It is rested on results obtained by combining by motion certain pro-

portions of white and black pigments on a revolving card. See the articles LIGHT, DISPERSION, and NEWTON'S RINGS.

CHROMATYPE (Gr. *chrome*, color; *typos*, impression), a photographic process, thus described by its discoverer, Mr. R. Hunt. One dram of sulphate of copper is dissolved in one ounce of distilled water, to which is added half an ounce of a saturated solution of bichromate of potash; this solution is applied to the surface of the paper, and when dry, it is fit for use, and may be kept for any length of time without spoiling. When exposed to sunshine, the first change is to a dull brown, and if checked in this stage of the process, we get a negative picture; but if the action of light is continued, the browning gives way, and a positive yellow picture on a white ground is obtained. In either case, if the paper, when removed from sunshine, is washed over with a solution of nitrate of silver, a very beautiful positive picture results. In practice, it will be found advantageous to allow the bleaching action to go on to some extent; the picture resulting from this will be clearer and more defined than that obtained when the action is checked at the brown stage. To fix these pictures, it is necessary to remove the nitrate of silver, which is done by washing them in pure water. If the water contains any chlorides, the picture suffers, and long soaking in such water obliterates it—or, if a few grains of common salt be added, the apparent destruction is rapid. The picture is, however, capable of restoration, all that is necessary being to expose it to sunshine for a quarter of an hour, when it revives; but instead of being of a red color, it assumes a lilac tint, the shades of color depending upon the quantity of salt used to decompose the chromate of silver which forms the shadow parts of the picture. Mr. Bingham suggested the substitution of sulphate of nickel for sulphate of copper, as yielding a higher degree of sensitiveness and greater definition. Neither process has been much used.

CHROMIC ACID, composed of trioxide of chromium and water; formula, CrO_3H_2 . It forms coloring pigments, such as chromate of lead, and chromate and bichromate of potash; and is used as a caustic in surgery.

CHROMIC IRON, or **CHROMITE**, ore of chromium, found in Maryland, Pennsylvania, the Shetland islands, Scotland, France, and other places. It usually occurs in mass, but is sometimes crystallized in octahedrons. Oxides of chromium and iron are its ingredients.

CHROMIUM (*chrome*, color) is a metal, so called from the many-colored compounds it produces. It was discovered by Vauquelin in 1797. C. occurs naturally as the chromate of lead (PbO, CrO_3), and the chromite of iron, *chrome iron ore* ($\text{FeO}, \text{Cr}_2\text{O}_3$), at Unst and Fetlar in the Shetlands, and Portsoy in Banffshire, etc. The metal has been obtained in powder and in scales, but as a metal it possesses no interest. The principal compound of C. is the bichromate of potash, obtained by heating chrome iron ore in powder with one fourth of its weight of niter, and then digesting in water, which dissolves out the chromate of potash (KO, CrO_3), a yellow salt, and when this is acted upon by sulphuric acid, it is converted into bichromate of potash ($\text{KO}, 2\text{CrO}_3$), readily crystallizes in orange-red crystals, which is soluble in water, and is largely used by the dyer and calico-printer. If this salt be added to a solution of lead, an abundant yellow precipitate occurs of chromate of lead (PbO, CrO_3), or *chrome yellow*, which is used largely by the painter as a yellow pigment. A sesquioxide of C. (Cr_2O_3), *chrome green*, possessing a bright green color, which renders it useful in enamel-painting, and being innocuous, it is now introduced into paper-hangings instead of the highly dangerous arsenical green pigment. The bichromate of potash is employed in conjunction with sulphuric acid as an agent in bleaching palm-oil and other oils and fats.

CHRONICLE (from *chronos*, time), denotes a history in which events are treated in the order of time. A C. is understood to differ from annals in being more connected and full, the latter merely recording individual occurrences under the successive years or other dates. Most of our older histories were called chronicles, such as the *Saxon Chronicle*, *Holinshed's Chronicle*. The term is seldom applied to a modern book, but frequently to a newspaper—as, for instance, *The Morning Chronicle*.

CHRONICLES, the name of two of the books of the Old Testament, as found in the common English Bible. In the Hebrew canon the C. form but one book, which is entitled *Events of the Times*—and this appears to have been a designation commonly applied to special histories—in more definite shape, *Events of the Times of King David*, or the like. The Greek translators divided the long Hebrew book into two, and adopted the title *Things Omitted*, that is, not recorded in the other historical books. Jerome suggested the title *Chronicon*, whence comes the English name. The book of C. begins with Adam and ends abruptly in the middle of Cyrus's decree of restoration. The continuation of the narrative is found in the book of Ezra, which fills up the fragment of the decree of the Persian king. Of the authorship of C. nothing is known except what can be determined by internal evidence. The language implies that the book is one of the latest of the Old Testament. In the Hebrew Bible it is placed last. As to the time of the writing of C., it is argued that the chronicler wrote after the fall of the Persian monarchy. What seems to be certain and important for a right estimate of the book is that the author lived a considerable time after Ezra, and stood entirely under the influence of the religious institutions of the new theocracy. This point of view determined the nature of his interest in the early history of his people. The true

importance of Hebrew history had always centered in the fact that this petty nation was the people of Jehovah, the spiritual God. The tragic interest which distinguishes the annals of Israel from the forgotten history of Moab or Damascus lies wholly in that long contest which finally vindicated the reality of spiritual things and the supremacy of Jehovah's purpose, in the political ruin of the nation which was the faithless depositary of these sacred truths. After the captivity, it was impossible to write the history of Israel's fortunes otherwise than in a spirit of religious pragmatism. But within the limits of the religious conception of the plan and purpose of the Hebrew history more than one point of view might be taken. The book of Kings looks upon history in the spirit of the prophets. But before the chronicler wrote, the last spark of prophecy had become extinct. The Jerusalem of Ezra was organized no longer as a nation, but as a municipality and a church. The center of religious life was no longer the prophetic word, but the ordinances of the Pentateuch and the liturgical service of the sanctuary. The religious vocation of Israel was no longer national, but ecclesiastical and municipal; and the historical continuity of the nation was vividly realized only within the walls of Jerusalem and the courts of the temple, in the solemn assembly and stately ceremonial of a feast day. These influences naturally operated most strongly on those who were officially attached to the sanctuary. To a Levite, even more than to other Jews, the history of Israel meant above all things the history of Jerusalem, of the temple, and of the temple ordinances. The author of C. betrays in every page his essentially Levitical habit of mind. To such a mind, in the fallen condition of the Jews as a political nation, there seemed to be room for a new history, which should confine itself to matters still interesting to the theocracy of Zion, keeping Jerusalem and the temple in the foreground, and developing the divine significance of the history in its causes and results, not so much with reference to the prophetic word as to the fixed legislation of the Pentateuch, so that the whole narrative might be made to teach that the glory of Israel lies in the observance of the divine law and ritual. For the sake of systematic completeness, the author of the C. begins with Adam; but he had nothing to add to the Pentateuch, and the period from Moses to David contained little that served his purpose. He therefore contracted the early history into a series of genealogies, which were by no means the least interesting part of his work at a time when every Israelite was concerned to prove the purity of his Hebrew descent. From the death of Saul the history becomes fuller, and runs parallel with the books of Samuel and Kings. The limitations of the author's interest in past times appear in the omission, among other particulars, of David's reign in Hebron, of the disorders in his family and the revolt of Absalom, of the circumstances of Solomon's accession, and of many details as to the wisdom and splendor of that sovereign, as well as of his fall into idolatry. In the latter history the ten tribes are quite neglected, and political affairs in Judah receive attention, not in proportion to their intrinsic importance, but according as they serve to exemplify God's help to the obedient and his chastisement of the rebellious. That the author is always unwilling to speak of the misfortunes of good rulers, is not to be ascribed to a desire to suppress the truth, but shows that the book was throughout composed not in purely historical interest, but with a view to inculcate a practical lesson. The more important additions which the chronicler makes to the old narrative consist partly of full details of points connected with the history of the sanctuary and the great feasts, or the archaeology of the Levitical ministry, and partly of narratives of victories and defeats, of sins and punishments, of obedience and its reward, which could be made to point a plain religious lesson in favor of faithful observance of the law. The minor variations of C. from the books of Samuel and Kings are analogous to the larger additions and omissions, so that the whole work has a consistent and well-marked character, presenting the history in quite a different perspective from that of the old narrative. An immense amount of criticism has been expended upon C.; but after all it is safe to conclude, with Ewald and other careful critics, that there is no foundation for the charge that the chronicler invented history in the interest of his practical purpose of exhortation and encouragement. But it is not to be doubted that in shaping his narrative he allowed himself the same freedom taken by other ancient historians, and even by copyists. [Portions of this article are, with modifications, from *Encyclopædia Britannica*, ninth edition.]

CHRONOGRAM, or **CHRONOGRAPH** (Gr. *chronos*, time, and *gramma*, a letter, or *grapho*, I write), a whimsical device of the later Romans, resuscitated during the *renaissance* period, by which a date is given by selecting certain letters amongst those which form an inscription, and printing them larger than the others. The principle will be understood from the following C., made from the name of George Villiers, first duke of Buckingham.

GEORGIVS. DVX. BVCKINGAMLÆ.

The date MDCXVVIII (1628) is that of the year in which the duke was murdered by Felton, at Portsmouth.

CHRONOGRAPH. Different forms of time-measures, or time-recorders, under this designation, have been invented within a recent period.

Benson's chronograph is intended to measure intervals of time down to tenths of a

second, for use at horse-races and other occasions where a seconds watch is not exactly suited. It has an ordinary quick train-lever movement, carrying hands which move over a dial. One of these is a seconds hand, very peculiarly made. The seconds hand is double, consisting of two distinct hands, one superposed on the other. The outer end of the lowermost hand has a small cup with a minute hole at the bottom; while the corresponding end of the uppermost hand is bent over so as exactly to reach this puncture. The little cup is filled with ink, having a consistency between that of writing-fluid and printers' ink. Suppose that a horse-race is about to take place. The observer keeps a steady look-out for the fall of the starter's flag, or whatever the signal may be; he gives a pull to a cord or string connected with the mechanism peculiar to the instrument; by this movement, the outer and bent end of the upper seconds hand dips down through the ink-cup in the lower hand, and through the puncture to the dial. A small black spot or mark is thus made upon the dial-plate; and this is repeated as each horse passes the winning-post. If the eye and hand of the operator are quick and accurate, there is a reliable record thus presented by the instrument of the duration of the race, sometimes as close as one tenth of a second. The instrument is now adopted at the principal races as a suitable one for the purpose; thus it is used for races such as the Derby, the Oaks, the Goodwood, the St. Leger, etc. It is also available for many other purposes.

Strange's chronograph is designed for a more scientific purpose, and constructed with more careful details. The object is to measure extremely short intervals of time, for the determination of longitudes in great trigonometrical surveys. The observer, when a particular star traverses the field of his telescope, touches a small ivory key; and on the instant, a dot or mark appears on a sheet of paper coiled round a barrel. The instrument being connected with an astronomical clock, there is a dot made for every beat of the pendulum; and as these dots are a considerable space apart (considerable, that is, for the refined instruments of the present day), it is possible to determine so wonderfully minute an interval as one hundredth of a second.

Other forms of chronograph have been adopted by astronomers. One was suggested by prof. C. A. Young in 1866 to assume the functions of a *recording* chronograph, by marking the instant of observation in hours, minutes, seconds, and hundredths of a second, in *printed* characters, and in a form suitable for preservation and reduction.

Chronographs connected with electric and magnetic apparatus are used for determining the velocity of projectiles. Many forms have been devised by Noble, Bashforth, Navez, Le Bouleuge, and other inventors. The most general arrangement consists in causing the bullet to pass through a series of screens; the rupture of each screen breaks for a moment the continuity of an electric current, sets in action an electro-magnetic apparatus, and makes a permanent mark or record.

CHRONOLOGY is the science of the divisions of time. It has two main branches—mathematical C., and historical chronology. Mathematical C. is engaged with such of the units for the measurement of time as begin and end with the period of complete evolution of recurring celestial phenomena. See articles CALENDAR, YEAR, MONTH, DAY, and CYCLE, where the chief points in mathematical C. are explained. Historical C. uses these units among others to measure the distance in point of time between events, and to fix their *dates*. As in geography and navigation, longitude is measured from some arbitrary line, such as the meridian through Greenwich, so in historical C., *dates* are fixed by giving their distance from some arbitrary point of time, usually chosen because of some remarkable occurrence which signalized it. Such a fixed point, or *epoch*, forms the beginning of an *era*. It is thus that *dates* have been aptly said to be to events in history what the latitude and longitude of places are to the places in geography and navigation. The mathematical, or, to speak more properly, the astronomical units of time above referred to have not been, as has been already hinted, the only units used in historical chronology. In early times, the more accurate methods of mathematics were unknown, and such vague periods as "a generation," or the lifetime of leading persons in a nation, such as the priestesses of Juno, or of the kings, were assumed as units in historical chronology. The great variety of eras, too, in ancient times confuses the student of chronology. Thus the era of the Greeks began with the year of the first olympiad, or that in which Coræbus was victor; being the first celebration of the games at which the victor's name was recorded, and which is calculated to correspond to the year 776 B.C. From this epoch, the Greeks measured time by olympiads or periods of four years. Thus, the 3d year of the 12th olympiad would be the year 729 B.C. The Roman era was reckoned from the founding of the city, being either 752 or 753 B.C. The Roman practice of dating events from the building of the city, seems to be the first instance of the method of reckoning time from a fixed point by single years. It thus forms one of the great stages in chronology. Of other eras we shall merely mention the Mohammedan, which commences with the flight of Mohammed, 622 A.D., and which is called the *Hedjrah* (q.v.). The Roman and Greek methods of measuring time continued to be in use long after the birth of Christ; the olympiads, indeed, appear to have been employed in Europe down to the 304th olympiad, or 440 A.D. From 312 A.D., however, the public mode of computation throughout the Roman empire was by indictions, which were periods of 15 years, beginning with that year (see INDICTIO); and this mode was at one time

almost universally followed in the west. In France, it was not altogether discontinued till the end of the 15th century. The Christian era is said to have been first proposed in the year 527 A.D., and is now universally used in Christendom. Part of the business of C. is to determine the relationships of the different eras, so as to enable one to express, in the language appropriate to one mode of computation, the date of an event recorded in another. Owing to the birth of Christ being a comparatively recent event, the Christian era is attended by this inconvenience, that we must count backwards from it for the dates of occurrences prior to it. To obviate this, various comprehensive periods, such as the Julian and Louisian periods have been invented, which have the merit of being applicable to most events lying within the limits of history.

Various systems of C., such as the Chinese, Babylonian, Egyptian, Indian, and Chaldean, are worthy of attention. Accounts of the periods which these nations respectively assign to their histories, will be found under the heads CHINESE EMPIRE, BABYLON, etc. Of *sacred C.* there have been various systems. In these the epochs are the creation of the world, and the flood; but the chief copies of the Bible do not agree as to the dates of these events. While the Hebrew text reckons 4,000 years from the creation to the birth of Christ, and to the flood 1656 years, the Samaritan makes the former much longer, though it counts from the creation to the flood only 1307 years. The Septuagint version differs from both. It removes the creation of the world to 6,000 years before Christ, and 2,250 years before the flood. These differences have never been reconciled. It is, now, however, universally admitted, that the creation of the world is not to be regarded as having occurred even so recently as 6,000 B.C. The modern understanding of the first chapter of Genesis leaves the period of the creation quite indefinite, and one scheme of interpretation stretches out the days of creation into periods of indefinite length. Of the *Newtonian C.*, all that can be said here is, that it was an attempt, now generally admitted not to have been very successful, to rectify the obvious blunders of ancient chronologers, by determining certain epochs by means partly of astronomical calculations, and partly of the critical examination of such chronicles as measured time by reigns and generations. By a very fine argument, the soundness of which has since been doubted, Newton set down the date of the Argonautic expedition as being 43 years after the death of Solomon, or 937 B.C.

CHRONOL'OGY (*anté*), a fixed period from which dates are reckoned. The Christian era (q. v.) starts at the birth of Christ. The years before are marked B.C. and those after, A.D. (Anno Domini). This era is now almost universally accepted. The olympiad was a Greek era in periods of five years; the birth of Christ occurred in the middle of the fourth (some say in the second or third) year of the 194th Olympiad. The era of the foundation of Rome is usually assigned to 753 B.C. The era of the creation is fixed at many widely varying points. The reckoning of Constantinople, which is still used by the Greek church, makes it 5309 B.C.; the Abyssinian church, 5492; the Alexandrian church, 5502, and later 5492; the Jews, 3761. One writer on the C. of sacred history collected more than 200 different estimates of the era of the creation, the shortest being 3483, and the longest 6984 B.C. If such or such a date from the creation means anything, it is probably to be read by the period fixed by Dr. Usher, which was 4004 B.C. Yet it must be understood that, on this point, we are without the data for an accurate and positive chronology. There is an era of the creation used in India, which is only 3102 B.C. The era of Vicramyiditya in common use in India begins 56 B.C. The Spanish era, dating from the conquest of Spain by Augustus, 38 B.C., was in use in Spain, Portugal, North Africa, and Southern France. The era of Diocletian, or of the martyrs, is dated 284 A.D. The Mohammedan era, beginning at the time of the prophet's flight to Medina, is 622 A.D. As reckoned by our ordinary C., the precise dates of commencing the above and other eras are:

Grecian Mundane.....	Sept. 1,	5598	B.C.
Constantinop.e. Civil.....	Sept. 1,	5508	"
Alexandrian.....	Aug. 29,	5502	"

Mohammedan, Hegira	July 16,	622 "
Persian of Yezdegird	June 16,	632 "

CHRONOMETER, or time-measurer, is the name given principally to such time-keepers as are used for determining the longitude at sea. The mechanism is essentially the same as that of a common watch; only the size is generally greater, and additional precautions are taken to secure regularity under changes of temperature and other deranging influences. See **HOROLOGY**.

CHRONOSCOPE, an instrument contrived by sir Charles Wheatstone to measure the duration of certain short-lived luminous phenomena, such as the electric spark, of which the eye itself can be no judge, owing to the persistence of impressions of light on the eye after the cause of sensation has ceased. The phenomenon is observed by reflection in a mirror, in such rapid motion that the image of the luminous object would appear to describe a circle, supposing the luminosity to endure long enough. Should the phenomenon be instantaneous, the image will appear as a mere point; should it last for an appreciable time, the image will form an arc, greater or less, of the circle. The electric spark is found by this test to have no duration.

CHRU'DIM, a t. of Bohemia, beautifully situated on a small river, about 62 m. s.e. of Prague. It is walled, has a noble collegiate church, a high school and Capuchin convent, manufactures of cloth, and very important horse-markets. Pop. '69, 11,218.

CHRY'SALIS, or **CHRY'SALID**, a name originally Greek, and strictly belonging to those pupæ of butterflies which are adorned with golden spots, but extended to the pupæ of lepidopterous insects generally, and even of other orders of insects. The chrysalids of lepidopterous insects are inclosed in a somewhat horny membranous case; sometimes very angular, sometimes nearly round; generally pointed at the abdominal end, sometimes at both ends; and before the caterpillar undergoes its transformation into this state, it often spins for itself a silken cocoon, with which earth and other foreign substances are sometimes mixed, so as to increase its size, and within which the chrysalid is concealed. Chrysalids are often suspended by cords, and generally remain nearly at rest; some have the power of burying themselves in the earth; others are bound by a single silken thread which passes round their middle some twirl themselves round when touched, or when the stalk or leaf to which they are suspended is touched; and in general, they give signs of life, when disturbed, by violent contortions of the abdominal part. See **INSECTS**; **PUPA**; **LEPIDOPTERA**; **BUTTERFLY**, **HAWK-MOTH**, **MOTH**, and **SILKWORM**.

CHRYSAN'THEMUM (Gr. gold-flower), a genus of plants of the natural order *compositæ*, sub-order *corymbifere*; having a hemispherical or nearly flat involucre, with imbricated scales, which are membranous at the margin, a naked receptacle, the florets of the disk tubular and hermaphrodite, those of the ray strap-shaped and female, the fruit destitute of pappus. The species of this genus are annuals, perennials, or shrubby; and all have leafy stems. They are natives chiefly of the temperate parts of the old world. *C. leucanthemum*, the **OX-EYE**, or **OX-EYE DAISY**, is abundant in fields, meadows, and grassy places of woods, in most parts of Europe. It has large flowers, with white ray and yellow disk. It is often a troublesome weed among hay and in pastures; being perennial, and having a creeping brittle root-stock, it is not easily extirpated. It is common in Britain, which has only one other native species, *C. segetum*, **CORN MARIGOLD**, a frequent weed in cornfields—although rare in the neighborhood of Edinburgh—an annual, with large deep yellow flowers. It is dealt with like annual weeds in general, by pulling it up when young.—*C. carinatum*, an annual species with white ray and dark-red disk, the scales of the involucre keeled, a native of Barbary, is frequently cultivated in green-houses or—where the climate permits—in flower-gardens. The favorite species of the gardener is, however, *C. Indicum*, the **CHINESE** or **INDIAN C.**, a native of China, Cochin-China, and Japan; which has long been cultivated in its native countries as an ornamental plant, and of which there are many varieties. Its colors are also very various—red, lilac, rose-color, white, yellow, orange, or two colors combined. It flowers in autumn and winter. It is easy of cultivation, succeeds best in a light rich soil, is easily propagated by cuttings, suckers, or parting the roots, but requires the green-house in Britain. It was introduced in 1789. It is reckoned among florists' flowers.

CHRYSELEPHANTINE (Gr., from *chrysos*, gold, and *elephas* ivory), the art of making images of gold and ivory, was extensively practiced amongst the Greeks. Winckelmann has calculated that about 100 statues of this kind are mentioned by the ancients. The colossal works executed by Phidias at Athens, in the time of Pericles, are the most famous of this class, the greatest being the Pallas of the Parthenon. It was 26 cubits high, and represented the goddess in armor, covered with a long robe. The famous Olympian Jupiter of Phidias, executed in the same materials, was also a world-wide

wonder. The combination of gold and ivory was chiefly used in temple statues; and though the execution of the more famous works of this class belongs to an advanced period of art, the use of various materials in the same statue was very ancient, and probably borrowed from the custom of adorning the wooden images of the earliest time with the precious metals. Sometimes, too, the head, the arms and hands, and the feet were of marble, whilst the rest was of wood, covered with thin plates of gold. These were called acrolites (*akrolithoi*). See STATUARY.

CHRYSIPPUS, an eminent Stoic philosopher, was b. about 280 B.C., at Soli in Cilicia. He came to Athens when still a youth, and eagerly addicted himself to philosophical pursuits. His principal master was Cleanthes, although he is said to have also studied under the academic teachers, Arcesilaus and Lacydes, and learned from them what were the objections urged by skeptics against the doctrines of the Stoics. He had the reputation of being the keenest disputant of his age, and was happily described as "the knife for the academic knots." In fact, his logic was held to be so convincing, that people were wont to say: "If the gods make use of dialectic, it can only be that of Chrysippus." It is also related of him, that he told Cleanthes he merely wanted to know the principles of his system, as he intended to find arguments for them himself; and this story appears to indicate his true position in philosophy. He was not the creator of a new system, but the expounder of an old. C.'s industry was very great. He seldom wrote less than 500 lines a day, and is said to have composed more than 700 works. Many of these, however, were compilations, and were not characterized by great beauty of style. Only a variety of fragments remain, which have been edited by Petersen (*Philosophiæ Chrysippiæ Fundamenta*, Altona and Hamburg, 1827).

CHRYSIS, a Linnæan genus of hymenopterous insects, now constituting a family *chryside*, allied to the *ichneumonide*, and forming a connecting-link between them and bees, wasps, etc. The French call them *Guêpes dorées* (gilded wasps), and they sometimes receive the English names of *golden-tailed* and *ruby-tailed flies*. They delight in sunshine, and may be seen poised in the air—the motion of their wings being so rapid as to render the body alone of the insect visible.

CHRYSOBALANA CÆÆ, or **CHRYSOBALANÆÆ**, according to some botanists, a distinct natural order of plants; according to others, a sub-order of rosacæ (q.v.). They are distinguished from the other plants usually included in the order rosacæ by their irregular petals, and by having the stamens also irregular, either in size or position; the ovary stalked, its stalk adhering on one side to the calyx, the style proceeding from its base. The fruit is a drupe of one or two cells. The species are trees or shrubs, natives generally of tropical and sub-tropical regions. About 50 species are known. The fruit of many is eatable, as the cocoa plums (q.v.) of the West Indies (*chrysobalanus*), the fruit of *parinarium excelsum* in Sierra Leone, and that of *moqueila grandiflora* in Brazil. The kernels of some resemble sweet almonds, as those of *parinarium campestre* and *P. montanum*. A useful oil is expressed from the seeds of *prinsepia utilis*, a spiny plant, common in some parts of the Himalaya mountains, and which is also planted for hedges in the Khasia hills, at an elevation of 5,725 ft. above the sea; whilst in Sikkim it is only found where the elevation is above 8,000 feet. This plant would in all probability succeed well in Britain, and an attempt should certainly be made to introduce it.

CHRYSOBERYL, a gem almost as hard as sapphire, and the finer specimens of which are very beautiful, particularly those which exhibit an opalescent play of light. Lapidaries sometimes call it oriental or opalescent chrysolite. It is of a green color, inclining to yellow, semi-transparent, or almost transparent, and has double refraction. It occurs crystallized in six-sided prisms; often in masses, or twin crystals. It is found in granite, in sandstone, and in alluvial soil; in Ceylon, Pegu, Siberia, Brazil, and Connecticut. It is composed of alumina, glucina, and a little protoxide of iron; the alumina being about 80 per cent of the whole.

CHRYSOCOLLA, or **COPPER-GREEN** (Gr. gold-gluë), an ore of copper, found in Cornwall and in many parts of the world, but particularly in Wisconsin and Missouri, where it is so abundant as to be worked for copper. As a pigment, it was much used by the ancients.

CHRYSOLITE (Gr. golden-stone), a mineral composed of silica, magnesia, and protoxide of iron; of a fine green color, with vitreous luster; transparent, and having double refraction; in hardness, about equal to quartz; and with conchoidal fracture. It often crystallizes in four-sided or six-sided prisms, variously modified. Very fine specimens are brought from Egypt and from some parts of the east, also from Brazil. C. is used by jewelers as an ornamental stone, but is not highly valued. *Olivine*, which occurs generally massive, in grains and roundish pieces, and is frequent in volcanic countries, and found in the igneous rocks of some parts of Scotland—as on Arthur's seat—is regarded as a coarse variety of chrysolite.—The chrysoberyl (q.v.) is sometimes called C. by jewelers.

CHRYSOLOBAS MANUEL, a learned Greek of Constantinople, was b. in the middle of the 14th century. He is regarded as the first who transplanted Greek literature into Italy. About the year 1391, the Byzantine emperor, John Palæologus, sent C. to England and Italy to entreat assistance against the Turks. This mission made C. known

in Italy, and, in 1397, he left his native land and went to Florence, where, as teacher of Greek literature, he was highly esteemed and admired. Leonardo Bruno, Poggius, Philolphus, Guarinus of Verona, and other eminent scholars, were pupils of his. He was afterwards employed in public services—especially in mediating a union of the Greek with the Roman church—by pope Gregory XII. In 1413, C. went with John XXII. to the council of Constance, where he died 1415. Besides theological works, his *Erotemata*, or “Accidence of the Greek Language” (Venice, 1484), has been preserved. Manuel C. must be distinguished from his nephew, JOHN CHRYSOLORAS, who also went to Italy and gave lessons in Greek.

CHRYSOMELA and **CHRYSOMELINÆ**. See **GODLEN BEETLE**.

CHRYSOPHYLLUM. See **SAPOTACEÆ**, **MONESIA BARK**, and **STAR APPLE**.

CHRYS'OPRASE is merely a variety of chalcedony, but is valued far above common chalcedony as an ornamental stone; so that a stone of this kind, fit for mounting in a ring, is worth from £10 to £20. It is of a fine apple-green color in choice specimens, but inferior ones exhibit other shades of green, and it is sometimes spotted with yellowish-brown. It is often set in a circlet of diamonds or pearls. Unfortunately, it is apt to lose its color through time, particularly if kept in a warm place; but dampness is favorable to its preservation, and it is therefore sometimes kept in damp cotton. It is found in lower Silesia—where the search for it was particularly encouraged by Frederick the great—and in Vermont. The inferior specimens are made into brooches, necklaces, etc.; and those still coarser, into snuff-boxes, seals, cups, etc.—The C. of the ancients was a stone of yellowish-green color, but it is not certain what it was.

CHRYS'OPS. See **CLEG**.

CHRYS'OSTOM, JOHN (Gr. *Chrystomos*, golden-mouth; so named from the splendor of his eloquence), was b. at Antioch in 347 A.D. His mother Anthusa was a pious woman, wholly devoted to her son, who grew up under her loving instructions into an earnest, gentle, and serious youth, passing through, as Neander significantly observes, none of those wild, dark struggles with sinful passions which left an ineffaceable impress on the soul of Augustine, and gave a somber coloring to his whole theology. He studied oratory under Libanius, a heathen rhetorician; soon excelled his teacher; and, after deoting some time to the study of philosophy, retired to a solitary place in Syria, and there read the Holy Scriptures. The ascetic severity of his life and studies brought on an illness which forced him to return to Antioch, where he was ordained deacon by bishop Meletius in 381, and presbyter by bishop Flavianus in 386. The eloquence, earnestness, and practical tone of his preaching excited the attention of Jews, heathens, and heretics, and secured for him the reputation of the chief orator of the eastern church. In 397, the eunuch Eutropius, minister of the emperor Arcadius, who had been struck by the bold and brilliant preaching of C., elevated him to the episcopate of Constantinople. C. immediately began to restrict the episcopal expenditure in which his predecessors had indulged, and bestowed so large a portion of his revenues on hospitals and other charities, that he gained the surname of “John the Almoner.” He also endeavored to reform the lives of the clergy, and sent missionaries into Scythia, Persia, Palestine, and other lands. His faithful discharge of his duties, especially in reproof of vices, excited the enmity of the patriarch Theophilus and of the empress Endoxia, who succeeded in deposing and banishing him from the capital. He was soon recalled, to be banished again shortly afterwards. He now went to Nicea, in Bithynia; but was from thence removed to the little town of Cucusus, in the desert parts of the Taurus mountains. Even here his zeal was not abated. He labored for the conversion of the Persians and Goths in the neighborhood, and wrote the seventeen letters (or rather moral essays) to Olympias, to whom he also addressed a treatise on the proposition—“None can hurt the man who will not hurt himself.” The emperor, enraged by the general sympathy expressed towards C. by all true Christians, gave orders that he should be more remotely banished to a desolate tract on the Euxine, at the very verge of the eastern Roman empire. Accordingly, the old man was made to travel on foot, and with his bare head exposed to a burning sun. This cruelty proved fatal. C. died on the way at Comanum, in Pontus, Sept. 14, 407 A.D., blessing God with his dying lips. The news of his death excited much sorrow among all pious Christians, for C. was a man who drew the hearts of his fellows after him; a lovable, manly Christian, hating lies, worldliness, hypocrisy, and all manner of untruthfulness, with that honest warmth of temper which all vigorous people relish. A sect sprang up after his death, or martyrdom as they conceived it, called *Johannists*, who refused to acknowledge his successors; nor did they return to the general communion till 438, when the archbishop Proclus prevailed on the emperor Theodosius II. to bring back the body of the saint to Constantinople, where it was solemnly interred, the emperor himself publicly imploring the pardon of heaven for the crime of his parents, Arcadius and Eudoxia. The Greek church celebrates the festival of C. on the 13th of Nov.; the Roman, on the 27th of January. In his *Homilies* (Thomas Aquinas said he would not give in exchange those on St. Matthew for the whole city of Paris) C. displays superior powers of exegesis. In general, he rejects the allegorical system of interpretation, and adheres to the grammatical, basing his doctrines and sentiments on a rational apprehension of the letter of Scripture. He is, however, far from being a bibliolater. He recognized the presence of a human element in the Bible as

well as a divine; and instead of attempting, by forced and artificial hypotheses, to reconcile what he thought irreconcilable in Scripture statements, he frankly admitted the existence of contradictions, and shaped his theory of inspiration accordingly. But his greatest and noblest excellence lay in that power, springing from the fervor and holiness of his heart, by which the consciences of the proud, the worldly, and the profligate were awakened, and all were made to feel the reality of the gospel message. The surname C. was first applied some time after his death, and, as it is supposed, by the sixth œcumenical council in 680. C.'s works are very numerous, and consist of, 1st, *Homilies*, on parts of Scripture and points of doctrine; 2d, *Commentaries*, on the whole Bible (part of which has perished); 3d, *Epistles*, addressed to various people; 4th, *Treatises*, on different subjects (such as Providence, the Priesthood, etc.); and 5th, *Liturgies*. Of these the most valuable, as well as the most studied, are the *Homilies*, which are held to be superior to everything of the kind in ancient Christian literature.

The most correct Greek edition of C.'s works is that by Henry Savil (8 vols., Eton, 1613); and the most complete Greek and Latin edition is that by Montfaucon (13 vols., Par. 1718-38; republished in 1834-40). The best authority in regard to C. is Neander, who, besides treating of his life and labors in his *Kirchengeschichte*, published a life of this eminent father.

CHRYSOTYPE (Gr. *chrysos*, gold; *typos*, impression), a photographic process invented by sir John Herschel, and depending for its success on the reduction of a persalt of iron to the state of protosalt by the action of light, and the subsequent precipitation of metallic gold upon this protosalt of iron. The process is conducted as follows: Good paper is immersed in a solution of ammonio-citrate of iron of such a strength as to dry into a good yellow color, without any tinge of brown in it. It is then exposed to light under a negative until a faint impression is obtained. A neutral solution of chloride of gold is then brushed over the paper, when the picture immediately appears, and is rapidly developed to a purple tint. It should then be freely washed in several changes of water, fixed with a weak solution of iodide of potassium, again thoroughly washed and dried. The action of the iodide of potassium is to convert any unaltered chloride of gold into a soluble double iodide of gold and potassium, thus rendering the picture permanent.

CHRZANOWSKI, ADALBERT, 1788-1861; a native of Poland, who participated in Napoleon's Russian campaign, in the engagements at Leipsic, Paris, and Waterloo. After Napoleon's final defeat he served in the Russo-Polish army, and was under Diebitsch in Turkey in 1829. In the Polish revolution of 1830 he served with distinction, rose to the rank of gen. of division, and was made governor of Warsaw. He fell under suspicion of friendliness to the Russians, and was from time to time under a sort of ostracism. In 1849, he was chosen by Charles Albert commander-in-chief of the Sardinian forces in the short-lived revolution of that period. Ramorino and C. were charged with treachery, and the former was put to death. Some years later C. emigrated to the United States, and died in Louisiana.

CHUB, *Leuciscus cephalus*, a fish of the family *cyprinidæ*, of the same genus with the roach, dace, bleak, minnow, etc. See *LEUCISCUS*. The color is bluish-black on the upper parts, passing into silvery white on the belly; the cheeks and gill-covers rich golden yellow. The C. rarely attains a weight exceeding 5 lbs. It is plentiful in many of the rivers of England, and occurs in some of those of the s.w. of Scotland. In the rivers of Cumberland it bears the name of *skelly*, supposed to have reference to the size of its scales; but the schelly of Ullswater lake is the gwyniad, and the C. is there called the *cherin*. It is found in many rivers of the continent of Europe; being the *jenltling* or *bratfish* of the Danube, and the *jese* of the Oder. It spawns in April and May. It is not in great esteem for the table.

The C. rises well at a fly, and takes freely a variety of baits. The same baits and the same means of fishing may be employed as for the barbel and bream. The C. is very fond, moreover, of slugs, grasshoppers, cockchafers, and humble-bees. The latter two are to be used either naturally, by means of dibbing or dapping, or, being imitated, may be used artificially, and cast as a fly. The best flies for the C. are large red, black, and brown palmers, with the hackles laid on thickly. The best places to fly-fish for C. are close under overhanging boughs at the sides of streams, or against piles, or other places where they can get some shelter, for the C. is somewhat shy and easily alarmed. He is a bold riser, and when he comes at a fly seldom fails to hook himself. Of all the baits for bottom-fishing, he prefers greaves, cheese, and worms; and the fatter the bait the better he likes it. He will occasionally run at a minnow, and is often taken on a spinning bait. The C. spawns in May and comes into condition again by the end of June or early in July; bites best, and is in the best condition for bottom-fishing, in Oct. and Nov. When first hooked, he makes a great dash, but he very soon gives in. Some years ago, the scales of the C. were in much at request, in common with those of the bleak, for artificial pearl-makers.

CHUBB, THOMAS, an English rationalist, who wrote on religious questions during the first half of the last century, was b. at East Harnham, in Wiltshire, in 1679. He received but a meager education in youth, and, after an apprenticeship to a leather glove and breeches maker in Salisbury, he became a tallow-chandler, in which business he con-

tinued to the end of his life. His first work, published in 1715, was entitled *Supremacy of God the Father Vindicated*. Besides this, he wrote a multitude of treatises on other religious subjects. Among these may be mentioned: *A Discourse on Reason, as a sufficient Guide in matters of Religion; On Sincerity; On Future Judgment and Eternal Punishment; Inquiry about Inspiration of the New Testament; and Doctrine of Vicarious Suffering and Intercession Refuted*. C. died in 1746.

CHUCK-WILL'S-WIDOW, *Antrostomus Carolinensis*, a bird of the goatsucker family (*caprimulgidae*), a native of the southern parts of the United States. It has received its singular name from its note, which resembles these words or syllables articulated with great distinctness, and is repeated like that of the cuckoo, or of its own congener, the whip-poor-will (q.v.).

CHUGUITO, or **CHUQUITO**, a t. of Bolivia, in the department of Puno, and 100 m. e.n.e. of Arequipa, on the w. shore of lake Titicaca, at the mouth of a stream flowing from the Andes. It was formerly of much greater size and importance than it is at present, having had, it is said, at the beginning of the 18th c., the incredible number of 300,000 inhabitants. Its present pop. is only about 5,000. In the province of the same name, of which it is the capital, there are mines of silver and gold, and interesting antiquarian remains.

CHU-LAN. See **CHLORANTHACEÆ**.

CHUMBUL', a river rising in the Vindhyan mountains, which form the southern limit of the basin of the Ganges. Its source, at a height of 2,019 ft. above the sea, is in lat. 22° 26' n., and long. 75° 45' east. During a generally n.e. course of 570 m., it receives many tributaries on both sides, till, in lat. 26° 30' n., and long. 79° 19' e., it enters the Jumna from the right, with such a volume of water, that, when itself flooded, it has been known to raise the united stream 7 or 8 ft. in twelve hours. The C. is remarkable, here and there, for the wildness of its current and the picturesque character of its banks.

CHUNAM', the Indian name for a very fine kind of quicklime made from calcined shells or from very pure limestone, and used for chewing with betel (q.v.), and for plaster. Both recent and fossil shells are used for making chunam. Extensive beds of fossil shells employed for this purpose occur in the s. of India, particularly in low marshy situations near the sea-coast. The shells used are in the first place very carefully cleaned; they are then calcined in kilns, with wood charcoal. When chunam is to be used for plaster, it is mixed with fine river-sand, and thoroughly beaten up with water. A little *jaggery* (coarse sugar) is also added. When very beautiful work is desired, three coats of chunam are given to the wall, and the result is a plaster almost equal to marble in its polish and beauty. The third coat is applied in the form of a very fine paste, consisting of four parts of lime and one of fine white sand, beaten up with whites of eggs, sour-milk, and *ghee* (butter). After it has been rubbed on with a wooden rubber, the surface is washed with a cream of pure lime, and is rubbed with a polished piece of quartz or rock crystal. During this process, the wall is sprinkled with powder of pot-stone, and the rubbing is continued until the wall is quite dry, every trace of moisture being finally removed by a cloth. Chunam is an important article of trade in India.

CHUNARGURH', or **CHUNAR**, a fortified t. on the right bank of the Ganges, 16 m. to the s.w. of Benares, and in the division of that name. It is in the district of Mirzapore, and lieutenant-governorship of the north-west provinces. The population of the town in 1871 amounted to 10,154. The fortress, which occupies the summit of a sandstone rock, contains the commandant's house, the hospital, the prison, and an ancient palace, with a deeply excavated well of indifferent water. The river in front is navigable at all seasons for vessels of from 50 to 60 tons.

CHUND, or **CHAND**, a Hindu writer of the 12th c., court poet to the last of the Hindu sovereigns of Delhi. He wrote in verse an immense encyclopædic work, including a history, and especially an account of the exploits of the author and of his master.

CHUPRA, a t. in India, in the province of Behar, Bengal, on the n. bank of the Ganges, 35 m. n.w. of Patna. It extends nearly a mile along the river, and has several pagodas, mosques, and churches. There is trade in cotton, sugar, and saltpeter. Pop. about 30,000.

CHUQUISA'CA, or **SU'CRÉ**, the capital of Bolivia or Upper Peru, in lat. 19° 20' s., and long. 65° 30' west. It is situated on a table-land about 9,000 ft. above the sea, and has a pleasant climate. The town is well built, has a cathedral of great magnificence, a university, a college of arts and sciences, and a mining-school. C. was founded in 1538 by Pedro Auzures, an officer of Pizarro's, on the site of an old Peruvian town called "Choque Chaka," or "bridge of gold," "the treasures of the Incas having passed through it on their way to Cuzco." At one time, C. bore the name of La-Plata, on account of the rich silver mines in its vicinity. Pop. 23,979. C. gives name to a territory containing 223,668 whites, besides many native Indians. It has five silver mines in operation; and in it are magnificent ruins of unknown origin. The second name is derived from the general who, in Dec., 1824, fought and won the last great battle for colonial independence at Ayacucho.

CHUR (Fr. *Coire*, anct. *Curia Rhetorum*), a t. of Switzerland, capital of the Grisons, in the valley of the Upper Rhine, in a fertile plain about 2000 ft. above the sea, and surrounded by high mountains, 60 m. s.e. of Zurich, on the Plessur, about a mile from its junction with the Rhine. It is of importance as standing on the great road to Italy by the Splügen and Bernardin passes, and thus possessing a considerable transit trade. C. stands on uneven ground, has narrow streets, and is divided into a high and low town. The bishop's palace, and the quarter around it, inhabited by the Roman Catholics, occupy the summit of an eminence, and are separated from the rest by walls and battlements, closed by double gates. In the same quarter stand the old cathedral, a round, arched, or Byzantine edifice, founded in the 8th c.; the church of St. Lucius or the *Dom*, a curious example of early pointed Gothic, including fragments of earlier buildings. It contains singular old carving, paintings, and statues, and also, it is said, the bones of St. Lucius, who was a British king. Behind the episcopal palace is a kind of ravine lined with vineyards. In the lower town there are also some very ancient buildings. Romansch is still spoken in the vicinity; a newspaper in this dialect is published in the town; and a considerable collection of Romansch literature is to be found in the library of the cantonal schools. There are several new roads leading in different directions through the Grisons; and a railway connects the town with Zurich and other places. There are manufactures of zinc wares and cutting tools. Pop. '70, 7,552, of whom about 2000 are Catholics.

CHURCH, a word which signifies either a place of Christian worship or a collective body of Christian people. It is, in all probability, derived from the Greek adjective *kyriakos* (from *kyrios*, lord), the place of worship having been called *the Lord's house*, and the worshippers *the Lord's people*. The Scottish *kirk*, the German *kirché*, etc., are merely different forms of it.

Under the terms apse and basilica (q.v.), we have already explained that the earliest ecclesiastical structures of the Christians were copied or adapted not from the heathen or Jewish temple, as might have been anticipated, but from that peculiar combination of a hall of justice and a market-place to which the name basilica was given by the ancients. The reason of this selection is probably to be found, not so much in the spirit of opposition which no doubt existed between Christians and heathens, as in the essentially different conceptions which they formed of the character and objects of public worship. The rites of heathendom were performed exclusively by the priest, the people remaining without the temple; and the temple itself, which was lighted only from the door, or by the few lamps which burned around the image of the god, was regarded not as a receptacle for worshippers, but as the abode of the deity. The dark, mysterious character which thus belonged to it, rendered it equally unsuitable for the performance of liturgical services in which the people were to participate, and for the delivery of those public addresses which from the beginning were employed as a means of Christian teaching and exhortation. To such purposes, the prætor's court-room, with its surroundings, were readily adapted, by the few simple alterations which we have described in the articles referred to. But the basilica, as thus altered, was a mere utilitarian structure. It served the purposes of Christian worship, but there was nothing in its form which responded to the feelings of Christian worshippers, or tended to awaken Christian sentiments. Now, the cross (q.v.) had been used by Christians from a very early period to indicate their allegiance to the author of their salvation and the object of their faith; and gradually it had become the distinctive emblem of Christianity. Nothing, then, could be more natural than that when it became desirable to give distinctively Christian characteristics to what hitherto had been a heathen structure, this should be effected by such a modification of its form as should convert it into a representation of this sacred emblem. Nor did this alteration lead to any very extensive change on the form of the C., as it had hitherto existed. The basilica, as we have already explained, not unfrequently had side entrances, either in place of, or in addition to, that from the end. All that was requisite, then, to convert the simple parallelogram of which it consisted into a cross, was, that at each side of the building these entrances, in place of direct communications with the exterior, should be converted into passages, or arms running out at right angles, and more or less prolonged, according as the object was to attain the form of a Greek or of a Latin cross (see *Cross*). If the C. was to be in the form of a Greek cross, the arms were made of the same length with the other two portions into which they divided the building; whereas if the cross was to be a Latin one, the portion of the building which ran towards the w. was made considerably longer than either of the others. In either case, the arms running at right angles to the C., and directly opposite to each other, cut it across, and thus obtained the name of *transepts*.

The external form of the C. being thus indicated, we now proceed to explain its internal arrangements, and to enumerate the various adjuncts which in cathedrals and others of the larger churches frequently sprang up around it.

Over the point at which the arms or transepts intersect the body of the cross, a central tower or spire is very frequently erected. From this central tower, or, if the tower or towers are situated elsewhere, from this central point, the portion of the building which runs westward, to where the Galilee or entrance chapel, or, in other instances, the

great entrance-door is situated, is called the nave (from *navis*, a ship), whilst the portion which runs eastward to where the altar, or high-altar, if there be several, is placed, is called the choir. In the larger and more complete churches, the nave, and frequently also the choir, are divided longitudinally by two rows of pillars into three portions, the portion at each side being generally somewhat narrower and less lofty than that in the center. These side portions are called the aisles of the nave, or of the choir, as the case may be. In some churches, the aisles are continued along the transepts, thus running round the whole C.; in others, there are double aisles to the nave, or to both nave and choir, or even to nave, choir, and transept. Behind, or to the e. of the choir, is situated the Lady's chapel, or chapel of the Virgin, with sometimes a number of altars; and it is not unusual for side chapels to be placed at different places along the aisles. These usually contain the tombs of the founder, and of other benefactors to, or dignitaries connected with, the church. The extent to which these adjuncts exist depends on the size and importance of the C., and they are scarcely ever alike in two churches, either in number, form, or position. Vestries for the use of the priests and choristers generally exist in connection with the choir. Along the sides of the choir are ranged richly ornamented seats or stalls, usually of carved oak, surmounted with tracery, arches, and pinnacles; and amongst these seats, in the case of a bishop's church, the highest and most conspicuous is the so-called *cathedra*, or seat for the bishop, from which the cathedral takes its name. The larger English cathedral and abbey-churches have usually a chapter-house attached to them, which is of various forms, most commonly octagonal, and is often one of the richest and most beautiful portions of the whole edifice. On the continent, chapter-houses are not so common, the chapter (q.v.) being usually held in the cathedral itself, or in one of the chapels attached to it. Cloisters (q.v.) are also frequent, and not unusually the sides of those which are furthest removed from the C. or chapter-house, are inclosed by other buildings connected with the establishment, such as a library, and places of residence for some of the officials of the cathedral. It is here that, in Roman Catholic churches, the hall, dormitories, and kitchens for the monks are commonly placed. Beneath the C. there is frequently a crypt (q.v.). In some cathedral churches, the crypt is in reality a second underground C. of great size and beauty. The baptistery (q.v.) is another adjunct to the C., though frequently forming a building altogether detached. Most of the parts of the C. which we have mentioned may be traced; but it must not be supposed that their position is always that which is there represented. The position of the nave, choir, or chancel, aisles, and transepts are nearly invariable, but the other portions vary, and are scarcely alike in two churches.

Churches are of five classes—metropolitan, cathedral, collegiate, conventual, and parish churches—and of these the first are, generally speaking, the most, and the last the least elaborate. In ordinary language, any building set apart for religious ordinances is called a church, though when of a minor kind it is more usually designated a chapel. After a long period of neglect and poverty of taste, the building of churches in a superior style, emulative of the older styles of architecture, has greatly revived, not only as regards the church of England, but the church of Scotland and nearly all dissenting bodies.

As applied to a collective body of Christian people, the word C. is the translation and equivalent of the Greek word *ecclesia* (Lat. *ecclesia*, Fr. *église*), used in the New Testament. It is common among Protestants to distinguish between the *visible* and the *invisible* C.—the invisible C. consisting of all those who are savingly or spiritually united to Christ, that is, of all true believers; the visible C. consisting of all who profess the religion of Jesus Christ. Roman Catholics do not in the same manner acknowledge the distinction between the visible and the invisible C., but regard a connection with the hierarchy, and consequent participation of ordinances, as establishing a connection with the true C. and with Christ. Protestants regard the C. as subsisting from age to age, in virtue of the authority of Christ, and through the faith of individual believers and their confession of him; Roman Catholics regard the apostolical succession of the hierarchy, and the regular administration of the sacraments, as essential to the continued existence of that *Catholic* or universal C. which Christ planted on the earth, and the existence of which he has promised to maintain throughout all ages. Protestants, in general, regard the C. of Rome and the Greek C. as forming part of the visible C. of Christ; but Roman Catholics are not accustomed to make a corresponding admission with respect to the Protestant churches. From the hierarchical principle of the C. of Rome and of the Greek C., results an employment of the term C. to designate the hierarchy alone, which is contrary to the principles of the reformation, although a tendency to it may be observed in some Protestant churches. It has been usual for Protestants to designate by the term C. the collective body of Christians in a particular country, distinguished by the name of that country; the greater number of Protestants (Episcopalians and Presbyterians) believing that such a portion of the universal C. may warrantably be associated under a common government; and in countries where religious liberty exists, diversities of opinion on points of doctrine and C. government have given rise to the existence of separate Christian associations, distinguished by names generally indicative of some of the peculiarities which characterize them; but these, however much they may differ on many points, do not in general hesitate to recognize each other as belonging to the universal visible C. of

Christ, whilst they retain in common the same great first principles of the Christian faith, and particularly the belief in one God and in the three persons of the Godhead, the incarnation of the Son of God, the atonement by Jesus Christ, and the work of the Holy Spirit. The term C., however, is regarded by Independents (q.v.) or Congregationalists, as more strictly applicable to those who are united as worshipers in a particular place of worship, partaking of the Lord's supper together, and exercising discipline and C. government among themselves.

CHURCH, ALBERT E., LL.D., 1807-78; b. Conn.; graduated at West Point in 1828. He became professor of mathematics in the U. S. military academy in 1838, and published *Elements of Differential and Integral Calculus*; *Elements of Analytical Geometry*; *Elements of Analytical Trigonometry*; and *Elements of Descriptive Geometry, with its application to Spherical Projections, Shades and Shadows, Perspective and Geometric Projections*.

CHURCH, BENJAMIN, 1639-1718; a New England soldier who served with distinction in king Philip's wars, and was commander in the fight in which Philip was killed. He commanded a number of expeditions against the Indians of New Hampshire and Maine. From his dictation and memoranda his son wrote a history of king Philip's war.

CHURCH, FREDERICK EDWIN, b. Conn., 1826; a pupil of Thomas Cole, and a painter of eminence. The works which gave him prominence are a "View of East Rock, near New Haven," and "Scenes in the Catskill Mountains." He visited South America in 1853 and 1857; and in Ecuador and New Granada made sketches for a number of paintings, some of which have attained great celebrity, such as the "Heart of the Andes," "On the Cordilleras," and "Cotopaxi." Another celebrated work is the "Horse-shoe Fall, Niagara." He visited Jamaica, and afterwards Europe and the Holy Land. Some of his other works are "Damascus," "Jerusalem," "The Parthenon," and "Tropical Scenery."

CHURCH, JOHN HUBBARD, D.D., 1772-1840; a graduate of Harvard in 1797, and for nearly 40 years pastor of a Congregational church in Pelham, N. H. He held various offices in Dartmouth college, Andover theological seminary, and Phillips academy, and was prominent in Bible, tract, and missionary societies.

CHURCH, sir RICHARD, 1780-1873; an Englishman, who held the principal command in the Greek war of independence. On the final establishment of the kingdom of Greece he was made a counselor of state, and afterwards a member of the senate; and was for many years at the head of the army and navy.

CHURCH, SANDFORD E., LL.D., 1815-80; b. N. Y.; bred to the law, in which he speedily rose to a prominent position. In 1850, he was elected lieut. gov. of New York, and was re-elected in 1852; in 1857, he was elected comptroller, but twice afterwards defeated for the same office. In 1870, he was elected chief justice of the court of appeals, which position he held until his death.

CHURCH, STATES OF THE. See PAPAL STATES.

CHURCH CALENDAR, a table of the order and series of days, weeks, months, and holy days in the year. The name is derived from *calendæ*, or first days of the Roman month. The earliest now existing which contains the Christian festivals is that of Silvius, 448 A.D. A fragment of a Gothic calendar remains, which probably belongs to the 4th century. The name is applied also to the *fasti* or catalogues for particular churches, of the saints most honored by them, such as bishops, martyrs, etc. At the reformation the German Lutheran church retained the Roman calendar. In 1850, a calendar was published for the evangelical church of Germany. It has been continued annually, and contains much interesting information, in addition to the table of feasts, fasts, etc. The full calendar of the church of England contains 9 columns, giving the golden number, days of the month, the dominical or Sunday letter, the calends, nodes and ides, the daily Scripture lessons, and the holy days of the church, together with some of the Roman festivals which have been retained, not as having any religious value, but because the practice of the courts, the habits of tradesmen, and the times of popular amusements had become interwoven with them. The calendar of the Protestant Episcopal church in the United States retains only the festivals which are referable to a Scriptural origin.

CHURCH CONGRESS, the name of free gatherings of ministers and laymen of the established church of England, annually convened for the discussion of ecclesiastical and religious questions. The first church congress was held in 1861 in Canterbury, and in the following years successively in Oxford, Manchester, Bristol, York, etc. The attendance is usually very large, and comprises many bishops and lower dignitaries. Full reports of the proceedings of each session are published. Such meetings, having the advantage of free interchange of views, but with no claim to ecclesiastical authority, have been found very profitable in this country; and though in the Protestant Episcopal church the sentiment in their favor has not been unanimous, they are winning for themselves an established position through either enthusiastic advocacy or silent consent.

CHURCH DIET, the free gathering of ministers and lay members of German Protestant churches. Such meetings arose in consequence of the revolutionary movements of 1848, which threatened to endanger the influence of the evangelical church upon society. Members of the Lutheran, Reformed, the United Evangelical, with the high church "confessionals" participated in the earlier meetings; but after 1860 only the evangelical parties were represented. Annual reports are published.

CHURCH DISCIPLINE, *Disciplina ecclesiastica*, includes all the means employed by the Christian church, besides the ministration of word and sacraments, to secure on the part of its office-bearers and members a faithful adherence to their profession and a corresponding blamelessness of life. It rests upon the authority of Christ, and at the same time necessarily arises, in some form of it, out of the very constitution of the church as a society. Among the early Christians, it soon assumed forms of great severity towards offenders, especially towards the *lapsid* (q.v.). At a later period, the discipline of the church was chiefly exercised with respect to persons accused of heresy and schism. The penances of the church of Rome have long formed an important part of its discipline, and therewith its *indulgences* (q.v.) are closely connected, as well as its doctrine and rule of *auricular confession* (see CONFESSION). In the Protestant churches, public confession of sins by which public scandal has been given, and submission to public rebuke, are sometimes required. Practices more analogous to those of the primitive church were established in many churches after the reformation, but in general have fallen greatly, or entirely, into disuse. The power of exclusion from the Lord's Supper, and from the rights and privileges of church membership, is, however, generally retained and exercised, until, by profession of repentance, and by reformation of life, the cause of such exclusion is removed; and ministers or other office-bearers are, upon offense given in their doctrine or conduct, suspended from their functions, or altogether deposed from their office. The exercise of C. D. belongs more or less exclusively to a hierarchy, or to the office-bearers assembled in church-courts, or to the members of each congregation, according as the church is Episcopalian, Presbyterian, or independent in its church government. There is an increasing tendency among Christians in general to scrutinize closely the claim of right to exercise C. D., and the limits within which it may be exercised.

CHURCH GOVERNMENT. The Christian church, like every other society, must have a certain constitution and rules according to which its affairs are administered. It is disputed, however, among Christians, how far this constitution has been defined, or these rules prescribed by divine authority, and how far they have been left to the discretion of men. The form of C. G. depends primarily on the idea entertained of the constitution of the church. Congregationalists, or independents (q.v.), accordingly place all C. G. in the hands of the members of the congregation and the office-bearers whom they have elected. This theory of C. G. is maintained by many Baptists and others, who, for various reasons, assume different denominations.—Episcopalians and Presbyterians agree that many congregations are to be united under a common government; but this, according to Presbyterians, is properly carried on by ministers and elders of these congregations meeting for this purpose on a footing of equality; whilst, according to Episcopalians, it is more or less absolutely in the hands of bishops, who are superior to the mere pastors of congregations. See EPISCOPACY and PRESBYTERIANISM.

CHURCH HISTORY or **ECCLESIASTICAL HISTORY**. The history of the Christian religion and church forms one of the most important parts of the general history of mankind, and is intimately connected not only with the political history of the world, but with the history of philosophy, of literature, and of civilization. The sources and authorities are extremely various, and their due appreciation often requires as much judgment as their exploration requires toil. Church history is either general—embracing a view of the affairs of the church in the whole world from the beginning to the present day—or particular, relating to some particular country, or time, or portion of the church. By some authors, it has been treated chiefly with regard to the outward affairs of the church; and by others, with reference to doctrine, morals, and the evidences of spiritual life; whilst others still have devoted their attention chiefly to the forms of worship, the constitution of the church, and other things generally comprehended under the name of ecclesiastical antiquities. All these, of course, have important relations to each other. The earliest writers of church history were in general mere chroniclers, following the order of time; in the great work of the Magdeburg centuriators, a method was adopted, of which there had been previous examples, and which afterwards became frequent, of treating each century separately, the centuries being subdivided according to convenience of subjects; but arrangements less mechanical and arbitrary have been adopted by the most eminent modern authors. With much diversity on minor points, there is a general agreement in dividing the whole history of the church into three great periods: the first, from our Saviour to the time of Constantine; the second, from that time to the reformation; and the third, from the reformation to the present day.

The earliest facts of C. H. are to be learned only from the New Testament, after which, however, the epistles and other writings of the apostolic and other primitive fathers afford sources of information, unfortunately very scanty; Hegesippus, who

wrote about the middle of the 2d c., has transmitted to us some very imperfect memoirs of these early times; but the first proper ecclesiastical history is that of Eusebius of Cæsarea (324). This work was continued to the 5th c. by Socrates Scholasticus, Hermias Sozomenus, and Theodoret. Similar compilations were executed by Lactantius, Epiphanius, Hieronymus, Theodoret of Cyrus, Philostorgius, and Zosimus. In the 6th c., the chief ecclesiastical historians are—Theodorus Lector, Evagrius, and Nicephorus Callistus; in the 8th, the venerable Bede and Paul Warnefried; in the 9th, Theophanes Confessor, Claudius of Turin, Haymo of Halberstadt, Scotus Erigena, and Hinkmar of Rheims; in the 12th and 13th, Photius, Simeon Metaphrastes, Theophylact, Matthew Paris, Albert of Strasburg, and Ptolemy of Luca; in the 15th, Laurentius Valla is the most conspicuous name. Protestant writers were the first to treat C. II. in a critical and scientific manner. This was natural, for their position as apparent schismatics compelled them to vindicate historically the changes which they had wrought in the character of the church. Hence their writings were of an apologetic and polemical cast. The first work of this kind was the *Magdeburg Centuries* (q. v.), published by Matthias Flacius. Special histories of the reformation were composed by Sleidan and Seckendorf. In the 17th c., Calixtus distinguished himself in this department, and after him Thom. Illig, Adam Rechenberg, and Thomasius. The new life that awoke in Germany towards the middle of the 18th c., produced a multitude of church historians, of whom we can only afford to mention Arnold, C. M. Pfaff, Mosheim, Semler, and J. Matth. Schröckh; while in still more recent times, Marheineke, Danz, Neander, Gieseler, and Hagenbach have achieved the highest distinction in the same sphere of labor. But others besides the Lutheran divines have rendered valuable services to church history. The reformed church boasts the eminent names of Du Moulin, Joh. Dallius, Blondel, Hottinger, Spanheim, Turretin, Venema, Jablonski, and recently, D'Aubigné; while among Englishmen, Usher, Pearson, Bingham, Lardner, and recently, Milman and Maurice, have won a distinguished place. Scotland has few names, the chief being Calderwood, Wodrow, M'Crie, and recently Cunningham. In the Roman Catholic church, since the period of the reformation, ecclesiastical historians have rarely manifested a dispassionate and philosophic spirit. They have appeared mainly in the character of defenders of the papacy. The greatest names in C. H. in Catholic France are Tillemont, Bossuet, Bayle, Du Pin, Thomassin, and Fleury. Among the Italians may be mentioned Orsi, Saccharelli, Pallavicini, Guicciardini, and Muratori; and among the Roman Catholics of Germany, Dannenmayr, count Stolberg, Ritter, Hortig, Döllinger, etc.

For the benefit of the English reader, it may be stated that the extensive, profound, and philosophic work of Dr. Augustus Neander has been translated from the original German into English, and is published in 10 vols. by Bohn.

CHURCHILL, a co. in w. central Nevada, intersected in the n. part by the Central Pacific railroad; 5,800 sq. m.; pop. '70, 196. It is watered by the Humboldt, Carson, Walker, and other rivers. Among the minerals are gold, silver, salt, soda, etc. Co. seat, Stillwater.

CHURCHILL, CHARLES, an English poet, now remembered almost as much for his profligacy as his poetry, was b. at Westminster, where his father was a curate, in 1731. He was educated at Westminster school, and in his 17th year made a clandestine marriage. In 1756, he was ordained, and, two years afterwards, succeeded his father as curate of St. John's, Westminster. Soon after his transference here, he fell into habits very ill-becoming his clerical character. In 1761, he published (at his own risk, the booksellers having refused him five guineas for it) *The Rosciad*, a satire on theatrical managers and performers, which displayed much critical acumen, clever sarcasm, and no little humor, and enjoyed such an immense success that C., who on its publication had withheld his name, was soon delighted to avow himself author. In the same year appeared *The Apology*, a bitter satire on some of his critics, which added alike to his purse and his notoriety. He now totally neglected the duties of his office, was a constant attendant at theaters, and altogether led a most dissolute life. His parishioners were scandalized, and his dean remonstrated, whereupon C., to show his utter contempt for the ministerial profession, appeared in a blue coat, gold-laced hat and waistcoat, and large ruffles. He was obliged, however, to resign his preferment, which pecuniary sacrifice was little, as his works brought him considerable sums. He further displayed the complete licentiousness of his nature by separating from his wife, and seducing the daughter of a tradesman in Westminster, and by endeavoring to excuse his vices in a poem called *Night*, on the ground that avowed profligacy was more harmless than profligacy practiced in concealment. The boon-companion of as great a debauchee as himself—Wilkes—he contributed to the pages of the *North Briton*, among other things, *The Prophecy of Famine—A Scots Pastoral*, one of the best of his satires. Among his other works, all more or less satirical, are the *Epistle to Hogarth*; *The Author*; *The Candidate*; *The Ghost*; *Gotham*; *The Duellist*, etc., of which *The Author* is the best. He died Nov. 4, 1764, while on a visit to Wilkes at Boulogne. C.'s thorough reprobacy has naturally led to an unjust depreciation of his poetical abilities. See *Poetical Works* by Took (1867), with *Life* by Hannay.

CHURCHILL, JOHN. See MARLBOROUGH, *ante*.

CHURCHILL, MISSISSIPPI, or ENGLISH RIVER, in British North America, rising in Methy lake, and running s.e. through Buffalo and La Crosse lakes, to Hudson's bay; length about 700 miles.

CHURCHING OF WOMEN, a religious usage prevailing in the Christian church from an early period, of women, on their recovery after child-bearing, going to church to give thanks. It appears to have been borrowed from the Jewish law (Lev. xii. 6). In the church of the early ages, it was accompanied with various rites; and in the church of Rome and Greek church, it is imperative. In the church of England, also, a service for the C. of W. finds a place in the liturgy. By the Presbyterian and independent churches of Britain it is rejected, as having no Scripture warrant.

CHURCH OF ENGLAND. See ENGLAND, CHURCH OF, *ante*.

CHURCH OF GOD. See WINEBRENNERIANS.

CHURCH OF SCOTLAND. See SCOTLAND, CHURCH OF, *ante*.

CHURCH OF SCOTLAND, FREE. See FREE CHURCH OF SCOTLAND, *ante*.

CHURCH RATES, in England, a tax or assessment laid on the parishioners and occupiers of land within a parish, by a majority of their own body in vestry assembled, for the purpose of upholding and repairing the fabric of the church and the belfry, the bells, seats, and ornaments, the churchyard fence, and the expenses (other than those of maintaining the minister) incident to the celebration of divine service. The parishioners are convened for this purpose by the church-wardens (q.v.). The chancel (q.v.) being regarded as belonging peculiarly to the clergy, the expense of maintaining it is laid on the rector or vicar, though custom frequently lays this burden also on the parishioners, as in London and elsewhere.

The C. R. were anciently a charge on the tithes of the parish, which were divided into three portions: one for the structure of the church, one for the poor, and the third for the ministers of the church. This distribution is said to have originated with pope Gregory, who enjoined St. Augustine thus to divide such voluntary offerings as might be made to his missionary church in England. A canon of archbishop Ælfric in 970, and an act of the Wittenagemote in 1014, in Ethelred's time, have been quoted in proof of the recognition of this rule by our Saxon fathers. It seems to have been their custom, also, to devote to the repair of each church a portion of the fines paid for offenses committed within the district attached to it; and every bishop was bound to contribute to the repair of his own church from his own means. A third of the tithes thus originally devoted to the repairs of churches, continued to be applied to that purpose under the Normans, down to the middle of the 13th c.; and the manner in which this burden came to be shifted to the parishioners, has been a subject of much discussion among legal antiquaries. Lord, then sir John, Campbell, who published a pamphlet on the subject in 1837, is of opinion that the contributions of the parishioners were at first purely voluntary, and that the custom growing, it at last assumed the form of an obligation, and was enforced by ecclesiastical censures. The care of the fabric of the church, and the due administration of its offices, are laid upon the ministers and the church-wardens conjointly, and the latter may be proceeded against by citation, in the ecclesiastical courts, should they neglect these duties. But there is no legal mode of compelling the parishioners as a body to provide the rate; and this circumstance has occasioned much difficulty in imposing the tax in parishes in which dissent is prevalent, and led to many churches falling into a partially ruinous condition. The proper criterion for the amount of C. R. is a valuation of the property within the parish, grounded on the rent that a tenant would be willing to pay for it. Glebe land, the possessions of the crown in the actual occupation of the sovereign, and places of public worship, are not liable for C. R.; but there is no other exception as regards immovable property, and in some parishes, custom even extends it to stock in trade. It has been often decided in the courts that a retrospective church-rate—i.e., a rate for expenses previously incurred—cannot be validly imposed. Much difficulty has been experienced in recovering the rates imposed by the parish on individuals refusing to pay. Previous to 53 Geo. III. c. 127, the only mode was by suit in the ecclesiastical court. That statute, however, in all cases under £10, empowered the justices of the peace of the county where the church was situated, on complaint of the church-wardens, to inquire into the merits of the case, and order payment. Against the decision of the justices, an appeal lies to the quarter-sessions. In 1868, an end was put to all parochial contentions by enacting that no suit or proceeding should thereafter be allowed in any court to enforce or compel payment of a church-rate, except where a local act authorized this rate. But except so far as related to the compulsory payment of these rates, the church-wardens might, as before, make, assess, receive, and deal with such rates. In each district parish, the inhabitants may treat their own church as if it were their parish church, and make and receive rates for the repair of the same. A body of trustees may now be appointed in each parish to receive contributions for ecclesiastical purposes in the parish. The result of this act of 31 and 32 V. c. 109, is thus not to abolish C. R., but rather to convert them into voluntary payments; allowing, as it does, all faithful adherents of the church to contribute, as before, to the repairs of their own churches. In Scotland the burden of upholding the parish churches is by custom imposed on the heritors of the parish; and where the parish is

partly within burgh and partly in the country, the expense must be borne by heritors and proprietors of houses, in proportion to their real rent. See SCOTLAND, CHURCH OF; see also DISSENTERS, and PARISH. [By an act passed in 1868, the compulsory collection of C. R. was abolished, and provision was made for the administration, by a body of church trustees, of such contributions as may be voluntarily agreed to, and of donations and bequests made for ecclesiastical purposes in the parish.]

CHURCH ROAD. See under the article HIGHWAY.

CHURCH-WARDENS, in England, are ecclesiastical officers, elected sometimes by the parishioners and minister jointly, sometimes by the minister alone, and sometimes by the parishioners alone, for the purpose of protecting the edifice of the church, superintending the celebration of public worship, and to form and execute other parochial regulations. They are generally two in number. See CHURCH RATES, PARISH, VESTRY.

CHURCH-YARD. See BURIAL, CEMETERY.

CHURN, a machine for agitating milk or cream for the production of butter. The principle of the operation is considered in the article on BUTTER. Of the great variety of forms that have been given to the machine, it is very difficult to determine which deserves the preference. It is obvious that the more thorough and uniform the agitation, the more completely will the butter be separated from the milk. The consistency and color of the butter are also elements in judging of the relative merits of churns. The temperature of the air and the milk affect the butter in these respects. During summer, that of the milk should not exceed 62°, and in very hot weather may be under 60°. During cold weather, the milk should be about 2° higher when put into the churn. The speed at which the operation is performed also influences the result. Trials instituted to test the relative merits of churns have failed to settle which is the best form for actual use in the dairy; for the same machine under different conditions does not always yield the same result. The oldest form is the upright or *plunge* churn. There is a general prejudice in favor of this form of C., on the ground that the butter is more completely separated and of better quality. Its great defect is that the operation, being generally performed by hand, is fatiguing. Recent improvements have chiefly aimed at ease in working, and a saving of time. The original *barrel* C., with a rotatory motion, like a grindstone, which motion was reversed every few rounds, has fallen from its once high repute into comparative neglect. An improvement on the barrel C. was the making of the barrel stationary, the milk being agitated by internal apparatus fixed on a horizontal spindle which is turned by a winch handle. Barrel churns, sometimes of monster size, are generally used in large dairies in Holland. For small or moderate-sized dairies, perhaps the most suitable is the *box* C., consisting of a cubical or oblong box, of birch or plane tree, having the agitators fixed on a horizontal spindle. Churns on a centrifugal action have also been successfully used, particularly in Sweden. More recently, churns of a barrel form, with an oscillating motion like a child's cradle, have been introduced, but without any decisively superior results.

To all forms of churns, power other than manual can be and is applied. In some parts of the continent of Europe, and in America, the dog is employed in churning by means of a contrivance like a squirrel's box. Horse-power is in very general use in large dairies in Great Britain. In very exceptional cases, steam-power is used.

CHURRUS. See HEMP.

CHURUBUSCO, a village 6 m. s. of the city of Mexico, on the river Churubusco, connected with the capital by an elevated paved causeway. In the village is the large convent of San Pablo. In the war between the United States and Mexico, Santa Anna made a stand here, Aug. 20, 1847, but the Americans under gen. Scott were victorious after a sharp action. On the same day occurred the battle of Contreras, and three weeks after that of Chapultepec, and the capture of the Mexican capital.

CHUSAN, an island on the e. coast of China, 40 m. n.e. from Ningpo, in 30° 40' n. lat., and 121° 48' e. long., of an oblong shape, and about 50 m. in circumference. It is mountainous; but has many fertile valleys, with a plentiful supply of water, and is very carefully cultivated by the hardy and independent people by whom it is inhabited. Mr. Fortune was struck with the richness of its flora. Azaleas clothe the mountains; clematises, roses, and honeysuckles grow in great luxuriance. The camphor and tallow tree, and many varieties of bamboo, are found in the valleys. Tea is cultivated to some extent on the hill-sides. For three fourths of the year, the climate is temperate. June, July, and Aug. are the hot months. In Aug., the thermometer averages 83°, but in Jan. and Feb. it is often as low as 20°. Ting-hai, the capital, a walled town about 2 m. in circumference, containing a fine specimen of Buddhist temple-architecture, surrendered to the British forces, July 5, 1840, and was retaken by them (having been evacuated the previous Feb.) Oct. 1, 1841. At the close of the war, the island was delivered up to the Chinese. In 1860, it was again occupied by British troops, but restored by the convention of Peking. Pop. about 200,000.

CHUSAN ISLANDS, a group of islands scattered round the one described above. The most remarkable of these is the sacred island of Pu-tu, lying e. from Chusan. It is covered with Buddhist temples, pagodas, and monasteries, which latter are inhabited by

a great number of Bonzes, as the Chinese priests are called. The island is devoted exclusively to religious purposes, and no layman is allowed to reside upon it.

CHUTIA, or **CHOTÁ, NÁGPUR**, a division of British India under the lieutenant-governor of Bengal, comprising the districts of Hazáribágh, Lohárdágá, Mánbhúm, and Sínhbhúm, and the seven tributary states which constitute the south-west frontier agency, between 21° and 25° n., and 82° and 87° e.; 43,901 sq. m.; pop. '72, 3,825,571, residing in 25,766 villages and 725,287 houses. The people consist of 2,567,292 Hindus, 169,006 Mohammedans, 15,798 Christians, and 1,703,475 of no religion specified. The last-named class consists mostly of remnants of tribes driven from the plains by the Hindus. There are in the division only six towns of more than 5,000 inhabitants. The chief productions are rice, corn, pulse, potatoes, and oil-seeds. A little tea is grown in two of the districts. The climate is dry and healthy.

CHUTIA, or **CHOTÁ, NÁGPUR TRIBUTARY STATES** (of India), seven in number, viz.: Sirguja, Udaipur, Jashpur, Gangpur, Bonái, Koriá, and Chang Bhakár, now under the political superintendence of the commissioner of Chutiá Nagpur, and forming the south-west frontier agency. The states are mountainous, thinly cultivated, and inhabited for the most part by wild aboriginal tribes; area, 15,419 sq. m.; pop. '72, 405,980. There are no towns, and only three villages of more than 1,000 inhabitants.

CHUT'NEE, or **CHUT'NY**, an East Indian condiment, very largely used in India, and to a considerable and increasing extent in Great Britain. Indian C. is a compound of mangoes, chillies or capsicum (q. v.), and lime-juice, with some portion of other native fruits, such as tamarinds, etc., the flavor being heightened by garlic. It is sometimes manufactured for sale in England, but not in any quantity. Families occasionally make it for their own use, and employ the following ingredients: Chillies, 1 to 1½ lbs.; apples, 1 lb.; red tamarinds, 2 lbs.; sugar-candy, 1 lb.; fresh ginger-root, 1½ lbs.; garlic, ¼ to ½ lb.; sultana raisins, 1½ lbs.; fine salt, 1 lb.; distilled vinegar, 5 bottles. The chillies are to be soaked for an hour in the vinegar, and the whole ground with a stone and muller to a paste.

CHWALYNSK', a t. of Russia on the Volga; pop., 14,262. It is a river port, and has important manufactures.

CHYLE. The food undergoes various changes in the alimentary canal, which will be fully noticed in the article on **DIGESTION**. One of these changes is its conversion in the stomach into a pulpy mass termed *chyme*. The chyme, which passes onward into the small intestine, is acted upon by the bile, pancreatic fluid, and intestinal juice, and through their influences is separated into the *chyle*, which is absorbed or sucked up by the lacteals (q. v.) and into matters unfit for nutrition, which ultimately find their way out of the system by the intestinal canal. The mode in which this nutritious C. is taken up by vessels distributed over the small intestines, and the changes which it undergoes before it is converted into true blood, are described in the articles **LACTEALS**, **THORACIC DUCT**, and **NUTRITION**. We shall here merely notice its leading physical and chemical properties. When obtained from the thoracic duct of an animal that has been killed while the process of digestion was going on (especially if it had taken fatty food), the C. is a white, milky-looking, or yellowish fluid, with a faintly alkaline reaction. Like the blood, it coagulates in about ten minutes after its abstraction from the body of the animal; and in about three hours a small but distinct gelatinous clot is separated from the serous fluid of the chyle.

On examining C. under the microscope, we find that it contains enormous numbers of minute molecules (probably consisting of fat), together with nucleated cells, which are termed the chyle-corpuscles, and are apparently identical with the white or colorless blood-cells. The chemical constituents of C. are much the same as those of blood; fibrin, albumen, fat, extractive matters, and salts being the most important.

CHYLIFEROUS SYSTEM. See **LACTEALS** and **THORACIC DUCT**.

CHYME. See **CHYLE** and **DIGESTION**.

CHYTRÆUS, DAVID, 1530-1600; an eminent Lutheran theologian. He studied at Tübingen and Wittenberg, and was a pupil of Melancthon. His learning and talents gave him high position, and he was employed by Maximilian II. to arrange ecclesiastical affairs in Austria. He was principal author of the statutes of Helmstadt, and one of the authors of the *Formula of Concord*. He left a number of important theological works.

CIALDINI, ENRICO, was b. at Castel Vetro, Modena, Aug. 10, 1813. Designed for the medical profession, he studied at Parma. When the abortive insurrection of 1831 broke out in the duchies, C. joined the volunteers of Reggio; and on the capitulation of Ancona, embarked for France, where he resumed his medical studies. The struggles against absolutism in the Iberian peninsula opened anew the career of arms to the Italian exiles. He joined the legion raised by Dom Pedro in France against the Miguelists, when his great personal courage soon secured his promotion; and the unanimous vote of his comrades pronounced him the worthiest man to receive the order of the tower and sword decreed by the government to his company. After the capitulation of Evora, C. joined (Oct. 22, 1835) the legion of Oporto, formed under Borso di Carminati for ser-

vice in Spain. In this force, C. gained further honors. In 1843, he followed Narvaez in his march against Madrid; was made by him col. of the regiment of St. Ferdinand; and afterwards employed in organizing the civil guard on the model of the French *gardarmée*. He was in this force when Charles Albert headed the Italian rising in 1848, when he hurried to Italy, and in the struggle which ensued he received a dangerous wound, and fell into the hands of the Austrians. On his release, he was employed by the Sardinian government to reduce to regular discipline the unruly volunteers from the duchies. He succeeded at last, and fought well at the head of his new regiment in the brief campaign of 1849. During the ten years that elapsed from the defeat of Novara to the renewal of the war in 1859, C. was actively employed. In the Crimea, he commanded the third division of the Sardinian contingent; and on his return was appointed inspector-gen. of bersaglieri and aide-de-camp to the king—a rare distinction for a man of plebeian origin. He was intrusted by Cavour with the formation of the famous Cacciatori delle Alpi, placed under the command of Garibaldi after the declaration of war, and co-operated actively with them at the head of the fourth division. The victory at Palestro was his chief exploit, the further progress of the Italians being stopped by the peace of Villafranca. In 1860, he defeated the papal army under gen. Lamoricière, at Castelfidardo. Diplomacy delayed the fall of Gaeta till Feb. 13, 1861, when it yielded to C. after a vigorous bombardment, as did the citadel of Messina shortly afterwards. Turin erected a statue to C. (*vincitore sempre*), and Reggio elected him deputy in April. For a few months he was governor of Naples. He had to act against Garibaldi in the second Sicilian expedition. When the army of Italy was reorganized in 1863, C. was appointed to one of the chief commands. Senator in March, 1864, he signalized himself by his brilliant speech in favor of the transfer of the capital (Dec., 1864). In the war of 1866, the advice of La Marmora was followed, and the defeat of Custoza was the result. C. was appointed chief of the staff on the resignation of La Marmora. In 1867, C. was intrusted by the king with the formation of a new ministry, but failed; he was also made commander-in-chief of the troops in central Italy. In 1870, he was engaged in the annexation of the papal states; and in 1876, he was sent as ambassador to Paris.

CIBA'O, a range of mountains in the middle of the island of Hayti, about 90 m. long, and having summits more than 7,000 ft. high. Gold has been found in these mountains.

CIBBER, CAIUS GABRIEL, 1630–1700; a sculptor, b. in Holstein, who was engaged to execute the *bassi rilievi* on the pedestal of the London monument, to commemorate the great fire of 1666. He made also the two figures representing "Madness" which once adorned the gate of the old Bethlehem hospital. He built the Danish church in London at his own expense.

CIBBER, COLLEY, was b. on the 6th Nov., 1671, in London. He was sent to the free school at Grantham, in Lincolnshire, in 1682. Five years thereafter, he returned to London, and in 1688 was a volunteer in the forces raised by the earl of Devonshire in support of the prince of Orange. He afterwards conceived a passion for the stage, and after performing gratuitously for several months, he succeeded in obtaining an engagement at 10s. per week, which was raised to 15s.; and on the commendation of Congreve, who had witnessed his performance of lord Touchwood, five additional shillings per week were added. Incited by this magnificent success, he, at the age of 22, married Miss Shore, to the great rage of her father, who revenged himself by spending the greater portion of his fortune in the erection of a retreat on the banks of the Thames. After marriage, C., discovering that 20s. per week was a somewhat insufficient income for an elegant gentleman and an elegant gentleman's wife, was induced to add thereto by the writing of comedies, some of which were remarkably successful. In 1711, he became one of the patentees in the management of Drury Lane, and remained in connection with that theater till 1730; when, on being appointed poet-laureate, he sold his interest in the business. He was, however, sometimes tempted back to the stage by an offer of 50 guineas a night. C. wrote and adapted many plays, but as an author he is best known by his *Apology*. He died suddenly on the 12th Dec., 1757.

CIBBER, SUSANNAH MARIA, 1716–66; wife of Theophilus, and daughter-in-law of the dramatist Colley Cibber. Dr. Arne was her instructor in music, in which first she appeared publicly; but after her marriage she preferred tragedy. She is the actress of whom Garrick exclaimed, on hearing of her death, "Then tragedy has expired with her!"

CIB'OL. See ONION.

CIBORIUM, a chalice, pyx, or cup, usually of gold or silver, with a cover surmounted by a cross. It is used in the Roman Catholic service to contain the host, or consecrated wafer, in the service of the mass. Ciborium is also the name of a canopy on the altar, supported by four columns, to which the cup, in the shape of a dove, was attached by chains. This especial cup contained the wafer for the communion of the sick.

CIBRARIO, LUIGI, an Italian historian and politician, was b. at Turin, 23d Feb., 1802. He studied at the university of that city, where he took his degree in 1824 as

doctor of laws. Devoted to historical investigations, he secured a reputation in this important department, at a very early period. In 1825 appeared his *Notizie sulla Storia dei Principi di Savoia*; in 1826, his *Notizie di Paolo Simone de Belli*; and in 1827, his *Delle Storie di Chieri Libri IV*. King Charles Albert—with whom he was always a great favorite—frequently employed him in diplomatic service, and in 1848, when Italy rose against the Austrians, appointed C. extraordinary royal commissioner at Venice. During the same year, he was created a senator of the kingdom. When Charles Albert—after the unfortunate issue of the war—went to live in voluntary exile at Oporto, C. was sent by the Sardinian senate to induce him to return. He wrote an account of his unsuccessful mission, entitled *Ricordi d'una Missione in Portogallo al Re Carlo Alberto* (1850). During his public career, however, C. did not neglect his early and favorite pursuits. In 1839, he published his *Della Economia Politica del Medio Evo*; in 1840, his *Storia della Monarchia di Savoia*; in 1844, his *Storia e Descrizione della Badia d'Altacomba*; and in 1847, his *Storia di Torino*. But the new life and energy which Sardinia began to manifest under Victor Emmanuel had its claims on his public usefulness. In 1850, he was appointed superintendent-general of customs, and while occupying this office introduced several important reforms. Subsequently he was intrusted with full powers to negotiate a treaty of commerce with France, in which he distinguished himself notably by his advocacy of the principles of free trade. In 1852, he was made minister of public instruction, and, in 1855, minister of foreign affairs. When Cavour took this department into his own hands, C. became first secretary of the king. In 1857, he was appointed president of the telegraphic congress of Turin. In 1860, C. again made a most successful appearance as an author, in his *Operette Varié* (Turino), and in his *Jacopo Valperga di Masino, Cancelliere di Savoia*. He died at Salo, in the province of Brescia, 1st Oct., 1870.

CICADA, a genus of insects of the order *hemiptera*, sub-order *homoptera*, remarkable for the sounds which they emit, the loudness of which is very extraordinary, when considered with reference to the size of the creatures producing them. The largest European species are only about an inch long. The elytra, or wing-covers, of the cicadæ are almost always transparent and veined. They dwell on shrubs and trees, of which they suck the juices. The male insects alone possess the organs of sound perfectly developed. These are in no way connected with the mouth or throat, but may be described as a musical apparatus on the under side of the abdomen. This apparatus is very complicated, consisting of a set of membranes and fibers connected with powerful muscles. The sound can be produced even after the insect has been long dead, by pulling the fibers, and letting them escape. Cicadas are most common in tropical and warm temperate regions, and are scarcely known in Britain, although one or two species have been found in the s. of England. The ancients regarded the sounds of these insects as types of music and eloquence. In some countries they bear names which signify that sleep is banished by their din. The sounds produced by some of the South American species, which are much larger than the European, are loud enough to be heard at the distance of a mile, and have been likened to the sound of a razor-grinder at work. The Greek name of the C. is *tettix*, often erroneously translated grasshopper. These insects have indeed no resemblance to grasshoppers, and no power of leaping. C. is the Latin name. The modern Italian is *cicale*, the French *cigale*. Byron speaks of the "shrill cicadas."

CICATRIZATION (Lat. *cicatrix*, a scar), the process of healing or skinning over of an ulcer or broken surface in the skin or in a mucous membrane, by which a fibrous material, of a dense resisting character, is substituted for the lost texture. The new tissue, in such a case, is called the cicatrix, and usually resembles, to a considerable extent, the structure which it replaces; it is, however, less elastic, and from its shrinking in volume, sometimes produces an appearance of puckering. The glands and other special structures of the original tissue are wanting in the cicatrix, which, however, performs perfectly well, in most instances, the office of protection to the parts below the surface. See INFLAMMATION and ULCERATION.

CICELY, *Myrrhis*, a genus of umbelliferous plants, nearly allied to chervil, of which one species, sweet C. (*M. odorata*), is common in the central and southern parts of Europe, and in similar climates in Asia, but in Britain is so generally found near human habitations that it appears probably to have been introduced. It is sometimes called *sweet chervil*, and in Scotland, *myrrh*. It is a branching perennial, 2 ft. high or upwards, with large triply pinnate leaves and pinnatifid leaflets, somewhat downy beneath; the fruit remarkable for its large size, and, as well as the whole plant, powerfully fragrant, the smell resembling that of anise. The seeds, roots, and young leaves are used in Germany and other countries in soups, etc. The plant was formerly much in use as a medicinal aromatic.

CICER. See CHICK PEA.

CICERO, MARCUS TULLIUS, the greatest orator of Rome, and one of the most illustrious of her statesmen and men of letters, was b. at Arpinum, on the 3d of Jan., in the year 106 B.C. He belonged to an ancient family, of the equestrian order, and possessed of considerable influence in his native district. His father, himself a man of

culture, and desirous that his son should acquire an eminent position in the state, removed him at an early age to Rome, where, under the direction of the orator Crassus, he was instructed in the language and literature of Greece, and in all the other branches of a polite education. In his sixteenth year he assumed the manly gown, and was introduced to the public life of a Roman citizen. He now acquired a knowledge of law, and underwent a complete course of discipline in oratory. At the same time, he studied philosophy under three successive preceptors, of the Epicurean, Academic, and Stoic schools, and neglected no mental exercise, however arduous, which might conduce to his future eminence; being thus early of the opinion which he afterwards maintained in his treatise *De Oratore*, that an orator should possess almost universal knowledge. With the exception of a brief campaign under Sulla, in the social war, he passed his time in these preliminary studies until his 26th year, when he began to plead in public. In one of his earliest causes, he distinguished himself by defending the rights of Roscius, a private citizen, against one of the favorites of Sulla, who was then dictator. Soon after, for the benefit of his health, and in order to his improvement in elocution, he traveled to the chief seats of learning in Greece and Asia; and, on his return, was regarded as second to no orator at the Roman bar. Having been elected quaestor (76 B.C.), he was appointed by lot to a government in Sicily, a post which he filled with great ability, and to the entire satisfaction of those whom he governed. Some years after his return, he laid the Sicilians under still greater obligations by his successful prosecution of their praetor, Verres, against whom he prepared no less than six orations, although the first had the effect of disheartening the accused so effectually, that he voluntarily retired into exile. Passing, at short intervals, through the offices of aedile (69 B.C.) and praetor (66 B.C.), he was at length elected, by an overwhelming majority, to the consulship. His tenure of office was rendered memorable by the conspiracy of Catiline, which he frustrated with admirable skill and promptitude. See CATILINE. The highest praises were showered upon C.; he was hailed by Cato and Catulus as the "father of his country;" and public thanksgivings in his name were voted to the gods. But his popularity did not last long after the expiry of his consulship. His enemies charged him with a public crime, in having put the conspiring nobles to death without a formal trial, and he found it necessary to leave Rome, and went to reside in Thessalonica (58 B.C.). A formal edict of banishment was pronounced against him, but he was recalled from exile in about 16 months, and on his return to Rome was received with great enthusiasm. His recovered dignity, however, soon excited the envy of the honorable party in the senate, with whom he had desired to make common cause; while Pompey and Cæsar, the greatest powers in the state, and from whose enmity he had most to dread, courted his alliance and co-operation. Thus, while preserving an appearance of independence, he was betrayed into many actions which he could not but regard as ignominious, and which, by increasing the power of the triumvirs, led indirectly to the ruin of the republic. A remarkable exception to this servile conduct is to be found in his assisting Milo when suing for the consulship, and defending him, against the wish of Pompey, and in spite of the hostile feeling of the populace, after he had slain Clodius in an accidental encounter. During this period he composed his works, *De Oratore*, *De Republica*, and *De Legibus*. After a year's admirable administration of the province of Cilicia (51 to 50 B.C.), he returned to Italy on the eve of the civil war. With the convictions which he avowed, there was but one course which it would have been honorable for him to pursue—to enlist himself, at all hazards, on the side of Pompey and the republic. But instead of this he hesitated, balanced the claims of duty and of interest, blamed Pompey for his want of preparation, and criticised the plan of his campaign. At length he joined the army of the senate, but, after the battle of Pharsalia, abruptly quitted his friends, and resolved to throw himself upon the generosity of the conqueror. After nine months' miserable suspense at Brundisium, he was kindly received by Cæsar, whom he followed to Rome. During the years which ensued, he remained in comparative retirement, composing his principal works in philosophy and rhetoric, including those entitled *Orator*, *Hortensius*; *De Finibus*; *Tusculanæ Disputationes*; *De Natura Deorum*; *De Senectute*; *De Amicitia*; and *De Officiis*. On the death of Cæsar, he was disposed to unite his interests with those of Brutus and the other conspirators, but was restrained by dictates of prudence. In the commotions which followed, he espoused the cause of Octavianus, and gave utterance to his celebrated philippics against Antony. These orations were the occasion of his death. When Octavianus and Lepidus joined with Antony in a triumvirate, C. was among the proscribed; and his life was relentlessly sought. The soldiers of Antony overtook him while his attendants were bearing him, now old, and in an infirm state of health, from his Formian villa to Caieta, where he intended to embark. He met his death with greater fortitude than he had supported many of the untoward incidents of his life. Desiring his attendants to forbear resistance, he stretched forward in the litter, and offered his neck to the sword of his executioners. He died in the 63d year of his age, on the 7th Dec., 43 B.C.

The character of C. is one which it is not difficult to estimate. Really a lover of virtue, no one could follow in her footsteps with greater dignity when attended by the popular applause. But he was weak enough to yield to the depraved spirit of his times, and to act according to his convictions only when they were not evidently discordant with his private interests. Few men, possessing such talents, have been so

utterly devoid of anything approaching to heroism. As a statesman, it would be unjust to deny his legislative abilities; but he was generally deficient in courage and resolution. He was one of the greatest masters of rhetoric that have ever lived. His orations were the result of consummate art, combined with unwearied industry, and survive as characteristic memorials of a time when eloquence, far more than at present, was a power which bent the verdicts of judicial tribunals, and influenced the decrees of the state. In philosophy, he does not rank with the original thinkers of antiquity; nor, in truth, did he aspire to do so. His writings on speculative subjects are chiefly valuable on account of the noble and generous sentiments which they contain, and as reflecting the varied thought of the different schools. The best edition of his collected works is Orelli's (9 vols. 8vo, 1826-1837). See Forsyth's *Life of C.* (1864).

CICERO NÉ (from Cicero, the orator or speaker), a guide, usually for the purpose of showing the curiosities and works of art in a town to strangers. Ciceronés are of all degrees, from distinguished archæologists, who undertake the office as a favor, to the humble *laquais de place*, who, though quite indispensable on a first arrival, is too often both incompetent and dishonest. The stranger ought to be particularly on his guard against allowing a C. to make purchases for or even with him, as the practice of adding a commission to him to the price charged now prevails probably in every country in Europe.

CICHO'RIUM. See CHICORY and ENDIVE.

CICINDELA, a genus of insects of the order *coleoptera*, section *pentamera*, the type of a large family, *cicindelidæ*. This family is nearly allied to *carabidæ*, and the insects belonging to it are among the most voracious of those beetles which, both in their perfect and larva state, prey on other insects. They have a strong head, with projecting toothed mandibles, and are particularly distinguished by a sort of hook or nail, which is articulated by its base to each of the lower jaws or maxilla. They are more abundant in tropical than in cold countries; a few species, none of them large, are found in Britain. The head of the larva is large, concave above, and the back furnished with two remarkable hooked spines, which are said to be used as anchors to fix it at any part it chooses of its burrow in the earth; whilst the soil which it excavates is carried to the mouth of the burrow in a sort of natural basket formed of the concave back of the head and the recurved mandibles. The larva lies in wait in its burrow, its head just level with the ground, till its prey comes within reach, upon which it suddenly rushes. —*C. campestris*, a green species with whitish spots, is common in most parts of Britain in dry sandy places exposed to the sun.

CICISBEO is the name given in Italy to the professed gallant or constant attendant upon a married lady. In the higher ranks of Italian society, it was at one time considered unfashionable for the husband to associate with his wife anywhere except in his own house. In society, or at public places of amusement, the wife was accompanied by her C., who attended at her toilet to receive her commands for the day. This custom, which was once universal, and which naturally gave rise to much scandal, has now almost disappeared. C. is synonymous with *cavaliere servente*.

CICO'GNA'RA, LEOPOLDO, Count da, 1767-1834; an archæologist and art-critic of Ferrara. He visited all the noted cities of southern Europe, studying them with the eye of an archæologist and connoisseur. Napoleon found him engaged in politics and a member of the legislative body of Modena. In 1808, C. was made president of the academy of fine arts in Venice. In 1813-18, he produced his great work on the history of art, designed to complete the labors of Winckelmann and d'Agincourt. He published many other elaborately illustrated works.

CICO'NIA. See STORK.

CICU'TA. See HEMLOCK.

CID'ARIS, a genus of *echinidæ* (q. v.), or sea-urchins, closely allied to the genus *echinus* itself, and included along with it in a family or tribe called *cidarites*, in which the mouth and anus are opposite to each other—the mouth below, and the anus above. Only one species, *C. papillata*, has been found in the British seas, and that only on the coasts of Zetland. The Zetlanders call it the *piper*, from a resemblance which they trace in its globe and spines to a bagpipe. They say that it is sometimes found with spines a foot long. The markings of the shell and spines are extremely beautiful.

CID CAMPÊADOR is the name given in histories, traditions, and songs to the most celebrated of Spain's national heroes. There is so much of the mythical in the history of this personage, that hypercritical writers, such as Masdea, have doubted his existence; but recent researches, more particularly those of Dozy, and the investigation of newly discovered Arabic sources, have succeeded in separating the historical from the romantic. See Dozy's *Récherches sur l'Histoire Politique et Littéraire de l'Espagne pendant le moyen âge* (Leyden, 1849). The following is the result of these inquiries: Roderigo Ruy Diaz (Roderic the son of Diego) was descended from one of the proudest families of Castile. His name first appears in a document written in 1064, during the reign of Ferdinand of Leon. Under Sancho II., son of Ferdinand, he became standard-bearer and commander of the royal troops. In a war between the two brothers, Sancho

II. and Alfonso VI. of Leon, it was a stratagem of Roderic's—which, according to modern notions, was anything but honorable—that secured the victory of Sancho at Llantada (1068) over his brother, who was forced to seek refuge with the Moorish king of Toledo. He appears at this time to have already been called the *campeador*, a word supposed to answer to our champion.

Upon the assassination of his friend and patron, king Sancho, he required the next heir, don Alonzo, to clear himself by oath of any participation in his brother's murder, ere the nobles of Leon and Castile should do homage to him. By this act, he incurred the new monarch's enmity; an enmity which, however, the king's policy concealed in the hour of danger, and he even consented to Roderic's marriage with his cousin Ximena—daughter of Diego, duke of Asturia. But when the king thought the services of Roderic no longer necessary to his own safety, he lent a willing ear to the latter's personal enemies, and banished him in 1081. Roderic then joined the Moorish kings of Saragossa, in whose service he fought against both Moslems and Christians. It was probably during this exile that he was first called the Cid or Sid, an Arabic title which means lord. He frequently defeated the king of Aragon and the count of Barcelona, the latter of whom, Berenguer Ramon II., he took prisoner.

He was again reconciled to the king, but only for a short time, when he was condemned to a second exile. In order to support his family and numerous followers, he now saw himself forced to carry his sword against the Moors, over whom he gained a victory, and established himself as sovereign or lord of Valencia (1094). He retained possession of Valencia five years, during which time he took many neighboring fortresses. He died of grief in 1099, on learning that his relative and comrade in arms, Alvar Fañez, had been vanquished by the Moors, and that the army which he had sent to his assistance had been defeated near Alcira. After the Cid's death, his widow held Valencia till 1102, when she was obliged to capitulate to the Almoravides, and fly to Castile, where she died in 1104. Her remains were placed by those of her lord in the monastery of San Pedro de Cadeña. The Cid had a son, who was slain by the Moors in a battle near Consuegra. He also left behind him two daughters, one of whom was married to the count of Barcelona; the other to an infant of Navarre, through whom the kings of Spain and many royal houses of Europe claim kindred with "*Mio Cid el Campeador*." Relics of the "Blessed Cid," as he is still called in Spain, such as his sword, shield, banner, and drinking-cup, are still held in great reverence by the populace. The numerous *Cid romances* that were first published in the 16th c., contain the most romantic improbabilities concerning the life and deeds of the Cid. See *Silva de Varios Romances* (1550), and *Romancero General* (1604). These romances were taken from the ancient *cantares* (national songs) and *poemas*, most of which are entirely lost. The most important of modern works on this subject, besides that of Dozy above mentioned, are Huber's *Geschichte des Cid*, etc. (Bremen, 1829), and Southey's fascinating *Chronicle of the Cid* (Lond. 1808). The former of these is, however, the more valuable in a historical point of view. See also Willemaers, *Le Cid* (Bruss. 1873).

CIDER is the fermented juice of apples, and is extensively prepared in Gloucestershire and other parts of England, in Ireland, in the northern districts of France, and in North America. In Normandy, a vast number of varieties of acid or bitter-apples are grown for the preparation of cider. The apples are first bruised in a circular stone-trough or *chase*, by a similarly shaped stone or *runner*, which revolves by machinery in the interior of the trough. The pulp so obtained is placed in sieve-bags made of hair-cloth or reed-straw, and subjected to pressure, which yields a dark-colored, sweet liquid, and leaves in the bag a somewhat dry residue, consisting of the pips, skin, and other fibrous parts of the apple. The apple-juice passes first into a shallow tub or *trin*, and is almost immediately placed in casks in a cool place, when fermentation begins, part of the sugar is converted into alcohol, and in a few days, a clear liquid is obtained, which can easily be racked off from sedimentary matter. C. is largely used in England as a beverage, and is very palatable and refreshing. It contains from 5½ to 9 per cent of alcohol, and is therefore intoxicating when drunk in quantity. It does not possess the tonic and nourishing properties, however, of bitter-beer. C. quickly turns sour, becoming *hard* C., owing to the development of lactic acid, and great difficulty is experienced in the attempt to preserve it.

CIENFUEGOS, a city in Cuba, on the s. coast of the island, on the bay of Jagua, 120 m. s.e. of Havana; pop. 9,950. It has a good harbor, and is one of the best built cities in the island. Railroads give communication with Cardenas and other towns on the n. coast. C. was founded in 1813 by a captain-general of that name.

CIÉZA, a t. of Spain, in the province of Murcia, 26 m. n.w. of the city of that name. It is situated on an eminence near the river Segura, overlooking a plain of great fertility. The streets are tolerably wide and well paved; and there are manufactures of linen, hempen fabrics, wine, and oil; and silk-worms are reared. Pop. 9,500.

CIGARS. See TOBACCO.

CIGOLI, LUDOVICO CARDI DA, an eminent painter of the later Florentine school, which, about the end of the 16th c., developed, in opposition to the languid mannerists of the time, a peculiar *eclectic* style of art. C. was b. at Enpoli in 1559. His model was

Correggio; but as the latter was deficient in design, and in the scientific knowledge of perspective, C. endeavored to unite these with the warm bright coloring and wonderful chiar-oscuro of Correggio. He was invited by Clement VII. to Rome, where he died in 1613. Among C.'s most famous pictures may be mentioned—"The Healing of the Lame Man" (St. Peter's, Rome), "The Martyrdom of St. Stephen" (Uffizi Gallery, Florence), "Tobias in the Act of Thanking the Angel" (St. Petersburg), and "St. Francis," a favorite subject with C. (Pitti Palace, Florence). C. was also held in high estimation as an architect, and designed several of the Florentine palaces.

CILIA, (Lat. eyelashes), a term variously employed in botany and zoology to designate fringing hairs or hair-like processes. Thus, the margins or nerves of leaves, petals, etc., are often described as *ciliated* or furnished with cilia. The fine thread-like processes which surround the opening of the fruit of many mosses, are called C.; but these processes, when broader, are denominated teeth.—The description and uses of C. in the animal kingdom are given in the article EPITHELIUM.

CILICIA, an ancient division of Asia Minor, now included in the Turkish eyalet of Koniah. The Taurus range, which separated it from Cappadocia, bounded it on the n., the gulf of Issus and the Cilician sea on the s., while the Amanus and Pamphylia bounded it respectively on the e. and west. Lat. 36° to 38° n., long. 32° 10' to 37° 8' e. The eastern portion of C. was fertile in grain, wine, etc.; while the western and more mountainous portion furnished inexhaustible supplies of timber to the ancients. The pass called by the Turks Gölek Bógház is that by which the younger Cyrus passed from Tyana in Cappadocia to Tarsus; and it is also the same by which Alexander the great entered Cilicia. Pop. about 100,000, mostly nomadic.

In early ages, C. was ruled by its own kings, the dynasty of Syennesis being apparently the most important. The Cilicians were a distinct people in the time of Xenophon; but the Greeks appear to have got a footing after the time of Alexander. The Cilicians were notorious pirates, but having carried on their depredations too close to the shores of Italy, the Roman arms were turned against them, and C. was made a Roman province in Pompey's time.

CIMABUÉ, GIOVANNI, one of the restorers of the art of painting in Italy, which had fallen into neglect during the barbarism of the dark ages, was b. at Florence in 1240. At this time, the fine arts were practiced in Italy chiefly by Byzantines, and had degenerated into a worn-out mechanical conventionalism. C. at first studied under Byzantine masters, and adopted their traditional forms, but gradually excelled his teachers, made innovations on the fixed patterns set before him, and gave life and individuality to his works. Two remarkable pictures of the Madonna by C. are still preserved in Florence—one (chiefly Byzantine in style) in the academy; the other, displaying a more purely original genius, in the church of Santa Maria Novella. It is said that this latter work in the time of C. was admired as a miracle of art, and was carried to the church in a sort of triumphal procession. More remarkable pictures in point of expression or dramatic effect, are found in C.'s frescoes in the church of San Francisco at Assisi. C. died soon after 1300. What strikes one as very wonderful about C.'s pictures, is the accuracy of his naked figures, considering that he had no better professional guides than the Byzantine artists. His draperies were also very good, but he had apparently no knowledge of perspective, though acquainted with architecture. His greatest pupil was Giotto (q.v.).

CIMAROSA, DOMENICO, an Italian composer of operas, was b. at Naples in 1755, and was educated in music under Sacchini, and in the conservatory of Loretto. His first pieces were the *Sacrificio di Abramo* and the *Olympiade*. When barely 22, he had achieved a reputation in all the leading Italian theaters. He was then called to St. Petersburg, where he resided four years. Afterwards, he lived at various German courts; thence he proceeded to Vienna, where he became imperial chapel-master; and finally, he returned to Italy. At Naples, his comic opera, *Il Matrimonio Segreto*, composed at Vienna, 1791, was repeated 57 times in succession. C. died at Venice in 1801. His comic operas are remarkable for their novelty, spirit, whimsicality, and liveliness of idea, as well as for their great knowledge of stage-effect. The wealth and freshness of his invention gave rise to the saying, that one finale of C. contained material for a dozen operas.

CIMBALO, a musical instrument with a set of keys like the clavecin or harpsichord.

CIMBRI, or **KIMBRI**, a people who issued from the n. of Germany in conjunction with the Teutones, and first came into hostile contact with the Romans in the eastern Alps in 113 B.C. They were victorious in several great engagements, and were only prevented from devastating Italy by sustaining a terrible defeat from Marius, on the Raudii Campi, near Verona, or, according to others, near Vercelli, in Aug., 101 B.C. Their infantry fought with their shields fastened together by long chains; their horsemen, of whom they had 15,000, were well armed with helmet, coat of mail, shield, and spear. Marius had so chosen his position that the sun and dust were in their faces, and yet they contested the victory most bravely with the Romans, who were 55,000 strong. When the battle was lost, the women, who remained in the camp formed of the wagons, killed themselves and their children. 140,000 C. are said to have fallen in the battle;

the number of prisoners is given at 60,000. It is not till long afterwards, when the Romans themselves penetrated into Germany, that the name of the C. again appears. Cæsar represents the Aduatici of Belgium as the descendants of the C. and the Teutones. Tacitus speaks of a people, bearing the name of C., few in number, but of great reputation, that sent ambassadors to Augustus. This people lived in the extreme n. of Germany, on the borders of the ocean; according to Pliny and Ptolemy, at the extremity of the peninsula called from them the Cimbric Chersonese, now Jütland. The ethnology of the C. is doubtful. Greek writers associated them groundlessly with the Cimmerians (q.v.); Sallust calls them Gauls; Cæsar, Tacitus, and Plutarch looked upon them as Germans, and the opinion of their German origin has been adopted by most moderns. Yet H. Müller, in his *Marken des Vaterlands* (1837), has endeavored to show that they belonged to the Celtic race, and lived originally on the n.e. of the Belgæ, of kindred origin; and that their name is the same as that by which the Celts of Wales designate themselves to this day—*Cymri*.

CIMEX AND **CIMI'CIDÆ**. See **BUG**.

CIMICIFUGA, or **BUGBANE**, an herb of the order *ranunculaceæ*. It is the black snake-root found in all the northern states, and much used in rural districts as a medicine, chiefly in the form of a decoction. It is believed to be useful in nervous diseases, rheumatism, and bronchitis.

CIMINNA, a t. of Sicily, in the province of Palermo, 18 m. s.e. of the city of that name. Pop. '71, 5,721.

CIMMERIANS, or **CIMMERII**, in the poems of Homer, the name of the people dwelling "beyond the ocean-stream," where the sun never shines, and perpetual darkness reigns.—But the historic C. were a people whose country lay between the Borysthènes (Dnieper) and the Tanais (Don), including also the Tauric Chersonesus (Crimea). The Cimmerian Bosphorus (strait of Yenikale) derived its name from them. Being driven out by the Scythians, they migrated to Asia Minor, dwelt there for some time, plundered Sardis, failed in an attempt upon Miletum, and were finally routed and expelled by the Lydian king Alyattes, some time after 617 B.C.

CIMOLITE. See **FULLERS' EARTH**.

CIMON, an Athenian commander, was the son of Miltiades, the conqueror at Marathon. In conjunction with Aristides, he was placed over the Athenian contingent to the allied fleet, which, under the supreme command of the Spartan Pausanias, continued the war against the Persians (477 B.C.). He effected the important conquest of Eion, a town on the river Strymon, then garrisoned by the Persians. Later (according to Clinton, 466 B.C.), when commander-in-chief, he encountered a Persian fleet of 350 ships at the river Eurymedon, destroyed or captured 200, and defeated the land-forces on the same day. He succeeded likewise in driving the Persians from Thrace, Caria, and Lycia; and expended much of the money which he had obtained by the recovery of his patrimony in Thrace upon the improvement of the city of Athens. At this period he appears to have been the most influential of the Athenians. The hereditary enemy of Persia, it was his policy to advocate a close alliance with Sparta; and when the Helots revolted, he led an army upon two occasions to the support of the Spartan troops; but on the latter occasion, having lost the confidence of his allies, he was ignominiously dismissed. After his return to Athens, his policy was opposed by the democracy, headed by Pericles, who procured his banishment by ostracism. He was recalled in the fifth year of his exile, and was instrumental in obtaining a five years' armistice between the Spartans and the Athenians. He died in the year 449 B.C., while besieging the Persian garrison of Citium, in Cyprus.

CINALOA, a t. of Mexico, in the state of the same name, on the Rio Cinaloa, about 50 m. from its entrance into the gulf of California. It is a thriving place, with gold-washings in the vicinity. Pop. about 9,000.

CINALOA. See **SINALOA**.

CINCHONA, a most important genus of trees of the natural order *cinchonaceæ*; yielding the bark so much valued in medicine, known as Peruvian bark, Jesuits' bark, China bark, quina, quinquina, cinchona bark, etc., and from which the important alkaloids *quina* or *quinine* (q.v.), and *cinchonina* or *cinchonine*, are obtained. The species of this genus are sometimes trees of great magnitude; but an after growth springing from their roots when they have been felled, they often appear only as large shrubs; and some of them in the highest mountain-regions in which they are found, are low trees with stems only eight or ten feet in height. They exist only in South America, between s. lat. 20° and n. lat. 10°, and chiefly on the eastern slope of the second range of the Cordilleras. All the cinchonas are evergreen-trees; with laurel-like, entire, opposite leaves; stipules which soon fall off; and panicles of flowers, which, in general appearance, are not unlike those of lilac or privet. The flowers are white, rose-colored, or purplish, and very fragrant. The calyx is small and 5-toothed; the corolla tubular with a salver-shaped 5-cleft limb. In the true *cinchonas*, the capsule splits from the base upwards; the species in which it splits from above downwards form the sub-genus *cascarilla*; the

distinction acquiring importance from the consideration, that the barks of the former alone contain the alkaloids so valuable in medicine; and this property is further limited to those species which have the corolla downy or silky on the outside. Beyond the botanical limits thus narrowly marked out, not a trace of these alkaloids has yet been discovered anywhere.

Great difficulty has been found in determining the species by which the different varieties of *C. bark* known in commerce are produced. The common commercial names are derived partly from the color of the kinds, and partly from the districts in which they are produced, or the ports where they are shipped. It appears, however, to be now ascertained that *calisaya bark*, also called royal or genuine yellow bark, one of the very best kinds—mostly shipped from Arica—is chiefly the produce of *C. calisaya*, a large tree, growing in hot mountain valleys of Bolivia and the south of Peru. To give all the varieties of bark and species of tree would go beyond our limits.

The accurate discrimination of the different kinds of bark requires much experience. The taste is always bitter; but it is possible even to distinguish by the taste those varieties which contain quinia most largely from those in which cinchona is most abundant.

The cutting and peeling of *C. trees* are carried on by Indians, who go in parties, and pursue their occupation during the whole of the dry season. They build a hut, which serves both for their abode and for drying the bark. The trees are felled as near the root as possible, that none of the bark may be lost; and the bark being stripped off, is carefully dried; the quilled form of the thinner bark is acquired in drying. The bark is made up into packages of various size, but averaging about 150 lbs. weight, closely wrapped in woolen cloth, and afterwards in hides, to be conveyed on mules' backs to the towns. These packages are called drums or *seroons*. It is in them that the bark is always brought to Europe.

A number of spurious kinds of Peruvian or *C. bark* are either sent into the market separately, or are employed for adulterating the genuine kinds. They are bitter barks, and have, in greater or less degree, febrifugal properties, but are chemically and medicinally very different from true *C. bark*. They are produced by trees of genera very closely allied to cinchona.

Whilst *C. trees* have been becoming every year more scarce in their native regions, no attempt has been made to cultivate them there, notwithstanding the constantly increasing demand for the bark; but the Dutch have recently made extensive plantations of them in Java; and the same has been done in British India, from seeds and plants obtained from the South American governments, by Mr. Markham. In the course of his researches in South America, Mr. Markham found only one *C. tree* planted by human hands. See PERUVIAN BARK.

The Indians of Peru call the *C. trees kina*, from whence are derived the names *china*, *quina*, etc. But it is not certain that they knew the use of the bark before the arrival of the Spaniards. It is a medicine of great value in the cure of intermittent fevers (see AGUE), and diseases attended with much febrile debility; also in certain forms of neuralgia (q. v.), and other diseases of the nervous system. It seems to have been first imported into Europe in 1639, by the countess Del Cinchon or Chinchon, the wife of the viceroy of Peru, who had been cured of an obstinate intermittent fever by means of it, and upon this account it was named *C. bark* and *countess's powder* (*pulvis comitissæ*). The Jesuit missionaries afterwards carried it to Rome, and distributed it through their several stations, and thus is acquired the name of *Jesuit's bark* and *powder of the fathers* (*pulvis patrum*). Cardinal Juan de Lugo having been particularly active in recommending and distributing it, it was also known as *Cardinal de Lugo's powder*. It attained great celebrity in Spain and Italy, being sold at high prices by the Jesuits, by whom it was lauded as an infallible remedy, while by most of the orthodox physicians it was coldly received, and by the Protestants altogether repudiated. Its mode of action not being well understood, and the cases to which it was applicable not well defined, it seems, in the first instance, to have been employed without due discrimination, and to have fallen very much into the hands of empirics. Falling, however, into disuse in Europe, it was again brought into notice by sir Robert Talbor or Talbot, an Englishman, who brought it to England in 1671, and acquired great celebrity through the cure of intermittents by means of it, and from whom Louis XIV. purchased his secret in 1692. A pound of bark at that time cost 100 louis-d'or. Talbor seems to have been a vain and self-seeking man, but who had, nevertheless, the acuteness to discern and systematically to avail himself of the healing virtues of the neglected Jesuits' bark, which he mixed with other substances, so as to conceal its taste and odor. Soon afterwards, both Morton and Sydenham, the most celebrated English physicians of the age, adopted the new remedy; and its use, from this period, gradually extended, both in England and France, notwithstanding the opposition of the faculty of medicine in the latter country. As it came into general use, it became a most important article of export from Peru; but for a long time, the value of the bark to be procured in New Granada remained unknown; and in order to the maintenance of a commercial monopoly, extraordinary methods were even employed to prevent it from becoming known at a comparatively recent period of Spanish rule in America. The discovery of the alkaloids on which its properties chiefly depend, constitutes a new era in the history of this medicine, and did not take place till the beginning of the present century.

The chief active principles are the two alkaloids, quinine (q.v.) and cinchonine. The latter is not generally present in so large a proportion as the quinine, and does not possess such powerful medicinal properties. When isolated, the alkaloid *cinchonina*, or cinchonine, has the formula ($C_{16}H_{24}N_2O_2$), and can be obtained in a crystallized state.

C. bark itself has, in later times, fallen into comparative disuse, owing to the discovery of the alkaloid quinine, which is now extensively in use in medicine in the form of sulphate or disulphate of quinine, and is given in doses of from one to twenty grains, in almost all the cases to which the bark was supposed to be applicable.

CINCHONA CÆÆ, a natural order of exogenous plants, consisting of trees, shrubs, and herbaceous plants, with simple, entire, opposite, or whorled leaves, and stipules between their foot-stalks. The calyx is adherent to the ovary; the corolla is tubular and regular, its segments are equal in number to those of the calyx, when the calyx is divided; the stamens arise from the corolla, and are alternate with its segments. The ovary is surrounded by a disk, and usually two-celled; the style single, the fruit either splitting into two halves or not splitting at all, either dry or succulent.—This order has been very generally regarded by botanists as a sub-order of *rubiaceæ* (q.v.), but far exceeds all the rest of that order, both in the number and importance of its species, of which from 2,500 to 3,000 are known, mostly tropical, and the remainder, with few exceptions, subtropical. The C. are nearly allied to *caprifoliaceæ* (woodbines or honeysuckles, etc.), and interesting relations have been pointed out between them and *umbelliferae*. They constitute a very large part of the flora of tropical regions. Besides the genus *cinchona* (q.v.) and other genera producing febrifugal barks—*exostemma*, *condaminaea*, *Pinckneya*, *Portlandia*, etc.—the order produces a number of valuable medicinal plants, of which *ipecacuanha* (q.v.) is the most important. The coffee (q.v.) shrub belongs to it; and also the tree which yields gambir (q.v.). It produces a number of plants employed in dyeing, among which are the chay root or choya, and some species of *morinda*. Some trees of this order yield valuable timber. Many of the species have beautiful and fragrant flowers; and some produce pleasant fruits, among which are the genipap (*genipa Americana*) of South America, the native peach (*sarcocephalus esculentus*) of Sierra Leone, and the voavanga of Madagascar (*cangueria edulis*).

CININNATI, the commercial capital of Ohio, is situated on the right bank of the river which gives name to the state, and separates it from Virginia and Kentucky. It stands in lat. $39^{\circ} 6' 30''$ n., and in long. $84^{\circ} 26'$ w., 458 m. below Pittsburg, in Pennsylvania, where the Ohio, as such, is first formed, and 500 m. above the junction of that stream and the Mississippi. Though C. was founded in 1788, yet in 1800 it had only 750 inhabitants. In the years 1820, 1830, 1840, 1850, and 1860, respectively, the census returns showed a population of 9,602, 24,830, 46,338, 115,438, and 161,004. In 1870, it had increased to 216,289, including a large proportion of Germans and Irish. The natural facilities of C. for commerce are great, and they have been increased artificially by the Miami canal, which unites it with lake Erie. Railways branch off from C. as a center in several directions, and the river Ohio gives facility for the carrying on of a large portion of the commerce. In the ten years ending 1875, the exports averaged \$201,236,066, and the imports \$314,528,009; being together equivalent to about £110,000,000.

The staple article of the trade of C. is pork. In 1874–75, 560,164 hogs were slaughtered. Wine from the Catawba (q.v.) grape is made in the neighborhood to a great extent. The city itself also is largely engaged in a variety of important manufactures, hundreds of steam-engines being employed in the different establishments, and the aggregate product having, in 1874, been computed at \$144,207,371. The manufactories include iron-foundries, rolling-mills, lard, oil, and stearine factories; and countless works connected with flour, clothing, furniture, paper, printing, tobacco, soap, candles, hats, etc. In 1874, iron was produced to the value of \$17,000,000; food, \$24,000,000; clothing, \$13,230,000; and liquors, \$24,000,000. There are about 75 newspapers and periodicals, including 9 daily, of which 3 are in German.

C. is substantially and handsomely built. Its ecclesiastical, literary, and commercial edifices are as numerous as befits the acknowledged queen of the west. The city occupies chiefly two terraces, which are elevated respectively 50 ft. and 108 above the level of the river. For the supply of the inhabitants, the water of the Ohio has been lifted up into an immense reservoir, at an expense of about £160,000. A large suspension bridge, 100 ft. above low-water, connects the city with Covington in Kentucky. There is a railway pier-bridge. Education flourishes, and there are numerous free schools.

CININNATI (antè), the chief city of Ohio, covers an area of 24 sq. m., and is laid out upon a plan substantially like that of Philadelphia, the long streets and avenues, mostly 66 ft. or more in breadth, being generally well paved or macadamized, and some of them adorned with shade-trees. The buildings are mostly of brick, and very substantial. Some of the streets leading back from the river towards the high hills on the w. are of a steep grade. The summits of these hills, which have been made accessible, command highly picturesque views of the surrounding country, including a wide sweep of the territory on the other side of the river, in Kentucky. The main portion of the city lies between Deer creek on the e. and Mill creek on the w., these two streams enter-

ing the Ohio at a distance from each other of $2\frac{1}{2}$ miles. The hillsides between the creeks, n. of East Liberty street and Hamilton road, are terraced with streets to the summits, and covered with dwellings. On some of the western hills are vineyards and gardens. The suburban portions of the city in various directions are very attractive, being filled with elegant and costly private residences, surrounded by trees and shrubbery and cultivated lawns, with picturesquely winding paths. There are beautiful drives in various directions, the roads being fine and the scenery of a very attractive character. The city is well provided with parks and public grounds. Eden park, on a hill in the eastern district, commands a fine prospect. It contains 216 acres. Lincoln, Washington, Hopkins, and City parks near the center of the city, are beautiful, though small. Burnet woods contains 170 acres, nearly all forest. Spring Grove, a beautiful cemetery, is 3 m. n.w. of the city, in the valley of Mill creek. It is approached by an avenue 100 ft. wide, and contains 600 acres of land tastefully laid out, and has a large number of costly monuments, among which are the Dexter mausoleum, and a bronze statue commemorating the suppression of the rebellion of 1861. The most noteworthy work of art in the city is the Tyler Davidson fountain, in Fifth street between Vine and Walnut, which was cast at the royal foundry in Munich, and which cost \$200,000. It was suggested by Mr. Tyler Davidson, after whose death it was completed and presented to the city by Mr. Henry Probasco in 1871. Standing in a conspicuous place, it is an object of perpetual interest to citizens and strangers. During the warm days of summer, from early morning till midnight, its flowing jets make their welcome music, and impart a refreshing coolness to the air. The suspension bridge across the Ohio, connecting Cincinnati with the Kentucky shore at Covington, was designed by John A. Roebling, and completed in 1867 at a cost of \$1,800,000. Another bridge, of wrought iron and resting upon piers, connects the city with Newport, Ky., and is used for both railroad and ordinary travel. Many of the public buildings of Cincinnati are distinguished for architectural beauty. The U. S. government building, containing the post-office, custom-house, court-rooms, and various offices, presents a front of 150 ft. on Vine street, and 80 ft. on Fourth street. It is of sawed freestone, three stories high, in the Roman Corinthian style. The county court-house is a square of three stories, and nearly fire-proof. Its cost was \$500,000. With the county jail in its rear it occupies a whole square. The buildings for the use of the city government are less imposing, though well adapted to their purpose. The city hospital, consisting of eight distinct buildings arranged around a central court, occupies a square of nearly four acres. It cost over \$700,000, exclusive of the ground, which is worth \$300,000 more. It has accommodations for 700 patients. The public library, built of brick in the Romanesque style, with funds raised by taxation, cost about \$675,000. Masonic hall, in the Byzantine style, 195 by 100 ft., and four stories high, is a very imposing edifice. Pike's opera-house also is of grand dimensions, with a front of 134 ft. and a depth of 170 feet. Mozart hall is a massive edifice, with an auditorium seating 3,000 people. St. Xavier's college is a splendid building, in the Romanesque style. The city work-house, 515 ft. long, has cells for 700 prisoners, with workshops and grounds for their employment. Longview asylum for the insane, at Carthage, 10 m. from the city, is of brick in the Italian style, 612 ft. long and four stories in height. The value of the buildings and grounds is \$1,000,000. St. Peter's cathedral (Roman Catholic) is the finest church edifice in the city. It is 180 ft. long and 60 and 90 ft. deep, in the pure Grecian style, with a stone spire 224 ft. high. The number of churches in Cincinnati exceeds 150, of which upwards of 40 are Roman Catholic, the rest being divided among a large number of Protestant sects. The public library contains 60,000 volumes, the young men's mercantile library 27,000, and the historical library 18,000 and many valuable MSS. There are in the city five literary colleges, six medical colleges, one law school, one college of dentistry, five commercial colleges, and a university. The common schools, about 30 in number, are well organized and managed. The Woodward and Hughes high schools have a high reputation for efficiency. The Roman Catholics support over 100 parochial schools. The Wesleyan college for women, established here in 1842, has preparatory, academic, and collegiate departments, and a department of music and art. St. Xavier's college, administered by the Jesuits, affords instruction to many students. Lane theological seminary, on Walnut hills, a Presbyterian institution, was organized in 1829, with an endowment of \$200,000. Cincinnati is the center of a vast network of railroads, by means of which it is in direct and easy communication with every portion of the country. It is connected with lake Erie by the Miami canal, and the Ohio river opens for it a channel of intercourse with a vast region, rapidly increasing in population and commerce. It is well supplied with daily and weekly papers and other periodicals, and is the center of a vast and various manufacturing industry and a widely extended commerce. Pop. in '80, 255,804. The city was founded in 1789 by settlers from New Jersey. Hostile Indians at that time rendered the navigation of the Ohio difficult and dangerous, and its progress for many years was slow. After the introduction of steam it grew rapidly. Though saved from the inroads of slavery by the ordinance of 1787, its proximity to, and its social and commercial relations with, the slave states, induced among its inhabitants an inveterate opposition to every scheme of emancipation. From 1831 to 1838, the public discussion of slavery there was hardly less odious and dangerous than it was in New

Orleans and Richmond. Two or three times an anti-slavery press established there by James G. Birney was destroyed by a mob, with the open and avowed sanction of eminent citizens and the connivance of the city government. The excuse urged for these outrages was that C. depended for her prosperity largely upon her trade with the slave states, and that this trade would not be retained if an anti-slavery journal were tolerated. The city was a rendezvous and a thoroughfare for fugitive slaves on their flight to Canada, and thus served to keep the people in a state of constant fermentation. Levi Coffin, a Quaker citizen of the place, who lately died at an advanced age, was proud to declare that he had harbored no less than 3,000 of these fugitives, not one of whom failed to make good his escape. A large proportion of the population, moreover, were natives of the south, and therefore in natural sympathy with the region whence they had emigrated. So strong was this sympathy in 1862, when an attack by a confederate force was expected, that it was deemed necessary to put the city under martial law. These memories, however unpleasant, are a part of the history of a period now happily passed away.

CINCINNATI (the Cincinnatuses), a society or order in the United States of North America, established by the officers of the revolutionary army in 1783, "to perpetuate their friendship, and to raise a fund for relieving the widows and orphans of those who had fallen during the war." It was so named because it included patriots, headed by Washington, who in many instances had left rural affairs to serve their country (see **CINCINNATUS**). The badge of the society is a bald eagle suspended by a dark-blue ribbon with white borders, symbolizing the union of France and America. On the breast of the eagle there is a figure of Cincinnatus receiving the military ensigns from the senators, with the plow in the background; round the whole are the words, *Omnia reliquit servare rempublicam*. On the reverse, the same hero is represented crowned by fame with a wreath on which is inscribed *virtutis premium*, etc. As this distinction was made hereditary, it was attacked as opposed to republican equality. Franklin saw in it the germ of a future aristocracy, and at a meeting held in Philadelphia in 1784, several changes were made in the constitution of the society, and in several of the states it was quietly abolished. There are still, however, several state societies, which hold a general meeting by delegates triennially.

CINCINNATI, SOCIETY OF THE (*ante*). At the second general meeting, in 1787, Washington was elected president-general, and was re-elected every third year during his life. His successors in office were Alexander Hamilton and the Pinckneys; and when Lafayette visited the country in 1824, he was its only surviving maj.gen. The last survivor of the original association was Robert Burnet, of New York, who died in 1854. The society now exists but in four or five states. Hamilton Fish, ex-secretary of state, is the presiding officer, and the largest gatherings are at the annual meetings in New York city. Nearly all the prominent generals in the U. S. army have been or are now members of the society. It has been thought or charged that the society has some political partisan significance or inclination, but this is not the fact. The Tammany society, which is aggressively partisan, was started to oppose the society of the Cincinnati, because the latter was supposed to be established in the interest of the wealthier and more aristocratic classes.

CINCINNATUS, LUCIUS QUINCTIUS, a Roman consul, regarded by the later Romans as the model of antique virtue and simple manners. So far as we can discern his character through the veil of legend, C. appears to have been a violent patrician. About 460 B. C., he was chosen consul, and two years later was made dictator. When the messengers from Rome came to tell C. of his new dignity, they found him plowing on his small farm. He soon rescued the consul Lucius Minucius, who had been defeated and surrounded by the Æqui. Livy's account of the mode in which the deliverance was effected is rejected by Niebuhr, who points out the inconsistencies and impossibilities of the story, and seems disposed to regard the whole as a mere myth. We are next informed that, after a dictatorship of sixteen days, C. returned to his small farm on the Tiber. When 80 years old, he was once more made dictator (439 B. C.), and suppressed a threatened plebeian insurrection.

CINDER-BED, a name given by the quarrymen to a stratum of the Upper Purbeck series, almost entirely composed of the loosely aggregated shells of a small oyster (*ostrea distorta*).

CIN'EAS, the chief adviser of Pyrrhus, king of Epirus. His most famous work was in visiting Rome, to arrange for peace, after the defeat of the Romans in 280 B. C. In Rome, he learned in a single day the name of every man of importance in the city. He was not successful in securing peace, and when he returned he told Pyrrhus that Rome was a temple and its senate an assembly of kings.

CINERARIA, a genus of plants of the natural order *compositæ*, sub-order *corymbiferae*, very nearly allied to *senecio* (groundsel, ragwort, etc.), from which it differs only in having the involucre formed of one row of equal erect scales. The species are numerous, and widely diffused over the world in very various climates. They are annual or perennial herbaceous plants; with simple, generally toothed or sinuate leaves. Many of them are remarkable for the ashy appearance of the lower part of

the leaves, whence their name (Lat. *cinis*, -*eris*, ashes). The leaves are often covered with a peculiar sort of down. Two small species are natives of the southern parts of Britain. The flowers of some are very pretty. *C. maritima*, a native of the s. of Europe, and other species, have for some time been much cultivated in gardens and green-houses. Many hybrids and varieties have been produced by cultivation.

CINERARY URNS (Lat. *cinis*, ashes) were used by the nations of antiquity to contain the ashes of the dead when gathered from the funeral pile. Previous to being deposited in the urn, the embers were soaked with wine; the urn was then placed in a niche in the family mausoleum. Only the wealthy could afford so expensive a rite. C. U. were either sculptured in marble, or formed of clay or glass. They were not always in the form in which we commonly see them represented on modern tombs. - The celebrated cinerary urn known by the name of the Portland or Barberini vase, preserved in the British museum, a beautiful production of Greek art, was discovered about the middle of the 16th c., in a marble sarcophagus in a sepulcher (believed to be that of the Roman emperor Alexander Severus, 223-235 A.D.) at Monte del Grano, near Rome. The height of the urn is 10 inches. One of the finest specimens yet discovered in the British isles, is preserved in the museum of the royal Irish academy. It was found in a small stone chamber near Bagnalstown, co. of Carlow. It is composed of very fine clay, and is but $2\frac{1}{2}$ in. high. It contained the burnt bones of an infant or very young child.

CINISI, a t. of Sicily, in the province of Palermo, 14 m. w.n.w. of Palermo, near the coast. It is a neat, cheerful town, with straight, regular streets, and has 6,714 inhabitants. The Benedictine convent here was once a feudal castle.

CINNA, LUCIUS CORNELIUS, a Roman noble, was one of the principal supporters of the faction of Marius. After Sulla had driven Marius from the city, and before setting out on his expedition against Mithridates, he allowed C. to be elected to the consulship. But C. had no sooner entered upon that office (87 B.C.) than he impeached Sulla, endeavored to form an interest among the citizens who had been added to Rome after the social war, and agitated for the recall of Marius. The events which led to the return of Marius are stated in the article Marius (q.v.). After a cruel massacre of the Roman citizens, in which some of the most eminent statesmen and orators were slain, Marius and C. declared themselves consuls. On the death of Marius, which occurred within a few days of his usurpation, C. made L. V. Flaccus his colleague for that year, and C. P. Carbo for the two succeeding years. In 84 B.C., he prepared to meet Sulla, who was then on his way from the east to take vengeance upon his enemies, but was slain by his disaffected troops at Brundisium. During his fourth consulate, his daughter Cornelia had been married to Julius Cæsar.

CINNABAR, an ore of mercury, from which almost all the mercury of commerce is obtained. Chemically, it is a bisulphuret of mercury, containing 86.2 parts of mercury and 13.8 of sulphur. It occurs both crystallized and massive, not unfrequently disseminated. Its crystals are six-sided prisms. It varies from perfectly opaque to almost transparent; has an adamantine almost metallic luster, and a carmine color, with a bright scarlet streak. Its specific gravity is 8 to 8.2. *Hepatic C.*, so called from its liver-brown color, is a variety containing a little carbon. C. sometimes occurs in primitive rocks, but more frequently in those of the coal formation, and is sometimes even intimately mixed with coal itself. It is, however, a rare mineral, and is nowhere found in Britain. The C. mines of Almaden, in Spain, have been worked for about 2,300 years, and are still the most productive in the world. At Almaden, the C. is found in a dark-colored slate mixed with quartzite. Next to the mines of Almaden, rank those of Idria in Carniola. C. mines exist also in Germany, Hungary, Peru, California, China, Japan, etc. C. is used as a pigment under the name of *vermilion*.

CINNAMIC ACID AND THE CINNAMYL SERIES. Cinnamyl is a compound radical, as yet unisolated, which is represented by the formula $C_{11}H_7O_2$, and which includes amongst its compounds cinnamic acid ($C_{11}H_7O_2.HO$), oil of cinnamon, which is chemically a slightly impure aldehyde of cinnamic acid, or a hydride of cinnamyl ($C_{11}H_7O_2.H$), chloride of cinnamyl ($C_{11}H_7O_2.Cl$), styrene or peruvine, known chemically as cinnamic alcohol ($C_{11}H_{11}O_2$), cinnamol and styrol, each represented by the formula $C_{11}H_8$, and styracin ($C_{11}H_{11}O_4$). We shall briefly notice the most important of these compounds—viz., cinnamic acid and oil of cinnamon. *Cinnamic acid* ($C_{11}H_7O_4$) crystallizes in colorless prisms, which are sparingly soluble in cold water, but dissolve readily in boiling water, alcohol, and ether. It fuses at 266° , and boils with or without decomposition, according to the manner in which it is heated, at about 570° . It is converted by most decomposing agents into benzoyl compounds, such as benzoic acid, oil of bitter almonds, etc.; for example, when fused with hydrate of potash, it assimilates the elements of water, and breaks up into acetic and benzoic acids; when boiled with peroxide of lead, it is converted into oil of bitter almonds and benzoic acid, etc. It exists naturally in a free state in liquid storax, the balsams of Tolu and Peru, and gum benzoin, and is often deposited in large crystals from old samples of oil of cinnamon and from cinnamon water. It is always formed from oil of cinnamon when the latter is exposed to the action of the air, and it has been synthetically or artificially formed by exposing equivalent quantities of chloracetyl ($C_6H_5O.Cl$)

and oil of bitter almonds ($C_{11}H_{16}O_2$) to a prolonged heat in a closed glass tube. *Oil of cinnamon* and *oil of cassia*, although prepared from different kinds of trees, are virtually identical in their composition, each consisting mainly of cinnamic aldehyde, or hydride of cinnamyl, mixed with certain resinous matters. Oil of cinnamon is an article of the *materia medica*, and in doses of one minim to a five-grain pill, forms an excellent aromatic addition to cathartic pill-masses.

CINNAMON is the spicy, aromatic, and stimulating bark of certain species of the genus *cinnamomum*. This genus belongs to the natural order *lauraceæ*, and was formerly included in *laurus*. It contains a considerable number of species, natives of tropical and subtropical parts of the east. *C.* has been in use from the remotest antiquity. It is mentioned in the Old Testament, and by a name almost the same as that which it still bears in most languages. The finest kind is said to be chiefly produced by *cinnamomum zeylanicum* (formerly, *laurus cinnamomum*), which chiefly grows in the island of Ceylon, although, having been introduced into the West Indies in 1782, along with various other plants of the east, it is now cultivated there to some extent. The tree attains the height of 20 to 30 ft., and is sometimes 1½ foot in thickness. Its bark is of a grayish-brown color, internally of a yellowish red. The leaves are oval, 4 to 6 in. long, with a blunt point, and marked with three principal nerves. They have the taste of cloves. The flowers are of a silky gray on the outside, and a pale-yellowish color internally. The fruit is somewhat like an acorn in shape; it is a small drupe, brown when ripe. There are two seasons of cinnamon-harvest in Ceylon, the first commencing in April, and the last in Nov.—the former being that in which the chief crop is obtained. The branches of 3 to 5 years' growth being cut down, the epidermis is scraped away; the bark is then ripped up longitudinally with a knife, and gradually loosened, till it can be taken off. The slices are then exposed to the sun, when, as it dries, it curls up into *quills*, the smaller of which are inserted into the larger, and the whole tied up in bundles of about 88 lbs. each. *C.* is examined and arranged according to its quality by persons who are obliged for this purpose to taste and chew it, although in a short time it produces painful effects on their mouths and tongues. The finest *C.* is yielded by the young branches of the tree, especially by the numerous shoots which spring up from the stump after a tree has been cut down, and which are cut when about 10 ft. long, and of the thickness of an ordinary walking-stick. The smell, particularly of the thinnest pieces, is delightfully fragrant, and the taste pungent and aromatic, with a mixture of sweetness and astringency. It is used like other spices by cooks and confectioners, and also in medicine as a tonic, stomachic, and carminative. The average quantity annually imported into London is about 500,000 lbs. Its virtues depend chiefly upon the essential oil which it contains (*oil of cinnamon*). Oil of cassia is very often substituted for this oil, as cassia—which, however, may readily be distinguished by its mucilaginous taste—is for cinnamon. The root of the cinnamon-tree contains camphor. The fruit yields a concrete oil, called *cinnamon suet*, which is highly fragrant, and in Ceylon was formerly made into candles, for the exclusive use of the king.—Cassia (q.v.) is the produce of another species of *cinnamomum*.—*C. loureirii*, a native of Cochin China and Japan, is said to yield a bark even superior to that of *C. zeylanicum*. A species of *C.*, which ascends to the elevation of 8,500 ft. in the Sikkim Himalaya, deserves a trial even in the climate of Britain.

The constituents of *C.* are a volatile oil (*oil of C.*), tannin, starch, mucilage, woody-fiber, resin, coloring matter, and an acid. The oil of *C.* is generally prepared in Ceylon by grinding the coarsest pieces of *C.*, soaking them in sea-water for two or three days, and then distilling. Two oils pass over, one lighter, the other heavier than water. Oil of *C.* varies in color from yellow to cherry-red, the yellow variety being considered the best, and is most highly esteemed. *Oil of C. leaf* is prepared from the leaves in Ceylon by a similar process, and is met with in commerce under the name of *clove oil*, which it much resembles in odor. *C. water* is obtained by adding water to *C.*, and distilling a large quantity, or by diffusing the *oil of C.* through water by the aid of sugar or carbonate of magnesia. *Spirit of C.* is procured by acting upon *C.* with spirit of wine and water, and distilling; and *tincture of C.*, by soaking *C.* in spirit of wine, and straining. The medicinal properties of *C.*, and its preparation, are aromatic and carminative, and it is serviceable in cases of nausea and vomiting, and in cases of flatulence and spasmodic states of the stomach and alimentary canal.

CINNAMON-STONE, a precious stone, of which the finer specimens are highly esteemed; it is regarded as a variety of garnet (q.v.). Its color varies from hyacinth red to orange yellow; and when pure, it is transparent. It is composed essentially of silica, alumina, and lime. It is found chiefly in Ceylon, where vast bowlders of gneiss containing it in profusion exist in many places.

CINNYRIS. See SUN-BIRDS.

CINQUÉ CENTO (Ital.), five hundred. A technical, or rather *slang* artistic term, used to designate the style of art which arose in Italy after the year 1500, and which therefore belongs to the 16th c.; i.e., after the fall of all the great schools. It is sensuous in its character, the subjects chosen being usually borrowed from heathen mythology or history.

CINQUEFOIL, in botany. See **POTENTILLA**.

CINQUEFOIL, a common bearing in heraldry. It is usually depicted with the leaves issuing from a ball as a center point.—C., in architecture, is an ornamental foliage in five compartments, used in the tracery of windows, panelings, and the like. The C. is often represented in a circular form, the spaces between the points or cusps representing the five leaves.

The C. of heraldry and of architecture is not derived from any leaf of five leaflets, but, as its perfect regularity of form indicates, from the flower of the plant called C. (*potentilla*), or other similar flower of five petals or *leaves*. The C. thus closely resembles the rose, with which it would, indeed, be identified, but that a double and not a single rose is chosen for the purposes of heraldry and decorative art.

CINQUE PORTS (Fr. five ports). It is said that the five maritime ports of England lying opposite to the coast of France—Sandwich, Dover, Hythe, Romney, and Hastings—were enfranchised in the time of Edward the confessor. But it was subsequent to the battle of Hastings that the conqueror, in order that he might wield the resources of the seaports with greater vigor, constituted this whole line of coast into a jurisdiction entirely separate from the counties of Kent and Sussex, and erected it into a sort of county palatine, under a warden or guardian, the seat of whose administration was in Dover Castle. The warden, whose office corresponded to that of the ancient count of the Saxon coast (*comes littoris Saxonici*), exercised jurisdiction, civil, military, and naval, uniting in his single person the functions of sheriff, *custos rotulorum*, lord-lieutenant, and admiral. Privileges equal to those originally bestowed on the C. P. were subsequently extended to the so-called *ancient towns* of Winchelsea and Rye, and most of the municipal towns had subordinate ports and towns attached to them, which were called *members*. In place of the Saxon terms of *aldermen* and *freemen*, those of *jurats* and *barons* were introduced, and the latter term has always been applied to the representatives of the C. P. in parliament. The chief function performed by the C. P. in early times consisted in furnishing such shipping as was required for the purposes of the state, the crown having possessed no permanent navy previous to the reign of Henry VII. In the time of Edward I., they were bound to provide no less than 57 ships, fully equipped and manned at their own cost; though the weight of this heavy burden was somewhat lessened by the provision, that the period of gratuitous service should be limited to 15 days. In consequence of the warlike navy which they were thus compelled to maintain, the C. P. became so confident in their strength, and so insolent and audacious, as not only to undertake piratical expeditions, but even to make war and form confederacies as independent states. Previous to the revolution of 1688, the lord-wardens were in use to nominate the barons, or parliamentary representatives of the C. P.; but in 1689, an act was passed to "declare the right and freedom of election of members to serve in parliament for the cinque ports." The reform bill of 1832 reduced the number of members sent to parliament by the C. P. from 16 to 8, and the municipal reform act has broken up the ancient organization of the ports, and assimilated their internal arrangements to those of other English municipalities. The ancient courts of Stepway, Brotherhood, and Guestling are still occasionally held, but their powers scarcely extend beyond matters of form, such as appointing the barons, who are to exercise an ancient privilege of the ports, which consists in carrying the canopy over the sovereign's head at a coronation. The lord-warden's jurisdiction, in relation to civil suits and proceedings, was abolished by 18 and 19 Vict. c. 48, amended by 20 and 21 Vict. c. 1.

CINTRA, a small but picturesquely situated town in Portugal, in the province of Estremadura, about 15 m. w.n.w. of Lisbon, with a pop. of 4,000. It stands on the declivity of the Sierra de Cintra, and is surrounded by country residences. There is a palace at C., a strange mixture of Moorish and Christian architecture, anciently occupied by the Moorish kings, and subsequently a favorite residence of the Christian monarchs. A charming view of the town and of the sea is to be had from the top of a hill crowned with the ruins of a Moorish castle. On another hill-top stands La Penna, once a convent, now a residence of the king of Portugal, who has restored and given it the outward appearance of a feudal castle. In the neighborhood, also, is what is called the Cork convent, which derives its name from the cells—which are cut out in the rock—being lined with cork to prevent damp.

C. is historically remarkable for the *convention* concluded here, Aug. 22, 1808, between the English and French, by which the latter agreed to evacuate Portugal. Junot had been defeated by sir Arthur Wellesley at Vimieira, and had retreated towards Torres Vedras and Lisbon, whither the English under sir Hew Dalrymple, who had just arrived and assumed the chief command, were preparing to follow them. But the French, despairing of finally holding out, agreed to evacuate the country, on condition of not being treated as prisoners of war, but landed on the coast of France, retaining their arms and effects. This convention excited the greatest public indignation both in the Peninsula and in England. Several English newspapers appeared in mourning, and the ministry were obliged to have the generals who signed the convention tried by a court-martial, which, however, resulted in their acquittal. In fact, though the terms of the convention might be advantageous for the French, to obtain immediate possession

of Portugal and Lisbon, instead of being put to the necessity of a bloody siege for months, was no less advantageous to the English and their allies. Such, at least, was the opinion of two competent judges—Napoleon and Wellington.

CIONE, ANDREA DI. See ORCAGNA.

CIOTAT, LA, a t. of France, in the department of Bouches-du-Rhone, situated on the w. side of a bay in the Mediterranean, about 15 m. s.e. of Marseilles, in the midst of a district clad with olive, orange, and pomegranate plantations. It is well built and has a good and commodious harbor, formed by a mole, and well defended. The industry consists in cotton-spinning, ship-building, and an active trade in the produce of the district. Pop. '72, 8,232.

CIPHER, an ornamental arrangement of the initial letters of a name, by which they become also a private mark, adopted by artists and architects as distinctive of their work. That of Albrecht Dürer is well known.

CIPHER-WRITING. See CRYPTOGRAPHY.

CIPRIANI, GIAMBATTISTA, painter and copper-engraver, was b. in Florence, 1732, or, according to others, in 1727, and when 19 years old, went to Rome, where he chose Correggio as a model, and soon gained a high reputation. Invited by certain English residents in Rome, the artist came to London about 1754, where he was one of the first members of the royal academy (founded 1769) and died in 1785. His drawing is correct, his coloring harmonious, his heads have grace and loveliness, and the general style of his works is attractive, although exceedingly conventional. A series of small copper-plate illustrations of *Orlando Furioso* well exemplifies his graceful style. Several of Bartolozzi's best engravings are in C.'s manner.

CIRCÆA (from *Circe*, q.v.), a genus of rather pretty little herbaceous plants of the natural order *Onagraceæ*, with a deeply 2-cleft calyx, a corolla of two petals, and two stamens. *C. lutetiana* is frequent in shady situations in Britain, and in most parts of the continent of Europe. It bears the English name of ENCHANTER'S NIGHTSHADE, and in Germany it is called Hexenkraut (witches' herb). The origin of such names is not easily explained. The plant possesses no remarkable properties, being merely a little astringent. Other species are found in the Himalayas, etc.

CIRCAR, an Indian term applied to the component parts of a province, each of which is administered by a deputy governor. In English, it is principally employed in the name of the Northern Circars, used to designate a now obsolete division of the Madras presidency, which consisted of a narrow slip of territory lying along the w. side of the bay of Bengal, from 15° 40' to 20° 17' north. These Northern Circars were Cicacole, Rajahmundry, Ellore, Condapilly, and Guntoor, in all 30,000 sq. miles.

CIRCASSIA, a division of the Western Caucasus, comprising the n., and also a portion of the s. slope of that mountain-range extending in lat. 42° to 45° n., and long. 37° to 47° east. See CAUCASUS.

CIRCASSIANS, in the wide sense of the term, is the name given to all the independent tribes of the Caucasus; in a narrower sense, it denotes the tribes who inhabited the western part of the range which is called, in consequence, Circassia. The C. proper, however, occupied only the s.w. wing of the Caucasus, with the exclusion of Abasia, or the portion between the Black sea in the w. and the lower bank of the river Kuban in the north. They call themselves Adighé, but the Russians and Turks call them *Teherkesses*. On their conquest by Russia in 1864, rather than remain in subjection to that power they chose to emigrate to Turkey, and from 400,000 to 500,000, or nearly the whole nation of 15 tribes, carried this resolution into effect. The greater part of them were distributed over the Turkish possessions in Asia Minor, but others were settled in the mountainous parts of Bulgaria and on the borders of Servia. In their original country they were a marauding and warlike people, amongst whom it was held more honorable to live by plunder than by peaceful industry. In common with all brigand tribes, the C. cherished the most unrestrained love of independence. Their government was a singular compound of constitutionalism and feudalism. There were five distinct ranks in the nation—viz., chiefs or princes, nobles, common freemen, dependants, and slaves. The class of common freemen made up the great mass of the people; they possessed property, and enjoyed the same political rights as the nobles. The fourth class, the dependants, were the vassals of the princes and nobles, whose lands they cultivated, and whose armies they formed. Yet their lord had no right over their persons; for in some cases they and their whole families left him; and they could only be sold as slaves for punishment according to the previous verdict of a national assembly. The fifth class comprised the slaves, or those who had been made captive in war. That the C. have not lost some of the worst traits of their natural character since their settlement in Turkey is shown by their participation in the Bulgarian massacres of 1876 and 1877.

The C. princes and nobles are principally Mohammedans, whilst the great mass of the people have a religion which is a kind of mixture of Christianity and paganism, in which the celebration of Easter, the sign of the cross, sacred trees, sacrifice, and processions with lights, play an important part. Besides agriculture and the raising of cattle, they possess a few other branches of industry. The C. are proverbially handsome;

they are also strong, active and temperate, and are characterized by the higher attributes of self-dependence, courage, and prudence. As a nation they made their first historical appearance during the middle ages. They are, however, chiefly known through their long struggles to maintain their independence against the aggression of Russia. See CAUCASUS. For their place in ethnology, see CAUCASIAN VARIETY OF MANKIND.

CIRCE, a fabulous sorceress, is described by Homer as "fair-haired, a clever goddess, possessing human speech," sister of "all-wise Æetes," daughter of "the Sun, who gives light to mortals, and of Perse, whom Ocean begot as his daughter." Round her palace in Ææa were numbers of human beings, whom she had changed into the shapes of wolves and lions by her drugs and incantations. She changed two-and-twenty of the companions of Ulysses into swine, but that hero, having obtained from Mercury the herb *moly*, went boldly to the palace of the sorceress, remained uninjured by her drugs, and induced her to disenchant his comrades. He remained with her for a year; and when he departed, she instructed him how to avoid the dangers which he would encounter on his homeward voyage (*Odyssey*, books x. and xii.). Jealous of Scylla, whose love was sought by Glaucus, she poured the juice of poisonous herbs into that part of the sea where her rival was accustomed to bathe, and changed her into a hideous monster (*Metamorphoses*, book xiv., fables 1 and 6).

CIRCEII, a t. of ancient Italy, in Litiu, at the foot of Mons Circeius, a short distance from the sea, 10 or 12 m. from Terracina. Its ruins are still visible on the Montedella Cittadella, and consist of walls and gateways, built of polygonal blocks.

CIRCENSIAN GAMES. See *Circus*, *ante*.

CIRCLE, a plane figure bounded by a curved line, which returns into itself, called its *circumference*, and which is everywhere equally distant from a point within it called the *center* of the circle. The circumference is sometimes itself called the C., but this is improper; C. is truly the name given to the space contained within the circumference. Any line drawn through the center, and terminated by the circumference, is a *diameter*. It is obvious that every diameter is bisected in the center. (See *ARC*, *CHORD*.) In co-ordinate geometry, the C. ranks as a curve of the second order, and belongs to the class of the conic sections. It is got from the right cone by cutting the cone by a plane perpendicular to its axis. The C. may be described mechanically with a pair of compasses, fixing one foot in the center, and turning the other round to trace out the circumference. The C. and straight line are the two elements of plane geometry, and those constructions only are regarded as being properly geometrical which can be effected by their means. As an element in plane geometry, its properties are well known and investigated in all the text-books. Only a few of the leading properties will here be stated.

1. Of all plane figures, the C. has the greatest area within the same perimeter.

2. The circumference of a C. bears a certain constant ratio to its diameter. This constant ratio, which mathematicians usually denote by the Greek letter π , has been determined to be 3.14159, nearly, so that, if the diameter of a C. is 1 foot, its circumference is 3.14159 feet; if the diameter is 5 ft., the circumference is 5×3.14159 ; and, in general, if the diameter is expressed by $2r$ (twice the radius), then c (circumference) = $2r \times \pi$. Archimedes, in his book *De Dimensione Circuli*, first gave a near value to the ratio between the circumference and the diameter, being that of 7 to 22. Various closer approximations in large numbers were afterwards made, as, for instance, the ratio of 1815 to 5702. Vieta, in 1579, showed that if the diameter of a C. be 1000, etc., then the circumference will be greater than 3141.5926535, and less than 3141.5926537. This approximation he made through ascertaining the perimeters of the inscribed and circumscribed polygons of 393,216 sides. By increasing the number of the sides of the polygons, their perimeters are brought more and more nearly into coincidence with the circumference of the circle. The approximation to the value of π has since been carried (by M. de Lagny) to 128 places of figures. It is now settled that π belongs to the class of quantities called *incommensurable* (q.v.), i.e., it cannot be expressed by the ratio of any two whole numbers, however great. In general, it may be considered that 3.14159 is a sufficiently accurate value of π .

Though the value of π was at first approached by actually calculating the perimeter of a polygon of a great number of sides, this operose method was long ago superseded by modes of calculation of a more refined character, which, however, cannot here be explained. Suffice it to say, that various series were formed expressing its value; by taking more and more of the terms of which into account, a closer and closer approach to the value might be obtained. We subjoin one or two of the more curious.

$$\pi = 4 \left(1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11} + \text{etc.} \right).$$

$$\pi = 8 \left(\frac{1}{1.3} + \frac{1}{3.5} - \frac{1}{3.5.7} + \frac{1}{5.7.9} - \frac{1}{7.9.11} + \frac{1}{9.11.13} - \text{etc.} \right).$$

3. The area of a C. is equal to π multiplied by the square of the radius (= πr^2); or to the square of the diameter multiplied by $\frac{\pi}{4}$; i.e., by .7854. Euclid has proved this

by showing that the area is equal to that of a triangle whose base is the circumference, and perpendicular height the radius of the circle.

4. It follows that different circles are to one another as the squares of their radii or diameters, and that their circumferences are as the radii or diameters.

The C. is almost always employed to measure angles, from its obvious convenience for the purpose, which depends on the fact demonstrated in Euclid (book iv. prop. 33), that angles at the center of a C. are proportional to the arcs on which they stand. It follows, from this, that if circles of the same radii be described from the vertices of angles as centers, the arcs intercepted between the lines, including the angles, are always proportional to the angles. The C. thus presents us with the means of comparing angles. It is first necessary, however, to graduate the C. itself; for this purpose its circumference is divided into four equal parts; called *quadrants*, each of which obviously subtends a right angle at the center, and then each quadrant is divided into degrees, and each degree into minutes, and so on. The systems of graduation adopted are various, and will now be explained.

The *sexagesimal scale* is that in common use. According to it, each quadrant or right angle being divided into 90 degrees, each degree is divided into 60 seconds, and each second into 60 thirds, and so on. According to this scale, 90° represents a right angle; 180°, two right angles, or a semicircle; and 360°, four right angles, or the whole circumference—the unit in the scale being the $\frac{1}{360}$ th of a right angle. As the divisions of the angles at the center, effected by drawing lines from the center to the different points of graduation of the circumference, are obviously independent of the magnitude of the radius, and therefore of the circumference, these divisions of the circumference of the C. may be spoken of as being actually divisions of angles. By laying a graduated C. over an angle, and noticing the number of degrees, etc., lying on the circumference between the lines including the angle, we at once know the magnitude of the angle. Suppose the lines to include between them 3 degrees, 45 minutes, 17 seconds, the angle in this scale would be written 3° 45' 17".

It is obvious, however, that the division of the quadrant into 90 degrees instead of any other number, is quite arbitrary. We may measure angles by the C., however we graduate it. Many French writers, accordingly, have adopted the

Centesimal Division of the Circle.—In this division, the right angle is divided into 100 degrees, while each degree is divided into 100 parts, and so on. This is a most convenient division, as it requires no new notation to denote the different parts. Such a quantity as 3° 45' 17" is expressed in this notation by 3.4517, the only mark required being the decimal point to separate the degrees from the parts. Of course, in this illustration, 3° means 3 centesimal divisions of the right angle, and 45' means 45 centesimal minutes, and so on. If we want to translate the quantity 3° of the common notation into the centesimal notation, we must multiply 3 by 100, and divide by 90. To translate minutes in the common notation into the centesimal, the rule is to multiply by 100, and divide by 54.

There remains yet another mode of measuring angles, known as the

Circular Measure.—The circular measure of angles is in frequent use, and depends directly on the proposition (Eucl. vi. 33), that angles at the center of a C. are proportional to the arcs on which they stand. Let POA be an angle at the center O of a C., the radius of which is r ; APB a semicircle whose circumference accordingly = πr ; and let the length of the arc AP = a . Then, by Euclid, $\frac{\text{angle POA}}{2 \text{ right angles}} = \frac{a}{\pi r}$; and

$\angle POA = \frac{2 \text{ right } \angle s}{\pi} \cdot \frac{a}{r}$. Now, supposing a and r to be given, although the angle POA will be determined, yet its numerical value will not be settled unless we make some convention as to what angle we shall call unity. We are free to make any convention we please, and therefore choose such a one as will render the preceding equation the most simple. It is made most simple if we take $\frac{2 \text{ right angles}}{\pi} = 1$. We shall then have (denoting

the numerical value of the angle POA by θ) $\theta = \frac{a}{r}$. The result of our convention is,

that the numerical value of two right angles is π , instead of 180°, as in the method of angular measurement first alluded to; and the unit of angle, instead of being the ninetyeth part of a right angle, is $\frac{2 \text{ right angles}}{\pi}$, or 57° 17' 44" 48" nearly. Making $\theta = 1$ in

the equation $\theta = \frac{a}{r}$, we have a (or AP) = r (or AO), which shows that in the circular measure, the unit of angle is that angle which is subtended by an arc of length equal to radius. It is frequently a matter of indifference which mode of measuring angles is adopted; the circular measure, however, is generally the most advantageous, as being the briefest. It is easy to pass from this mode of measurement to the sexagesimal. If

θ be the circular measure of an angle, the angle contains $\frac{\theta}{\pi} \cdot 180^\circ$; conversely, if an angle contain n° , its circular measure is $\frac{n}{180} \cdot \pi$.

CIRCLE, MAGIC, a space in which sorcerers were wont, according to the ancient popular belief, to protect themselves from the fury of the evil spirits they had raised. This C. was usually formed on a piece of ground about 9 ft. square (in the east, 7 ft. appears to have been considered sufficient), in the midst of some dark forest, church-yard, vault, or other lonely and dismal spot. The C. was described at midnight in certain conditions of the moon and weather. Inside the outer C. was another somewhat less, in the center of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines which inclosed the larger one, were filled "with all the holy names of God," and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this C., the magician, it was believed, would have been carried off by the spirits, as he would have been, had he by chance got out of the charmed space.

CIRCLE, MURAL, an instrument used for determining the meridian altitude or zenith distance of a star. It consists of an astronomical telescope firmly fixed to a graduated circle, which moves about a horizontal axis, fixed in a strong vertical wall running north and south. In the common focus of the eye-piece and object-glass of the telescope is a system of cross-wires (spider lines are generally used for the purpose), one being horizontal, and five vertical, with equal spaces between. The line joining the optical center of the object-glass with the intersection of the horizontal and middle vertical wires, is called the line of *collimation* of the telescope, and when the instrument is in perfect adjustment, this line moves in the plane of the meridian.

Besides the above-mentioned fixed wire, there is a movable one, called a micrometer wire, which is moved by means of a screw, remaining always parallel to the fixed horizontal wire.

If the instrument be so adjusted that the image of a star, while passing across the middle vertical wire in the field of view, shall at the same time be bisected by the fixed horizontal wire, the star is at that moment in the line of collimation of the telescope. It is therefore at that moment in the meridian, and its meridian zenith distance is the angle through which the circle would have been turned from the position it had when the line of collimation of the telescope pointed to the zenith. There is a fixed pointer, for the purpose of approximately reading the instrument. If the instrument were accurately adjusted, so that the pointer was opposite the zero point of the circle, when the line of collimation of the telescope pointed to the zenith, the arc intercepted between these two positions of the instrument would be the meridian zenith distance of the star.

Great nicety is required in "reading" the instrument; i. e., in determining exactly the arc through which the circle has moved in bringing the telescope from the vertical to any other position. The rim is usually graduated at intervals of five minutes; and the eye could determine only the division nearest to the fixed index. But by means of a "reading microscope," or micrometer (q. v.), fixed opposite to the rim, the portion of the interval to the nearest division on the rim can be read to seconds. There are usually six such microscopes fixed opposite different points of the rim; and the "reading" of the instrument is the mean of the "readings" of all the microscopes. This tends to eliminate errors arising from imperfect graduation and adjustment. If the instrument is properly adjusted, the zero point of the circle will be opposite the fixed pointer when the line of collimation of the telescope points to the zenith. In practice, however, this is not always accurately, or even approximately the case. As we shall immediately show, it is of no consequence, as the final result of every observation is the *difference* between two readings.

It is evident that the difference between any two readings of the instrument will represent the angle through which the line of collimation of the telescope moves in passing from one position to the other. It remains to show how a fixed point, viz., the nadir (q. v.), is observed, and then how an observation is taken of the star itself in its meridian passage.

We must explain here that the fixed horizontal wire in the eye-piece of the telescope, in the instruments as now used, is only an *imaginary* line which determines the line of collimation of the telescope. It coincides with the position of the micrometer wire, when the screw-head of the micrometer marks zero.

To observe the nadir, a trough of mercury is placed underneath the instrument, and the telescope is turned so as to look vertically downwards into it. An image of the system of cross-wires which is in the common focus of the object-glass and eye-piece, will be reflected back again to nearly the same focus. Looking in'o the telescope, the observer now adjusts it by means of a tangent screw till the reflected image of the horizontal wire coincides with the real one. The final adjustment is perhaps most delicately affected by turning the screw-head of the micrometer which moves the wire itself. When they coincide, the line joining the center of the object-glass of the telescope with

the intersection between the middle vertical and horizontal micrometric wire, will be vertical. Now, the angle between this and the line of collimation of the telescope, which, as we have said, joins the optical center of the object-glass with the intersection of the middle vertical and imaginary fixed horizontal wire, will, if the micrometer is in proper adjustment, be at once read off the micrometer screw-head. The instrument being clamped as above adjusted, the microscopes are read off, and the reading of the micrometer screw-head above mentioned being added to or subtracted from this reading, as the case may be, the nadir reading of the instrument is determined. The zenith reading, therefore, which differs from it by 180° , is at once known.

• Again, to observe a star in the meridian, the instrument is previously adjusted so that the star, in passing the meridian, shall pass over the field of view of the telescope. As the image of the star approaches the center of the field, the observer adjusts the telescope by the tangent screw, so as very nearly to bring the image of the star to the horizontal wire. Finally, just as the star passes the middle vertical wire, he bisects the image of the star with the horizontal wire by a touch of the micrometer screw-head. The circle being now clamped (or made fast), the "reading" is determined as before by reading the pointer and microscopes, and adding or subtracting, as the case may be, the reading of the micrometer. This reading now subtracted from the zenith-reading gives the meridian zenith distance of the star; and this, again, subtracted from 90° , gives its meridian altitude above the horizon.

At the royal observatory of Greenwich, the principal observations are now made by an instrument which combines the mural C. with the transit instrument. See TRANSIT INSTRUMENT.

CIRCLE, QUADRATURE OF. See QUADRATURE.

CIRCLES OF THE SPHERE. See ARMILLARY SPHERE.

CIRCLEVILLE, a city in Pickaway co., Ohio, on the Scioto river, and the Cincinnati and Muskingum Valley railroad, and the Ohio canal; pop. '70, 5,407. It was built on the site of an old Indian fortification of circular form, from which comes the name. The city has many mills and manufactories.

CIRCUIT COURT, in American jurisprudence, a court whose jurisdiction extends over a number of counties or districts, and which holds its sittings in various places within the jurisdiction. More definitely, a class of federal courts of which the terms are held in two or more places successively in the various circuits into which the whole union is divided. They are presided over by the chief-justice of the United States, or one of the associate judges, or by a special circuit justice, or in some cases by a district judge. The C. C. has jurisdiction in law and equity, direct and appellate; hears appeals in admiralty, and in some instances in criminal cases. The systems respecting circuit courts in the several states differ considerably. In the classification of English courts no such title is known.

CIRCUITS (Fr. *circuit*; Lat. *circuitus*, a going round). IN ENGLAND.—England and Wales, with the exception of the co. of Middlesex, are divided, for judicial purposes, into eight C., which the 15 judges visit twice or thrice a year, in pairs, for the purpose of adjudging civil and criminal causes. These C. are the Home, the Midland, the Norfolk, the Oxford, the Northern, the Western, the North Wales, and the South Wales. Criminal charges within the co. of Middlesex and the city of London and surrounding district, are disposed of at sessions which are held monthly at the central criminal court. Before and after term, the judges of the superior courts sit for the adjudication of civil causes in the Guildhall of the city of London, with the exception of the lord chancellor and the vice-chancellor, who sit at Lincoln's inn. "These judges of assize came into use in the room of the ancient justices in eyre, *justiciarii in itinere*, who were regularly established, if not first appointed, by the parliament of Northampton, 1176 A.D., in the twenty-second year of Henry II., with a delegated power from the king's great court, or *curia regia*, being looked upon as members thereof."—Stephen's *Com.*, vol. iii. p. 415. See ASSIZE and NISI PRIUS.—IRELAND is divided into the North-east, the North-west, the Home, the Leinster, Connaught, and Munster circuits. See IRELAND, SCOTLAND, JUSTICIARY COURT.

CIRCULAR NOTES are bank-notes specially adapted for the use of travelers in foreign countries; and being, in fact, bills personal to the bearer, they are believed to be more safe as traveling money than ordinary notes or coin. C. N. are furnished by the chief London banking-houses. Those who wish to obtain them, determine beforehand what sum of money they will require on their journey, and that they pay to the banker, who, in exchange, gives C. N. to the amount, each of the value of £10 and upwards. Along with these notes is given a "letter of indication." This letter (a lithographed form in French) is addressed to foreign bankers, requesting them to pay the notes presented by the bearer, whom they name, and to aid him in any way in their power. By way of verification, the bearer appends his signature, and the letter is complete. On the back of the letter there is a long list of foreign bankers, extending all over Europe, any of whom will cash one or more of the C. N., on being presented and indorsed by the bearer; the indorsement being of course compared with the signature on the letter of indication, which is at the same time exhibited. In paying these notes, the money

of the country is given, according to the course of exchange, and free of any charge for commission. For security, the letter and the notes should not be carried together, in case of being stolen or lost. These C. N. are doubtless a safe and convenient species of money, exchangeable in almost every town visited; and if any remain over on coming home, they will be taken back at their value by the banker who issued them. There are, however, certain drawbacks connected with these notes, which every traveler less or more experiences. In many, almost in all, instances, there is a difficulty in finding out where the banker named is to be found; for foreign bankers generally occupy obscure apartments several stories high, and not unusually in dingy out-of-the-way alleys. To discover them, a commissioner may be necessary. Then, in some instances (in Paris invariably), the banker jealously scrutinizes the bearer, asks to see his passport, and takes a note of the hotel at which he lodges; all which may be proper as a precaution against roguery, but it is not pleasant. Further, the C. N. are ordinarily of a thick stiff kind of paper, which does not well fit into a purse or pocket-book. On these several accounts, the careful class of travelers who keep to the main thoroughfares of France, Germany, and Belgium, will find £5 or £10 bank of England notes, and sovereigns or napoleons, a preferable kind of money to take on their journey. w. c.

CIRCULAR NUMBERS are numbers whose powers end on the same figure as they do themselves: such are numbers ending in 0, 1, 5, 6.

CIRCULAR PARTS, the name given to a rule in spherical trigonometry, invented by lord Napier. It is to be found in any treatise on that subject.

CIRCULATING DECIMALS. See DECIMALS.

CIRCULATING LIBRARY, a collection of books lent out on hire—circulated from hand to hand. The plan of lending books on hire is not new. Chevillier, in his *Origines de l'Imprimerie de Paris* (4to, 1694), mentions that, in 1342, a century before the invention of printing, a law was framed in Paris, to compel stationers to keep books to be lent on hire, for the special benefit of poor students and others. This fact is alluded to as follows, by E. S. Merryweather, in his entertaining work, *Bibliomania in the Middle Ages* (London, 1849): "The reader will be surprised at the idea of a circulating library in the middle ages, but there can be no doubt of the fact, they were established at Paris, Toulouse, Vienna, and other places. These public librarians, too, were obliged to write out regular catalogues of their books, and hang them up in their shops, with the prices affixed, so that the student might know beforehand what he had to pay for reading them." This writer, quoting from Chevillier, gives a list of books so lent out, with the prices for reading them. The books are all of a theological or classical kind. Among them is the Bible, the perusal of which is set down at 10 sous. "This rate of charge," it is added, "was also fixed by the university, and the students borrowing these books were privileged to transcribe them, if they chose; if any of them proved imperfect or faulty, they were denounced by the university, and a fine was imposed upon the book-seller who had lent out the volume." In these arrangements, we see the efforts that were made to procure the use of books before the art of printing had cheapened the cost of literature.

By whom the modern C. L. was projected, there is no record. All that can be given are a few facts on the subject. It is known that Allan Ramsay, author of *The Gentle Shepherd*, who was a bookseller in Edinburgh, established a C. L. in that city about 1725. Fond of dramatic literature, Ramsay appears to have incurred some local obloquy by lending out plays; and his wish to introduce a taste for the drama into Edinburgh may accordingly have suggested the notion of a circulating library. Be this as it may, the library which he began was continued through various hands for above a hundred years. At Ramsay's death in 1758, his library was sold to a Mr. Yair, whose widow carried it on till 1780, when it was bought by Mr. James Sibbald, an ingenious inquirer into Scottish literary antiquities. Sibbald lived some years as a literary man in London, during which period, beginning with 1793, the C. L. was carried on, subject to an agreement by a Mr. Laurie. Sibbald afterwards resumed the direction of the library, which he considerably extended. At his death in 1803, his brother attempted to carry it on; but not being successful in his management, he disposed of it in 1806 to Alexander Mackay, a person of extraordinary energy and perseverance. By the acquisition of various other libraries, Mr. Mackay greatly enlarged the collection, which, under the name of the Edinburgh C. L., he conducted at 154 High street. Here, by long-continued and minute attention to business, Mr. Mackay realized a competency, and he retired from active pursuits in 1831, when this extensive collection of books was broken up and sold by auction.

There are several circulating libraries in London, claiming to be of old date, but probably not so early as 1725. In a late reprint of an old advertisement, we see "Proposals for erecting a public circulating library in London," under date June 12, 1742. This library was to be established "in some convenient place at or near the royal exchange;" and the subscription was to be a guinea per annum. Two of the present circulating libraries are believed to be descended from this primitive stock. So numerous had circulating libraries become in the early years of the present century, that they absorbed whole editions of novels and romances prepared for the purpose by a London

publishing establishment, designated the Minerva press. The issue of cheap books and periodicals about 1832 (see BOOK-TRADE) seriously damaged the C. L. system; for people now bought instead of borrowing materials for light reading. The vast increase to the reading public in recent times, and the continually augmenting number of new and popular works of a respectable class, have been the means of restoring prosperity to circulating libraries, more especially in London, where some of them are on a surprisingly gigantic scale. To one library alone, as many as 100,000 new books are said to be added annually, and of kinds very different from those of the old Minerva press school. The method of reading from these libraries consists in paying a sum per annum—usually a subscription of a guinea—for which a number of new books may at all times be procured, and kept for a specified period. When the books are no longer in demand, they are sold at reduced prices.

The method of circulating books among the members of private associations, is noticed under the head BOOK-CLUB; and that of circulating books in rural districts by means of libraries which are shifted from place to place, will be found in the article ITINERATING LIBRARIES.
